Huron Forge & Machine Co., 9041 Alpine Avenue, Detroit, is planning installation of additional equipment in its machine shop.

Board of Education, Pontiac, Mich., will soon take bids for a two-story manual arts school on Central High School campus, to cost $100,000. Childs & Smith, 720 North Michigan Avenue, Chicago, are architects.

Frank F. Taylor Co., Inc., 2801 Highland Avenue, Norwood, Cincinnati, manufacturer of automobile wheels, juvenile vehicles, etc., has purchased Central Wheel Co., Muskegon, Mich., and will consolidate with its organization. Equipment will be removed to Cincinnati works which will be extended to accommodate increase.

L. A. Young Spring & Wire Corporation, 9200 Russell Street, Detroit, manufacturer of special springs and other wire goods, is disposing of preferred stock issue to total $2,550,000, a portion of fund to be used for expansion.

New interests headed by F. C. Bowers and A. J. Jennings are completing arrangements for purchase of controlling interest in Farmer Lubrication Systems, Inc., 2633 Sixteenth Street, Detroit, manufacturer of lubricating devices and equipment, and will carry out an improvement and development program. A new company will be formed with capital of $375,000 to take over property.

Board of Education, Lincoln Park, Mich., plans installation of manual training equipment in new three-story high and grade school to cost about $900,000, for which plans will be prepared by Verner, Wilhelm & Molby, Book Building, Detroit, architects.

Karp Brothers Coal & Ice Co., 3900 Orleans Street, Detroit, has awarded general contract to Zacks & Lerner, Broadway Exchange Building, for a one-story ice-manufacturing plant, 50 x 175 ft., to cost approximately $100,000 including equipment.

Buick Motor Car Co., Flint, Mich., has acquired property at West Sixty-fifth Street and LaVergne Avenue, Chicago, and plans early erection of one-story factory branch, parts and distributing plant, totaling 240,000 sq. ft. floor space, to cost about $650,000 with equipment. Factory branch at Calumet Avenue and Twenty-first Street, Chicago, will be transferred to new location.

Brown Instrument Co., Philadelphia, maker of recording instruments, has removed its Detroit branch to larger quarters at 576 Maccabee Building. R. W. Mayer is district manager.

Milwaukee

MILWAUKEE, March 26.

A MODERATE run of orders is being booked by local machine-tool manufacturers. Sources of new business cover a wide range of industries, and while individual bookings usually represent only one or two items, the aggregate is relatively satisfactory. Purchasers as a rule request quick delivery. Automotive and farm machinery plants are probably the best buyers and most active in putting forth inquiries. The tool market as a whole exhibits less of the dragging tendency and while activity is uneven, improvement is discernible.

Follen-Lorenz Tool Co., Kenosha, Wis., has acquired plant of former Marwin Motor Truck Co., with 35,000-sq. ft. of floor area, and is expanding output and character of product. It manufactures tools, dies, special tools, bank and postal cancelling machines, and in new plant will also manufacture metal stampings and do deep drawn work, equipment for which is now being purchased. Firm title is being changed to Follen-Strom Mfg. Co. Carl Arthur Strom will join the company as vice-president and general sales manager about June 1. Fred Lorenz, while retaining an interest, has not been active in company's affairs for some time. James H. Follen is president-treasurer and general manager, and E. Mindermann, secretary.

Consolidated Water Power & Paper Co., Wisconsin Rapids, Wis., plans investment of $350,000 in a new digester plant designed by Childs & Smith, architects and engineers, Chicago. Work will begin April 1. Plant will be 60 x 180 ft., 90 ft. high, to house nine Mitscherlich process digesters. Biggs Boiler Works Co., Akron, Ohio, has contract for tanks. W. F. Thiele is chief engineer.

H. Barkow Co, 179 Milwaukee Street, Milwaukee, manufacturer of automobile bodies, truck bodies, cabs, etc,, will replace its present factory with a new plant, 60 x 120 ft., two stories and part basement, at a cost of about $40,000. Construction work has been placed with H. Schmitt & Son, Inc., 14 Burleigh Street, local.

Johnsen Engine Devices Co., Milwaukee, has been organized by Peter Johnsen and associates to develop and promote use of a new injection system for Diesel engines which he recently designed and patented. New concern will specialize in marine engines but will also do work in converting tractor and industrial gasoline engines into oil-burning engines. J. Gilbert Hickcox and Arthur Kowarsch are associated with Mr. Johnsen. Offices have been opened at 110 East Wisconsin Avenue.

Indiana

INDIANAPOLIS, March 26.

BIDS will be asked soon for extensions and betterments in municipal electric light and power at Logansport, including installation of additional equipment. C. J. Horn, Citizens' Loan & Trust Building, is architect.

George J. Mayer Co., 36 South Meridian Street, Indianapolis, manufacturer of dies, stamps, etc., has awarded general contract to Brandt Brothers & Co., Indiana Trust Building, for a two-story addition, 50 x 150 ft., to cost about $25,000. Vonnegut, Bohn & Mueller, Indiana Trust Building, are architects.

Showers Brothers Co., Bloomington, manufacturer of kitchen cabinets, etc., has completed plans for a one-story addition, 78 x 100 ft., to cost approximately $50,000.

Board of Public Works, Evansville, will take bids early in April for a one-story municipal automobile repair, service and garage buiding, to cost about $45,000. Frank Schletter, 113 South Fourth Street, is architect.

United Public Utilities Co., Winchester, operating light, power and ice-manufacturing plants, is disposing of an issue of $3,750,000, part of the proceeds to be used for extensions and improvements, including transmission line construction.

Board of Education, Tell City, plans installation of manual training equipment in a new high school, to cost $200,000, for which bids will be asked on general contract early in April. Troutman & Kreisel, American Trust Building, Evansville, are architects.

North Indiana Public Service Co., Valparaiso, Ind., has approved plans for construction of a pipe line for gas supply between Valparaiso and Michigan City, Ind.

Board of Sanitary Commissioners, Indianapolis, is planning installation of a new turbine pumping unit for municipal sewage system, to replace an engine destroyed by explosion several months ago. A fund of $110,000 is being arranged for this and other sewage station work.

Case Electric Co., Marion, is erecting a factory, 137 x 140 ft., to replace structure destroyed by fire several weeks ago.

Finnell System, Inc., Elkhart, has taken over business of American Scrubbing Equipment Co., Hannibal, Mo., and removed plant to Elkhart. Company manufactures floor machinery, requiring sheet steel, malleable, gray iron and aluminum castings. Castings are machined, but not made in plant and pressed steel is produced.

Pacific Coast

SAN FRANCISCO, March 21.

CONTRACT has been let by E. H. Edwards Co., Butler Road, South San Francisco, manufacturer of wire rope, for a one-story addition, 60 x 720 ft., to cost about $80,000 with equipment. Engineering department of company is in charge.

R. M. Faliday, Los Angeles, has engaged J. Thomas Payne, Mutual Life Building, architect, to prepare plans for a one-story machine shop, 40 x 140 ft., to cost close to $20,000 with equipment.

Crane Co., 836 South Michigan Avenue, Chicago, has plans for a one and one-half story factory branch and distributing plant at Tucson, Ariz., to cost about $45,000 with equipment.

Wolfe & Higgins, Realty Building, San Jose, Cal., architects, have plans for a one and two-story machine shop for company whose name is temporarily withheld, to cost about $19,000 with equipment.

East Bay Iron & Metal Works, Oakland, Cal., has awarded general contract to Spivock & Spivock, Hobart Building, San Francisco, for rebuilding portion of plant at 2310 Peralta Street, to cost about $25,000. Charles Wagner, Hobart Building, is architect.

O. L. Cowan, San Bernardino, Cal., local representative for Lincoln and Ford automobiles, is having plans drawn for a new two-story automobile service, repair and garage building, 150 x 300 ft., to cost about $150,000 with equipment. John P. Perrine, Lincoln Building, Los Angeles, and Howard E. Jones, San Bernardino, are architects.

Salt Water Valley Water Users Association, Phoenix, Ariz., has plans for construction of hydroelectric power plant in Stewart Mountain district, with initial output of 8000 kw., to cost more than $250,000 with equipment. A transmission line will be built for connection with lines of Central Arizona Light & Power Co., which will use majority of output.

Federated Fruit & Vegetable Growers Association, Merced, Cal., is considering construction of new one-story cold storage and refrigerating plant to cost close to $50,000. E. W. Yeager and L. E. Arnold, are at head of organization.

Apple Growers Cold Storage Co., Watsonville, Cal., will soon take bids on general contract for one-story cold storage and refrigerating plant, 300 x 500 ft., to cost $240,000 with equipment. Uttley & Kleindinst, 354 Hobart Street, Oakland, Cal., are engineers.

Clyde Equipment Co., Portland, Ore., has been appointed distributer in Northwest for Jaeger Machine Co., Columbus, Ohio; C. S. Johnson Co., Champaign, Ill.; Milwaukee Gas Tool Corporation, Milwaukee; Alloy Steel & Metals Co., Los Angeles, and Bucyrus-Erie Co., Erie, Pa., and Milwaukee.

Canada

TORONTO, March 26.

THE general upward trend in industrial activities in the Dominion is reflected in more extensive buying of machinery and machine tools. The automotive industry continues to place orders and local builders and dealers are receiving considerable new business from this source. Both the Canadian National and Canadian Pacific railroads have been in the market of late for shop equipment and much other business is pending. The Canadian Pacific will purchase considerable equipment for replacement at shops at Brownville Junction, Me.; McAdam, N. B.; Newport, Vt.; Three Rivers, Que., and at Ottawa, Kingston, London, Windsor, Sudbury and Toronto. At Vankleek Hills, Buckskin and Ayr, Ont., water stations will be improved by the installation of electrically operated pumps.

Waltheimer Paint & Varnish Corporation, London, England, will establish a manufacturing plant at Toronto, Ont., to cost $500,000. R. Mellor, president and general manager, has been in Toronto and will refer plans to the board in London. He expects to return to Toronto in about six weeks when building operations will be started.

National Refractories, Ltd., has purchased land and buildings at Welland, Ont., formerly occupied by Niagara Appliances, Ltd., for establishment of a plant to manufacture fire brick, etc. Building will be razed to make room for a modern manufacturing plant. H. I. Darby, Montreal, is general manager.

L. & N. Co., Ltd., St. Johns, Que., manufacturer of electrical conduits, plans erection of a $100,000 addition. Company is interested in purchase of machinery and tools.

Lorne Fire Engine Co., Ingersoll, Ont., has purchased a building at Mitchell, Ont., and will remove its business to that city.

Sully Brass Foundry, Ltd., which recently purchased Bigley Foundry on Wabash Avenue, Toronto, will spend $10,000 on improvements and installation of new machinery to use for an extension. Two machine shops on site have not been in operation for two years but will be reopened at once.

Andrew Malcolm Furniture Co., Listowel, Ont., is planning an addition to its factory. Details have not been completed, but is is understood that construction work will start this summer.

James Playfair and Associates, Midland, Ont., are having plans prepared by C. D. Howe & Co., Whalen Building, Port Arthur, Ont., for a 1,000,000-bu. reinforced concrete grain elevator at Toronto. Provision will be made for an additional 1,000,000-bu. storage. Construction work will start immediately.

Stephens-Adamson Mfg. Co. of Canada, Ltd., with plant at Belleville, Ont., Canadian subsidiary of Stephens-Adamson Mfg. Co., Aurora, Ill., maker of conveying, transmission and screening machinery, has established branch sales engineering offices in Bank of Hamilton Building, Toronto, in charge of A. F. White, and in New Birks Building, Montreal, in charge of George H. Smith.

MacLaren Co., Buckingham, Que., contemplates erection of a power development plant on Lievre River at High Falls, Que.

Durham Furniture Co., Durham, Ont., will add another story to its factory and will be in market for wood-working machinery, tools, etc. Construction work will start in summer.

Goodyear Cotton Co. of Canada, Ltd., Laframboise Street, St. Hyacinthe, Que., is planning erection of a four story factory, 200 ft. long, to cost $600,000.

Western Canada

International Clay Products, Ltd., plans erection of a factory at Estevan, Sask., to cost $75,000.

Reliance Motor & Machine Works, Ltd., 1039 Georgia Street West., Vancouver, B. C., has awarded contract to Dominion Construction Co., local, for construction of machine shop and garage to cost $35,000. Building will be one story and basement, 100x120 ft., of reinforced concrete construction.

Midland Pacific Terminals, Ltd., care of Harbor Board, Vancouver, B. C., plans construction of 500,000 bu. grain elevator at North Vancouver, to cost $300,000.

Cork Province Mines, Ltd., Vancouver, B. C., has awarded contract to Bartholomew, Montgomery & Co., engineers, for installation of a hydroelectric plant to cost $60,000. Company also proposes installation of additional machinery in milling plant.

Foreign

BIDS will be received by State Electricity Commission, Melbourne, Australia, until May 21 for 22,000-volt transformer equipment and spares. Specifications available at office of Bureau of Foreign and Domestic Commerce, Customhouse, New York, and 33 South Clark Street, Chicago.

Municipal Gas & Electric Corporation, Recklinghausen, Germany, owned and operated by the municipality, has arranged for sale of securities in United States, through E. H. Rollins & Sons, 44 Wall Street, and Foreign Trade Securities, Ltd., 43 Exchange Place, New York, totaling $1,500,000, entire proceeds to be used for extensions and improvements in power plant and system, including installation of additional equipment.

Rumanian Council of Ministers, Bucharest, Rumania, has approved plans for a hydroelectric power development on Ialomitza River, Moreni, with construction of transmission line to connect with present system from Ploesti to Bucharest. Plant is to be completed in 24 months. Information at office of American Consulate, Bucharest, L. J. Cochrane, assistant trade commissioner.

American Chamber of Commerce in France, 32 Rue Taitbout, Paris, has received an inquiry (No. E-3648) from a company at Paris desiring to get in touch with American manufacturers of special automatic screw drivers, suitable for use in garages and by electricians; also an inquiry (No. F-3655) from a company at Paris desiring to get in touch with American manufacturers of paint polishing equipment and abrasive papers.

Plans are being completed for construction of an electric generating plant by a company at Hull, England, to cost close to $1,900,000. Information at office of Bureau of Foreign and Domestic Commerce, Washington, reference England No. 63592; also at office of American Consulate, London, England, William L. Cooper, commercial attaché.

State Council, Helsingfors, Finland, is considering construction of a State-owned nitrogen plant and has appointed a committee to secure information and estimates of cost, headed by Prime Minister Sunila. Information at office of American Consulate, Helsingfors, Frederick B. Lyon, commercial attaché.

Central Electricity Board, London, England, is planning purchases of electrical machinery, including generators, engines, condensers, substation and line equipment, to cost more than $1,000,000 covering a period of several months.

NEW TRADE PUBLICATIONS

Limit Switch.—General Electric Co., Schenectady, N. Y. Folder G. E. A. 914, describing operating mechanism of a compact control for motor-opened doors, windows or valves. Major adjustment for limit of travel is made by a split cam, pinned against a gear driven from the motor to be controlled. Cams open and close contactors. Fine adjustment on contactors is made by micrometer screws.

Motors for Dusty Places.—Wagner Electric Corporation, St. Louis. Broadside illustrating air-jacketed motors. Standard induction motors from 1 to 30 hp. are totally enclosed. Stub end of shaft is prolonged to receive fan blades, and a perforated end and body shield incloses the whole so that cooling air is blown around the tight motor casing rather than through the windings.

New and Used Equipment.—Ross Power Equipment Co., 11 South Meridian Street, Indianapolis. Catalog of steam and electrical equipment, including rock crushers, engines, kilns, boilers, pulverizers, pumps, heaters, heat exchangers, bridge and locomotive cranes, compressors, machine tools, shovels, motors, generators, electric furnaces, steam turbines, hoists, etc.

Pipe Hangers, Unions, Signal Switches, Etc.—Crouse-Hinds Co., Syracuse, N. Y. Advance sheets 97, 98, 99 and 100 are devoted to hangers for pipe or wire, telephone jack condulets, self-threading unions and connectors for pipe, and signal switches for mines.

Leveling or Stretching Machines.—Torrington Mfg. Co., Torrington, Conn. Four-page folder, illustrated, describing stretching machines operated with reciprocating and also with rotary pumps. Two machines are shown which are of the mechanical type.

Electric Magnets.—Electric Controller & Mfg. Co., Cleveland. Four-page folder showing the use of electric magnets on a truck to pick up nails, tacks and other magnetic material on highways.

Centrifugal Pumps.—Pennsylvania Pump & Compressor Co., Easton, Pa. Bulletin 209, devoted to the company's double suction, single stage centrifugal pump, built in sizes to handle capacities up to 20,000 gal. per min. and for heads up to 290 ft.

THE IRON AGE

New York, April 5, 1928

ESTABLISHED 1855

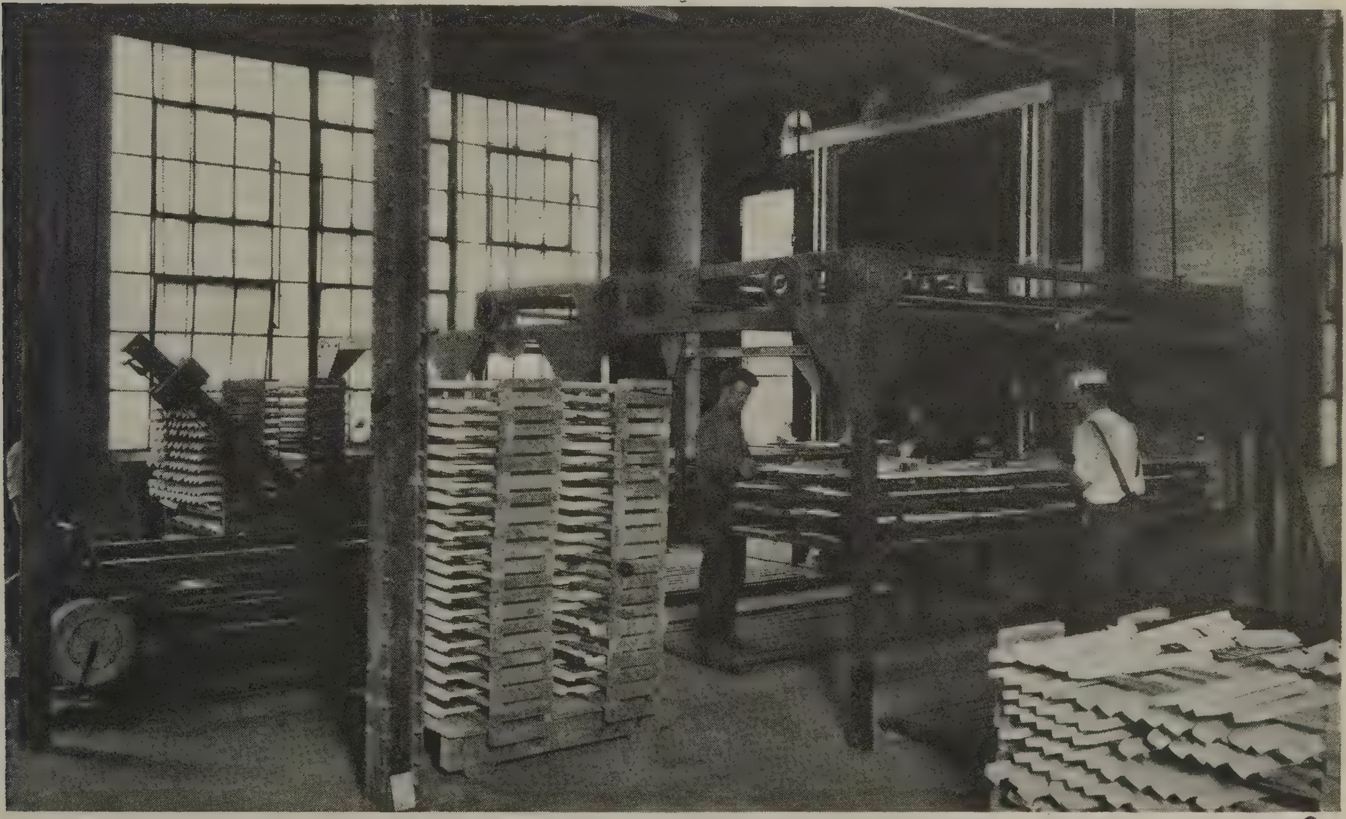
VOL. 121, No. 14

Handling of Materials Is Feature of Plant Changes

Chicago Company Readapts Its Buildings and Equipment for Increased Production of Gas Stoves —Method of Loading Trucks and Various Applications of Mechanical Conveying Are Noteworthy

OCCASIONALLY a manufacturer is compelled to change from one product to another to keep a step ahead of public demand. In taking such a step he will naturally try to choose a product with a wider market appeal. At the same time he will give full consideration to the selection and arrangement of production and material handling equipment so that costs will be held at the minimum consistent with quality of product.

In 65 years of manufacturing experience the Cribben & Sexton Co., Chicago, has kept in close touch with the pulse of demand. Until 30 years ago the bulk of its business was in plumbing supplies, but about 1897 it sold that branch and swung into the production of coal ranges and, to some extent, gas stoves. As rapidly as localities were served by gas housewives were quick to recognize the advantage of that fuel as compared with coal. The rural trade, to a large extent, was left for the coal range manufacturer, although even in this field increasing competition from oil stove makers was

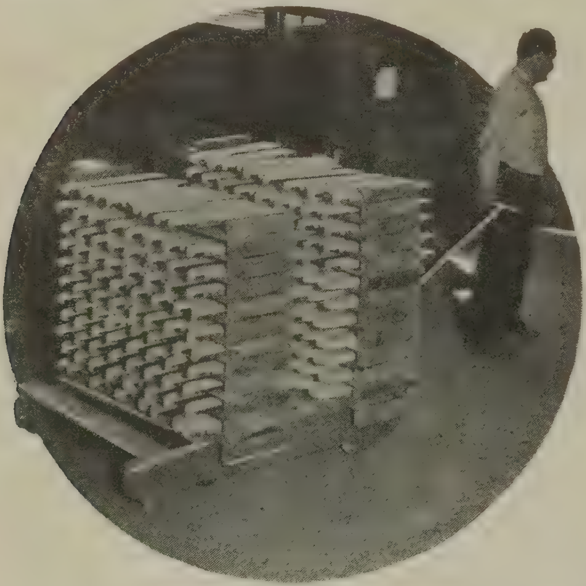


Enameling Furnaces Are Charged by Means of a Buggy With a Rising and Lowering Bed. The buggy takes its load from a carriage which is suspended from an overhead track encountered. To make a long story short, the Cribben & Sexton Co. still manufactures coal ranges, but not in quantities comparable with its output of gas stoves.

Large Press Department Installed to Make Gas Stove Parts

The decision to swing over to heavy production of gas stoves made it necessary to use pressed metal on a larger scale, thus releasing part of the foundry capacity and entailing the expense of constructing a large press department and installing a complete assortment of machine tools for the production of dies. About the time this was done it became evident that social prestige was diminished unless the kitchen gas stove was red, green, yellow or some other color besides the conventional gray, black or white. With attractive gas stoves in heavy demand, it occurred to the manufacturer that a yellow or light blue enameled coal range would strike the fancy of the "domestic engineer," whose duty for years has been to blacken an old-fashioned stove.

Probably the most far-reaching change resulting from tendencies in stove design and demand has been a wider use of pressed metal parts. Before this trend got under way, 180 molders and two cupolas were employed in the Cribben & Sexton foundry. At the present time stove castings occupy only one cupola and 110 molders, and a larger amount of jobbing work is being done.



To Prevent Damage to Enameled Parts Through Their Rubbing Against Each Other, Platform or Skeleton Trucks Are Used. In loading a platform truck, such as the one shown above, the operator mounts one tray over another as rapidly as each is covered with enameled parts. The tray used consists of end spacers and crosswise slats

Three buildings make up the Cribben & Sexton plant. The foundry is a one-story building, as is also the structure which houses the enameling department. The third building is of the multi-story type with basement. Shears and forming presses are located in the basement, and the finished stock room and assembling department are on the upper floors.

Careful attention is given to economy in materials-handling from the time the pig iron for the foundry is unloaded from the railroad cars and placed on piles that are separated by concrete runways. Cupola charges are made up in four-wheeled box trucks which are moved by means of an electric battery lift truck. The same transport equipment is used to remove castings from the pouring floor to the cleaning department and from the cleaning department to the enameling building.

Automatic Machines in Polishing Room

Incidentally, it is standard enameling practice in this plant to apply the undercoat to castings within 48 min. after the casting is sand blasted. This time limit is set to prevent oxidation of the casting prior to its receiving its protective coating of enamel. Parts that are to be nickel-plated go to the plating department, where standard equipment is used.

Ingenious equipment for handling material features the polishing room. One machine, used for polishing the tops of stoves, is 50 ft. long and is equipped with 24 emery wheels. It is entirely automatic, a moving platform carrying a stove under the different wheels. In this department also is an automatic pipe polisher, which employs rotating idlers to force the pipe along and against power-driven polishing belts.

Parts Mechanically Handled through Enameling Furnace

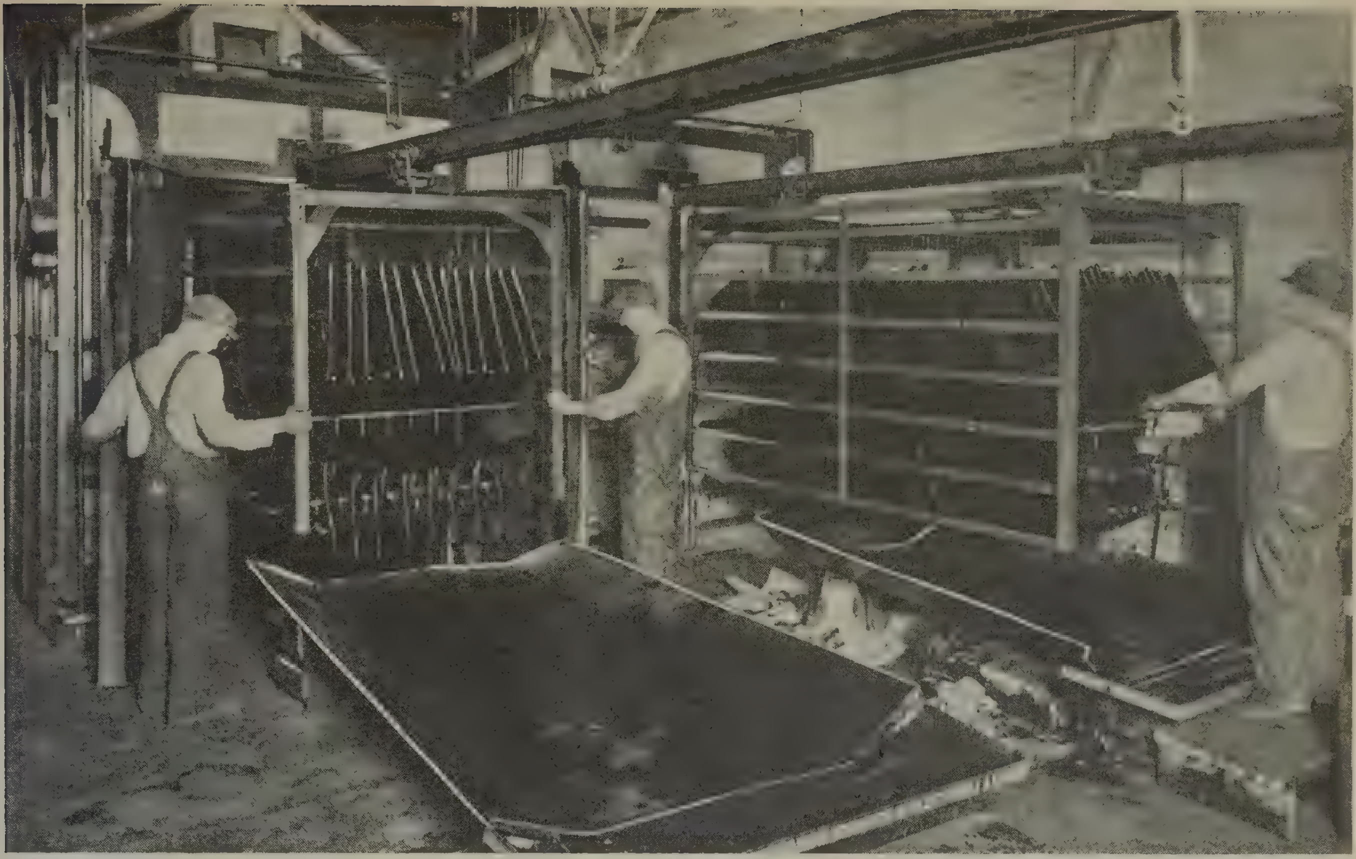
Castings to be enameled are mounted on small metal racks. These are placed in spray booths, and liquid enamel is applied with air guns. The racks are then delivered to a dryer, where they remain from 30 min. to 1 hr, in a stream of air heated to 125 deg. Fahr. by radiator-type heaters, which are equipped with motor-driven fans. Following the drying operation, the racks or trays are placed on either one of two carriages that hang from a structural frame which is directly in front of the burner furnace. This furnace has a capacity of 7500 to 10,000 lb. daily. As soon as a carriage is loaded it is picked up by a charging buggy, which is designed with a rising and lowering bed. The furnace doors are then opened, and the charging buggy delivers the load into the furnace, after which the charging buggy bed is lowered and withdrawn while the burning operation of 30 min. duration is carried on at temperatures that range between 1300 and 1350 deg. Fahr.

Special Trucks Used to Prevent Damage to Enamel

As previously stated, castings are delivered to the enameling department in box trucks. After the enamel is applied great care must be used in handling the various parts so that the enamel coat will not be damaged. Therefore the trucks that are spotted at the spray booths are of a skeleton type with four corner uprights fixed to the truck floor. Cross bars and trays are superimposed on the truck as the spray operator needs space for newly enameled parts. Trucks of this type prevent considerable losses, because they eliminate the necessity of sliding parts between shelves, with the danger of one part rubbing against another or of a part rubbing against a shelf, thus destroying or impairing the enamel coat. Many of the trucks used in this department consist merely of a platform and wheels. A truck of this kind is spotted at a work station. Here within reach of the operator are a number of wooden trays, which consist essentially of end spacers and a number of crosswise slats. The operator mounts a tray on the floor of the truck and, after having covered it with the product on which he is working, places another tray on top of the first one. In this way he gradually builds up the truck load to as great height as is safe for transport purposes.

Sheet Metal Handled by Chute, Elevator and Truck

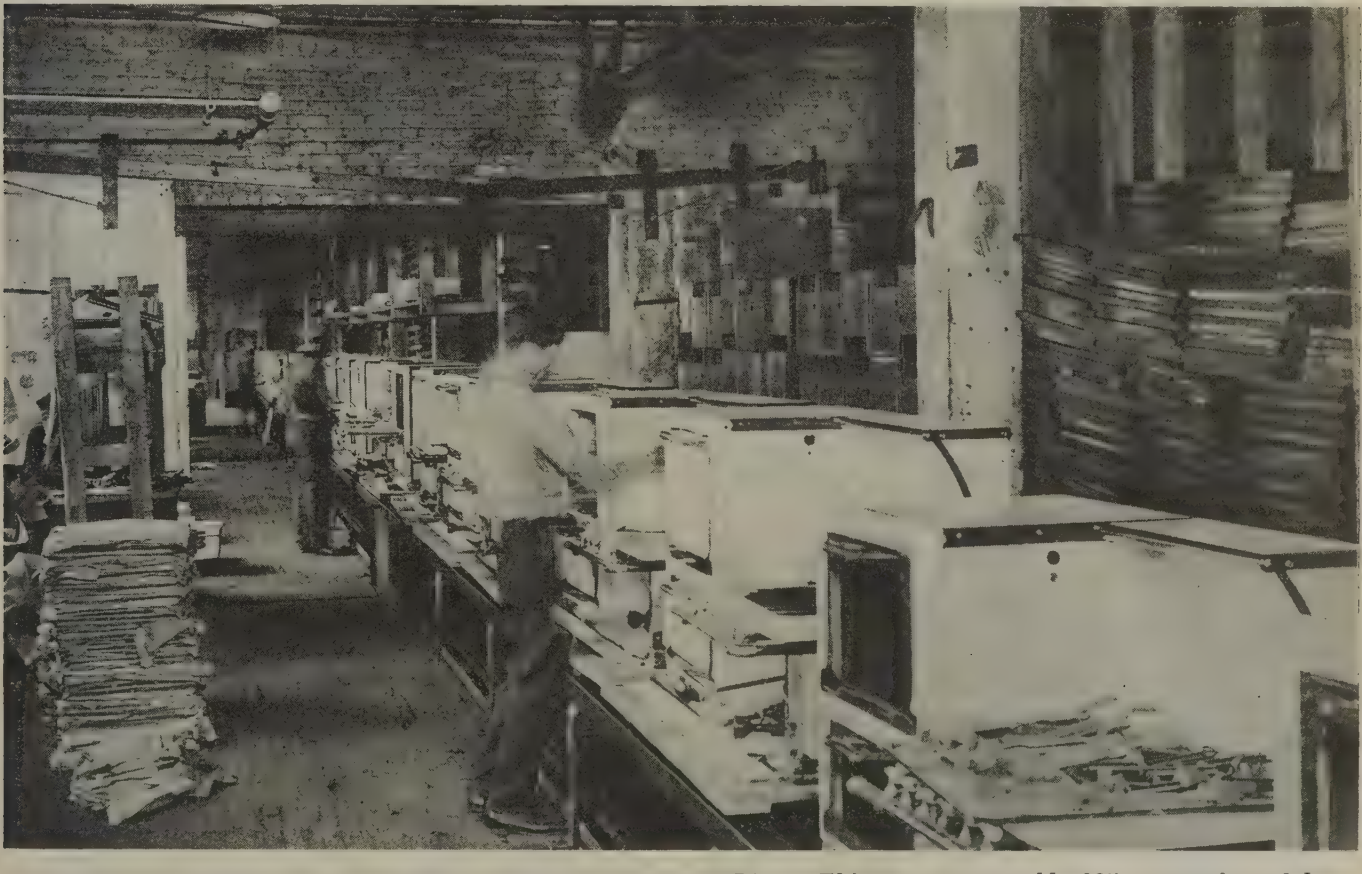
Sheets for press work are unloaded from railroad cars and passed down a chute to the press department, in the basement of the multi-story building, where they are placed in stock. After having been sheared and formed they are loaded in box trucks, which are moved by an electrically operated truck to the end of the building, where an elevator brings the load up to the yard level. The electric truck then transports its load over a concrete roadway to the enameling building, where the formed sheets are delivered to the cleaning department. Here they are first dipped for 10 min. in a caustic solution, which removes all traces of grease. They are then given a cold water bath and allowed to remain 8 min. in a 7 to 8 per cent sulphuric acid bath heated to about 75 deg. Fahr. The next operation is to rinse and sub-



Parts That Are to Be Japanned Are Hand-Dipped and Suspended on a Rack Which Hangs from an Overhead Trolley Beam. The drip pan is located only a few feet from the japanning oven

merge the sheets in a soda solution to assure the removal of any acid solution which may remain on them. The soda tank is heated by means of a steam coil. The sheets attain the temperature of the soda solution before they are removed and, therefore, are warm enough when brought into the air so that evaporation is rapid and they are quickly air-dried, thus avoiding the installation of a dryer.

Sheet metal parts are hand-dipped in the ground coat, which is always of the same color regardless of the color of the finished coat. Trucks used for transporting enameled pressed steel parts are similar to, and in many cases interchangeable with, those used for handling enameled castings. The burning period for the ground coat is 4 min. Each part is then given a thorough inspection and, if passed, is delivered to a spray booth, where it is given the first finish coat. Before burning the first finish coat some stove parts are brushed back by means of stencils and brushing wheels in order to produce an attractive trim and also to protect the enamel from chipping on edges that are bolted together. Finish coats are burned for 2½ min. at a

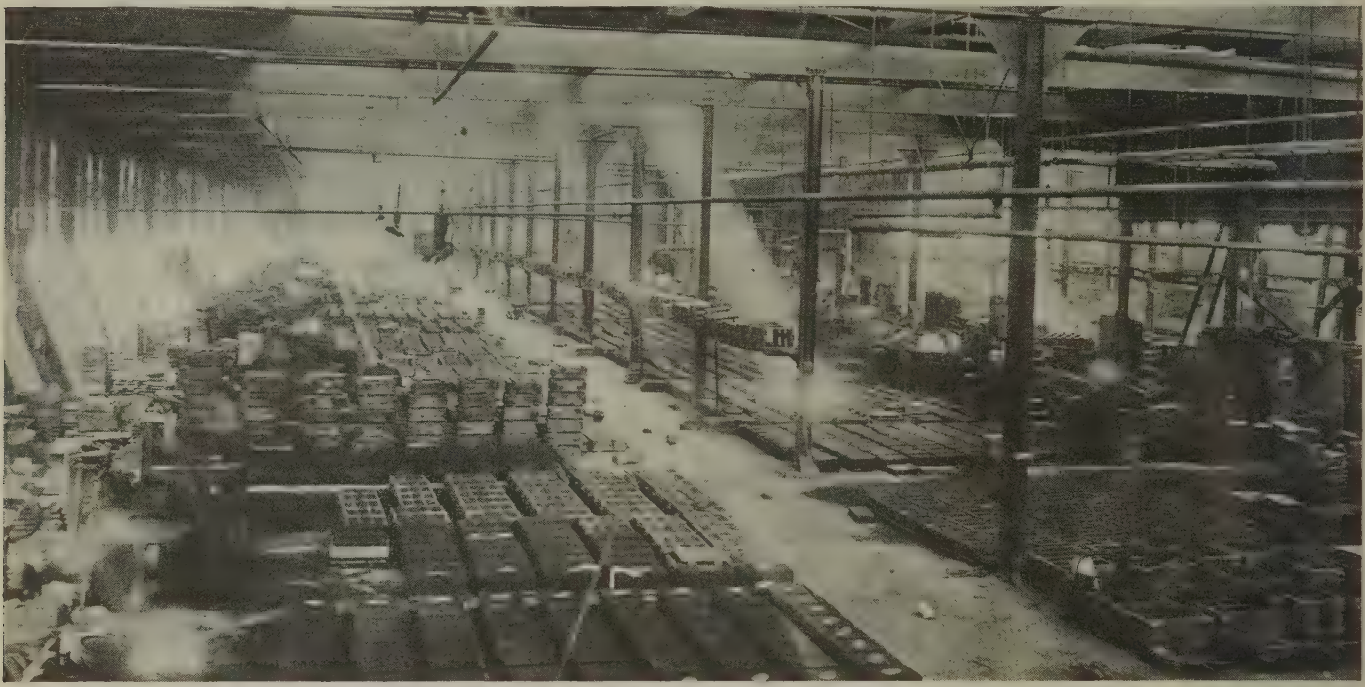


Stoves Are Assembled and Tested on a 130-Ft. Conveyor Line. Thirty men assemble 225 stoves in a 9-hr. day temperature of 1600 deg. Fahr. Careful inspection is given each part before the final color coat is applied. If defects discovered are not too serious, they are retouched and then the second finish coat is applied and burned.

Belt Conveyor Carries Parts to Store Room

All enameled parts, including both castings and pressed metal, come together in a final inspection room, which is on the ground floor of the enameling building. From this room a 36-in, canvas conveyor belt pitches upward at a 17-deg. angle and then extends overhead across the yard to a store room, where a complete line of all parts is kept to facilitate the assembly operations. The conveyor is completely inclosed in a structure which is sufficiently high to provide headroom above an adjacent walkway. This equipment was furnished by the Chain Belt Co., Milwaukee, Wis.

Enameled parts placed on this conveyor are so spaced that they do not touch. Formerly enameled parts were transported from the enameling building to the store room in trucks. It was necessary at that time to carefully pack each part in the truck, and even then there was always the danger of chipping and scratching surfaces, which necessitated an additional inspection in the store room and the rejection of many parts that had reached the stage where they should have been ready for assembly. With the conveyor system, the final inspection is made in the enameling department. The conveyor is reversible so that at the end of a day's run materials may be delivered from the store room back to the enameling department if need be.



The Foundry Is Well Equipped to Supply All the Needs of a Modern Stove Factory. Proper ventilation and the admission of daylight are features of this building

Monorail System Serves Japanning Furnaces

Parts manufactured in the multi-story building that can go directly to the stock room are transported from one floor to another by means of elevators. In this building are two japanning furnaces provided with a loop monorail system, from which six baskets are suspended. Two baskets are always in the oven and two are spotted in front of the charging door, where the parts to be japanned are dipped and suspended over drip pans. Two baskets that are being unloaded are run out on the free length of monorail, which is a return line, to the front of the furnaces.

Conveyor 130 Ft. Long Serves Straight-Line Assembly

The assembly and crating departments are on the same floor with the store room. Assembly starts on benches, where the skeleton of the burner and the oven are put together. A wooden skid, which is part of the shipping crate, is bolted to the skeleton, which is then placed on the receiving end of a 130-ft. assembly conveyor. Thirty men work at given spaces on both sides of this conveyor. Before a stove reaches the end of the conveyor it has been completely assembled, accessories have been wired to it, gas connections have been tested for leaks and burners have been adjusted for proper combustion. The assembly schedule on this conveyor is 225 stoves in a 9-hr. day.

American Steel & Wire Co. Studies Special Properties of Wire

Research with various forms of wire which, when under tension, are subjected to vibration, is being undertaken by the American Steel & Wire Co. in a laboratory at 5149 Agatite Avenue, Chicago. The work is under the direction of William Braid White.

Among the instruments are two that have been developed especially for piano wire investigations. One of these is a "monocord," which consists essentially of an iron frame similar to a lathe bed, except that the sides of the horizontal box member are open and a longitudinal slot extends the full length of the top. At the left end of the frame is a tuning wheel and a jaw for holding one end of the wire. At the opposite end of the frame is a spring-loaded dynamometer. A movable bridge makes this machine adaptable for testing strings from 1 in. to 6 ft. long. A piano action slides along the lower member of the box frame, and, when the key is struck, the hammer reaches the string through the slot in the top section of the frame. The piano action can be moved to strike the string at any point in its length.

Photographic studies of strings under vibration are made by the use of an oscillograph furnished by the Westinghouse Electric & Mfg. Co., Pittsburgh. This instrument is special in that it is adaptable to the study of low-frequency vibrations, the range being from 30 to 50,000 cycles per second. This unit, including a microphone, is portable and may be used for experiments on the "monocord" or on any stringed musical instrument.

Pipe Bends Made by New Process

Typical Large Bend Made in 16-In. Pipe to 40-In. Radius

Forcing Hot Pipe Over Horn-Shaped Mandrel Produces Short-Radius Bends Without Buckling at Inside of Turn or Excessive Thinning at Outer Diameter

PRODUCTION of short-radius pipe bends by a new and unusual process has been started by the Pipe Bending Process Co., Louisville, Ky. The bends are really short arcs of pipe made on a production basis in a standard series of sizes, and can be made of any "bendable" material in any thickness. They should not be confused with the long sweeping curves made to order for expansion joints in steam or hot water lines. Their utility lies in a separate and distinct field, taking the same place in welded pipe lines that cast fittings, elbows, goose necks and returns do in screw-coupled lines.

The manufacturers believe that a definite series of bends with long and short radius will take care of practically every requirement in the way of a fitting for welded piping. Standardized shapes make available to the trade those advantages incident to mass production, such as quick delivery, low cost and small inventory.

A typical standard series of bends would include 180-deg., 90-deg. and 45-deg. turns, of a single radius, for each common size of pipe. It is apparent that any angle of bend can be cut from the 180-deg. return bend. Should it be found inconvenient to anticipate an exact requirement, a small supply of 180-deg. bends in long and short-radius types will provide for any kind of turn at less cost, it is said, than if the pipe were mitered and welded in the field.

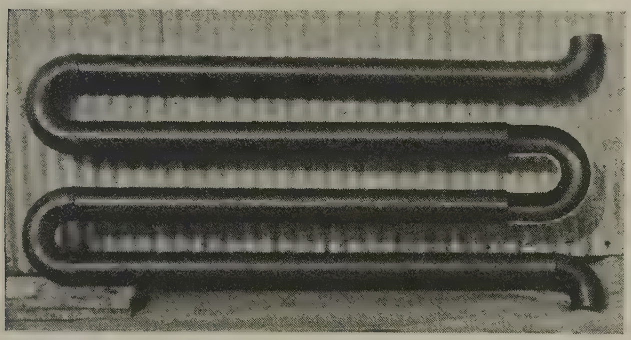


Fig. 2—Flat Coil Spaced at Two Diameters

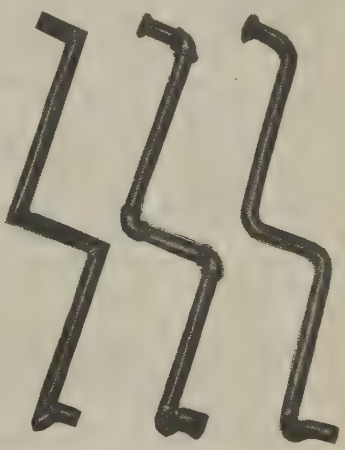
Steel, copper, brass, aluminum and special alloys have been successfully formed into short-radius bends by the Louisville company. Bends are furnished with square or chamfered ends as desired, but are normally without tangents or straight lengths, although short tangents for threading or welding on flanges can be made by an additional press operation. When long tangents are necessary, they are welded on.

In contrast with other methods of bending, the company finds that thin tubes of large or small diameters can be bent easily to radii of from one to one and a half pipe diameters without buckling the inner walls.

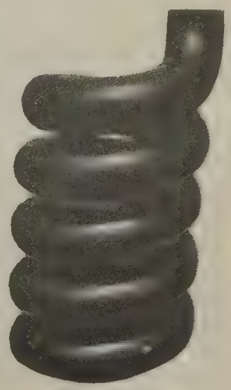
The manufacturing process was invented in Germany and is protected by patents. The essential parts of the equipment consist of a gas furnace, special mandrels and a hydraulic press. The ram from the latter travels over a long steel shaft, fixed into the stationary head of the hydraulic cylinder. Over this shaft a straight length of pipe is slipped until it strikes a flat ring fixed on the nose of the ram. After the straight pipe is placed on the shaft, a horn-shaped mandrel is attached to the forward end of the shaft by a double-threaded turnbuckle coupling. The ram then moves the pipe outward until the forward end binds against the turn at the base of the mandrel. A gas furnace is then moved up to surround the mandrel and the pipe end, and three gas blow torches play flames on the end of the pipe until it is plastic. More pressure is applied from the hydraulic cylinder so the pipe is pushed over the mandrel as fast as it is hot enough to work. The design of the mandrel determines the curvature of the bend and the wall thickness, and variations from a straight bend to a wide coil are obtained by the location of the heat during the operation.

Fig. 1—Complicated Outlet Pipe Made by Three Methods: Left, Mitered Joints, Welded; Middle, Screw Fittings; Right, Short-Radius Bends, Welded



Applications of the bend are numerous. Changes in direction in welded pipe lines can be secured with comparative ease by using different combinations of

Fig. 3—Four-Inch Pipe Coiled in Spiral with 12-In. Outside Diameter



the standard unit. To illustrate this fact a tortuous pipe string was made up, the same dimensions built using malleable iron fittings, and a third by mitering and welding all joints (Fig. 1). A tank of water was filled and drained three times, once through each of these strings. The time noted was as follows:

With short-radius bends	7 min.
With cast elbows	8.5 min.
With mitered joints	12 min.

This indicates that pipe on a true curve, smooth inside, sets up fewer eddy currents at changes in direction and has a greater capacity of flow.

Tests of these bends are said to show them to be equivalent to standard straight pipe in strength.

Of interest to fabricators of flat coils in which a close spacing of pipe is important is the return bend shown in Fig. 2. This coil is made of straight pieces of pipe of standard thickness welded to bends with a radius equal to the pipe diameter, thus providing a center-to-center spacing of only twice the diameter of the pipe. Full strength is maintained at the returns; the wall thickness is correct, both inside and outside, as shown by the bend which has been cut open.

Spiral coils, to give a maximum heating or refrigeration area in minimum volume, are made in any pipe size. Fig. 3 shows a coil of standard 4-in. pipe formed to a diameter of only 12 in. It is composed of a single section, the only weld being at the outlet. Similar coils of indefinite length can be made by welding together duplicate sections.

In underground piping of any kind such bends afford an easy means of passing various obstructions. If flanges are desired, they can be gas, electric or hammer-welded on the bend section, thus providing a fitting for attaching standard flanged castings.

STEEL HOUSES IN GERMANY

Dwellings of Steel Plate Construction Adapted to Mass Production by German Steel Trust

WASHINGTON, April 3.—Domestic steel producers have shown considerable interest in a circular issued by the iron and steel division, Department of Commerce, on the subject of building steel houses in Germany. The circular, based on a report received by Hugh S. Fullerton, consul at Cologne, shows that the steel houses of German manufacture which have been on view or on sale in the Cologne district appear to have features similar to those found in structures in the United States. Durability, warmth and protection from dampness are outstanding selling points in these houses, and it is proposed to have their parts available in stock in order that no time may be lost in supplying the public. It is also planned to have the construction so simple that the purchaser may complete the house himself merely by putting the various parts together and following directions of an elemental nature. The report indicates that German manufacturers obtained their ideas from achievements in the steel house construction field in the United States and England.

Houses Will Be Built in Quantities

A report has been confirmed that the Vereinigte Stahlwerke, the German steel trust, is soon to begin mass production of steel houses and it is declared to be probable that many settlements for industrial operatives, similar to one at Duisburg-Laar, will be the result. Row and block houses of steel construction are reported to be in strong demand in the Rhineland, and large industrial firms are beginning to find in them a ready and rapid solution for housing problems. At present, the report says, the plant of the Vereinigte Stahlwerke at Weidenau, Westphalia, is supplying the demand for steel houses in western Germany, while it is understood that the BAMAG (Berlin-Anhaltische Maschinen-Fabrik Aktiengesellschaft) is intrusted with this responsibility for eastern Germany. The German firms of Gropius, Holzman, Phonix and Czech are reported to be producing or experimenting with steel house construction. The so-called "Boehlerhaus system" (Viennese), employing interior steel plates and plates covered with plaster for the exterior, is said also to be used in some parts of Germany.

Walls and Roofs of Steel Plates

Describing the steel houses in the Cologne district, the report says: "The roof and the side walls are made of strong steel plates which are connected by means of screws with the rims which are turned. Wood borders, which are affixed to the latter, serve as supports for the inner partition walls, consisting of light boards (Tekton plates, etc.) which are nailed on them. Between the outer steel wall and the inner light boards is an air space for protection against cold and sound. The walls, with a thickness of 14 cm., which have been installed in a very short time, are claimed to be as much of an insurance against cold as a brick wall of 51 cm. thickness.

"As the steel plates are all of uniform size, 1.15 m. in width, it is possible to build the house in any desired length. It is also practicable to divide the dwelling space into more spacious rooms if desired. As the partition walls, apart from a supporting middle wall, have no basic connection with the outer walls, they may be transferred according to the individual desires of the purchaser. Construction, therefore, is very simple. The types described and now being manufactured to the greatest extent in Germany are the three, four, and five-room dwelling.

"The foundation is made with concrete walls, 30 cm. thick, beneath the outer walls. Usually, one-third to one-fourth of the building space is occupied by cellars. The roof consists entirely of steel. The steel sheets require no stays to support them so that no framework is required. Doors and windows are furnished in several sizes."

Costs Are Very Low

A five-room house, with two attic rooms, varies in cost between 6,000 and 10,000 marks, or about $1,429 and $2,390. A four-family structure, with cellar space under every room on the ground floor, is quoted at about 22,000 marks, or about $5,238. Each of the four apartments involved has 50 square meters of dwelling space. To complete steel houses of all sizes in this part of Germany, three or four weeks are required, depending upon the size. That so short a period is needed for the construction contributes in no small degree to the low cost of the completed building, as labor charges are reduced to a minimum. According to specifications for inner fittings, the price for a one-family house, consisting of two rooms, plus kitchen, bath and closets, ready for occupancy, inclusive of installations for gas, light and water, amounts to from 6,000 to 7,000 marks, or about $1,429 to $1,667. These figures do not include the cost of fittings for the bath and kitchen.

The weight of a one-family steel house, all materials included and ready to be put together, is approximately 50 tons, according to the claims of German manufacturers, while a stone house of similar dimensions weighs from 150 to 175 tons.

The Interstate Commerce Commission has suspended from March 29 to Oct. 29 the operation of tariff schedules which propose to cancel commodity rates on iron and steel articles, in less-than-carload lots, from the Pittsburgh district to Pennsylvania Railroad stations between Salisbury, Md., and Portsmouth, Va., and to apply fourth class rates instead. The proposal would result in increasing the rates from 47.5c. to 48c. per 100 lb.

Perin & Marshall, consulting engineers, New York, have moved to the seventeenth floor, Salmon Tower Building, 11 West Forty-second Street, New York.

Why So Much Talk About Safety?

Considerations of Responsibility Both to Society and to Shareholders—Safety of Workers Menaced by Automobiles

BY W. H. MEESE*

VIEWING the question of industrial safety from the angle of public safety, it appears that there was no grave question of the safety of the public until the advent of the automobile. Today we have in the United States more automobiles than telephones. With the tremendous increase in the number of cars, the increase in the number of automobile accidents has been enormous—so great, in fact, that adequate protection for the public has almost got out of hand.

We recently prepared statistics in our company, which showed that an employee's chances of losing time from being hurt outside of employment were twice as great as that of being injured while at work. Think of that condition—when a few years ago it was felt necessary to legislate industry into safe practices. No doubt, statistics of other industries would prove the same point.

With industrial accidents going down, motor accidents are decidedly on the increase. The Metropolitan Life Insurance Co. paid in accident claims during 1927 about $10,000,000. Deaths from motor vehicles were the most important, both from the number of deaths and the amount of claims. Over $2,500,000 was paid by that company alone in claims arising from motor vehicle fatalities, an increase of 67.6 per cent since 1920.

In Cook County (Illinois), since Jan. 1, 196 people have been killed in automobile accidents. In most of these cases the people killed or injured were going about their business with no more thought of possible injury or death than any one of us in this room has at this moment.

Irresponsibility at the Steering Wheel

Yet this tremendous increase in motor deaths and accidents is not greatly to be wondered at, when it is remembered that there are about 30,000,000 drivers. In other words, one person in every four in the United States is supposed to be capable of handling a motor car—a car which in an instant may become a juggernaut of destruction. Again, bearing in mind that nearly 500,000 persons in this country are confined in institutions maintained for irresponsible people, it surely looks as if we, as a people, are willing to take some long chances with ourselves.

In 1927 there were over 14,000 motor accidents in Chicago alone. Ten thousand adults and 4600 children were injured, and over 600 adults and 200 children were killed. Many of us came from small farming communities of less than 1000 souls. Picture every man, woman and child in your little home town killed by motor cars within a year.

Industry would not for one moment think of intrusting to inexperienced hands the operation of a punch press, drill press, or a high-powered machine. In filling a vacancy one insists upon the applicant meeting certain necessary requirements.

The State, in fact, prohibits the employment of an individual under 14 years of age and between the ages of 14 and 16 he must present a working certificate. The main purpose, of course, in so far as the State is concerned, is to see that the boy's education is continued, at least until he is 17 years of age. But another real reason is to postpone until that age his introduction to industrial life, and the machine hazards which inexperienced hands might meet.

At the same time, another law permits any boy or girl, provided he or she is accompanied by an adult person, to drive an automobile which, in an instant, can be changed from a pleasure vehicle to an instrument of destruction. And any person 16 years or older, is, by law, qualified to drive a car on his own responsibility.

As this daily toll of injuries and deaths from automobile accidents mounts higher and higher, I believe it is time to consider seriously the adoption of more rigid requirements for persons who are to be allowed to operate motor vehicles.

Safety Promotion Accomplished in Industry

Within the memory of most of us, the danger of snuffing out a life existed primarily in industry. Industry was on the defensive. Finally the recognition of the hazards of industry, and the possible loss of the breadwinner of the family, resulted in legislation regarding guarding of machines, workmen's compensation acts, industrial boards and other means of insuring that industry did carry what the law considered was its responsibility.

Industry proceeded to see that its machines were well guarded, only to find that, even with the guards, the number of accidents did not decrease materially. Then industry began to preach to its personnel the gospel of "Safety First" and the accident ratio began coming down.

During the 10 years preceding 1925, our own company expended about a million dollars in machine guards. In 1925, with our equipment as well guarded as it is today, our lost-time accidents were 4.5 per 1000 employees per month. In 1927, after an intensive effort to train our people to think, talk and act safety, our lost-time accidents were only 1.2 per 1000 employees per month. And we don't believe that we have reached the ultimate.

Small Plants Must Fall in Line

It may be argued that the smaller industries cannot afford to devote as much time and effort to safety work as do some of the larger ones. I do not believe they can afford not to. No matter what the business is, large or small, its owners are interested in eliminating waste and improving methods of operation so that the plant may be run efficiently. But how can efficiency be had, without consideration of the men and women who *are* the plant? Machines without competent operators are worse than useless.

The extent of the cooperation of the men and women in the plant largely determines the success or failure of the enterprise. To make that cooperation possible, if for no other reason, management is justified in making any expenditure necessary to keep its force safe.

If industry will fully meet its moral obligations to its workers, it will not need to worry much about its financial responsibilities to its stockholders. Industry has made splendid progress in its safety work, as industrial statistics show, but we have by no means approached its possibilities.

A shipment of 22 all-steel passenger cars was made March 16 by the American Car & Foundry Export Co., to Sao Paulo, Brazil, for the Paulista Railroad. This is the first all-steel passenger equipment installed on South American railroads. There are 7 first-class coaches; 6 second-class coaches; 3 parlor cars; 2 dining cars; 2 mail cars and 2 baggage cars. These cars were built at Berwick, Pa.

The Erie Railroad Co., development service, has issued an industrial map of its system for use in the locating of new industries. The map is available at the company's offices, 50 Church Street, New York.

Cap Screws Made by New Method

Blank for Threading Produced by Extrusion Process—Tumbling and Lubricating Machine, Electric Heat Treating Furnace and Quenching Machine Are Features

BY FRED L. PRENTISS*

TO satisfy the more exacting requirements of the automotive industry, manufacturers of cap screws have given increased attention to improving the quality of their product. The importance of this small part in the construction of a motor car is indicated by the fact that about 400 cap screws are used in the average motor car, and it is stated that the new Ford Model A, taking less than other cars, uses nearly 300.

Recent improvements in manufacturing processes in making cold-headed cap screws include a new method that is employed by the Cleveland Cap Screw Co., Cleveland. This method is designed to increase the quality of the product both in accuracy and in tensile strength and, at the same time, to save material and to reduce the cost of manufacture as compared with the usual method of cutting the thread. An increase of 30 per cent in tensile strength is claimed for the product, as compared with cap screws made by the ordinary upset method. The process used was developed by Charles Kaufman of the Cleveland Cap Screw Co. and is covered by patents owned by that company.

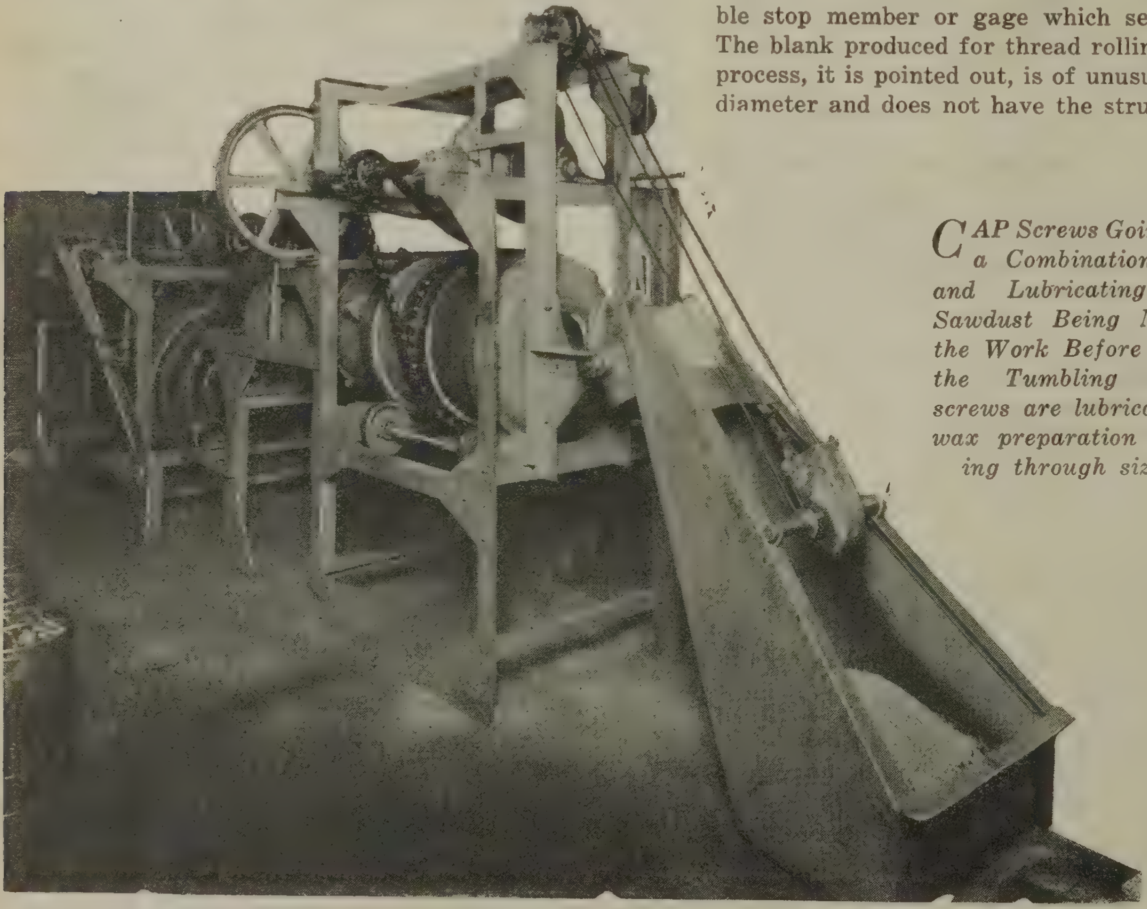
One of the important parts in the process is the heat treating, which is done in a recently installed electric furnace, which insures close temperature control and, consequently, uniformity in the heat treating operation and a finished product that is very uniform in hardness. The furnace was built by the Westinghouse Electric & Mfg. Co., East Pittsburgh, Pa.

In the method commonly employed in making cold-headed cap screws the threads are rolled on the blank in the original diameter of the mill stock and the portion of the blank that forms the shank or body between the threaded portion and head is built up by being expanded in a die by the upsetting process, so that its diameter corresponds to the external diameter of the threads. As a part of the same upsetting operation the head is formed.

Wire Reduced to Proper Pitch Diameter Simultaneously with Heading

Under the new process, wire of the same diameter as the body of the unthreaded portion of the finished screw is fed into the solid die of a double-stroke header of a standard type and is cut off to the proper length. As the wire is forced into the die the portion to be threaded is reduced in diameter to the pitch diameter of the thread to be formed. The heading operation is completed on the second stroke of the plunger.

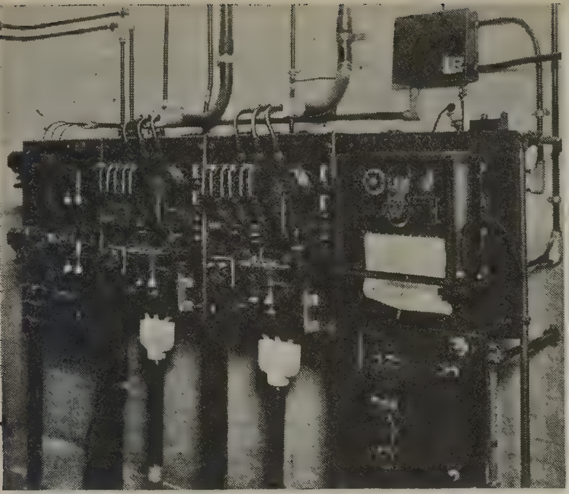
The female die member, which is stationary, has an irregular-shaped cavity including an outer head-forming portion, a section of smaller diameter or approximately the same diameter as the stock and, at the base of this, a section having a further reduction in diameter in which the stock is forced, decreasing the diameter of the portion to be threaded to the pitch diameter of the thread and lengthening that part of the blank by the drawing or extruding process. The stock is driven into the die cavity to a point at which it engages an adjustable stop member or gage which serves as an ejector. The blank produced for thread rolling by the extrusion process, it is pointed out, is of unusually accurate pitch diameter and does not have the structural weakness of

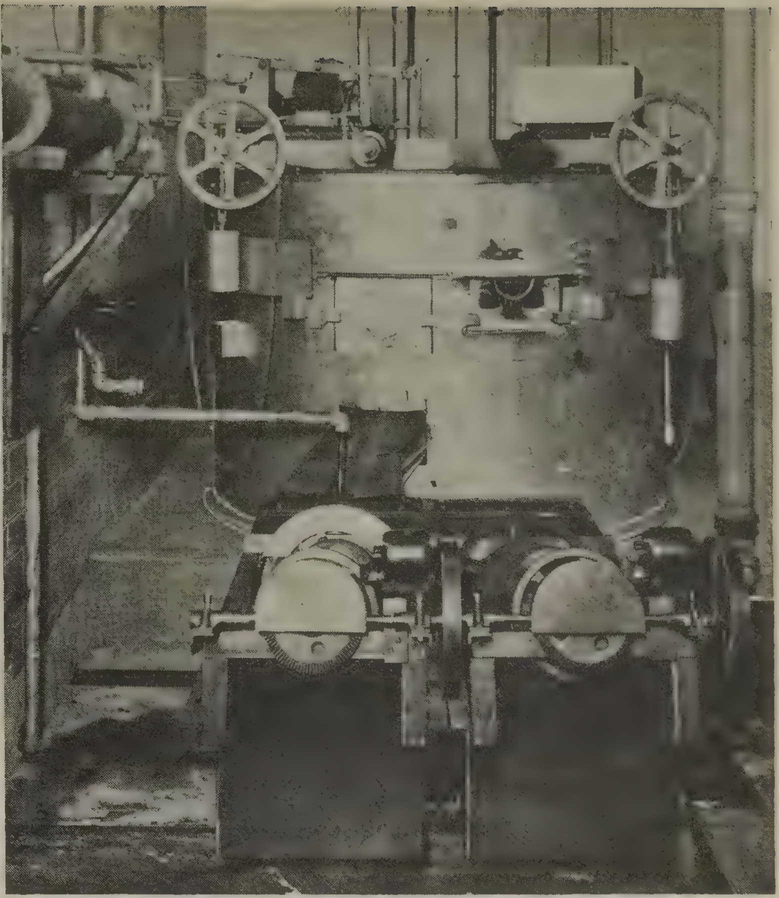


CAP Screws Going Through a Combination Tumbling and Lubricating Machine, Sawdust Being Mixed with the Work Before It Goes to the Tumbling Mill. The screws are lubricated with a wax preparation before going through sizing dies

---

*Resident editor THE IRON AGE at Cleveland.





UNIFORMITY in the Heat Treating Operation and in the Hardness of the Finished Product Is Secured by Passing the Screws Through an Electric Furnace of the Rotary Type. From the furnace the work is dumped into a quenching machine. There are two of these machines, one for quenching carbon steel screws in water and the other for oil quenching alloy steel screws. At the left, the control equipment for the furnace

crystallization. An outstanding feature of the process is the reduction of the wire to the proper pitch diameter at the same time that the heading operation is performed.

The part of the blank that is reduced in diameter is given a skin or surface hardening by the drawing process, which, it is pointed out, is of advantage in steel used for screw-forming purposes. As the shank retains its original diameter, it can be of any length, which is also true of the part to be threaded. As previously stated, the diameter of the shank is the same as the stock, but should there be any variation in the size of the stock the shank portion is enlarged or reduced in the die, assuring greater accuracy, it is said, than is provided by mill tolerances.

Less Severe Upsetting Blow Reduces Possibility of Crystallization

Since the head is formed of larger stock than is usually used in the cold-heading process, not as severe an upsetting blow is required in forming the head as would be necessary were the shank and head upset from smaller stock as in the more common process. Consequently, it is pointed out, there is less possibility of crystallization and fracture in the body and there is less tendency to set up strains in the body and head. The method of heading is said to knit the steel structure more closely together, increasing the tensile strength so that there is less danger of heads shearing or breaking.

In using the more common upsetting process in manufacturing cap screws in which the body is built up by upsetting, stock 0.340 in. in diameter with mill tolerances is used for a ⅜-in. cap screw. Under the process described 0.370 in. stock is used, and this is reduced on the threaded end to 0.344 in. in diameter. The finished product is held, on a screw with 24 threads to the inch, within 0.3479 in. maximum and 0.3455 in. minimum pitch diameter, allowing a maximum tolerance of 0.0024 in., including lead and angle errors. This is an American standard screw thread, Class 3 fit, a classification that includes the better grades of interchangeable screw thread work for cap screws for automobiles. The manufacturer claims that because of holding the blanks to very close limits it is possible to keep within the above tolerances more easily than when screws are made by the standard upsetting process. The cold-heading and drawing operations are performed on standard cold-heading machines, the plant being equipped with eight of these machines, supplied by the E. J. Manville Machine Co., Waterbury, Conn.

Trimmed Screws Pass Through Tumbling and Lubricating Machine

After the combined upsetting and drawing operation the secondary operations of trimming the head into its hexagonal form, sizing and burnishing, pointing, facing, shaving, threading and heat treating are performed in the order named. The common thread-rolling process is used in making the threads.

After trimming, the screws go through a combination tumbling and lubricating machine that has a series of three rotating barrels. The screws are shoveled into a loading skip with sawdust, which adheres to the oil on the work and aids in taking off the rough edges during tumbling. While one lot is going through the tumbling mill another lot is being dumped into the skip. The tumbling barrel is 24 in. in diameter by 30 in. long. Work is tumbled for 5 to 10 min. From the tumbling barrel the screws pass over a revolving screen, through which the sawdust is discharged, and from there to a second rotating section—a perforated metal barrel, 36 x 36 in. The barrel extends into a tank containing a hot wax preparation through which the screws pass. The barrel then dumps the screws into a small revolving barrel in which the surplus lubricant is drained off, and a spiral in the latter barrel discharges them into a handling receptacle.

The lubrication provides a film on the screws and takes the place of oil that would be required on the sizing dies if the screws themselves were not lubricated. All stock sizes pass through the tumbling and lubricating machine and then are sized in a die on a punch press to secure good fits on wrenches having close tolerances. The head is forced through the die, which burnishes it, at the same time bringing it to accurate size.

Some of the products made of alloy steel are annealed after heading and before the secondary operations to relieve strains. This is done on a rotary-type gas-fired annealing furnace.

Screws Heat Treated in Electric Furnace

The heat treating, which is the final operation, is done in a 90-kw. three-phase 60-cycle 230-volt rotary, tilting, tray-type, automatic discharge, hardening furnace having a capacity of 900 lb. per hour. While the furnace does not differ materially from other furnaces of this type, some of its construction features are new. Screws 5/16 in. to ½ in. in diameter are kept in the furnace 22 min., during which they make one rotation of the hearth. The time cycle is slightly increased for the larger sizes. The furnace can be set for a time range in the rotation of the hearth of from 14 to 50 min. The work is carried through the furnace in 12 cast nickel-chrome trays, each having a capacity of 25 lb. The screws are shoveled into the trays through the charging door, the trays usually carrying two layers of work weighing about 15 lb.

The furnace is divided into two zones, a heating and a soaking zone. A temperature of 1525 to 1550 deg. Fahr. is maintained in the soaking zone, and a slightly lower temperature in the heating zone. When a tray completes its circuit of the hearth, it is automatically dumped by a mechanism operated by a motor located on top of the furnace. The motor that operates the hearth is located at the back of the furnace. The automatic electric control of the two motors is interlocked so that the hearth makes one-twelfth of a complete circuit, bringing a trap to a discharge position, and stops. Then the tilting motor operates the lifting mechanism, causing the tray to tilt and discharge its load. The hearth motor cannot again operate until the tilting motor returns the lifting mechanism to its starting position and the timing mechanism has completed its cycle. The furnace has push button control and magnetic starters.

Each heating zone has a separate Leeds & Northrup temperature controller. The heating zone has a non-indicating controller and the soaking zone a recording controller. One thermocouple is located in the heating zone and a second in the soaking zone. The temperature control is very close, the range being within 7½ deg. plus or minus of the temperature at which the control is set. By having accurate control over the rate of heating and the actual temperature readings there is a range of only ½ point plus or minus in the Brinell hardness of the product.

An important new construction feature of the furnace is that the roof can be removed to permit the rebuilding of the hearth. When a replacement of the hearth is necessary the roof is raised as a unit by means of a hoist. In other types of rotating furnaces the rotating member is dropped into a pit beneath when the hearth is to be replaced. Access to the furnace for minor repairs is made through the charging door.

Screws Passed Through Quenching Machine into Rust-Proofing Solution

The screws are dumped from the furnace trays through a chute into a Greene quenching machine. This consists of a rectangular tank in which a motor-driven perforated drum revolves. One end is submerged in the quenching liquid, and the other projects over the end of the tank. The work slides down an inclined plate through the quenching medium into the drum, and the spiral in the drum causes it to circulate through the medium and, at the same time, elevates it out of the tank and discharges it into a rust-proofing solution. The screws are then ready for packing.

Two quenching machines are provided, one for quenching in water, which is used for carbon steel screws, and the other for oil, in which alloy screws are quenched. The oil quenching tank is connected with oil cooling equipment, the oil being circulated in coils through a drum in which water is kept in circulation. This has a capacity for cooling 100 gal. of oil per min. Cooling equipment was supplied by the Griscom-Russell Co., New York.

The furnace is made as airtight as possible, so that air and moisture are kept out and the work in passing through the chute to the quenching tank is exposed only a moment to the cooling action of the air. Consequently oxidation is held at a minimum.

To assure the accuracy in the product now demanded by the automotive industry the company has just completed a chemical and metallurgical laboratory, and its manufacturing processes will be closely tied up with laboratory work. A check will be made on all incoming shipments of steel to make sure that the material conforms to the specified analysis. Other checks will be made during the various stages of manufacture, and the finished product will be tested for tensile strength and hardness.

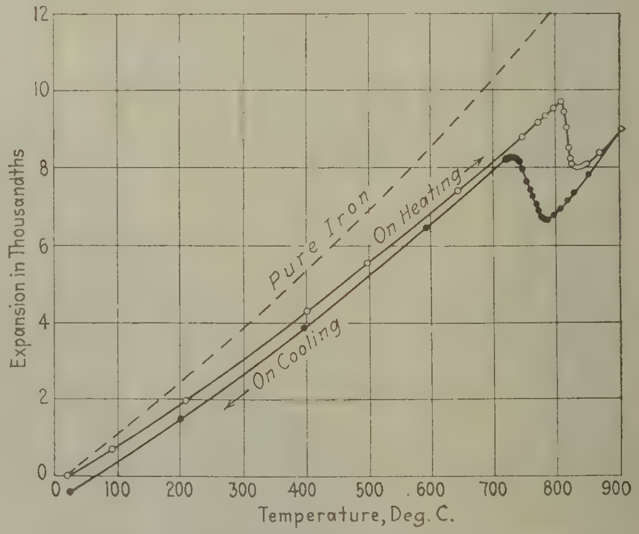
The products of the company include cold-headed cap screws made of carbon and of various grades of alloy steels in both S. A. E. and U. S. S. threads in sizes ¼ to 1 in. in diameter and in maximum lengths up to 8 in. The plant equipment includes one of the first 1-in. heading machines built for cold upset work.

Expansion of Stainless Iron

SCIENTIFIC PAPER No. 570 of the Bureau of Standards contains data on the thermal expansion of stainless iron secured by Peter Hidnert and W. T. Sweeney. Nine samples were investigated within the following ranges of composition:

Carbon	0.09 to 0.13	per cent
Chromium	12.0 to 16.4	per cent
Manganese	0.16 to 0.60	per cent
Silicon	0.25 to 0.57	per cent
Nickel	none to 0.39	per cent
Phosphorus	0.01 to 0.03	per cent
Sulphur	0.01 to 0.02	per cent

The sketch shows the relation between change in length and temperature for a C 0.09, Cr 12.2 steel, which is quite typical of the group. Transformations at about 800 deg. C. are quite marked. It will be observed that the coefficient of expansion increases slightly with increasing temperature (that is, the curve turns upward); furthermore, that the expansion is quite markedly lower than that for pure iron.



Linear Thermal Expansion of Stainless Steel on Heating and Cooling as Compared to That of Pure Iron

Large Expansion in Electric Drive

Nearly 2,000,000 Hp. in 1510 Mill Motors—Units Purchased in 1927 Added 9 Per Cent to Horsepower Previously Employed

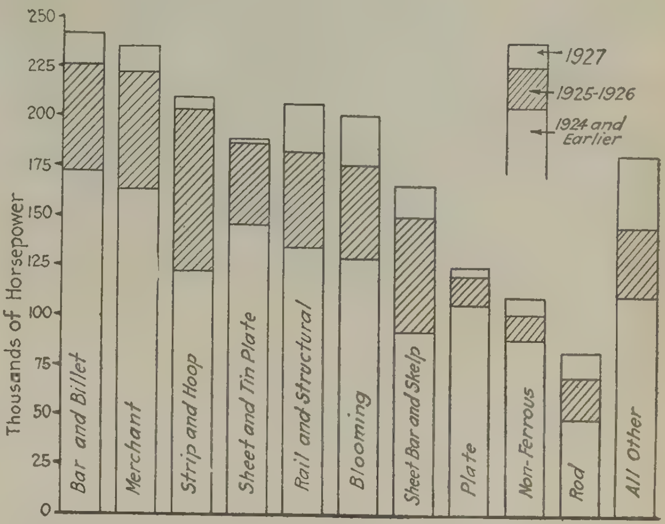
BY SIDNEY G. KOON

THREE years ago (Feb. 12, 1925), page 488, and June 25, 1925, page 1880) THE IRON AGE published details regarding the extent of installation of electric drives in rolling mills of the United States and Canada. This was based on a comprehensive tabular compilation made by the Association of Iron and Steel Electrical Engineers. Data covering 1927 and the entire list to the end of that year have now been made available.

Present installations, as analyzed by THE IRON AGE, aggregate 1510 units of a total of 1,949,800 hp. Of these, 116 motors of 170,350 hp. were added in 1927. The average size of the 1927 units was 1469 hp., while the average of all units is 1291 hp. No motors of under 300 hp. are covered in the tabulation.

Types of Mills Showing Heaviest Use

Bar and billet mills, with 242,175 hp. in 152 units, lead the list. Merchant mills make a close second, with 235,100 hp. in 277 units. Strip and hoop mills have 217,355 hp. in 150 units, while rail and structural mills with 73 units aggregate 205,800 hp., and 44 blooming mill units make a total of 200,500 hp. Other types of mills are powered as shown in Table I.



Total Horsepower of All the Mill Motors in the Principal Classes of Mills, Showing Separately the Additions of 1927 and of the Two Preceding Years Upon the Accumulated Totals of All Earlier Years

TABLE I—ELECTRIC DRIVE IN AMERICAN ROLLING MILLS

Type of Mill	Total Equipment			1924 and Earlier			1925, 1926 and 1927			Added in 1925-27, Per Cent
	Motors	Hp.	Avg.	Motors	Hp.	Avg.	Motors	Hp.	Avg.	
Blooming	44	200,500	4,557	31	128,450	4,144	13	72,050	5,542	53.6
Bar and billet	152	242,175	1,593	114	172,135	1,510	38	70,040	1,843	40.7
Sheet bar and skelp	68	165,000	2,426	41	91,300	2,227	27	73,700	2,730	80.7
Rail and structural	73	205,800	2,819	46	134,550	2,925	27	71,250	2,639	53.0

Growth in the Application of Electric Drive to Main Rolls Is Shown Clearly Above. The dotted portions of the yearly columns are motors of 300 to 1999 hp.; solid black, those of 2000 to 4999 hp.; shaded, those of 5000 hp. and over

Blooming mills made the largest gain in 1927, with 25,050 hp. in five units. Rail and structural mills, with five units, added 22,000 hp., while ten sheet bar and skelp mills accounted for 20,800 hp. Additions in 1927 were smaller than in the two preceding years, which saw 313 new motors aggregating 482,000 hp., or an average of over 240,000 hp. a year. Except for wire mills, however, all of the 16 types represented showed some addition during the year.

Something of the advance being made in production of seamless tubes is shown by the piercing mills. With 17,300 hp. added, they showed a gain of more than 50 per cent over the 33,300 hp. previously installed. The 1927 addition was almost equal to the 17,450 hp. of 1925, and was greater than the total in all years preceding 1925, which was but 15,850 hp. The average size of these mills increased from less than 800 hp., in units installed prior to 1925, to more than 1900 hp. in the 1925 additions and almost 2900 hp. in the 1927 additions.

While the total number of motors advanced in 1927 only 8 per cent, the total horsepower rat-

Total	1,510	1,949,800	1,094	1,308,155	416	641,645	49.0

ing increased about 9 per cent and the average size of motor installed in 1927 was 15 per cent greater than the average previous installation. This gain shows up in particular in the largest size units.

In 1927 there were installed 23 motors of 3000 hp. and more to operate American rolling mills. This compares with 138 in service at the end of 1926 and represents an increase of over 16½ per cent in number. Of motors under 3000 hp., there were 93 added in 1927 to the 1256 previously in use, representing a gain of not quite 7½ per cent, or less than half the rate of gain of the heavier motors.

Horsepower added in 1925, 1926 and 1927, to the list of units of 2000 hp. and over, added 64.1 per cent to the aggregate power existing in those units at the end of 1924. Additions to the smaller units represented only 35.7 per cent of the earlier installed horsepower.

Diagrams and tables show the principal characteristics of the motors, both as a total driving force for American rolling mills and as regards distribution according to size, type of mill and other particulars.

Warns Against Quickly Applied Chromium Plating

From Ten Minutes to Twenty Hours Required to Make Satisfactory Surface Depending Upon Expected Duty and Character of Underlying Metal

AT a meeting of the Chicago section of the American Society of Mechanical Engineers, held on March 14, Dr. J. Becker, chief research chemist Vacuum Can Co., read a paper on "The Relation of Chromium Plating to Industries and the Truth About Its Value and Application." After recounting the history of the metal and describing the rapid increase in interest in plating experiments during the past four years, the speaker emphasized that slight variations of the chemicals in the solutions or any other factor relating to deposition create distinct variations in the properties of the plate.

Rule of Thumb Inadequate

"The man who can chromium plate a few steel golf heads will dispute this and in 15 min. explain all the factors which he thinks have produced the result, but ask him to plate golf heads that not only look pretty but will stand hard service, in a quantity run and at a reasonable cost, and then he must either deal with it as an exact science or grope in the dark. If the amateur should be asked to chromium plate golf heads of different shape or made of a different metal or to plate an entirely different article for a different kind of service he will find himself completely lost.

"Any intelligent, careful and systematic workman can successfully chromium plate particular types of articles to the highest standard of quality, but when and only when he is furnished complete detailed instructions.

"Decorative chromium plating may be adapted to all instances where beauty of appearance and easy cleaning is desired, but unless it is a real plate and not merely a superficial coloring it is of no value. In the first place the base metal determines the thickness of a chromium plate which should be applied. Naturally a decorative coat not subjected to wear need not be very heavy, provided, however, that such a plate is produced from a solution which will give a coherent and homogeneous plate. Otherwise such a plate is worse than none and will hasten instead of retard corrosion.

"When it is considered that good chromium solutions have no higher efficiency than 30 per cent, that there are many with an efficiency as low as 6 per cent, and further that the deposit of chromium from an excellent chromium solution is only about 0.00025 in. thick from 150 amp. current density per square foot in 1 hr. of plating time, you will realize how little metal and how thin a plate you receive from the average plater, who considers 30 sec. to 1 min. plating time sufficient for chromium plating a radiator shell, a reflector or a plumbing fixture. Such a plate is less than 2 to 4 millionths of an inch thick and, though of nice appearance immediately after plating, will last but a very short time.

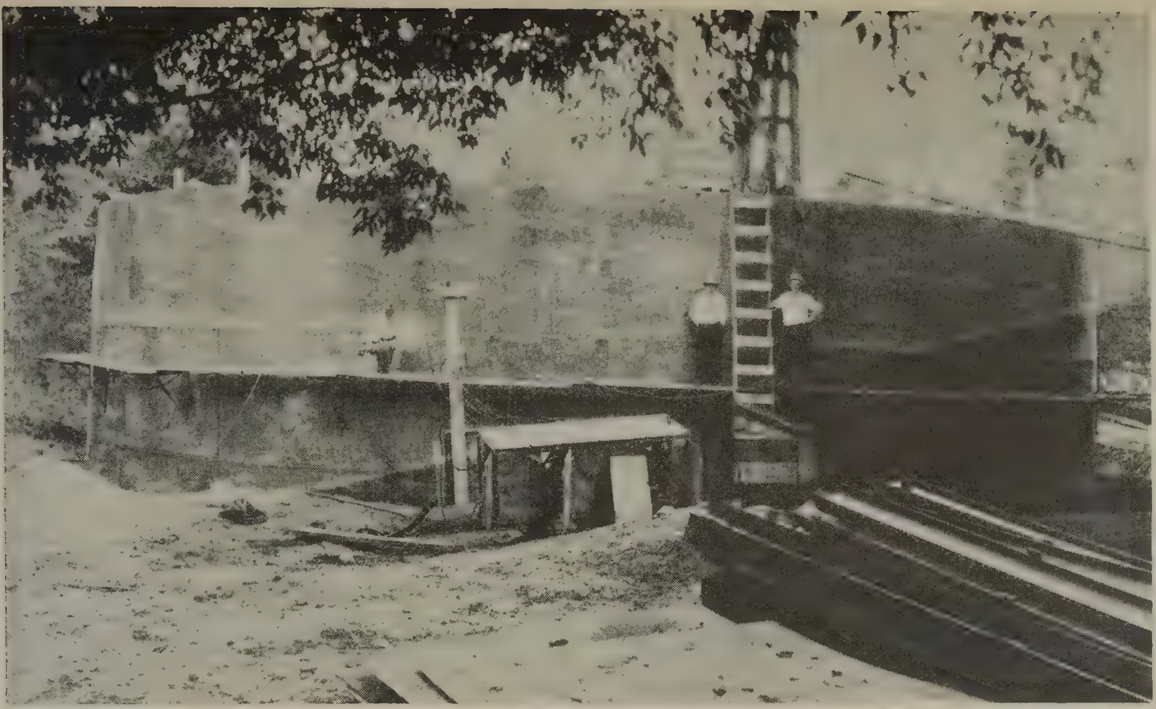
Thickness of Decorative Coatings

"If copper, brass or zinc is to be given a decorative chromium plate, I consider it necessary that such pieces should be in the solution about 30 min., which will result in a plate of about 1½ ten-thousandths of an inch thick, provided a highly efficient chromium solution is used. If the base metal has a homogeneous adherent and continuous nickel plate or (as in the case of steel) copper or copper-and-nickel plate, a chromium plate in 5 to 10 min. will be sufficient as a decorative coat, resulting in a thickness of from 2 to 4 hundred-thousandths of an inch.

"Articles which have to withstand abrasion and corrosion, like plumbing fixtures and valves, should be treated entirely differently. If chromium is applied directly to brass or bronze fixtures, 1 hr. of plating time is recommended. If such fixtures are first nickel plated, 30 min. should be the minimum, resulting in a thickness of about 1½ ten-thousandths of an inch of chromium.

"The average nickel plating is not adapted as a base for chromium plating. It has been pointed out that chromium plating has a tendency to raise and make the nickel plating peel, but this occurs only when the nickel plating is not adherent. A great deal of nickel plating will stand buffing and give a good appearance, though it does not adhere to the base metal, and such a layer may withstand 30 to 60 sec. in a chromium solution, but will peel and blister if immersed longer than this period. This is the reason why only a flash-coat, taking less than a minute, is often given by platers.

"Where chromium is applied for wear, as in bearings, shafts, rollers, plungers, pistons or valves, special solutions are necessary which give the desired and demanded characteristic of the plate. The applications are more or less individual, and no specific rules can be given as to thickness, hardness and character of the plate. Especially if hardened steel is the base metal to be plated, a plating time of from 2 to 24 hr. is necessary."



THE Water Tank With All Plates Erected. Welding generator near tank is covered with wooden shed to protect it from weather

All-Welded Gas Holder Takes 258 Tons of Plates and Shapes

Plates Are Erected with Narrow Overlap and Held with Bolts at Wide Spacing Until Welder Completes the Seam

BY F. H. BEEBE*

A GAS holder of 300,000 cu. ft. capacity has just been completed at Albion, Mich. It is believed to be the largest all-welded low-pressure gas holder ever built and was designed and constructed by the Western Gas Construction Co., Fort Wayne, Ind. With all lifts elevated the holder stands 113 ft. 7 in. above the foundation; it has a diameter of 74 ft. and required 258 tons of plates and shapes plus 4 tons of welding rod.

A 15,000-cu. ft. single-lift gas holder, all arc-welded construction, was built by the same company for the Missouri Gas & Electric Co. at Lexington, Mo., in 1924. Experience with this rather small structure proved that welded joints were perfectly satisfactory in strength and are gas and water tight.

Electric welding for gas holder construction has inherent practical advantages. It reduces fabricating cost, because it is only necessary to lay out and punch a few holes for erection bolts. After the plates are erected in position with bolts, they may be tack-welded for additional stability, and then all lapping edges welded in a continuous seam. In the Albion job, cups and grips were fabricated in the shop, assembled in sections on the ground and welded in place.

The bottom was assembled flat on the concrete foundation and all seams were welded. The first course of 7/16-in. steel plates was then erected and welded, and water was allowed to stand in the foundation pit about 12 in. deep. In this manner the bottom and lower curb was tested for leaks, and it is interesting to know that none was found.

What is known in gas holder construction as the cup is easily attached by electric welding. It is a narrow trough attached to the inside shell about 2 ft. from the floor. Two dozen sets of I-beams were welded together and to the floor to form the landing blocks to receive the weight of the successive lifts when the holder is low.

One illustration shows the gas holder when the final welding was being done on the water tank. It can be seen that the joints are lap joints, bolted at long intervals, a variety easy to erect and to weld. This picture also indicates the timber scaffolding erected inside the tank to carry the erection traveler, and the wooden cleats for holding the upper course at the required position until the joints were completed. Scaffold brackets for outside welding were bolted on, and the holes later welded shut. Such construction devices consisted of

THE Largest All-Welded Gas Holder Is 113 Ft. Tall and Has a Diameter of 74 Ft. Seventy per cent of the welding necessary for complete fabrication was done in the field virtually the same elements that would be necessary on a riveted job. All through this work it was the simplicity of welding that was its greatest virtue.

---

*Vice-president Western Gas Construction Co., Fort Wayne, Ind.

The other view shows the gas holder after completion of the final lift. The guide frame was entirely arc welded, the only bolts that were used being those employed in assembly. Around the top of the different lifts can be seen the goose necks. In the past these have been of riveted construction. On this job they were fabricated with metallic arc welding.

Plates forming the sides of the water tank range from 7/16 to ¼ in. thick, and the three lifts are of No. 10 gage. Everything on this gas holder, the ladders, the platforms and the crown, is assembled by welding.

On this gas holder 4 tons of electrode was used. If a holder of the same size were made of riveted construction, 7½ tons of rivets would be necessary. Four "stable-arc" welders manufactured by the Lincoln Electric Co., Cleveland, placed 21,414 ft. of seam. The entire job was carried through almost without a hitch and with much less difficulty than would naturally be expected with a new structural process.

This holder at Albion was built largely through the cooperation of D. F. Burritt, vice-president in charge of engineering Middle West Utilities Co., Chicago, and Roy Campbell, president Albion Gas Light Co.

Forging and Heat Treating of Long Cylinders

Special Furnaces Used by Manufacturer of Printing Presses for Swaging Ends and Carbonizing Surfaces

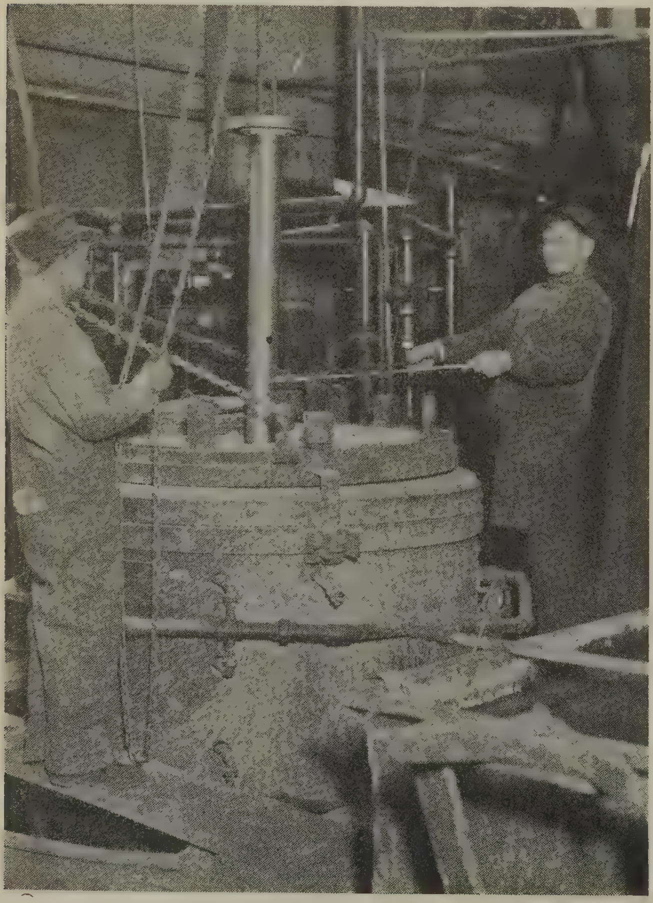
BY J. B. NEALEY

IN addition to the more usual types of heat-treating furnaces, some special equipment has been installed at the Miehle Printing Press & Mfg. Co., Chicago. Many of the parts to be treated are long cylinders of various diameters. To case-harden rollers and shafts an interesting vertical furnace has been installed.

As shown in the view, it is 5 ft. in diameter and 7 ft. high, set in a pit. It is heated with 18 gas burners. Instead of packing the parts with carbonizers in pipes or boxes, they are lowered into vertical retorts (of which there are three) fixed within the combustion chamber. These retorts are charged with a small amount of carbonizing material, and gas is passed through them continually during the heating period. Parts that required 24 hr. to carbonize in coal-fired furnaces are treated in 8 hr. in this unit.

Another furnace which is a little unusual is a three-high furnace—that is, it has three chambers, one above the other. The upper chamber gets the first impact of the gas flame, and the waste heat from it is passed down into the other two. The three chambers are maintained at 2400, 1700 and 1000 deg. Fahr. respectively and are used progressively for pre-heating and heating. This furnace is very compact—5½ ft. high and about 3 ft. square in cross-section.

Other unique furnaces are installed in the blacksmith shop. Two helve hammers are used for swaging ends on press rollers and for similar work on rounds up to 6 in. diameter. Each hammer has a battery of six cylindrical furnaces, set side by side under a ventilating hood. Each furnace is a steel casing about 18 in. long and 12 in. in diameter, lined with fire brick and heated with two gas burners so set as to produce a swirling flame within the brick lining. Air is supplied at from 4 to 5 lb. pressure, and the gas is inspirated. As shown in the view, one pipe or bar is a complete furnace charge.



(At Left) Withdrawing Shaft from Vertical Carbonizing Furnace. Swaging hammer (above) served by battery of small cylindrical furnaces

Treated Fuels Feature Meeting

Powdered Coal and Dry Quenching of Coke Discussed by Combustion Engineers—Steel Mill Looks for Record

MORE than 100 men, drawn largely from the combustion engineers' division of the Association of Iron and Steel Electrical Engineers, participated last Thursday in an inspection of the Edgar Thomson Steel Works of the Carnegie Steel Co., Braddock, Pa., and a technical meeting devoted to two topics in their particular line. One of these was the dry quenching of coke, while the other dealt with the use of pulverized coal as an industrial fuel.

Great efforts were being put forth in the steel mill to produce a record month. This, with 28 days of the month completed, was already assured. It was reported unofficially that the preceding day had witnessed the production of some 4800 tons of open-hearth ingots from sixteen 100-ton furnaces. The expectation for the month was about 100,000 tons, against a previous high record of about 90,000 tons. Rail production of the preceding 24 hr. was put at 95 tons an hour and sheet bar production at 70 tons an hour.

Among the new pieces of equipment shown in this plant are three turbo-blowers for the blast furnaces. These have replaced 10 old reciprocating engines, of which eight or nine were normally active and the other one or two spares. Each of the new blowers provides sufficient wind for one furnace. Two were made by the Ingersoll-Rand Co., New York, and one by the Brown-Boveri Co. of Switzerland. Each was designed for a normal load of 60,000 cu. ft. a minute. The maximum pressure under the design is 30 lb., and the normal pressure 18 lb. to the square inch. At 18 or 20 lb. the machines run at 2600 r.p.m., going up to 2975 r.p.m. for maximum pressure. The steam turbines, on the same shaft with the blowers, are rated at 7000 hp., taking steam at 225 lb. to the square inch, with 150 deg. superheat and 28½ in. of vacuum.

Development of Andrew Carnegie's First Steel Plant

After luncheon in the company's club dining room the technical session was put under way without changing location. L. C. Edgar, chief engineer of the works, told something of the history of the development of the plant, from the first Bessemer blow of Aug. 26, 1875, and the first rail rolled, Sept. 1, 1875, through the first open-hearth heat, Aug. 16, 1913, and up to the present, when the high records above mentioned are being made.

This plant was started by Mr. Carnegie and associates as his first venture in steel making. It had capital stock originally of $700,000, and a daily capacity of 225 tons of rails. Rails had been $175 a ton shortly before this plant was put into operation, these being wrought iron rails. The price dropped from $120 a ton in 1873 to $42 in 1878, causing a great deal of trouble in meeting expenses by the new Bessemer method of manufacture. The first blast furnace, erected in 1880, had a daily capacity of 56 tons. The furnaces were gradually increased in size until in 1890 one made the best record of that time, of 457 tons in 24 hr. About this time the mill was rolling a maximum of 277,000 tons of rails in a year.

In 1905 a second rail mill was added, this being the first mill in America to utilize electric drive. The capacity of the original rail mill had been increased from 1120 tons rolled from ingots in September, 1875 (its first month of operation), and 30,632 tons in the 12 months of 1876, to 213,000 tons in the 12 months of 1906. That mill was then changed over to roll sheet bars, as the other rail mill had been installed. It made a high record in sheet bar production of 250,929 tons shortly after the conversion. In March, 1927—just a year ago—that mill turned out 24,320 tons. This figure is likely to be bettered in the current month, although the mill is 52½ years old.

Dry Quenching of Coke

QUENCHING of coke without dousing it in water was the subject of a paper by Col. H. B. Savage, which, in his absence, was read by Walter Sennhauser, engineer of Sulzer Brothers, Winterthür, Switzerland. The paper dealt with the system whereby successive charges of incandescent coke are passed through a large container, which holds from six to a dozen or more such charges for a period of 3½ to 4 hr. Inert gas drawn from the coke by the action of a fan, at a temperature of about 1800 deg. Fahr., is operated in a closed circuit through tubes of boiler units, whereby steam is raised. Heat is taken from this gas to such an extent that it is relatively cool as it enters the bottom of the coke container and passes up through the mass again. After each coke charge is entered at the top of the container an equivalent amount is withdrawn from the bottom, at a low enough temperature to satisfy requirements.

A complete description of a plant operating on this principle was published in THE IRON AGE of Feb. 10, 1927, page 425. This description covered the plant at Rochester, N. Y., which is the only one of this type in the United States. The speaker showed a large number of slides of similar plants in various sections of Continental Europe, some of which are considerably larger than the Rochester installation, while others are much smaller.

In the paper as read it was estimated that the loss of coke in water quenching, through carrying away fine particles and from other sources, amounted in the United States to about 2,250,000 tons a year, which was figured at 5 per cent of the production. This coke is largely saved in the dry quenching process. In some cases there is no measurable change in the production of coke braize. Other cases, however, have shown a reduction in braize from as much as 14 per cent down to 8 per cent—a gain of 6 per cent.

Steam Makes the Plant Pay

Production of steam is the paying part of this proposition. The various units have been figured at 400 to 450 lb. of steam for each 1000 lb. of coke put through the apparatus. At Rochester the average for six months on this basis was 420 lb. of steam, equivalent to 840 lb. for each net ton of coke. It is figured that this return is sufficient to amortize the investment in about four years. After that the gain is largely clear profit. One speaker in the discussion reported that the Rochester plant had proved capable of handling about 520 tons of coke a day, in place of 420 tons nominal figure. This meant a return, on the money invested, about 20 per cent higher than the original calculation.

While the first experimental plant on this basis was installed in Switzerland in 1918, it was not until 1922 that the first commercial plant was put in. The largest present plant has a capacity for handling 1000 tons of coke a day. This consists of four units (that at Rochester has two), each with a capacity of about 333 tons, one unit being a standby. Power consumption was placed at about 3 kwhr. for each ton of coke, this including power for both the fan and the hoist. A plant now under design will have a capacity of 1500 tons, and Mr. Sennhauser spoke of 2000 tons as being a near possibility. It was brought out that there is no dry quenching of coke in any of the German steel works or blast furnace plants. Hence, there was no opportunity to observe the action of dry-quenched coke in making pig iron.

Powdered Coal for Industrial Furnaces

CLEAN gas was called the best possible form of fuel, because of its molecular condition, by Prof. William B. Shoudy of Columbia University in his paper entitled "Powdered Coal Applications to Industrial Furnaces." Clean oil was listed as next in order of merit, because of the ease with which this can be broken up into a condition approaching the molecular. Coal is not so easy to handle from this point of view. Combustion takes place on the surface of each chunk or particle. The heat gradually breaks up the coal, exposing a larger amount of surface for each pound of fuel. Air gets through the interstices and wipes off from the surface the CO or CO_2 produced, changing the former to the latter, and combustion proceeds.

Pulverized coal particles, while they do not approach very closely to molecular dimensions, are yet such a long step in that direction that they overcome largely the disabilities of coal as ordinarily fed into furnaces. This coal is usually so pulverized that about 85 per cent of it will pass through a 200-mesh screen. A comparison was made with a molecule, whereby the speaker visualized this 200-mesh particle as being enlarged to the size of the dirigible Los Angeles, compared with which a molecule would be 0.08 in. in diameter. Incidentally, another comparison made later by another speaker considered particles of coal with a diameter of 0.002 in. If these were to be expanded 1,000,000 diameters, we would have a sphere or balloon shape nearly 200 ft. in diameter. Compared with this a molecule would be about the size of a poppy seed.

With powdered coal blown into a furnace the air has to move faster than the coal, if it is to wipe off the CO and CO_2 particles from its surface. Otherwise, if the air and coal moved together, the combustion chamber would have to be very large and the flame would be long. It has been found that a turbulent motion gives a good mixture and shortens the flame requirements. This is commercially important, because it makes available furnaces much smaller than would otherwise be required. Greater fineness in the coal has somewhat the same effect.

Ash Deposits May Be Harmful

Another reason for great fineness in the coal lies in the ash element. Ash from coal used in industrial furnaces, if it lands on the product, may affect the quality of the surface of that product. As yet we do not know completely what this effect is, but we do know that it is likely to be deleterious. Hence, with the finest possible coal the ash particles are so fine that they are carried on by the gases from the furnace to the stack, with much less likelihood of landing on the product. Professor Shoudy believes that coal pulverized so that 85 per cent will pass a 200-mesh screen is sufficiently fine for most industrial processes. For boiler use the coal can be much coarser.

Several photomicrographs were thrown on the screen, showing the results of pulverization by different types of pulverizing equipment. In each of these highly magnified views particles were pointed out which were about the measure that would readily pass through the 200-mesh screen. It was notable that each sample showed a number of particles much too large for that screen, but the great majority of particles were so small that it was difficult to see them. Some of them undoubtedly were less than 0.001 in. in diameter and a goodly proportion must have been less than 0.002 in.

Central vs. Unit Systems

Taking up the question of central supply of pulverized fuel vs. unit supply, the speaker pointed out that sometimes a unit installation may be shut down through some trouble in the pulverizer, with considerable loss to the industrial process under way. He advocated, where such loss might be experienced, a sort of compromise between the two systems. His proposal was to introduce between the pulverizer of the unit system and the burner an auxiliary bunker sufficient to carry a supply which would last the burner 2 or 3 hr. This would permit adjustment or repair of the pulverizing element, should this become necessary, without necessitating shutting down the whole equipment.

Inherent moisture in the fuel does not ordinarily cause trouble. Surface moisture does. It is for this reason that drying is usually resorted to before the coal goes into the pulverizer. Sometimes the pulverized coal itself is passed through a drier operated with a steam jacket as its heating element. There are, of course, industrial plants which dispense altogether with driers. One of these in which an air furnace figures is that of the Eastern Malleable Iron Co. at Naugatuck, Conn., described in THE IRON AGE of March 1, page 600.

Discussion of this paper by Henry Kreisinger took the form of running comment on a large part of the material which Professor Shoudy had furnished. The expansion of the fine coal particle by 1,000,000 diameters was Mr. Kreisinger's illustration. In this particular case he pointed out that, if this enlarged particle of 200 ft. in diameter were to receive 100 per cent of the air necessary for its complete combustion, this air surrounding the particle would, at the temperature of combustion, have a diameter of two miles. Particles of air on the circumference of this two-mile sphere would have a long travel before they could pick up particles of carbon on the incandescent surface of the burning coal. This example was given principally to show the relationship between the fuel and the oxygen supply from the air.

The speaker pointed out that it is possible to go as high as 3 lb. of coal to the hour for each cubic foot of combustion space, if the walls of the furnace are water-cooled. This figure takes the place of 2 lb. in the ordinary furnace without water cooling. Hence, the supply of heat with water-cooled walls may reach around 35,000 B.t.u. an hour for each cubit foot of combustion space.

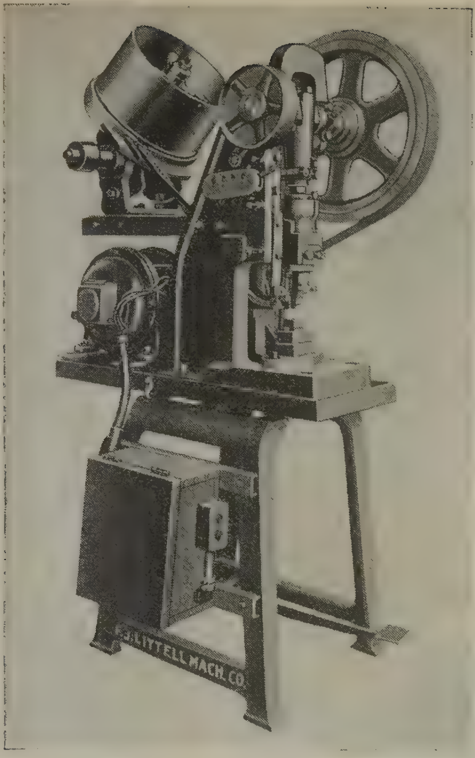
How the Section Came Into Being

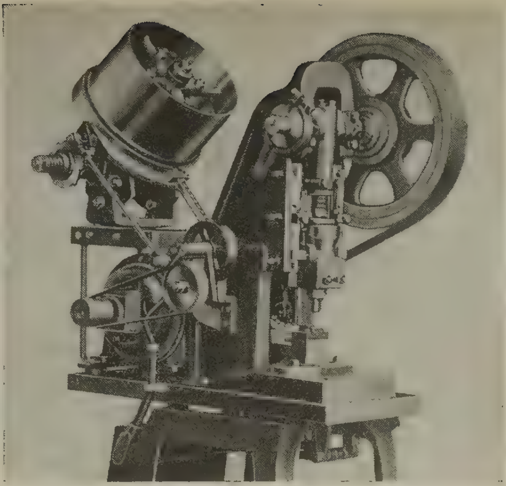
Preceding the presentation of the papers, A. J. Standing, president of the Association of Iron and Steel Electrical Engineers, extolled the work which the combustion section has done since its inception. In particular, he told about how the group of combustion engineers, without any parent society, had begun to do a certain amount of work. The directors of the Association of Iron and Steel Electrical Engineers, observing the work under way, decided that it would be a good thing to bring the two groups together, inasmuch as the combustion engineers naturally would sooner or later become affiliated with some one of the national societies. This approach was made first in 1922, and from a small beginning the division has already presented more than 75 major papers along its specialized line.

Fellowships Offered by Carnegie Institute of Technology

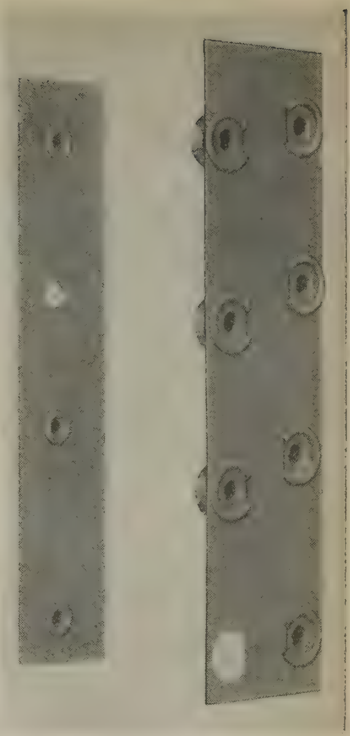
Several fellowships are open, as of Aug. 13, 1928, at the Carnegie Institute of Technology, Pittsburgh, for investigations in the physical chemistry of steel making. As noted in THE IRON AGE for Oct. 27, 1927, page 1171, provision has been made for a five-year program of intensive study through the cooperative action of the institute, the United States Bureau of Mines and several leading steel makers.

Fellowships are open to the graduates of colleges, universities and technical schools who are properly qualified to undertake research investigations. Each fellowship carries a stipend of $750, paid in 10 monthly instalments. Fellowship holders are required to register as graduate students and become candidates for the degree of Master of Science unless an equivalent degree has previously been earned. Fellows will not be required to pay registration fees. Application blanks will be furnished by Prof. Edward Steidle. Each applicant will be required to supply a copy of his collegiate record from the registrar's office of his college. He will also submit a photograph and names and addresses of at least three persons who are familiar with his character, training and ability, together with a statement of his technical or practical experience. Applications are due not later than May 1, 1928.





THE Feed Used for Fastening Round Nuts to Grooved or Curved Body Parts Is on Press at Left. The feed above is for handling D-shaped clinch nuts, samples of which, together with the round nuts, are shown at right



Special Punch Press Feeds for Clinch Nuts

PUNCH press feeds for use in connection with the fastening of clinch nuts in automobile body parts have been developed by the F. J. Littell Machine Co., 4125 Ravenswood Avenue, Chicago. Five types are available and, although developed primarily for use on automobile bodies, the machines are offered for other work involving similar problems. Increased production is claimed, as well as adaptability for fastening nuts in inaccessible places.

The feeds are designed to take flat-sided as well as round nuts, which may be fed either from the top or the bottom. One type, designated as the model A, feeds the nuts from the bottom, and lifts the body piece out by means of an automatic lifter. The lifter has a disappearing action, so that another piece may be fed to the button immediately. This model feed is for round clinch nuts. The model B, illustrated herewith, is made in two styles, for long and short strokes respectively. This feed is particularly useful for fastening round nuts to body parts that are deeply grooved or curved in such a way that access is difficult. The round nuts fed by this model are fastened into hexagonal holes, and are curled over the hexagon sides of the hole to prevent the nuts from turning.

Model C feed is similar to the model A but has an automatic lifter which ejects the piece to the front instead of raising it straight up. This style feed is also arranged with a thin anvil so that nuts may be inserted inside of U-shaped body parts. The fifth model of feed is especially designed for feeding D-shaped or flat-sided nuts to the body parts. This type of feed can be supplied to feed the nuts either from the top or the bottom, the model illustrated herewith being arranged to feed the nuts from the bottom.

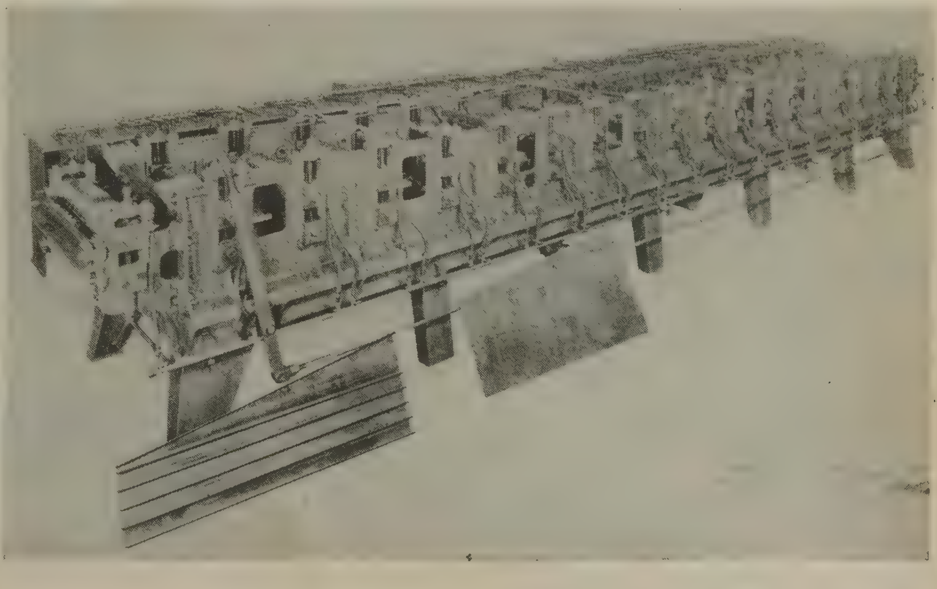
All of the feeds are arranged so that the operator merely has to put the body piece over the clinch nut and trip the press. A new nut is then automatically pushed into place. It is claimed that an operator can set 25 to 40 or more of the nuts per minute.

Automatic Machine to Form Automobile Running Boards

DEMANDS of the automotive industry for rapid and economical production of parts has led to the development of many one-operation machines which perform the work that formerly required several operations. A recent addition to this list of special production machines, designed to speed up output and reduce labor costs, is a rolling machine for forming automobile running boards. It has been brought out by the Yoder Co., Cleveland.

With this machine, running boards having parallel

STOCK of Sheet Steel or Cold Rolled Strip, as Shown at Right, Is Made in This Machine into Automobile Running Boards, One of Which Appears at Left of the Sample of Stock. Operation is automatic, including rolling ribs and hemming one edge



edges are completely formed in one pass through the machine, the operations including making the ribs and hemming the edges. Boards tapered on one side go from this machine to a smaller, standard open-side rolling machine on which the tapered edge is hemmed. The board is then ready for the necessary machine work and for parts for attaching it to a car.

The machine has a series of rolls or dies which successively form the ribs and hem the parallel edge or edges. Each machine is built to meet the special requirements of the purchaser. It is made with from 14 to 18 sets of rolls and for forming running boards from stock ranging from No. 16 to No. 22 gage. The machine illustrated has 18 sets of rolls and is built for making running boards from No. 20-gage steel.

Stock, either of sheet steel or of cold-rolled strip, is cut to the required length, 4½ to 5 ft. It is fed into guides at the feed end, at the right in the picture, and passes first through flat feed rolls. Then it goes through rolls that form the ribs, which are about ¾ in. deep, and finally through the rolls that hem both sides of boards having parallel sides and one side of boards having one tapered side. The machine illustrated was built for rolling two, three or four ribs and hemming one edge.

If there are three ribs, the center rib is made in the first rib-forming rolls, then the two outside ribs in the next rolls and the hemming is done on the last rolls. If there are four ribs, the two inside ribs are rolled first and then the two outer ribs. The machine has a capacity of forming 20 running boards a minute or approximately 100 ft. of stock a minute. It is driven by two 15-hp. motors mounted at the back, each operating nine sets of rolls. All bearings are lubricated by a one-shot lubricating system.

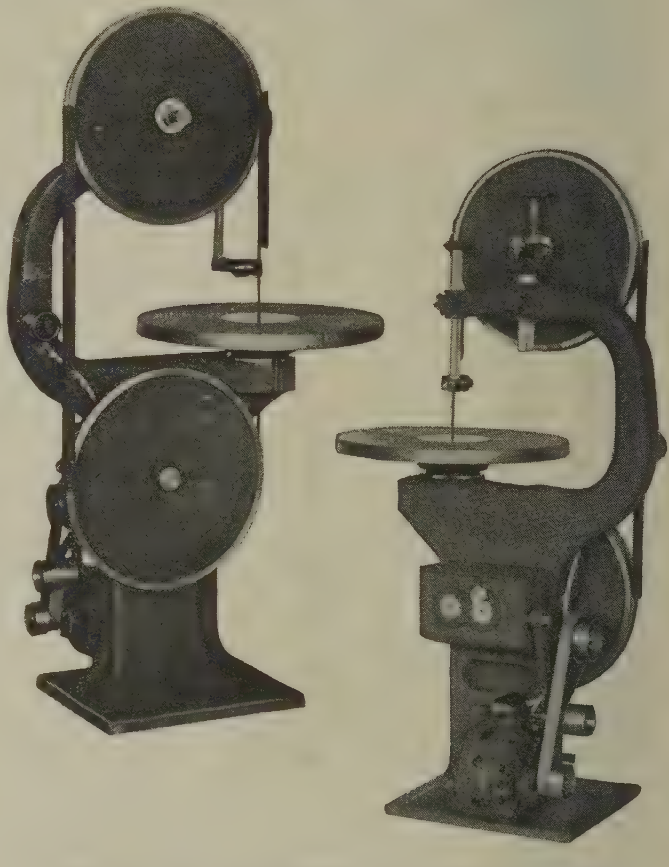
Band Saw for Cutting Brass and Other Soft Metals

FOR brass foundries, metal pattern and other shops having soft metals to cut, William Laidlaw, Inc., Belmont, N. Y., is offering a metal cutting band saw improved features of which include the mounting of the ½-hp. 1750-r.p.m. driving motor on the side of the frame directly under the gear box. Control of the motor is from a switch on the side of the column. The machine is compact, the floor space occupied being 25 by 36 in.

From the motor the drive is by endless belt which runs over a ball-bearing idler. A two-step cone pulley is mounted on the motor shaft and also on the worm shaft, and these pulleys are interchangeable. Eight speed changes are obtainable, two of which are secured through the gear box without shifting the belt or interchanging the pulleys. Changes through the gear box are made by sliding gears and lever.

Ball-bearings are used throughout. The lower bearings are lubricated from the gear box and the upper wheel bearings have a large grease chamber which requires attention only at long intervals. The worm wheel is of bronze and the worm, hardened and ground, runs in oil. Transmission gears also run in oil.

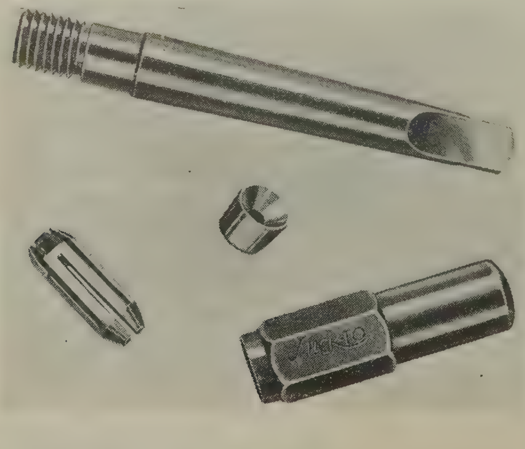
Band wheels are of web construction and are 20 in. in diameter. They are flanged on the front side to protect the operator in case the saw breaks. With this construction wheel guards are not necessary. Upper and lower guides are interchangeable; either guide can be used for two widths of saws simply by loosening one screw and turning the guide half over. The machine will take any width of saw blade up to and including 1 in. in width. Guide plates are made for ½ in. and ⅝ in. saws, but guide plates for other widths of saw can be furnished.



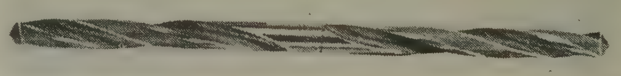
Compactness Is a Feature. The drive is by motor and ball bearings are used throughout

Chuck Designed to Hold Broken and Double Twist Drills

DRILL chuck and double-end twist drills bearing the trade name of Stick-To are being marketed by the Specialty Trading Corporation, 551 Fifth Avenue, New York. The chuck is designed to prevent breakage of twist drills and to permit use of broken drills. It is said to grip the tool without marring or dulling the cutting edge and will also grip the round shank.



Construction of the chuck may be noted from the illustration. There are two main parts, a hollow arbor and an outer sleeve, which when screwed together hold the twist drill firmly. This is accomplished with the aid of internal taper surfaces and a jam sleeve that is slit and beveled at both ends. One of the beveled ends is jammed against the tapered surface in the outer sleeve, while the other end is pressed together by a loose interior collar, which is tapered and beveled on the inside at one end. The twist drill in the chuck is held at two places, providing eight contact points, which is



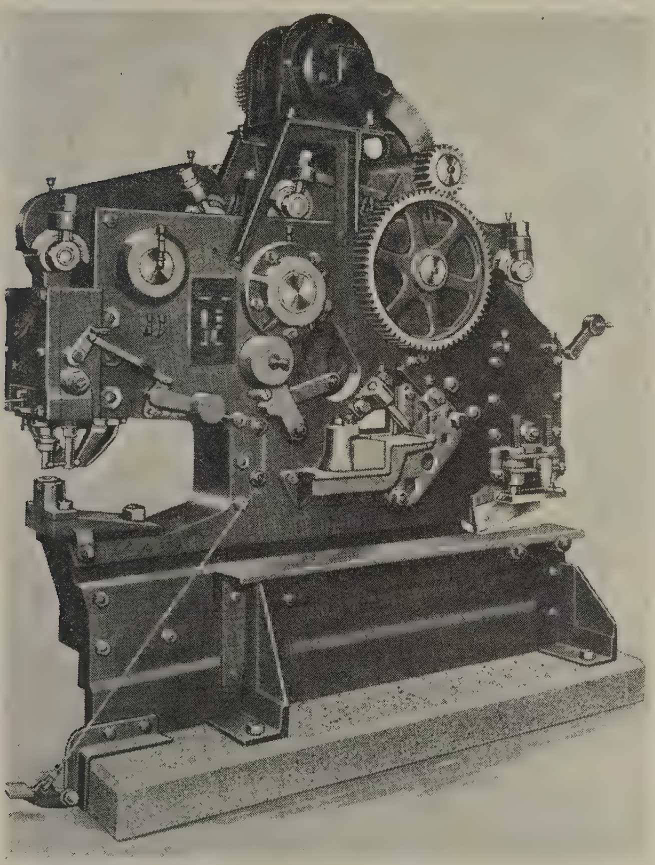
Double Drills May Be Used in the Chuck, the Parts of Which Are Shown at Left said to prevent slippage of drills and provide proper alinement.

Projection of the twist drill outside of the chuck may be regulated to the depth of the hole or to the most effective free length desired. The chucks are recommended for use with the quick-change collet system, and adaptability for multiple-spindle work, both drilling and tapping, is attributed to the small diameter of the chuck, which permits working to close centers. Each chuck has capacity to take five sizes of drills, by sixty-fourths of an inch. Simplicity of construction is emphasized as minimizing repair and maintenance expense.

Double-twist drills, one of which is illustrated, are offered for use in these chucks. A feature of these tools is that when one end becomes dull the drill may be inverted in the chuck and the other end used. The full length of the drill may be consumed and there is no shank to be discarded. Both high-carbon and high speed double-end drills of Swedish steel are available.

Combination Punch, Slitting Shear and Bar Cutter

TWO combination punches, slitting shears and bar cutters have been added to the all-steel universal iron worker line of the Buffalo Forge Co., Buffalo, N. Y. These machines, designated as the Nos. 2½ and 3½, are intended for use where a machine of greater capacity than the company's smaller iron workers is required, but not the high punch throat of the Buffalo 25 to 29 U D punch, slitting shear and bar cutters. The lower throat permits compact design.



One Eccentric Operates the Three Tools Successively During One Revolution

One eccentric operates all three tools in succession, all three tools being actuated during one revolution of the eccentric but not at the same instant. This prevents overloading the machine and permits using the three separately controlled parts of the machine at the same time.

Interchangeable high and low die blocks on the punch end permit the handling of beams, channels, girders, Bethlehem beams and H-sections. The stripper swings out of the way when changing tools. Shear blades are unusually long and are reversible. The bar cutter is the same as on other U D machines. Angles can be cut on a miter without inclining the stock. A triple punching attachment is available.

The No. 2½ machine is designed for punching holes up to 1 3/16 in. in ¾-in. plate or 1-in. holes in ⅞-in. plate. The larger machine, the No. 3½, has capacity for punching 1¼-in. holes in ⅞-in. plate or 1 1/16-in. holes in 1 1/16-in. material. Angles up to 3 x ⅜ in. can be notched, and I-beams up to 5 to 9 in. and channels 5 to 8 in. can be coped by the smaller machine. The depth of throat of the punch unit of both machines is 20 in.

Shearing of ¾-in. plates through the center and trimming of ⅞-in. material may be done on the No. 2½ machine. Flats up to 6 x ⅞ in. can be cut with standard knives, and flats from 3 x ⅞ in. to 10¼ x ½ in. with a special upper knife. The knives of both machines are 12 in. long.

The bar cutter of the smaller machine will handle 2¼-in. rounds; 2-in. squares; 6 x ½-in. 90-deg. angles; 4 x ½-in. 45-deg. angles; 4 x 5 x 9/16-in. 90-deg. tees; as well as 9-in. 21.8-lb. I-beams and channels; 10-in. 20-lb. channels; 6-in. 22.8-lb. H-sections; and 9-in. 20.5-lb. Bethlehem beams.

A 10-hp. motor is employed to drive the smaller machine and a 15-hp. motor for the No. 3½ machine. The No. 2½ machine is 7 ft. 4 in. long, 4 ft. wide and 6 ft. 10 in. high, the same measurements of the larger machine being 8 ft., 4 ft. 3 in. and 8 ft. 8 in. The weights are 8250 lb. and 9600 lb. respectively.

Deterioration of Lead Cable Sheathing

S. Beckinsale, Callender's Cable & Construction Co., London, and H. Waterhouse, metallurgist research department, Woolwich Arsenal, reported to the recent meeting of the British Institute of Metals the results of an examination of large numbers of cables with cracked lead sheaths. The cracks were found to be intercrystalline, had commenced on the inside of the sheaths and were generally free from corrosion. The lead in the region of the cracks was not distorted. Definite evidence was obtained that where lead sheathing failed by cracking the cable was in a state of vibration. Alternating stress tests indicate that lead has a very low fatigue limit, and the fractures obtained in the pure lead test pieces were similar in all respects to those found in failed cable sheathing. The conclusion was therefore reached that the cracking is a fatigue type of failure.

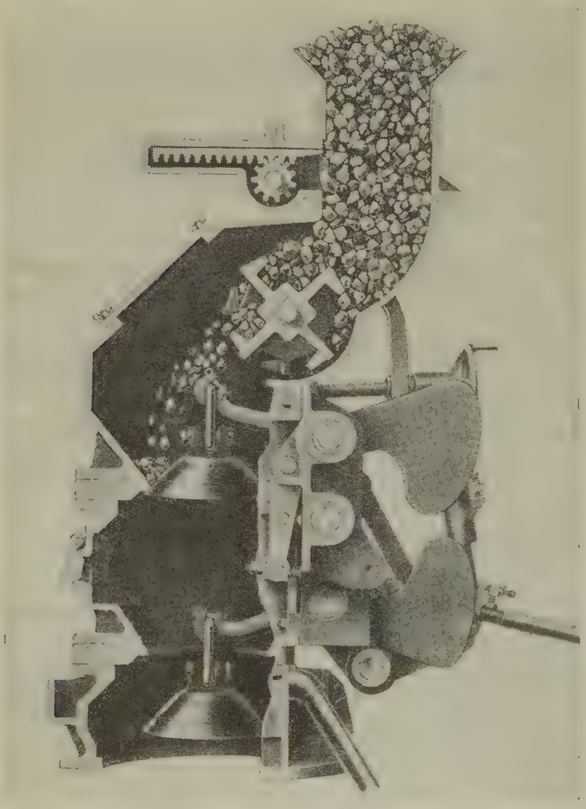
Other explanations have been advanced to account for the cracking. Of these only two, corrosion and prolonged stress, might cause intercrystalline cracking in lead, but cracks produced by the former are associated with much corrosion product, and by the latter with much deformation of the lead.

In America, the work of J. R. Townsend, R. S. Dean and their collaborators in the Bell Telephone and Western Electric Laboratories have developed the fact that pure lead hardened with a little antimony gives much better resistance to cracking after repeated bending. The British authors favor the lead-cadmium alloys, with or without tin or antimony. Comparative fatigue limits, in pounds per square inch after annealing 1 hr. at 250 deg. C., are as follows:

Metal	Analysis	Fatigue Limit
Pb	99.99	450
Pb:Sn	97:3	1,070
Pb:Sb	99:1	1,390
Pb:Cd	99.7:0.3	940
Pb:Cd	99.5:0.5	1,320
Pb:Cd:Sn	98.25:0.25:1.5	1,140
Pb:Cd:Sb	99.25:0.25:0.5	1,590

Mechanical Gas Producer Fed by New Device

A new type of fuel feed for mechanical gas producers has been brought out by the Wellman-Seaver-Morgan Co., Cleveland. This is a double-bell type of feed that operates on an entirely different principle from the commonly used revolving pocketed vane-wheel type of feed. Two bells, which automatically lower and rise alternately, pass the fuel into the producer. Their action is so timed that one bell is open when the other is closed. Their operation requires but a fraction of a horsepower, which is supplied by the producer motor. The rate of feeding is regulated by a rotating fingered vane-wheel, located above the upper bell, through a control traveling nut, screw and hand wheel. At the top of the feed there is a shut-off valve which, when closed, stops the flow of fuel from the overhead bin when the working parts beneath require removal and replacement.



Double Bell Type of Feed in New Producer

The bells and seats are of alloy steel, machined to secure the closure of a spherical surface against the circular seat. This, it is stated, insures a gas tightness even when the parts are worn from long use.

Any granular fuel may be used, such as bituminous or anthracite coal, coke or lignite, in any size from slack up to 3-in. lumps. The use of this feed, it is pointed out, assures an even distribution of the fuel in a sprinkled layer on the fuel bed. The volatile constituents are quickly gasified, and an incandescent bed of coke is maintained for the reception of a fresh charge of fuel. The feed is made in two sizes, one with a capacity up to 5000 lb. and the other with a capacity up to 10,000 lb. per hour. Only one feeding device is required for a producer. The new double-bell fuel feed has been adopted as standard equipment on the W-S-M Type L producer. It is also interchangeable with previous types of mechanical feeds supplied with the Hughes type of producers.

By-Product Coke at Higher Rate

Output of by-product coke during the 29 days of February amounted to 3,708,000 net tons, a decrease of 172,000 tons, or 4.4 per cent, compared with January, according to the Bureau of Mines, Washington. The daily rate, however, increased from 125,161 tons in January to 127,862 tons in February, a gain of 2.2 per cent. There were 78 active plants and one was idle, production being at the rate of 82 per cent of capacity.

Exhibits Open Side Planer for Tool Room Use

A specially designed open side planer for tool room operations, built by the Cleveland Planer Co., Cleveland, was on exhibition at the company's plant April 3. In response to invitations by the company, the machine was inspected by a number of machine tool users and others. This is a 30-in. x 30-in. x 8-ft. unit built for the Brown-Lipe-Chapin Co., Syracuse, N. Y. Features include rapid power traverse, dial feed, forced feed lubrication to the vees, parallel belted motor drive, two rail heads and one side head.

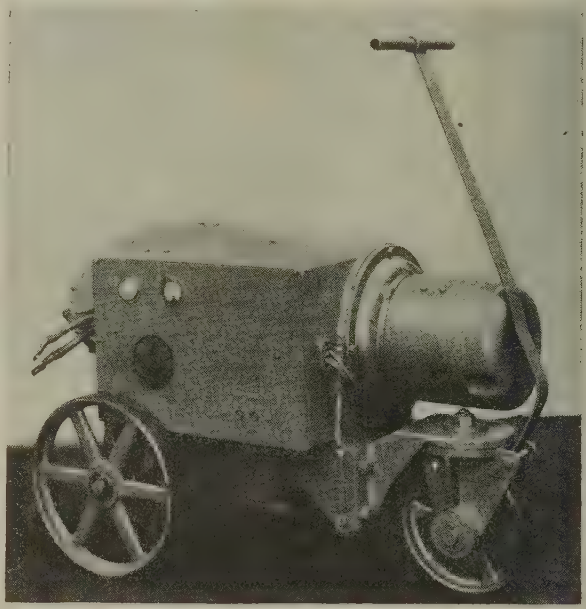
Wholly Inclosed Arc Welder

A new 200-amp. single-operator welding set, for both shop and field, has been designed by the Westinghouse Electric & Mfg. Co., East Pittsburgh, Pa. Simplicity of operation and compactness in construction are the features of the new unit.

The set is connected directly across an alternating current line. Starting, by means of a linestarter and linestart motor, is accomplished by a push button. A single rheostat varies the arc current in steps of 5 amp. over the entire welding range from 60 to 300 amp.

Motor, constant-current generator and control equipment are assembled in a completely inclosed frame. The separater exciter, which is overhung from the motor end, is securely fastened to the unit frame. This type of construction guards the operator against injury, and protects the set from dirt and falling objects. In performance tests, entirely satisfactory welding operations have been carried on while the sets were suspended at all angles and positions.

The unit is rated at 200 amp., 1 hr., 50 deg. rise on a resistance load at 25 volts, which conforms to the standard rating of the National Electrical Manufacturers Association. The motor is wound for single-phase, 220 or 440-volt, alternating current. If it is desired to operate the unit from a 440-volt, three-phase 60-cycle circuit, it is only necessary to replace the operating coil on the magnetic starter and to reconnect the motor leads.



The Chicago Association of Commerce has started a movement for the immediate establishment of a Government barge line on the Illinois River in case the Deneen-Denison bill increasing the capital stock of the Inland Waterways Corporation is passed at this session of Congress. The purpose of this move is primarily to make it possible to extend Government service to those parts of the Illinois River where navigable channels are maintained. The bill in question provides $10,000,000 for use by the corporation in the purchase of new equipment for expanding the barge service.

Foreign Markets Less Active

United Steel Works to Reduce Output 40,000 Tons a Month—Welsh Tin Plate Business Good—British Pig Iron Quiet

(*By Cable*)

LONDON, ENGLAND, April 2.

PIG iron is quiet, but Cleveland prices are firm and makers are well sold ahead, with output going directly into consumption and stocks of both foundry and forge iron depleted. Scotland has purchased fair tonnages through the Cleveland producers' agency, at less than the official quotations.

Foreign iron is being offered, but users are not attracted by present quotations. Hematite is still rather quiet, but inquiry is improving and makers hope to reduce their heavy supplies. Foreign ore continues quiet, as consumers are well covered. Prices of the foreign product, however, are stiffening as a result of the Swedish situation.

Finished iron and steel is quiet, makers being in need of orders, but being unwilling to reduce prices. Export demand for plates and shapes is especially poor.

Tin plate bars are active and non-members of the association are increasing prices. Baldwin's, Ltd., is operating in three Landore steel furnaces after 12 months of idleness.

Tin plate is active, with foreign and domestic consumers buying well and works in a satisfactory position. Makers are to meet April 17, when it is expected that the minimum price will be advanced. Meanwhile no mills are quoting less than 18s. ($4.39) per base box, f.o.b. works port.

Galvanized sheets are quiet in the Indian market, but South America, South Africa and Australia have purchased moderately. Black sheets continue inactive.

Continental iron and steel is quiet and prices are generally weakening, while consumers are awaiting some evidence of stability at lower levels. Some works are holding out for the full market price, but others are offering concessions for new business. The European Rail Makers' Association has reaffirmed the rail price at £6 7s. 6d. ($31.05) per ton, f.o.b. Antwerp, for second quarter shipment.

GERMAN EXPORT QUOTA HIGHER

International Cartel Gives Additional 50,000 Tons—No Action on Selling Syndicate

BERLIN, GERMANY, March 15.—Improved business and firmer prices in Continental markets evidently accounted for lack of action at the recent meeting of the International Steel Cartel in Paris. At the preceding meeting of the cartel there were evidences of dissatisfaction with the price situation, and member countries showed interest in the establishment of selling syndicates as a means of insuring more profitable prices. The recent death of M. Mayerisch, president of the cartel, was also a reason for inactivity at the recent meeting.

Early this year the French mills established a national selling syndicate for semi-finished material and beams, thus eliminating one of the obstacles to the formation of international syndicates. Similar action, however, is still to be taken by Belgium.

The expected increase of steel quotas for the second quarter of the year was not made. Such an increase would have reduced the penalties payable to the cartel for overproduction, but the countries which habitually produce more than their quotas preferred to continue paying the penalties rather than to risk a general price decline from an incresae of Continental production. Germany, therefore, will continue to pay a fine of $1 a metric ton upon surplus output sold in the domestic market and $4 a ton on excess production exported. The German export quota, however, has been increased 50,000 tons a month on the declaration of the German delegates that export business cannot be longer neglected. In January, the German export surplus was only 101,000 metric tons, compared with an average monthly export surplus in 1926 of 340,000 tons. The willingness of other cartel members to agree to this increase in exports was evidently based on the belief

(a) Nominal.

that foreign business will be better this year than in 1927.

The penalty payable for overproduction by the Central European group of producing countries (Austria, Hungary and Czechoslovakia) was reduced to $2 a ton. This concession was based on the fact that most of the surplus output of Central Europe is consumed in domestic markets. The International Wire Rod Cartel has advanced prices 5m. ($1.20) per ton.

The secretary of the Verein Deutscher Eisen und Stahl Industrieller (Association of German Iron and Steel Producers) recently stated that Germany can best meet the competition of low French and Belgian prices by concentrating on the export of high-quality products. He estimates that $250,000,000 has been invested in German industry since the beginning of 1924 for expansion of production in heavy iron and steel.

German Domestic Market Less Active—Prices Unchanged

(By Radio)

BERLIN, GERMANY, April 2.

ALL steel prices are unchanged for April. Orders are coming in unsatisfactorily and the pig iron and steel markets are weaker. It is reported that the United Steel Works will reduce its steel output by 40,000 tons monthly and will also curtail its rolling mill operations.

The most active domestic demand is for semi-finished material, steel bars, wire rods, wire and heavy gage sheets.

Demand for structural material, light gage sheets and rails is declining. The domestic tube market is decidedly weak. Steel consuming manufacturers are buying cautiously. Export trade in all products, especially tubes, is better, but the price advance has temporarily ceased.

Considerable Iron and Steel Shipped by Water in Germany

HAMBURG, GERMANY, March 17.—The steel industry has developed considerable traffic on the German rivers and canals, a fact which accounts, at least in part, for the ability of the industry to quote prices competitive with Belgian, French and Luxemburg mills, although wages and taxes are higher. Some German works receive and ship almost all their materials by water. This is especially true of seaboard blast furnaces at Bremen, Lübeck and Stettin. Their iron ore comes from Sweden, Spain or North Africa to their own docks, and the coal for their coke ovens, from British ports or Rotterdam, Holland. Limestone is received from the interior by canal. The finished product is either shipped abroad or to German consumers able to accept shipment by river or canal.

Simplified Practice in Belgium

Standardization of industry through simplification of manufacturing processes and its resultant elimination of waste in money, time and material is attracting the increased attention of Belgian industries, according to a report received by the Department of Commerce from George W. Berkalow, assistant trade commissioner, Brussels. The Belgian Association of Standardization has inaugurated a campaign to impress the industrialists, merchants and economists with their responsibility in the matter and has published pamphlets on various subjects regarding standardization. Among those treated are construction of bridges, simplification of steel rivets, copper rivets, chains, metallic cables and water pipes.

"Generated vs. Purchased Electric Energy" is the subject of a brief paper which has been reprinted from *Power Plant Engineering* and is being distributed by its author, H. O. Swoboda, consulting engineer, 3400 Forbes Street, Pittsburgh. The pamphlet, of 16 small pages, contains a number of illustrations. It deals with some concrete problems involved in an investigation of the subject matter covered in the title.

GERMAN HOME MARKET ACTIVE

Unemployment Declining as Spring Demand Develops—Steel Output Near 1913

BERLIN, GERMANY, March 15.—Despite a favorable business situation, it is still believed that the present year will show less activity in domestic steel-consuming industries than 1927. Unemployment is declining and the usual spring demand for materials, especially for building operations, has begun.

February iron and steel output was considerably better than a year ago. Production of pig iron totaled 1,122,384 metric tons, compared with 968,774 tons in February, 1927, and steel output was 1,322,695 tons, compared with 1,233,609 tons in the same month of last year. Steel production is now at 92 per cent of the 1913 figure for pre-war Germany, and 1913 was a year of heavy production. It is noteworthy that consumption of iron and steel scrap last year totaled 9,200,000 tons, compared with 5,500,000 tons in 1913. The scrap used in 1927 equaled iron ore consumption, while 70 per cent of all materials used in 1913 was ore and only 30 per cent scrap. Ore imports last year totaled 17,409,000 metric tons, which included 8,652,000 tons from Sweden, 3,081,000 tons from Spain and 2,867,000 tons from France.

Domestic iron and steel prices are unchanged. As a result of a buying movement in the French domestic market, low quotations to German consumers by French mills have been withdrawn. Another favorable factor in current business is increased demand from abroad, particularly from the Far East. Higher export quotations seem to have served to stimulate purchasing. Although the margin between German domestic prices and quotations in the "world market" has been reduced by recent advances in the export market, the difference is still great. The price of Belgian bar iron, f.o.b. Antwerp, has advanced steadily since October, but the German domestic price still exceeds it by about 25 per cent.

Foundries report a decline in business. Belgian and Dutch competitors are underselling them in the Western frontier districts, especially on castings for electrical and agricultural machinery and machine tools. This is attributed in part to the high cost of working capital in Germany. Nearly all German manufacturers are short of capital and the Reichsbank policy of restricting municipal borrowing from abroad is given as one cause. Not being permitted to obtain foreign loans, the municipalities are obtaining credit from domestic manufacturers who supply them with materials required for various projects.

The efforts to promote an international understanding on tin plate recently made by British tin plate manufacturers are not expected to have much success. German competition for tin plate business is increasing, and German exports of tin plate in 1927 exceeded the 1926 figure by about 90 per cent. In the past two years Germany has had export surpluses of tin plate, whereas formerly there was an import surplus. Compared with 1913, the output has about doubled.

The machine tool and textile machinery industries report some slackening of business. Demand for agricultural machinery has increased, but business is hampered by purchasers' demands for long-term credits. Builders of railroad and street cars are seeking an agreement for a distribution of orders. Under an agreement made last year, all orders for cars from the Railroads Corporation are distributed among the member firms of the car builders' syndicate, the Deutsche Wagenbauvereinigung, on a quota basis. The present plan is to extend this distribution to cars purchased by private companies and municipalities.

German Workers Have Shorter Week

HAMBURG, GERMANY, March 17.—Effective April 1, the working time in the steel industry will be 60 hr. per week for blast furnace workers, 52 hr. per week for employees in open-hearth plants, 48 hr. per week in structural mills and 51 hr. per week in plate and sheet mills.

STEEL IMPORTERS MORE ACTIVE

Bidding On Some Bridge Work—Prices Lower —Japanese Railroads Revise Specifications

NEW YORK, April 3.—Steel importers in New York report slightly more activity in sizable projects, but current buying of foreign steel is small and there is not much expectation that foreign steel will be bought for work on which bids have been submitted. Quotations on open-hearth reinforcing bars have been made to contractors bidding on the Bayonne-Port Morris, N. J., bridge and on a bridge at Raritan, N. J. Prices on European steel are slightly lower than after reaching a peak about a fortnight ago. Current quotations range from 1.70c. to 1.75c. per lb., base, on plain steel bars and 1.65c. per lb., base, on structural material. There is some business in hot-rolled strip steel, the foreign product being from 80c. to $2 per ton under the current domestic market.

No appeal from the decision by Justice I. F. Fischer, sitting in Customs Court, that reinforcing bars are dutiable as construction material instead of steel bars, has been entered by the Government. Meanwhile, a similar decision based on Justice Fischer's finding has been rendered in the case of Henry L. Exstein & Co., New York. This second decision involved imports of about $100,000 worth of reinforcing bars.

Exports to Japan Light

Except for small purchases of tin plate by Japanese merchants and some grooved and girder rail business, trade with the Far East has been light. A tonnage of six miles of 122-lb. and one mile of 140-lb. guard rails has been placed by Tokio municipality with an American mill. Yokohama municipality has awarded 10 miles of 91-lb. high T-rails and three miles of 136-lb. T-rails to a Japanese export house. Part of the order is expected to go to a Continental maker. The Han-Shin Electric Railway in Japan has closed on five miles of 100-lb. rails, A. R. A. specifications, with a Continental mill and has placed two miles of 60-lb. rails and 50 pieces of 91-lb. high T-rails with the Yawata steel works in Japan.

According to recent reports from Japan, the Imperial Government Railways, which contemplates gradually replacing all its track with 100-lb. rail sections, will probably buy most of its future requirements from the Government works at Yawata. At present only the main lines of the Government railroads are constructed with 100-lb. sections, such as the Tokio-Yokohama division and the Kobe-Osaka division. It is understood that a new specification will call for 45-ft. lengths.

Cancellation of Certain Commodity Rates on Iron and Steel Products

WASHINGTON, April 2.—The Interstate Commerce Commission, in a recent decision, justified the proposed cancellation by the railroads of certain commodity rates on iron and steel articles, in less-than-carload lots, in the Official, Illinois and Western classifications. The commission said the cancellations would eliminate preferences and discriminations. The products affected generally are given a fourth-class rating, but a few of them are rated as high as first class and others between first and fourth.

The commodity rates which the railroads proposed to cancel were established to favor particular movements, especially between important commercial centers in northern Illinois, southern Wisconsin and adjacent territory, according to the decision. For the most part, it was declared, these commodity rates applicable to interstate traffic now approximate the level of the fourth-class rates. The opinion added that the few accompanying cancellations of commodity rates in Central territory proper merely do away with rates which have fallen into disuse, restore the classification bases without change in rate levels, or cancel rate groups which do not correspond with those of the class rates. For movements wholly within Illinois territory, however, it is stated, the present commodity rates are much below the fourth-class level.

JAPANESE SHEET PRICES LOW

Domestic Maker Moving Good Tonnages at Less Than Foreign Prices—Tin Plate Firm

February business in Japan was generally considered the worst on record, says the monthly report of A. Cameron & Co., Kobe. However, customs returns indicate that for the first two months of the year the adverse trade balance was reduced by yen 15,000,000 ($7,153,500) compared with the same period of 1927.

Slack money conditions still prevail, and it was reported on the Tokio stock exchange that the Bank of Japan would be compelled again to lower its rediscount rates. Further lowering is not generally approved, it being contended that such action would stimulate the demand for money, creating an exorbitant note circulation, false prosperity and depreciated currency.

At the end of last year, in expectation of a higher tariff on sheets which did not develop, there was considerable speculative buying. As a result, about 7000 tons of sheets arrived during February, and, with no possibility of any tariff increase this year, the importers are now seeking to dispose of their stocks. Meanwhile, the Kawasaki Dockyard Co. continues to sell black sheets in lots of 1500 to 2000 tons, and each sale shows a further recession in price, as low as 50 sen (25c.) per sheet having been quoted. The market price based on most sales, however, ranges from 73 to 73.50 sen (36½c. to 36¾c.) per sheet for American, 72 to 72.50 sen (36c. to 36¼c.) for British and about 71 sen (35½c.) per sheet for the domestic product.

Local galvanizing plants have booked a good tonnage of galvanized sheets from Chinese merchants. As the business was taken at low prices, defective sheets have been used in rather large quantities. Heretofore British defective sheets were about the only imports, but recently American defective sheets have been finding a ready market.

Not long ago the Kawasaki Dockyard Co. contracted with Belgian and German makers for 12,000 tons of sheet bars a month. The dockyard, however, had insufficient stock to await April-June delivery and has been experimenting on the production of its own sheet bars. Should present efforts prove successful, it is expected that the largest sheet bar consumer in Japan will begin to make its own supplies.

Only a small tonnage of tin plate was imported during January, so that local stocks have been somewhat depleted and the market has taken on additional firmness. The Government works prices for tin plate are about 50 sen (25c.) per base box lower than the British delivered price, and the Government plant is pressing for business for forward delivery. Nevertheless, there are a number of consumers and dealers who prefer foreign tin plate, so that there has been considerable buying of the American and British product recently.

German Freight Rates on Scrap Reduced

HAMBURG, GERMANY, March 17.—Freight rates on imported iron and steel scrap have again been reduced, provided the material is shipped from a German port and not from a frontier. This reduction directly benefits American and British shippers of scrap to Germany. Varying 25 to 40 per cent from the present freight rates, the new rates apply only to companies shipping a minimum of 40,000 tons annually, who must post a security bond of 100,000 m. ($23,910) with the German railroads.

Bolivian Tin Industry Hit by Low Prices

WASHINGTON, April 3.—Low prices for tin, with the possibility of causing curtailed output, are depressing the Bolivian tin industry, according to a cablegram from Consul Joseph F. McGurk, La Paz. The price of tin fell as low as £223 17.5 shillings during March and the month's average price was £228 14.5 shillings. A few of the smaller mines are now said to be working at a loss and others have either reduced the number of employees or have cut wages 10 per cent. The industry, however, is reported generally optimistic in the hope of better prices during the next few months.

Atlantic Seaboard Imports Dominate

Finished Iron and Steel Coming In on East Coast About Half of Total—Five-Sixths of Pig Iron Total

BY L. W. MOFFETT*

DESPITE the 34 per cent decline in the total iron and steel imports into the United States in 1927, compared with those of 1926, there was an increase in the incoming movement of finished products. Shipments of finished steel from abroad last year aggregated 483,202 tons, while those of the previous year amounted to 478,722 tons. The larger total importations in 1926, with 1,110,049 tons as compared with 750,467 tons in 1927, were due mainly to the much heavier 1926 imports of pig iron.

The four principal lines of importations entering the American market are steel bars, structural shapes, cast iron pipe and "other pipe," the latter made up chiefly of seamless tubes. Imports of these four products in 1927 were 385,202 tons, or 79 per cent of the total incoming movement of all finished lines. During the preceding year imports of the four finished lines amounted to 339,518 tons, or 70.9 per cent of the aggregate of imported finished steel. Each year structural shapes led in tonnage of the four finished lines, with steel bars coming second, cast iron pipe third and "other pipe" fourth.

Imports of structural shapes in 1927 amounted to 161,848 tons, increasing from 121,099 tons in 1926, while steel bar imports declined to 91,497 tons from 103,473 tons. Cast iron pipe imports decreased to 81,769 tons from 83,873 tons and imports of "other pipe" rose to 50,088 tons from 31,073 tons. Pig iron imports showed a remarkable drop to 133,068 tons in 1927 from 445,773 tons the previous year.

Belgium was the principal source of imports, during both years, of structural shapes and steel bars. France led in both years as the source of cast iron pipe imports, while Germany supplied the bulk of "other pipe" imports during the two periods. India was the largest supplier of pig iron imports in 1927, succeeding to the position held in 1926 by Germany, when the latter country furnished 157,094 tons of pig iron for the American market. In 1926 Germany supplied only 9711 tons of pig iron, a drop of 93.8 per cent.

The Atlantic seaboard was the largest recipient each year of pig iron and the aggregated four finished line imports, taking 107,797 tons and 388,781 tons of pig iron in 1927 and 1926, respectively, and 183,530 tons and 169,120 tons of the four finished lines. The Pacific Coast each year received more than half the total imports of "other pipe." The Atlantic Coast led in receipts of other lines, but with a margin in certain instances which reflected a shift toward greater imports into the Pacific Coast area particularly.

Imports of the four finished products through the Atlantic Coast last year represented 47.7 per cent of

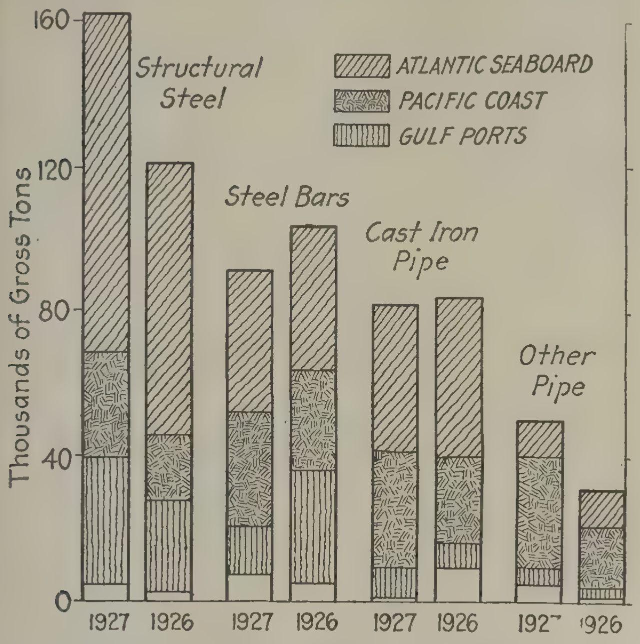
the total incoming movement of these tonnages, while in 1926 they were 49.8 per cent. Imports of these products through the Gulf Coast last year, amounting to 61,170 tons, constituted 15.8 per cent of the total, as compared with 65,693 tons or 19.3 per cent in 1926. Imports of these products through the Pacific Coast in 1927 amounted to 124,603 tons or 32.3 per cent of their total, while in 1926 they were 88,011 tons or 25.2 per cent. Receipts of the four products through inland ports of continental United States and into Porto Rico were 15,899 tons or 4.2 per cent last year and 16,694 tons or 5.7 per cent the preceding year.



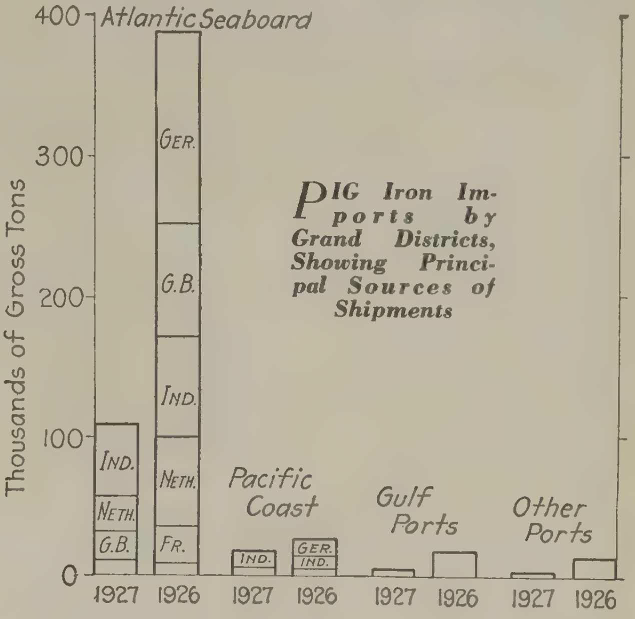
IMPORTS of Four Leading Finished Lines of Iron and Steel in 1927 and in 1926, Showing Where the Tonnages Came In

Belgium supplied 48,516 tons, or 53 per cent, of the steel bar imports last year. In the previous year Belgium supplied 56,573 tons, or 54.6 per cent, of the 103,473 tons of steel bars imported. The Pacific Coast received 31,674 tons of steel bar imports, 34.5 per cent of the total, in 1927, Belgium supplying 20,110 tons. In 1926 receipts of steel bars from abroad through the Pacific Coast amounted to 28,227 tons, or 27.2 per cent of the total, Belgium furnishing 21,277 tons.

Belgium was the source of 103,104 tons, or 65.3 per cent, of structural steel imports in 1927, the Atlantic Coast receiving 93,696 tons or 57.8 per cent of the total, with the Gulf ports taking 35,140 tons or 21.9 per cent. In 1926 Belgium supplied 85,177 tons, or 70 per cent, of the total structural steel imports of 121,109 tons. Receipts through the Atlantic Coast were 75,484 tons or 62.3 per cent of the total.

France furnished 63,458 tons of cast iron pipe, or 77.6 per cent of the total imported in 1927. Imports of cast iron pipe from France in 1926 amounted to 57,354 tons, or 68.1 per cent of the total of 83,873 tons.

Germany supplied 26,988 tons, or 53.9 per cent, of the "other pipe" imported in 1927, the Pacific Coast receiving a total of 31,013 tons. In 1926 Germany was the source of 19,839 tons, or 63.8 per cent of the 31,073 tons of imported "other pipe."



PIG Iron Imports by Grand Districts, Showing Principal Sources of Shipments

Germany supplied only 7.29 per cent of the 1927 pig iron imports, against 35.2 per cent in 1927, while India furnished 50 per cent and 18.7 per cent, respectively; the Netherlands 22 per cent and 15.4 per cent; and the United Kingdom, 15.1 per cent and 20.6 per cent. The Atlantic Coast received 81 per cent of the total pig iron imports in 1927 and 84.5 per cent in 1926.

The Erie Foundry Co., Erie, Pa., has shipped to Milan, Italy, one of its latest improved type high-speed steam drop hammers for exhibition at the Milan Fair, which is to be held during April, May and June. There are already installations of Erie hammers in many of the drop forging shops in Europe, notably in the shops of the leading automobile builders.

SORTING NON-FERROUS SCRAP

Color, Fracture, Knowledge of Source and Type of Casting, and Specific Gravity All Used

SOME 250 different stock items will be found on the inventory of a typical producer of non-ferrous metals or centralized dealer in such wastes, according to Don C. Blackmar, superintendent Federated Metals Corporation, Detroit. In a paper read before the February meeting of the Institute of Metals at New York he gave a representative classification for yellow brass and said that something like this must be used if the maximum profit is to be secured from miscellaneous purchases of scrap.

Sorting and Storage Classifications for Yellow Brass

- No. 1 brass tubes
- No. 1 brass pipe
- Clean nickel-plated tubes
- Soldered brass tubes and clips
- No. 1 brass clippings
- Leaded brass clippings
- Medium brass
- Light brass
- Old rolled brass
- Leaded brass rod ends
- Automobile radiators
- Rifle shells
- Tableware (nickel and silver-plated)
- Mixed small clippings (soldered or plated)
- Gaskets
- Yellow brass faucets
- No. 1 high yellow cast scrap
- Aluminum-brass cast scrap
- Brazing spelter scrap
- No. 1 manganese-bronze cast scrap
- Manganese-bronze cast turnings
- No. 1 yellow rod turnings
- Yellow cast brass turnings
- Yellow brass grindings
- Yellow brass furnace residues
- Yellow brass with iron

Actual sorting of non-ferrous scrap (the most important operation prior to remelting it into usable ingots) calls for a combination of knowledge of its source, observation of color and shape, and laboratory tests. Large shipments of uniform materials offer no difficulties. Mixed lots must be screened through a coarse riddle, hand picked, and magneted. The hand sorting may be done while screening, and heavy brass wire riddles are used so that no interference is offered to using hand magnets. Screenings, borings and small scrap are machine-magneted on double-belt pick-up machines. A second magnet completes the work, so that reasonably dry material may then be considered iron-free. After sorting and magneting, sheet clippings, wire and light material are bricked in a hydraulic press to convenient size. Certain classes are pressed into bales weighing around 1000 lb. and are wired and wrapped in burlap for convenient shipping. Other materials are stocked in bins according to class.

Other groups of waste materials which are treated according to the same general scheme include copper, red brass, babbitt, solder, typemetals, lead, tin, zinc, zinc-base die castings, nickel-bearing alloys and aluminum. Any one or all of these materials may be received in a few hundred pounds or a carload. The sorters differentiate between several grades of red and yellow brass by color and fracture. Files and scrapers are used on dirty, painted or plated pieces to show color, and every casting must be closely examined for iron screws and other harmful materials.

Long experience and a wide knowledge of the current commercial practice and use of metals in every trade are the most valuable assets to supervisors of sorting. It is vitally important, for example, to know what type of casting will probably be aluminum bronze; therefore all gears, welding-machine parts, acid-tank rods and paper-mill pipe fittings, or plating baskets are regarded with utmost suspicion. Manganese bronze may also be recognized by the type of casting. Different grades of sheet-metal clippings may be identified by similar knowledge, coupled with color and fracture tests. The aluminum-sheet and extruded-shape wastes are becoming complicated due to use of alloys, but by recognizing the purpose and knowing the source, together with hardness and bending tests, a very close grading is accomplished. Rapid laboratory tests are constantly made to check and establish precedents for materials of uncertain antecedents. Sorters use the specific gravity balance to check solders and other soft white metals, as well as melting and pouring tests, whereby the "set" of a small bar discloses the difference between a typemetal and a similar composition of lead-base alloy containing copper.

Sorting of copper scrap for remelting presents no special difficulties. Elimination of iron and segregation of tinned and soldered clips and wire and bronze alloys are fairly easy. Common sense, knowledge of uses of metals, and laboratory tests make it possible to grade all these materials very precisely. Where there is any doubt as to exactness in sorting, the lower grade is selected or else the material goes to a smelting furnace.

Residues, which include all skimmings, drosses and ashes are almost wholly classified by chemical analysis. The laboratory tests show the percentage of metallic, analysis of metallic, acid content (chlorine), iron, sulphur, aluminum and silicon. These elements are considered in smelting to avoid unnecessary losses.

It is at times economical to screen and magnet drosses; with the fines and iron removed, contaminants may be easily picked out. Examples of this are solder sweepings from automobile-radiator manufacturers, which may contain brass tubes, and electrotypers' dross containing copper trimmings.

Americans Handicapped in Selling to Japan by F. A. S. Quotations

Most American business men feel that a prime requisite in selling goods in Japan is to ask for payment f.a.s. American ports, but this is a handicap to the American business house trying to sell goods in the Orient, declared J. S. Ruble, vice-president and manager of construction of the H. K. Ferguson Co., Cleveland, in a talk before the Foreign Trade Division of the Cleveland Chamber of Commerce March 30. Mr. Ruble has just returned from his fourth trip to Japan, where his company is engaged in construction work.

The English and Germans, the latter particularly, he said, have an arrangement whereby they can accept payment on delivery to consumer or at least on delivery to the Japanese importer. It is important to make arrangements by which deliveries can be made in Japan without handicap to the consumer. A large manufacturer can have personal representation in that country and small business concerns might combine to have a personal representative there. The third alternative is to arrange with a large Japanese importing concern to handle the business. These concerns import anything on which they can make a commission and are not particularly qualified to exploit and demonstrate the merchandise they import. They may make a quotation on a product and on two or three competitors' corresponding products at the same time.

The danger in making shipments c.i.f. or on actual delivery to the consumer, he said, is that an unscrupulous consumer may refuse to accept the shipment on the ground that it did not meet its specifications, was delivered in bad condition, or he may misrepresent the quantity. However, if an exporter has a personal representative or an importer in good standing to deal with, there is little difficulty from this type of complaint.

Apparently the best thing to do, said Mr. Ruble, is to make an arrangement with an Oriental importer with proper credit standing, who can be held responsible for payments, but who will sell the product with the aid and inspection of the American representative.

The financial situation in Japan is still bad, said Mr. Ruble. For the last six years Japanese imports have largely exceeded exports and no healthy financial condition can be expected until their production exceeds consumption.

Referring to conditions in industrial plants, he said that there are factories in Japan where an employee produces the same number of parts per hour as are produced by a workman in a similar American factory. When Japan generally speeds up production it will become a competitor of other manufacturing nations, because of its low labor costs. The successful manufacturing industries in Japan include electric lamp production, telephone production, electric power equipment and steel fabrication. Their steel mill operation is Government subsidized and is not successful. Many important large businesses in Japan are now being subsidized. One of the handicaps of Japanese industry is that an employer is not permitted to discharge a factory worker except for causes that are satisfactory to the Government and then only on the payment of a bonus for discharge which is equivalent to one month's pay for each year of service.

ELECTRIC FURNACE IRON

Results of Extended Experiments Show Practicability, Advantages and Costs

ALTHOUGH the cupola is the cheapest melting device for the production of molten iron under normal market conditions for pig iron, coke and clean cast iron scrap, there are conditions under which expense of melting is not the major factor, so that certain other advantages possessed by the electric furnace sometimes make it more desirable, says the United States Bureau of Mines. A comprehensive investigation of the making of electric furnace cast iron has been completed by the bureau at its Northwest Experiment Station, Seattle, Wash., in cooperation with the College of Mines of the University of Washington. The investigation involved a year's successful operation of a jobbing foundry making miscellaneous gray iron castings from steel scrap.

Under the special conditions that make the electric furnace advantageous, this type of furnace need not necessarily displace the cupola but can be used in conjunction with it. The ability of the electric furnace, and not of the cupola, to refine and to superheat iron and the superiority in many ways of electric furnace iron to cupola iron make the electric furnace advantageous under special conditions. In addition, the possibility of producing electric furnace cast iron from cheap grades of ferrous scrap has brought the electric furnace into prominence.

Electric furnace cast iron is stronger, tougher, and more dense than cupola iron, and a higher recovery of metal in casting can be obtained as a result of the higher pouring temperature, state C. E. Williams and C. E. Sims, in Technical Paper 418, just issued by the Bureau of Mines. Cast iron scrap of high-sulphur content can be converted into high-grade cast iron, low in sulphur, either by melting directly in the electric furnace or by refining molten metal from the cupola. Large additions of steel scrap may be used if desirable, or steel scrap can be used entirely and synthetic cast iron made. Some of the advantages of the production of synthetic cast iron are outlined below.

Both Iron and Steel Can Be Made

One electric furnace can be used to produce both iron and steel and can thereby be kept in operation during periods when it might otherwise be idle. By operating an electric furnace continuously labor is kept usefully employed, the heat of the furnace is conserved, life of the refractories is extended, overhead charges are reduced, and a high load factor on the power lines is maintained. Therefore, even under conditions where production of synthetic iron would not of itself be economical, it might be profitable in conjunction with the making of steel, because of the possibility of reducing the cost of producing steel.

A large variety of steel and iron scrap can be used to make the same product, and many different products can be made from the same materials. As a rule, scrap is purchased locally, and the foundryman can buy and use what is at hand without shopping around for special materials. The production of synthetic iron in a steel foundry simplifies the purchase of steel melting scrap. For instance, the making of acid steel requires selected scrap, for which a higher price must be paid than for general scrap; but if, in addition to steel, synthetic iron is made, miscellaneous steel scrap may be purchased at a minimum price and the foundryman can do his own sorting, using the best scrap for acid steel.

Synthetic iron may be tested and adjusted for composition and temperature before it is poured, thus assuring castings of the desired composition. Moreover, if the pouring crew is not ready, the metal can be kept hot as long as necessary, whereas metal must be taken from the cupola when enough has been melted to pour.

Electric Iron Stronger

In the electric furnace a superior iron, having about twice the strength of ordinary cupola iron, can be made. Transverse strengths of 5000 to 6000 lb. on standard bars of synthetic gray iron have been repeatedly obtained, and tensile strengths above 40,000 lb. per sq. in. are common. One of the outstanding characteristics of electric furnace gray iron is its resistance to the impact of shock. These advantages in strength and toughness are due largely to the physical structure of the iron, which is fine grained and dense. The graphite exists in such small flakes that a piece of synthetic iron of the same graphitic carbon content as a piece of cupola iron will appear to contain less graphite. Although it looks whiter and harder than cupola iron, synthetic iron is soft and easily machined. A coarse-grained synthetic iron can be obtained only when the carbon and the silicon contents are exceptionally high. Ordinary synthetic iron is at least equivalent in strength to the so-called high-test irons and semi-steels of the cupola.

Virtually any kind of ferrous scrap can be used in the electric furnace, thus providing a means for industrial plants to utilize the scrap they produce instead of shipping it away at an economic loss. Besides steel scrap, which may be carburized to gray iron, gray iron borings and light scrap may be used profitably.

The production of synthetic cast iron in the electric furnace is advantageous in such places as large non-ferrous smelters and mills, where pig iron is expensive and ferrous scrap is usually available. Many ore-concentration plants consume a large tonnage of steel and iron balls and ball-mill liners for fine grinding, and satisfactory white cast iron for these purposes could be made economically at the plant.

A tough and hard white iron, such as may be produced in the electric furnace from steel scrap, will find useful application where resistance to shock and abrasion are required.

The detailed results of this investigation are given in Bureau of Mines Technical Paper 418, "Electric-Furnace Cast Iron," which may be obtained from the Superintendent of Documents, Government Printing Office, Washington, at a price of 10c.

Increasing Employment in Metal-Working Industries

Comparison of numbers on payrolls and amounts of payrolls in identical establishments show a healthy increase in February over January, according to figures of the United States Bureau of Labor Statistics. In 199 iron and steel plants the number on payrolls increased from 252,261 to 260,609, or 3.3 per cent. Meantime, the amount of the total week's payroll increased 11.9 per cent, from $7,430,652 in January to $8,312,582 in February. This indicates that the average pay envelope had about 8.5 per cent more in it in the latter month.

Similarly, for 950 establishments turning out foundry and machine shop products, the number on payrolls increased from 216,968 to 222,420, or 2.5 per cent. At the same time the amount of the week's payrolls increased by 6.9 per cent, from $6,218,129 to $6,647,302. Similar gains are reported in 148 establishments making machine tools, which show an advance of 2.6 per cent in employment and 6.4 per cent in the amount of payroll. Other metal-working establishments participated in the same improvement, with the exception of 37 plants making cast iron pipe, which show a reduction of 2.5 per cent in number of employees but an increase of 12 per cent in the amount of the payroll.

Schedule of the next instalments of the ***Business Analysis and Forecast****, by Dr. Lewis H. Haney, Director New York University Bureau of Business Research, follows:* ***April 12****—Activity in Steel Consuming Industries:* ***April 19****—Position of Iron and Steel Producers;* ***April 26****—General Business Outlook.*

National Metal Trades Association Arranges Convention Program

The program for the thirtieth convention of the National Metal Trades Association, to be held at the Hotel Astor, New York, April 25 and 26, will deal with problems and methods relating to the metal trades industry in the fields of production and labor.

Features of the meeting will be the following addresses: "Industrial Budgeting," by Howard Coonley, president Walworth Co., Boston; "Rackets and Racketeering," or the practices employed by labor leaders, especially in Chicago, by Gordon L. Hostetter, executive secretary Chicago Employers' Association; a study of mechanization of industry and unemployment to be presented by Magnus W. Alexander, president National Industrial Conference Board; "The Government in Business," by Bernard J. Mullaney, vice-president People's Gas, Light & Coke Co., Chicago; "Business Profits," by Dr. Charles J. Bullock, director Harvard Economic Society, Cambridge, Mass.; "The Significance of the Present Situation to Change the Laws in Respect to Labor Combinations," by Walter Gordon Merritt, counsel for League of Industrial Rights.

At the banquet Wednesday evening, April 25, Charles Nagel, former Secretary of Labor and Commerce, will speak on "The Majesty of Law," and Dr. Samuel W. Grafflin, one time director industrial relations Ward Baking Co., New York, will also speak.

At the closing session George W. Seyler, Lunkenheimer Co., Cincinnati, will conduct a demonstration in foremen training and Floyd Darrow will relate "The Story of Chemistry," with a demonstration of dry ice.

Iron, Steel and Tin Workers Meet at Middletown, Ohio

The fifty-third annual convention of the Amalgamated Association of Iron, Steel and Tin Workers was opened April 3 at Middletown, Ohio. The principal business of the gathering is to formulate changes in wage scales and working conditions to be presented at a conference to be held some time next month between sheet, tin plate and bar iron manufacturers operating under an agreement with the association and its wage scale committee. There was no advance information as to what the demands of the men are going to be, since the recommendations of the wage scale committee must first be approved by the general membership as represented by delegates to the convention.

Steel Club of Cleveland Holds First Banquet

The Steel Club of Cleveland held its first annual banquet at the Hollenden Hotel, Cleveland, March 30. There were over 100 present including sales managers and other members of sales organizations of steel companies, purchasing agents and other representatives of consuming industries. J. G. Carruthers, general sales manager of the Otis Steel Co., is president of the club.

Waste Material Dealers Meet

The fifteenth annual convention and dinner of the National Association of Waste Material Dealers was held March 21 at the Hotel Astor, New York. At a meeting of the scrap iron division, under the chairmanship of H. R. De Groat, A. M. Wood & Co., Philadelphia, there was consideration of the problem of educating dealers to a better understanding of costs in handling materials. The metal division with George Birkenstein, S. Birkenstein & Sons, Chicago, presiding, devoted considerable discussion to a letter from the Chicago Non-Ferrous Metal Dealers' Association regarding trade practices.

Officers elected for the coming year were: President, Henry J. Lissberger, president Federated Metals Corporation, New York; first vice-president, Carlton B. Overton, Castle & Overton, Inc., New York; second vice-president, George Birkenstein, S. Birkenstein & Sons, Chicago; third vice-president, R. W. Phillips, E. I. du Pont de Nemours & Co., Wilmington, Del. Charles M. Haskins is the permanent secretary-treasurer of the association. As division heads, H. R. De Groat, A. M. Wood & Co., was reelected chairman of the scrap iron division and E. J. Jarvis, president Niagara Falls Smelting & Refining Corporation, Buffalo, was elected chairman of the metal division.

The dinner was attended by about 500 members and their guests. The retiring president, G. H. Rady, E. J. Keller Co., New York, was toastmaster. United States Senator Walter F. George of Georgia was the speaker.

Standard Steel Girder Rails

The Bureau of Foreign and Domestic Commerce has just published a pamphlet on industrial standards, No. 204, concerning standard specifications for the manufacture of open-hearth steel girder rails of the plain, grooved and guard types, using the text as adopted by the American Society for Testing Materials. The publication is printed in both English and Portuguese, the translation having been by Kenni Norris Bletz. Copies may be obtained for 5c. each from the superintendent of documents, Government Printing Office, Washington.

COMING MEETINGS

April

American Gear Manufacturers Association. April 19 to 21. Twelfth annual meeting, Hotel Seneca, Rochester, N. Y. T. W. Owen, 3608 Euclid Avenue, Cleveland, secretary.

American Society of Mechanical Engineers. April 23, 24. Meeting of materials handling division, Benjamin Franklin Hotel, Philadelphia. Calvin W. Rice, 29 West Thirty-ninth Street, New York, secretary.

National Metal Trades Association. April 25, 26. Annual convention, Hotel Astor, New York. J. E. Nyhan, Peoples Gas Building, Chicago, secretary.

National Foreign Trade Council. April 25 to 27. Fifteenth annual convention, Rice Hotel, Houston, Tex. O. K. Davis, India House, New York, secretary.

American Welding Society. April 25 to 27. Annual meeting, Engineering Societies Building, New York. Miss M. M. Kelly, 33 West Thirty-ninth Street, New York, secretary.

American Management Association. April 26, 27. Fourth financial executives' conference, Hotel Pennsylvania, New York. W. J. Donald, 20 Vesey Street, New York, managing director.

American Electrochemical Society. April 26 to 28. Spring meeting, Stratfield Hotel, Bridgeport, Conn. Colin G. Fink, Columbia University, New York, secretary.

May

Iron and Steel Institute. May 3 and 4. Annual meeting, House of Institution of Civil Engineers, London, England. George C. Lloyd, 28 Victoria Street, London, S. W. 1, England, secretary.

American Refractories Institute. May 8 and 9. Annual meeting, White Sulphur Springs, W. Va. Dorothy A. Texter, 2202 Oliver Building, Pittsburgh, secretary.

American Foundrymen's Association. May 14-18. Annual meeting and exhibition, Commercial Museum, Philadelphia. C. E. Hoyt, 140 South Dearborn Street, Chicago, secretary.

American Iron and Steel Institute. May 25. Annual meeting, Hotel Commodore, New York. E. A. S. Clarke, 75 West Street, New York, secretary.

National Association of Purchasing Agents. May 28 to 31. Thirteenth international convention and Inform-A-Show, Kansas City, Mo. George A. Reynard, 11 Park Place, New York, secretary.

CARNEGIE LIBRARY OF ATLANTA

FABRICATION IN TRANSIT

Railroads and Fabricators Unite on Seeking Uniform Basis for Establishing Rates

TO prevent action which might be injurious to the steel fabricating industry and to obtain uniformity and avoid discrimination in fabrication-in-transit arrangements, H. N. Holdren, Pittsburgh, representing a large group of fabricators, early last December presented a tentative suggestion to the railroads as a basis upon which all future transit privileges might be negotiated.

Mr. Holdren's action was prompted by an investigation begun some months previously by the Interstate Commerce Commission with a view toward eliminating transit arrangements involving circuitous routes or back hauls and possible violations of the long-and-short-haul clause of the Interstate Commerce Act. It was said at that time, particularly in the East, that the carriers were considering the cancellation of all fabrication-in-transit rates on iron and steel articles in the United States. Corresponding rates were abolished in Canada some time ago, and some steel makers in this country were said to be willing to have such arrangements abolished in the United States. The fabrication-in-transit privilege makes it possible for mills located some distance from the fabricating shops to supply the steel as advantageously as, and in some cases more so than, a mill near the fabricating plant. This accounts for some rolling mill opposition to the plan and the desire of the fabricating companies to preserve it.

Lack of Uniformity in Rates

In Official Classification territory the fabrication-in-transit charge is 3c. per 100 lb., while in Western Classification territory it is 2c. per 100 lb. Many fabricators believe that there should be country-wide uniformity in fabrication-in-transit charges and that the privilege should apply on a definite list of articles fabricated from iron and steel. In some sections of the country it now applies on articles not specified in others, resulting in discrimination. Prior to the series of freight rate advances which began in 1914 there was a uniform charge of 1½c. per 100 lb., and, based upon the measure of the advances and upon one general reduction that has since taken place, the proper rate would now be 2c. per 100 lb. in all parts of the country.

Mr. Holdren made the following proposal:

"Subject to rules, regulations, conditions and charges prescribed in this tariff, carload shipments of iron and steel articles as designated in paragraph (b) below may originate at (here refer to points of origin), be forwarded to (here refer to transit points) for the purpose of bending, bolting, boring, countersinking, cutting, drilling, flanging, gagging, painting, planing, punching, reaming, riveting, sawing, shearing, straightening, tapping, threading or welding, and may be reshipped in carloads to (here refer to points of destination), when the outbound material from the fabrication point is to be further assembled into bridges, buildings, ships, tanks, towers or tunnels."

Carriers Desire Definite Policy

On March 13 in Pittsburgh the railroads responded with the first of what is expected to be a series of meetings at which steel fabricating companies will be given an opportunity to present their views on the subject. As a result of the growing tendency to create more and more manufacturing-in-transit rates, storage rates, etc., and regulations involving transit privileges, the railroads are of the opinion that they must declare a definite policy for future negotiations, and they saw in Mr. Holdren's proposal an opportunity to open the subject. At the Pittsburgh meeting representatives of the railroads in Official Classification territory, with L. E. Oliphant of the Central Freight Association as chairman, heard the Pittsburgh district manufacturers, fabricators and others.

At the Pittsburgh meeting Mr. Holdren made it clear that he would not oppose any reasonable proposition for fabrication-in-transit which included articles in addition to those enumerated in his proposition, as it was merely a tentative suggestion. However, he declared that the loss of the privilege on existing routes would be a serious loss to the fabricators and that restricting the routing to direct routes would result in a loss of business to both fabricators and carriers.

Plates for Navy Sold at 2.24c., Delivered Norfolk

WASHINGTON, April 3.—Submitting the lowest bid, 2.24c. per pound, delivered at Norfolk, Va., John T. Hill is expected to be awarded a contract for supplying 450 net tons of steel plates to be used as blister shell plating and blister shelf for the battleship Nevada. The steel will be made by the Central Iron & Steel Co., Harrisburg, Pa. Mr. Hill also was the lowest bidder at 3.53c. per pound, carlots, delivered at Occaquan, Va., on sheet steel for automobile license tags for the District of Columbia, the maker to be the Apollo Steel Co.

Advocates Eye Conservation in Industry

America must safeguard the eyes of its workers, for without sound vision industry is handicapped and reasonable attainment of human happiness made difficult, James J. Davis, secretary of the United States Department of Labor, declares in a statement made public by the Eye Sight Conservation Council of America, of whose board of councillors he is a member.

"Until recent years," Secretary Davis says, "care of the eyes was regarded largely as a question for the individual. Development of the physical sciences, and their application through engineering has, however, revealed eyesight as a problem of national concern.

"In industry and in education the need of organized eye conservation has been most insistently pressed, for it is in these spheres that untoward conditions have been most convincingly uncovered. It is now plain that a child without good eyes cannot be expected to make normal progress in school. It is equally plain that workers, whether in factory, office, field or mine, cannot meet the obligations of their tasks unless they can see with the ease and precision intended by nature.

"The economic and social losses resulting from defective eyesight are now beginning to be realized. Inquiries by governmental and public service bodies are tracing to poor eyesight an appreciable portion of industrial waste. Defective vision ranks well up among the contributing causes of accidents. Poor lighting, it has been shown, is a substantial factor in causing industrial injuries.

"Steps are being taken to remedy fundamentally bad conditions, and the results are most encouraging. Pennsylvania provides evidence that appropriate precautionary methods will cut down the number of eye accidents. In that State analysis by the bureau of statistics of the Department of Labor and Industry shows that for three years eye losses have been steadily decreasing in the metal and metal-products industries."

New Solenoid Brakes

Simplification features a complete new line of solenoid brakes offered by the General Electric Co. The line includes brakes for operation on alternating and direct current, and involves in its construction the use of a spring setting device—a new feature for alternating-current applications. The brakes are especially designed for severe service in connection with mill, crane and hoist motors.

The manufacturer claims smooth operation for making quick stops in either direction of rotation, with a dependable holding value. The brake mechanism is held in the "off" position by a coil and plunger; when power is applied to the motor, the coil is energized and the brake is released. When the power is shut off, the spring setting device forces the mechanism into the closed or braking position.

This Issue in Brief

Employment is gaining in the metal trades. Number of workers on the payroll increased 2.5 per cent in representative firms operating machine shops and foundries. Gain in iron and steel industry was 3.3 per cent. —Page 955.

Many foundries and others could profitably install electric furnaces, bureau official thinks. Electric iron has twice the strength of ordinary cupola iron, and machines more easily. A wider variety of scrap can be used, and where pig iron is expensive and scrap is plentiful the electric furnace is advantageous.—Page 955.

Machinery export business continues to expand. February sales amounted to close to 36 million dollars, a gain of 21 per cent over February, 1927. Gain in first two months over the same period of last year was almost 13 per cent.—Page 989.

Sorters of non-ferrous scrap must have a wide knowledge of metals and commercial practices. Some 250 classifications must be made to get the maximum profit. Classifying is based on knowledge of source, observation of color and shape, and laboratory tests.—Page 954.

Powdered coal installation should have an auxiliary bunker between pulverizer and the burner, so that adjustment and repair of the pulverizer may be made without shutting down the whole equipment. The bunker should carry a supply sufficient to last the burner two or three hours.—Page 944.

Divides heat-treating furnace into three compartments, all heated from the same flame. The top chamber gets the first impact of the flame and the waste heat is passed down into the other two. The chambers are used progressively for preheating and heating.—Page 942.

Over two million tons of coke lost annually in the United States by wet quenching, engineer declares. This loss, representing 5 per cent of the production, is said to be largely saved by dry quenching.—Page 943.

Welding cuts fabricating cost of gas holder. A 300,000 cu. ft. capacity holder was made with welded lap joints, bolts at long intervals holding it together during welding.—Page 941.

New process of making pipe bends prevents buckling or thinning. Pipe is placed against a horn-shaped mandrel, then heated in a gas furnace until it becomes plastic, and pushed over the mandrel as fast as it is hot enough to work.—Page 933.

Steel houses of five rooms built in Germany for less than $2,500. Roof and side walls are made of steel plates with turned rims, so that they may be screwed together. They can be erected in three to four weeks.—Page 934.

Accident liability is twice as great on the street as in the shop, says electrical equipment manufacturer. Western Electric Co. statistics reveal that the automobile has made the factory relatively a far safer place than the highway.—Page 935.

Clean gas is the best possible form of fuel, says professor, because of its molecular construction. Clean oil comes next. Pulverizing largely overcomes the disabilities of coal as ordinarily fed into furnaces.—Page 944.

Danger lies in chromium-plating by rule-of-thumb methods. Slight variations of the chemicals in the solutions, or of any other factor relating to the deposition, create distinct variations in the properties of the plate.—Page 940.

Higher proportion of finished iron and steel exports is going to Pacific Coast. In 1926 the Coast took one-quarter, and in 1927 almost one-third. The Atlantic Coast accounted for 47.7 per cent in 1927 compared with 49.8 per cent in 1926.—Page 952.

If you want Japanese business, don't insist on payment f.a.s. American port, for English and German shippers make more attractive terms—payment on delivery to consumer—and so are favored. Personal representation in Japan is desirable if you wish to cultivate this market.—Page 954.

Damage to enameled parts is prevented by use of special trucks. Stove manufacturer uses a skeleton type of truck, with four corner uprights fixed to the truck floor. The operator mounts a tray on the floor of the truck, fills it with enameled parts, then adds other trays until a truckload is built up.—Page 930.

Tensile strength of cap screws is increased 30 per cent by new extrusion process, says screw manufacturer. As the wire is forced into the die, the portion to be threaded is reduced to the pitch diameter of the thread to be formed, and at the same time the heading operation is performed.—Page 937.

How manufacturers are meeting the small order problem. Among the methods employed are: Decreasing discounts, making a special charge, penalizing salesmen for small orders, and charging larger gross profits.—Page 963.

Gain of 3.2 per cent in March daily pig iron output, which was 103,215 tons. On April 1 there were 197 furnaces in blast, a gain of 10 during the month.—Page 964.

Sales and Goods Movement as Gages

VARIOUS classes of statistics have indicated somewhat greater trade in the early part of this year than at the same time in other recent years, but the opinion has been rather widespread that such figures were not a gage of the actual strength of trade. In some lines there was more forward buying than in other years. The Steel Corporation's unfilled tonnage, for instance, increased for five months through February. The October, November and December increases were in line with precedent, while those of January and February contrasted with decreases in the first two months of both 1927 and 1926.

In the circumstances the freight car loadings are consulted with particular interest, since they show the physical movement of product, though by no means its value. Car loadings in the first 11 weeks of the respective years have been as follows:

1924	9,772,232
1925	9,938,159
1926	10,273,480
1927	10,551,127
1928	9,890,593

While this year has run the lowest in four, being merely above 1924, the 6.2 per cent decrease from a year ago must not be taken at face. Early in 1927 there was extra coal movement, consumers accumulating stocks against the expected bituminous strike. The stocks were fairly well held for months afterward, but since the holidays there has been much reduction of stock. Coal loadings, which in the first 11 weeks of 1927 were 2,383,399 cars, fell to 1,898,371 cars in the like period this year. Deducting coal, there was a decrease of only 2.1 per cent this year in loadings of all other commodities. Still, that was a decrease, when normally as the country grows there should be an increase.

If industry as a whole ran at a shade slower pace early this year than last, in some respects it has greater momentum at the present time than a year ago. The steel industry is better supplied with contracts, on which specifying has been at a very fair rate. Conservative feeling rules in nearly all quarters, but this may be laid to consideration of the stock market and the fact that this is a presidential year, rather than to a feeling that the actual state of trade at the present time is unfavorable.

Ban the Thin Roofing Sheet

FROM several quarters come reports that galvanized sheets lighter than No. 28 gage are being offered to the public for roofing purposes, despite the efforts of the Sheet Steel Trade Extension Committee and of other bodies to eliminate such sheets from the roofing category. One of the leaders of the movement against the sale of thin galvanized sheets even predicts that the work already done will be nullified unless drastic action is taken.

The original pronouncement of the Sheet Steel Trade Extension Committee, when the campaign for a better galvanized product was taking shape, recommended that "under no circumstances should galvanized sheets lighter than No. 28 gage be used for roofing purposes." "This same recommendation," the committee added, "is made by the Bureau of Standards, Department of Commerce, through its Division of Simplified Practice. Lighter gages are found to be unsatisfactory for roofing purposes. The material is too thin to provide the long life desired in a roof, particularly where climate is severe. When this very thin material is used for roofing in severe climates it frequently reflects discredit on sheet steel roofing in general."

While this declaration was nominally subscribed to by the associated sheet steel manufacturers, some apparently have had neither the foresight nor the courage to put into effect this program. Various makers are producing No. 29 and No. 30 gage galvanized sheets, and in some cases mills are selling No. 29 gage black sheets to galvanizers who themselves do the corrugating and galvanizing. Thus thin-gage galvanized roofing sheets are being offered today without let or hindrance, even though under an official ban of long standing. On the one hand he Sheet Steel Trade Extension Committee is aboring to extend present markets for sheet steel, vhile certain manufacturers and jobbers, on the ther hand, are defeating its aims by selling an nferior product to the public.

It is well known that in the past few years ompetition between different industries for the ame markets has steadily grown sharper. The heet steel industry has felt the pressure along with thers, meanwhile making an aggressive fight to ain new markets and to retain or regain old ones. n the effort to live down the poor performance f some galvanized roofs of other years the camaign of the trade extension committee has met its hief handicap. It is quite understandable, thereore, that those manufacturers who have conformed o the standards of the committee find ordinary anguage entirely unequal to the situation created y such makers as have gone back to the discredited ractice of four years ago.

The Over-Supply of Capital

APPARENTLY an anomaly in the economic situation is the abundant supply of capital at a ime when it is claimed that the recognized source f capital—earnings—has been drying up. If we an find an explanation for this anomaly or develop hat no anomaly exists, we shall have made an important step toward understanding a condition that onfuses many.

Two overflows of capital are visible—into the oreign field and into the stock market. As to oreign capital issues, the current Federal Reserve Bulletin reports them, exclusive of refunding operations, as follows:

1926	$1,052,000,000
1927	1,382,000,000
January, 1928	155,900,000

The amounts themselves are large, being nearly hree times for 1926 and more than double for 1927 he amount of our merchandise trade balance. Apart from that, there was a 30 per cent increase from 1926 to 1927, while January of this year was t a rate 35 per cent above the average rate of 1927, hough, of course, the single month of January ndicates little as to a general rate.

Then there are loans to stock brokers, running about four billions lately, an amount which many pine is "too high," but without suggesting who is really responsible for the desired application of a remedy. Analysis of the sources of the funds shows that it is not to any extent a case of the Federal Reserve banks themselves loaning, but New York banks are loaning their own funds, country banks are sending their funds to New York, and private individuals and corporations are endeavoring to earn something with the cash it is more or less necessary for them to carry.

Thus there is a large, and apparently growing, supply of capital over and above the demand for investment in domestic enterprises outside that of carrying securities in New York. We might say that supply is abnormally large or demand abnormally small, but it is safer to take only one step at a time and say that the relationship is abnormal. Reverting to first principles, the source of capital is earnings, and we have been accustomed in all the past to see earnings and the demand for capital move more or less together. If an industry was making money it used to expand. In these recent years, however, we have seen much making of money by reduction in cost without large capital expenditure. The automobile industry is an outstanding example.

Viewed in this light, the years since the war are one period, really important differences from year to year having been only in degree. We found ourselves with a commercial machine admittedly too large. Thereupon efforts of individuals and corporations to get along were directed to efficiency, expansion in volume of turnover and reduction in cost, and not to the large expansion of physical equipment and capital investment that used to go naturally with increase in volume of trade.

There is then no real anomaly in capital being abundant when earnings are diminishing. The condition is merely unusual or perhaps unprecedented, growing out of the state of affairs the war left us, calling for improvements in methods of doing the work more than for investing additional capital in tools. The consequences of this long period we must face. There is available capital for new and promising enterprises which we shall now do well to bring forth.

Prohibition Extends to "Nickel Silver"

SPORADIC thought has been given to devising systematic methods for naming new alloys. Some committees have been organized to study the problem. After canvassing the situation they usually come to the conclusion that nothing much can be done about it and lapse into inactivity. So every inventor chooses some word which strikes his fancy, and if the metal mixture is a commercial success technical literature is enriched by a new word while alloy nomenclature is thereby so much the more confused. Probably the real reason why nothing is done about it is the feeling that the question is quite academic—to those who use Muntz metal, Muntz is just as good a name for 60:40 brass as any other word which might be proposed by the innovators.

Geologists are somewhat more fortunate. By common consent the suffix "ite" denotes a mineral; and whenever a new one is discovered it can be named in a manner satisfactory to everybody. For example, if the discoverer, Mr. Gerstenheimer, wishes to perpetuate his fame he adds the standard suffix to his family name and we have the new mineral "Gerstite." Or Przemysl, the locality where the rare rock was found, may be chosen for root of the new term, thus: "Przemysite." Or perhaps the mineral has a peculiar and distinctive glitter, and it is fancied that some term describing its appearance will be more suitable than the two former possibilities. Very well; just call it "Glitterite." Any of these will do, so long as it appears on consultation with the alphabetical list in Dana's "Mineralogy" that the desired combination of letters has not already been preempted by some predecessor.

But alloy namers have no such simple rules.

In the first place there is no suffix which connotes the fact that the substance named is an alloy. In the second place metallurgists have no comprehensive standard list, giving the commonly accepted names. Thirdly, many alloys have more than one name. And lastly, there is the urge, drawn from commercial considerations, to camouflage a cheap composition with a name suggesting more noble properties.

This last consideration has brought on a situation which ceases to be academic. The Federal Trade Commission recently issued a "cease and desist" order against the use of the name nickel silver by certain jewelry manufacturers, on the complaint of others that the name is misleading and detrimental to silversmiths whose product actually contains silver. This gives rise to a very practical problem: What are the brass manufacturers who make rods, wire, plate and other shapes of copper-nickel and copper-nickel-zinc alloys going to call their product? As a matter of fact it already has been called at least fifty different names (many of them proprietary) like german silver, pack-fong, white copper, argentan and alpakka. The new name must avoid the trademarked terms, but is it to be derived from the name of the inventor or some other metallurgist, from the properties of the alloy, or from the composition?

We believe that the only systematic scheme of nomenclature must rest primarily upon chemical composition. The way is indicated by the Society of Automotive Engineers' system for steels. Steel 1010 is definite as to its essential composition. A 3½ per cent nickel steel 2335 also means a narrowly restricted composition from which definite physical properties may be expected. Likewise in non-ferrous alloys the term nichrome (were it not patented) approaches the ideal, for it is easy to say and indicates perfectly a member of a particular binary alloy system. It can be made more definite by saying "nichrome 80:20"—obviously denoting an 80 per cent nickel, 20 per cent chromium alloy.

Similar abbreviations could be made for the nickel-copper alloys with or without zinc or tin. All the words nickel, copper, zinc or tin are of Anglo-Saxon or German origin; consequently compounding the syllables into new words would not create any philological monstrosities.

For the purpose of eliciting discussion on the nickel silver question, we propose the term "coppernick 80:20". It is quite definite as to composition; it describes an alloy neatly. Would a manufacturer of german silver fail to recognize what its color and other physical properties would be? One could have as many kinds of coppernicks, ranging from 99:1 to 1:99, as would be found useful, just as we have many kinds of steels. Furthermore, the important ternary alloys containing zinc could be called zinc-coppernicks. Zinc-coppernick 17:65:18 is the American Brass Co.'s 18 per cent nickel silver alloy No. 719.

Admitted that these words sound highly artificial on first striking the ear. Nor do they trip lightly from the tongue. But the same was true of "Socony," "Uneeda" and "Prest-o-lite" when they were first invented, and it has not prevented their widespread and profitable use.

The Day of the Massive Rail

HEAVIER steel rails are coming more and more into use to meet conditions imposed by heavier and denser traffic. Rails of 100-pound section and over, rolled in 1927, were more than two-thirds (68.84 per cent) of the year's production of all rails. Only three times previously had the ratio passed one-half: In 1926 it was 61.12 per cent; in 1925, 58.76 per cent; in 1923, 50.47 per cent. In keeping with this rapidly growing proportion of the heavier sections, the decline of 12.78 per cent in total rail production last year was confined almost wholly to rails of under 100 pounds to the yard. The drop in the heavier bracket was only 1.66 per cent.

Recognizing the growing importance of the extra-heavy rail sections, the American Iron and Steel Institute has now made a separate grouping of those rails weighing 120 pounds or over. The total for 1927 is given as 617,524 tons, or 22.01 per cent of all the rails produced last year. This action recalls that of thirteen years ago when for the first time the 100-pound rails were segregated from the 85-pound and over classification, previously the heaviest reported. At that time this new group constituted 27.18 per cent of the year's tonnage.

IN its rejection recently of the nomination of John J. Esch for reappointment to the Interstate Commerce Commission the Senate gave an exhibition of politics but little removed from the aldermanic level. What was held against Mr. Esch was that he changed his vote in the long contested Lake cargo case and joined with the majority of the commission in favoring a reduction in coal rates from the Pittsburgh and eastern Ohio districts. Evidence showing changed economic conditions led to the reversal of the first order, which had been favorable to the West Virginia-Kentucky mines. But since this evaluation of economic changes caused a decision that was obnoxious to members of the Senate Committee on Interstate Commerce and their coal mining constituencies, senatorial "courtesy" was invoked for the punishment of the offending commissioner. This legislative coercion of the executive department may come back many times to plague its instigators. But retaliation is poor satisfaction for the injury done to an able public officer.

Truscon Steel Co. Takes Over Hydraulic Steel Co.

The sale of the East side plant of the Hydraulic Steel Co., Cleveland, to the Truscon Steel Co., Youngstown, for $1,000,000 was confirmed in the Federal Court in Cleveland, March 31. The court rejected a bid of $1,525,000 submitted by New York financial interests on the ground that this bid did not offer sufficient safety to creditors. The sale of the property concludes a receivership which began in October, 1923. It is stated that the creditors will receive 34 cents on the dollar.

EXTRA COST OF SMALL ORDERS

Effect of Hand-to-Mouth Buying on Distribution Expense Analyzed at Management Meeting

CONTROL of marketing costs was the topic of discussion during four of the six sessions of a conference held by the American Management Association, March 28 to 30, inclusive, at the Palmer House, Chicago. The remaining two sessions, under the auspices of the employees training group, were devoted to the training of salesmen. At a luncheon held on March 29 the effect of the airplane on marketing was reviewed.

An analysis of extra costs resulting from small orders was made by Dr. Leverett S. Lyon, Institute of Economics, in a paper entitled "Keeping Down the Extra Marketing Expenditures That Have Grown Out of Hand-to-Mouth Buying." In his search to determine whether the small order is really a problem and, if so, to what extent it is such, Doctor Lyon sent out a questionnaire to a number of manufacturers. Of 104 replies 79 stated that there has been a growth in the proportion of small orders, while 25 companies, including makers of spark plugs, floor sweepers, alarm clocks and iron foundry products, said that no such increase is apparent in their business.

Over 91 per cent of the companies that acknowledged an increase in the number of small orders felt that the cost of distribution had increased, whereas 9 per cent were of the contrary opinion. Of the 91 per cent, 75 per cent found an increase in the cost of securing orders. A large number of reporting manufacturers stated that the cost of securing orders is due largely to added traveling expenses of salesmen. In some instances this cost had been cut by substituting telephone calls for personal visits by salesmen.

On the subject of office cost the questionnaire was worded so that each manufacturer could take as a working basis what he considered an average large order for his company and for comparison an order one-fifth of that size. Averages of all the replies indicated that recording the small order costs 87 per cent as much as recording the large order, that billing costs 82 per cent as much, granting credit 97 per cent and collecting 102 per cent. In connection with this it was brought out that small orders more often come from doubtful customers, while large orders usually come from good risks.

Averages of replies on proportionate costs of packing, trucking and shipping indicated that the cost of packing the small order was 53 per cent of that of the large order, trucking 52 per cent, and shipping 55 per cent.

Doctor Lyon then applied these percentages as though they represented the products of one company which manufactured all of the lines from which replies had been received. He took as a basis of comparison a large order valued at $100 and a small order valued at $20. Taking a hypothetical office cost on the large order of $4, or 4 per cent of the value of the order, the office expense on the small order was $3.68, or 18 per cent of the value of the order. Assuming that handling charges on the $100 order were $3, or 3 per cent of the value of the order, it was shown that the handling charge on the small order would be $1.60, or 8 per cent of the value of the order.

Replies to the questionnaire indicated that manufacturers are using the following methods to meet the small order problem:

1. Decreasing discount or increasing price on small orders.
2. Special charge for handling small orders.
3. Offering or soliciting a more varied line.
4. Change in methods of sales force in solicitation.
5. Educating trade to desirability of larger orders.
6. Penalizing salesmen for small orders.
7. Deferred dating plans.
8. Refusal to handle small orders.
9. Charging larger gross profit.
10. Use of branches and warehouses.
11. Concentrating trade with jobbers and wholesalers,
12. New policies which aid small-order buying, such as extending discounts, carrying large stocks and offering contracts against which specifications can be issued as required.
13. Special cooperation with dealers, helping them to keep inventories as low as possible, thus assisting in making turnover that much more rapid.

Manufacturers need to know more about the part of gross profit that disappears in the cost of marketing in the opinion of Willard E. Freeland, president, Freeland & Warren, Inc., who delivered a paper on "Objectives and Essentials of Costing Marketing Activities." Mr. Freeland urged a closer study of individual customers to ascertain whether or not it is profitable to do business with them. He also recommended a study of those sales which can be obtained only at high cost. Further attention, he said, should be given to developing markets where sales costs are low rather than to press for business at high cost in territories already well covered.

At the luncheon meeting C. S. Ching, president American Management Association, stated that prosperity is measured by the production and consumption of goods. In late years manufacturers have made rapid strides in methods of production, but they have not yet learned that marketing is one of the most important of business problems. The result of greater output per person in manufacturing means that fewer people are on the payrolls of manufacturers. Unemployment at this time, he said, is not a result of recession of output but of a reduction in the number of people necessary per unit of production. He sounded a note of warning that unemployment may result in shaking public confidence in the efficacy of labor-saving equipment as a means of reducing costs. Open resistance to the further introduction of labor-saving machinery is not an impossibility.

Another New Record in Steel Furniture Orders

Orders for steel furniture in February are reported by the United States Department of Commerce at $3,295,861, compared with $3,248,165 in January. Both figures were new high records for this line. The reports came from 33 manufacturers. Shipments in February, at $2,908,527, showed an increase of about 7 per cent over January and made the largest total since March, 1927. With the further exception of December, 1926, the shipments were the largest in more than two years. Unfilled orders have been increasing markedly since Dec. 31, at which date they totaled $1,413,880. At the end of February the total was $2,389,306, which is much the largest figure in more than two years.

Steel shelving orders in February at $741,310 showed a drop of less than 4 per cent from January's record-breaking total. Shipments were $681,999, which is the highest amount since March, 1927. Unfilled orders at the end of February, $743,376, were the greatest since Oct. 31, 1926.

Heavy Steel Output by Weirton Company

The Weirton Steel Co., Weirton, W. Va., operated all 11 of its open-hearth furnaces last month and produced 103,576 gross tons of steel. This showing amply supports an estimate made earlier in the year by J. C. Williams, vice-president and general manager of the company, placing its annual capacity at 1,050,000 tons. The March output was at an annual rate of 1,242,912 tons. The company has more than doubled its capacity in three years, as in 1925 it stood at 570,000 tons annually.

Decline in Foundry Equipment Orders

Members of the Foundry Equipment Manufacturers' Association received orders in February amounting to 123.6 per cent of the average monthly shipments of 1922 to 1924. This is a reduction from January, when 132.7 per cent was reported, but otherwise it is the largest total since last June. Shipments are reported at 110.6 per cent and unfilled orders at 132.9 per cent of the base. The returns are from 18 companies, of which 11 during the base period showed individual sales of more than $10,000 a month, while the other seven were in the smaller group.

Moderate Gain in March Iron Output

Daily Rate Increased 3211 Tons or 3.2 Per Cent Over February, According to Actual Data—Net Gain of 10 Furnaces

RETURNS of actual production of pig iron from practically all furnaces show that the March output expanded more than 3 per cent over that of February. At 103,215 gross tons per day the March rate was 3.2 per cent or 3211 tons larger than the 100,004 tons per day for February. This compares with a gain in February over January of 8 per cent and of January over December of 6.4 per cent.

Total March pig iron output of 3,199,674 tons or 103,215 tons per day for the 31 days compares with 2,900,126 tons or 100,004 tons per day for the 29 days of February. The March production last year was 3,483,362 tons or 112,366 tons per day. As in the case of February, the March daily rate is the smallest for that month since March, 1922.

Net Gain of 10 Furnaces

Thirteen furnaces were blown in and three were blown out—a net gain of 10. This compares with a net gain of two in February and with 16 in January. Twelve of the 13 furnaces blown in were steel making, six belonging to the Steel Corporation and six to independent steel companies. Only one merchant stack was started. The three furnaces shut down were steel making—two Steel Corporation stacks and one independent steel company furnace.

Capacity Active on April 1

Operating rate of the 197 furnaces active on April 1 is estimated at 104,650 tons per day. This contrasts with the daily operating rate of 100,060 for the 187 furnaces blowing on March 1.

Manganese Alloy Output

Ferromanganese output in March was 27,912 tons, the largest since the 29,232 tons made last June. Only one company made spiegeleisen last month, but the total cannot be published.

Furnaces Blown In and Out

During March the following furnaces were blown in: One furnace at the Coatesville plant of the Bethlehem Steel Corporation in the Schuylkill Valley; one Carrie, one Duquesne and one Isabella furnace of the

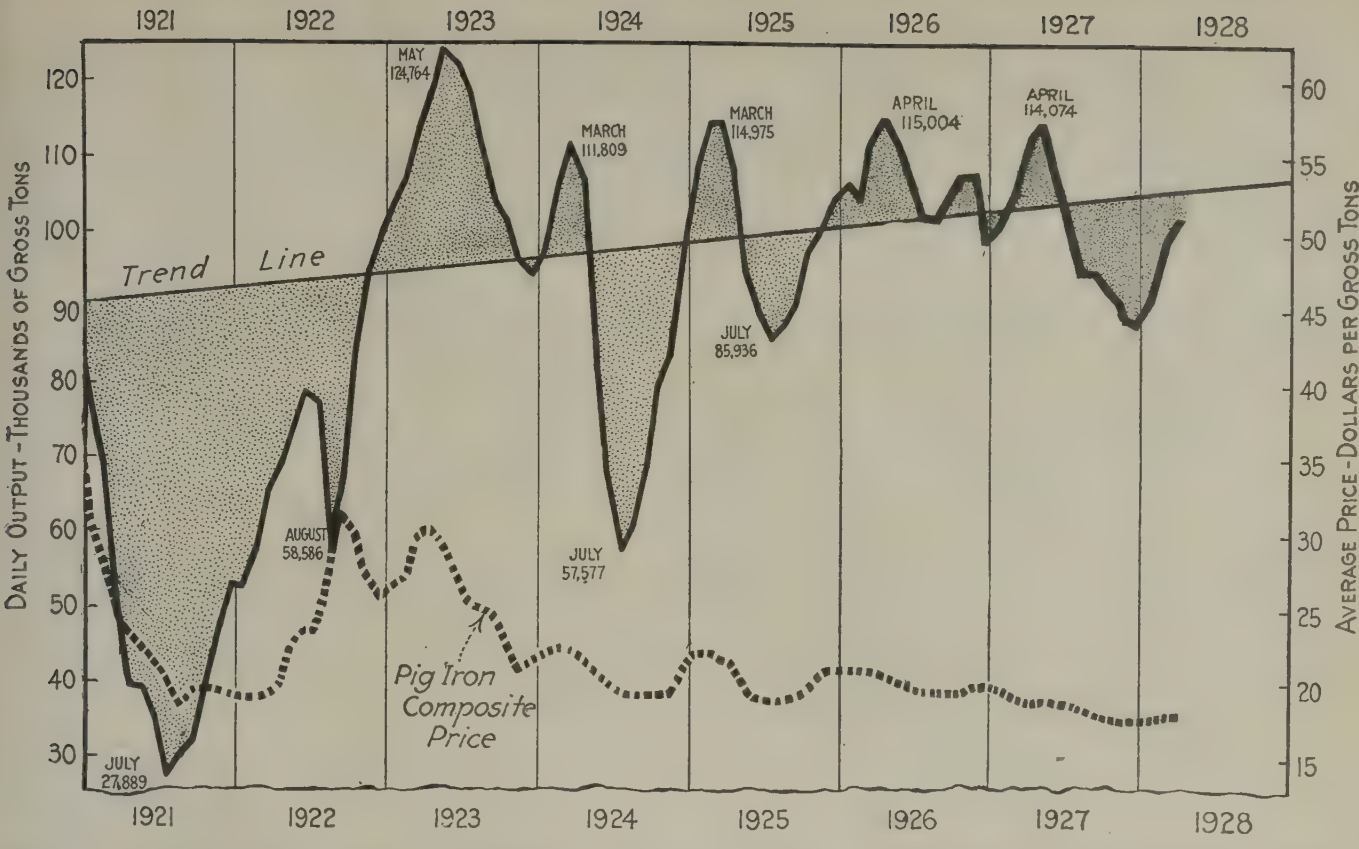
*These totals do not include charcoal pig iron. The 1926 production of this iron was 163,880 tons.



Daily Pig Iron Output in March Was 3.2 Per Cent More Than in February; Composite Price Increases Slightly

Inclined line represents the gradually increasing theoretical needs of the country, and shows that production is now below the so-called normal. Dotted line represents THE IRON AGE *composite price*

Carnegie Steel Co. and one Eliza furnace of the Jones & Laughlin Steel Corporation in the Pittsburgh district; the Perry furnace in western Pennsylvania; one furnace at the Sparrows Point plant of the Bethlehem Steel Corporation in Maryland; two furnaces of the Youngstown Sheet & Tube Co. in the Mahoning Valley; one furnace of the American Steel & Wire Co. and the United furnace of the Central Iron & Steel Corporation in northern Ohio; one Gary furnace in the Chicago district and one Bessemer furnace of the Tennessee Coal, Iron & Railroad Co. in Alabama.

During March the following furnaces were blown out or banked: One Carrie furnace of the Carnegie Steel Co. in the Pittsburgh district; one furnace of the American Rolling Mill Co. in central Ohio, and one Gary furnace in the Chicago district.

Possibly Active Furnaces Reduced

The Leesport Furnace of the Leesport Furnace & Foundry Co. in the Schuylkill Valley and the Lochiel furnace of the Central Iron & Steel Co. in the Lower Susquehanna Valley are being dismantled. This reduces the number of possibly active blast furnaces in the United States from 349 to 347.

No. 5 Aliquippa Furnace Made 30,287 Tons of Pig Iron in March

The performance of No. 2 Aliquippa furnace of the Jones & Laughlin Steel Corporation, which in the year ended Dec. 31, last, produced 285,148 tons of pig iron, or an average of slightly more than 781 tons daily is being considerably improved upon by No. 5 furnace of the same group. Since it was blown in on Aug. 1, 1927, this furnace has been averaging about 900 tons daily and last month produced 30,287 tons, a daily average of 977 tons. During the last 10 days of the month this furnace produced 10,381 tons, an average of 1038 tons daily, and twice during the month it produced more than 1100 in one day, making 1135 tons one day and 1185 tons on another.

The month's total production of the furnace, its daily average and the output of one day of 1185 tons, are all said to be American high records for a furnace running on ore, plus its own scrap. About two years ago, one of the Carrie furnaces of the Carnegie Steel Co., produced 1263 tons, but the burden contained a substantial amount of scrap other than that produced in the furnace. The Jones & Laughlin corporation will soon start rebuilding its No. 4 Aliquippa furnace and so change its lines to insure a daily output of 1200 tons of pig iron.

Decline in Freight Cars Installed and Ordered

Class I railroads in the first two months of this year installed 6032 freight cars, compared with 10,621 for the same period in 1927 and 12,817 for the corresponding months in 1926. On March 1 the railroads had 21,726 freight cars on order, compared with 29,395 on the same date last year and 50,947 on March 1, 1926.

Locomotives installed in the first two months of 1928 totaled 325, an increase of 20 compared with the corresponding period of last year, but a decrease of 41 compared with the same period in 1926. Locomotives on order March 1 totaled 171, compared with 276 on the same date last year.

Iron and Steel Markets

Heavy Specifying Steadies Market

Large Orders Against Expiring Steel Contracts Insure Continuance of Heavy Output—Net Gain of 10 Blast Furnaces in March —No Increase in Price Irregularities—Steel Pipe Advanced

HEAVY specifications against expiring steel contracts, a rate of production that is still on an ascending scale and a price situation that is holding its own, barring minor irregularities, mark the opening of the second quarter of the year.

Blast furnace returns for March collected by THE IRON AGE show a net gain of 10 stacks, of which nine were steel company furnaces. This reflects a sharp increase in steel works activity and lends support to the belief that ingot production for March exceeded the high record made in the same month last year. Merely assuming that the March rate was equal to that of February, output for the first quarter surpassed that of the same period last year by nearly 200,000 tons. Since the March rate actually gained, final returns for the quarter will show a total closely approaching, if not larger than, the record made in the first quarter of 1926.

Steel production in April, it is conceded, may recede from the March rate, but there are no indications of as sharp a decline as occurred in April, 1927. Shipping orders placed in the last week of March were large enough to insure a sustained output until the middle of the month. At no time during the first quarter, with its high rate of plant engagement, have producers been able to look much further ahead.

Unquestionably the large volume of specifications against contracts that expired March 31 has had a steadying effect on prices. In some cases buyers were successful in overspecifying their contracts and in other instances mills have continued to accept shipping orders, not choosing to enforce the cancellation clause, but as a rule producers added excess tonnage to second quarter contracts and canceled tonnage that remained unspecified at the end of the month.

Buying at second quarter prices has not yet reached important proportions, but since shipments against first quarter contracts will continue through most of this month, consumers do not find it necessary to place much additional tonnage at this time. There continue to be price irregularities in wire nails and some finishes of sheets, but they are no more numerous, and possibly fewer, than a week ago. Meanwhile, mills are showing more of a disposition to ignore price concessions, some of which emanate from middlemen and are possibly of a transient character. At any rate, the week has seen another postponement of serious tests of the price structure.

The only important new development in steel prices during the week was an advance in standard steel pipe. This took the form of a withdrawal of a preferential discount of 5 per cent which had been in effect since Oct. 1, 1927.

Among the leading consuming lines, the automobile industry, building construction and farm implement manufacturing continue to take steel at an undiminished rate. Reports indicate heavy sales by dealers in low-priced automobiles, but a less promising movement of some of the medium and high-priced cars. An expected increase in Ford production this quarter will, if it materializes, tend to counterbalance a possible decline in the output of other motor car builders. Automobile makers are still cautious in buying steel, committing themselves only for a few weeks ahead.

Structural lettings of 46,000 tons include 18,000 tons for a bridge across the Ohio River at Louisville, 7800 tons for a section of the New York subway and 4300 tons for a store building at Oakland, Cal. New projects call for 20,800 tons, of which 5000 tons is for a Pennsylvania Railroad bridge at Newark, N. J.

Railroad buying was featured by the purchase of 300 refrigerator cars by the North American Car Corporation and 260 ballast cars by the Canadian National. Inquiries include 500 flat and 50 gondola cars for the Southern Pacific and 500 tank cars for the North American Car Corporation.

The extent of the recent large buying of pig iron in the Central West is shown by the fact that second quarter sales at Chicago were larger than for any three-month period in several years. At Cleveland the market has resumed its recent activity with sales of 65,000 tons in the week. Other districts are less busy. Through arrangements now being perfected Buffalo iron will move by barge or by water and rail to New England and to points in the eastern Pennsylvania district at delivered prices low enough to prove serious competition for other Eastern producers.

Details of pig iron output in March show a total of 3,199,674 tons produced, or 103,215 tons per day, against 2,900,126 tons, or 100,004 tons in February. The daily rate was the smallest for any March since 1922. Reflecting a larger use of scrap in steel making and a poorer showing by merchant furnaces, pig iron production in the first three months of 1928, at 8,969,561 tons, was the smallest for any first quarter since 1922.

Quotations on 440,000 tons of Lake Superior ore for the Ford Motor Co. were identical with last year's prices, indicating their probable reestablishment for the coming season.

Sales of copper in March, estimated at 160,000 tons, were the second largest since the war. The record was over 220,000 tons in December, 1919.

Both of THE IRON AGE composite prices remain unchanged at last week's levels, that for pig iron at $17.67 a ton and that for finished steel at 2.357c. a lb.

Pittsburgh

Steadier Price Situation on Steel Products —Flow of Orders Undiminished

PITTSBURGH, April 3.—The second quarter of the year opens with considerably less uncertainty as to prices than existed during most of the past month. Producers seem to have been a good deal more concerned than now appears to have been warranted over what would happen when the higher prices they have been seeking were tested. While the extreme advances have not been attained, and there have been a good many cases involving sizable tonnages where buyers will continue to enjoy the low prices of the first quarter for another month or so, it is equally clear that second quarter contracts will average higher in price than those for the quarter just ended.

Hot-rolled strip steel makers have yielded little of the advance they sought even to the largest tonnage buyers and much of the tonnage booked is at the full quotations. Makers of wire products seem more disposed to wait buyers out than to force the issue, feeling that the chances of success in getting present prices will be better when the real requirements are present. While admitting weakness in galvanized sheets and that it has been impossible to hold the market on tin mill black plate at 3c. base, sheet makers are firm on other finishes and insist that prices below regular quotations on black sheets are concessions rather than straight out cuts. Current shipments of plates, shapes and bars include much tonnage carrying a price of 1.80c., base Pittsburgh, but manufacturers generally ask 1.85c. on new business and there is no evidence that less is being done. An interesting price development of the week was the announcement made April 2 of a withdrawal of the preferential of 5 per cent that steel pipe makers have been giving on standard pipe since Oct. 1.

The steadier price situation is associated with the fact that the steel industry steps from the first into the second quarter with no appreciable letdown in the flow of orders, and while the prospect is that April will show a smaller production than March, which incidentally is believed to have beaten the record of the same month last year, evidence is lacking that there will be any such tapering in output as marked April last year. The last week of March produced enough business in the aggregate to insure sustained ingot production until about the middle of this month, which really is as far ahead as the producers could look at any time during the first quarter with its high rate of plant engagement.

It may be necessary to revise upward the potential steel making capacity of the country if the March performance of the Weirton Steel Co. is a criterion, and in pig iron if the output of one of the Jones & Laughlin Steel Corporation furnaces is a true measure of what modern blast furnaces can do.

The primary materials still are out of step with finished steel in point of sales and to a considerable extent in the matter of prices. Open-hearth grades of scrap are not plentiful and prices are firm, but this merely emphasizes a generally opposite condition in other grades. Pig iron producers believe they have seen their lowest prices, but the activity necessary to strengthen them is lacking. The fuel market is very dull and prices are soft.

Pig Iron.—One good sized sale of No. 3 foundry iron stands out in an otherwise quiet market. This sale, amounting to about 5000 tons, is reported to have been at slightly more than the regular price of $16.75, Valley furnace, but hardly establishes the market at a higher level in view of the fact that the sale was tied up with a coke deal. It develops positively that a recent large sale of basic and a smaller sale of Bessemer iron were by a steel company to another steel company and that the iron did not come from a Valley furnace. One good sized sale of Valley basic iron, from 2000 to 4000 tons, is noted at a price well under what has been nominally quoted for some time, but the transaction proves to have been substantially an inter-company deal and hardly is recognizable as establishing a lower general market. The seller says that iron would not have been sold at the price at which this lot was moved to other than the company which bought. Valley producers are taking a firmer stand on basic iron, as it develops that they have less reason to fear competition from Pittsburgh district steel companies which either are sold up or have no iron for sale. The Jones & Laughlin Steel Corporation added a furnace in the past week at its Aliquippa Works and now has all five there in production. W. P. Snyder & Co. make the March average prices of Valley basic and Bessemer iron $17 and $17.50, the same as in February.

Prices per gross ton, f.o.b. Valley furnace:

Basic	$17.00
Bessemer	17.50
Gray forge	16.75
No. 2 foundry	17.25
No. 3 foundry	16.75
Malleable	17.25
Low phosphorus, copper free	27.00

Freight rate to the Pittsburgh or Cleveland district, $1.76.

Ferroalloys.—One sale of 200 tons of British ferromanganese for second quarter shipment is noted at the regular market price. Generally, consumers are covered through the first half of the year and new business is infrequent and for small lots. Specifications on contracts are active not only in that alloy, but in ferrosilicon and spiegeleisen. Tonnage releases in the latter are exceeding quotas and the use of it is much wider than in recent years.

Fluorspar.—Leading domestic producers have withdrawn all prices below $15 per net ton at mines for gravel spar analyzing 85 per cent calcium fluoride and not over 5 per cent silica and are expected to announce higher prices soon. All producers have a good deal of business on their books taken at $14.50.

Semi-Finished Steel.—Good operations by sheet, tin plate and strip manufacturers who buy their steel are reflected in a well sustained movement of billets, slabs and sheet bars, but there is little or no open market activity, as shipments are almost entirely on standing contracts between producers and consumers. The quoted prices are unchanged. The present price of wire rods is yet to come into full play, as consumers had until the end of March to enter specifications on first quarter contracts written at $40 and appear to have secured their requirements for this month at least.

Bars, Plates and Shapes.—The last week of March was a good one for local companies in specifications, with a good many buyers attempting to overspecify against expiring first quarter contracts. Some makers appear to have accepted the extra tonnage, but others either cancelled the amount beyond the quota or added it to second quarter contracts, carrying an advance of $1 a ton over first quarter contracts. The price situation is without change. Much of the contract tonnage moving from the mills this month will be at the first quarter price of 1.80c., base Pittsburgh, with a smaller amount at the second quarter price of 1.85c. Small lots of all three products have gone at 1.90c., base, but the prevailing contract tonnage price for this quarter is 1.85c. Considerable tonnage of plates will be required for the river barges lately closed and now pending, and 50,000 to 100,000 tons will be wanted for the Amarillo, Tex.-Kansas City gas pipe line, which is believed to be nearing the mills. Bolt and nut makers are taking bars very steadily, but demands from makers of cold-finished bars are not as heavy as they were earlier in the year. Structural steel lettings in this area still are moderate.

Rails and Track Supplies.—A heavy movement of standard-section rails and track supplies is noted against old contracts, but new business is light. Continued depression in the coal industry is limiting purchases of light-section rails and of small spikes.

Wire Products.—Prices announced as of Jan. 26, last, or $2.65, base, per keg, Pittsburgh, for nails and $2.50, base, per 100 lb. for plain wire, are still to be seriously tested. Buyers had until the end of last month to specify on first quarter contracts carrying prices $2 per ton lower and appear to have exercised the privilege in wire and to the extent of their needs in nails. Because they took heavy deliveries during the quarter just ended on nails bought at lower prices last December, and the movement into consumption has been rather light, some jobbers could not provide specifications on first quarter contracts at $2.55, base. In such cases there is an impasse on prices, with the mills insisting that the time has passed for specifications on $2.55 contracts and jobbers equally firm in demanding that the price be extended until they can lighten their stocks.

Tubular Goods.—The Youngstown Sheet & Tube Co. has announced, effective April 2, the withdrawal of the 5 per cent preferential which has been quoted since the fourth quarter of last year on standard steel pipe, making the price base and 5 per cent. The announcement says that the change also affects other classes of steel pipe, including line pipe, water well casing, etc. It is expected that similar action will be taken by other steel pipe producers. The market has been unsettled on standard pipe since Oct. 1 last, when the discounts were increased by an extra 5 per cent to bring quotations in line with actual selling prices and there have been a good many cases where the supplementary and preferential discounts amounted to three fives. Neither jobbers nor mills have made money and this step is said to have been prompted by a desire for stability on the part of both. There is a steady movement of stand-

Long Ternes

No. 24, 8-lb. coating, f.o.b. mill primes	4.10c.

Tin Plate

	Per Base Box
Standard cokes, f.o.b. P'gh district mills	$5.25
Standard cokes, f.o.b. Gary	5.35

Terne Plate

(*F.o.b. Morgantown or Pittsburgh*)
(Per package, 20 x 28 in.)

8-lb. coating I.C.	$11.20	25-lb. coating I.C.	$16.70
15-lb. coating I.C.	14.00	30-lb. coating I.C.	17.75
20-lb. coating I.C.	15.30	40-lb. coating I.C.	19.85

Alloy Steel Bars

(F.o.b. maker's mill.)

S.A.E. Series Numbers		*Per* 100 *Lb.*
2000	(½% Nickel)	$2.90
2100	(1½% Nickel)	3.20
2300	(3½% Nickel)	4.15
2500	(5% Nickel)	4.90
3100	Nickel Chromium	3.20
3200	Nickel Chromium	3.65
3300	Nickel Chromium	6.45
3400	Nickel Chromium	5.85
4100	Chromium Molybdenum (0.15 to 0.25 Molybdenum)	3.15
4100	Chromium Molybdenum (0.25 to 0.40 Molybdenum)	3.35
4600	Nickel Molybdenum (0.20 to 0.30 Molybdenum, 1.25 to 1.75 Nickel)	3.70
5100	Chromium Steel (0.60 to 0.90 Chrome)	3.00
5100	Chromium Steel (0.80 to 1.10 Chrome)	3.10
5100	Chromium Spring Steel	2.85
6100	Chromium Vanadium Bars	3.85
6100	Chromium Vanadium Spring Steel	3.60
9250	Silicon Manganese Spring Steel	2.90
Chrome Nickel Vanadium		4.15
Carbon Vanadium		3.60

Above prices are for hot-rolled steel bars, forging quality. The ordinary differential for cold-drawn bars is 1c. per lb. higher. For billets 4 x 4 to 10 x 10 in., the price for a gross ton is the net price for bars of the same analysis. For billets under 4 x 4 in. down to and including 2½ in. squares, the price is $5 a gross ton above the 4 x 4 billet price.

Slabs with sectional area of 16 in. or over carry the billet price; slabs with sectional area of 12 in. to 16 in. carry a $5 extra above the billet price and slabs with a sectional area under 12 in. carry the bar price.

Band sizes are 40c. per 100 lb. higher.

Rails

	Per Gross Ton
Standard, f.o.b. mill	$43.00
Light (from billets), f.o.b. mill	36.00
Light (from rail steel), f.o.b. mill	34.00
Light (from billets), f.o.b. Ch'go mill	36.00

Track Equipment

	Base Per 100 *Lb*
Spikes, $\frac{9}{16}$ in. and larger	$2.80
Spikes, ½ in. and smaller	2.80
Spikes, boat and barge	3.00
Tie plates, steel	2.15
Angle bars	2.75
Track bolts, to steam railroads	$3.80 to 4.90
Track bolts, to jobbers, all sizes, per 100 count,	70 per cent off list

Welded Pipe

Base Discounts, f.o.b. Pittsburgh District and Lorain, Ohio, Mills

Butt Weld

Steel			*Iron*		
Inches	Black	Galv.	Inches	Black	Galv.
⅛	45	19½	¼ to ⅜	+11	+39
¼ to ⅜	51	25½	½	22	2
½	56	42½	¾	28	11
¾	60	48½	1 to 1½	30	13
1 to 3	62	50½			

Lap Weld

2	55	43½	2	23	7
2½ to 6	59	47½	2½	26	11
7 and 8	56	43½	3 to 6	28	13
9 and 10	54	41½	7 to 12	26	11
11 and 12	53	40½			

Butt Weld, extra strong, plain ends

⅛	41	24½	¼ to ⅜	+19	+54
¼ to ⅜	47	30½	½	21	7
½	53	42½	¾	28	12
¾	58	47½	1 to 1½	30	14
1 to 1½	60	49½			
2 to 3	61	50½			

Lap Weld, extra strong, plain ends

2	53	42½	2	23	9
2½ to 4	57	46½	2½ to 4	29	15
4½ to 6	56	45½	4½ to 6	28	14
7 to 8	52	39½	7 to 8	21	15
9 and 10	45	32½	9 to 12	16	2
11 and 12	44	31½			

On carloads the above discounts on steel pipe are increased on black by one point, with supplementary discount of 5, and on galvanized by 1½ points, with supplementary discount of 5. On iron pipe, both black and galvanized, the above discounts are increased to jobbers by one point with supplementary discounts of 5 and 2½%.

Note.—Chicago district mills have a base two points less than the above discounts. Chicago delivered base is 2½ points less. Freight is figured from Pittsburgh, Lorain, Ohio, and Chicago district mills, the billing being from the point producing the lowest price to destination.

Boiler Tubes

Base Discounts, f.o.b. Pittsburgh

Lap Welded Steel		*Charcoal Iron*	
2 to 2¼ in.	27	1½ in.	+18
2½ to 2¾ in.	37	1¾ to 1⅞ in.	+ 8
3 in.	40	2 to 2¼ in.	— 2
3¼ to 3¾ in.	42½	2½ to 3 in.	— 7
4 to 13 in.	46	3¼ to 4½ in.	— 9

Beyond the above discounts, 7 fives extra are given on lap welded steel tubes and 2 tens to 2 tens and 1 five on charcoal iron tubes.

Standard Commercial Seamless Boiler Tubes

Cold Drawn

1 in.	60	3 in.	43
1¼ to 1½ in.	52	3¼ to 3½ in.	47
1¾ in.	36	4 in.	50
2 to 2¼ in.	31	4½, 5 and 6 in.	43
2½ to 2¾ in.	39		

Hot Rolled

2 and 2¼ in.	37	3¼ and 3½ in.	53
2½ and 2¾ in.	45	4 in.	56
3 in.	51	4½, 5 and 6 in.	51

Less carloads, 4 points less. Add $8 per net ton for more than four gages heavier than standard. No extra for lengths up to and including 24 ft. Sizes smaller than 1 in. and lighter than standard gage to be held at mechanical tubes list and discount. Intermediate sizes and gages not listed take price of next larger outside diameter and heavier gage.

Seamless Mechanical Tubing

	Per Cent Off List
Carbon, 0.10% to 0.30%, base	55
Carbon, 0.30% to 0.40%, base	50

Plus differentials for lengths over 18 ft. and for commercial exact lengths. Warehouse discounts on small lots are less than the above.

ard pipe, with a few extra demands prompted by the news of higher prices, but in other classes of pipe business still is slow. In line pipe the Amarillo, Tex.-Kansas City gas line, requiring more than 100,000 tons, is believed to be the nearest the mills of the several projected lines.

Sheets.—No complaint is heard as to the rate at which business is flowing in, but there continues to be a lack of satisfaction over prices, notably on galvanized sheets, which are hard to sell at more than 3.65c., base Pittsburgh. No small part of the production of this grade is distributed through jobbers and, having had opportunity to stock up at low prices, they can now profitably compete with the mills at less than mill prices. On black sheets, the efforts of mills to establish 2.90c., base, is less seriously hampered and on blue annealed sheets deviations from quotations are rare.

Tin Plate.—Tin plate mill operations are holding their recent gains and there are sustained specifications on contracts. New business does not amount to much, as there are few important consumers that are not under contracts for the first half of the year. Condensed milk can sizes are moving especially well just now.

Cold-Finished Steel Bars and Shafting.—Important consumers are covered for second quarter at 2.20c., base Pittsburgh, but except for the writing of these commitments, the market lacks feature and with prices settled, buyers are specifying in strict accordance with known requirements.

Bolts, Nuts and Rivets.—Reference to a price of $2.75, base Pittsburgh, on large rivets in last week's report was an error. It should have read $2.90, to which almost all manufacturers advanced five weeks ago and which has been the basis of the great bulk of the business since closed. Small rivets are commonly quoted at 70 per cent off list. Bolt and nut business in March stepped up substantially from the February rate, which in turn ran better than January's. Railroads are releasing more tonnage than at the beginning of the year, and companies supplying the automotive industry are still doing well. Observance of quotations by makers is remarkably uniform.

Hot-Rolled Flats.—Recent price uncertainty appears to have disappeared, and fears by manufacturers that the advances could not be maintained have vanished before the fact that much second quarter business has been taken at 1.90c. for stock wider than 6 to 12-in., 2.10c. for 6 to 3-in. and 2.20c. for narrower than 3-in. Any deviations from these prices appear to have been on the very large tonnages of the motor car builders, who, however, are paying $2 to $3 per ton more for second quarter tonnage than on first quarter shipments. The market is steadier than it was even as recently as a week ago.

Cold-Rolled Strips.—This product has not had the test of large inquiries that have been out on hot-rolled strips. One explanation appears in the fact that large buyers were able to add to their first quarter purchases and they have not yet developed fresh requirements of size. On ordinary tonnages the market appears established at 3.15c., base, for lots of 1 to 3 tons, or 2.90c. for lots of 3 tons or more.

Warehouse Prices, f.o.b. Pittsburgh

	Base per Lb.
Plates	3.00c.
Structural shapes	3.00c.
Soft steel bars and small shapes	2.90c.
Reinforcing steel bars	2.75c.
Cold-finished and screw stock—	
Rounds and hexagons	3.60c.
Squares and flats	4.10c.
Bands	3.60c.
Hoops	4.00c. to 4.50c.
Black sheets (No. 24 gage), 25 or more bundles	3.65c.
Galvanized sheets (No. 24 gage), 25 or more bundles	4.50c.
Blue annealed sheets (No. 10 gage), 25 or more sheets	3.10c.
Galvanized corrugated sheets (No. 28 gage), per square	$4.39
Spikes, large	3.40c.
Small	3.80c. to 5.25c.
Boat	3.80c.
Track bolts, all sizes, per 100 count,	62½ per cent off list
Machine bolts, per 100 count	62½ per cent off list
Carriage bolts, per 100 count	62½ per cent off list
Nuts, all styles, per 100 count,	62½ per cent off list
Large rivets, base per 100 lb.	$3.50
Wire, black soft annealed, base per 100 lb.	$3.00 to 3.10
Wire, galvanized soft, base per 100 lb.	3.00 to 3.10
Common wire nails, per keg	3.00
Cement coated nails, per keg	3.05

Coke and Coal.—It is hard to imagine a duller market than exists in spot coke and coal. Blast furnaces running on Connellsville coke are entirely covered against their requirements for this quarter and almost the only demand for spot furnace coke is from water gas producers. Demand for heating coke has dwindled on account of mild weather. Some good sized orders from the East for coke for water gas have gone to Eastern by-product coke companies, futher reducing the market for western Pennsylvania coke. Users of foundry coke are well covered by contracts and spot business is limited.

Old Material.—The market here holds its recent strength in heavy melting steel and compressed sheets. In the latter, the local production is light and it is necessary to go into other districts to secure them. One melter in this district uses nothing else, while another prefers them to the general run of offerings of heavy melting steel at equal prices. Dealers are short of heavy melting steel at several points in the district and are eagerly picking up offerings, particularly of railroad or equivalent steel, for which they are paying up to $15.50 and yet are not getting enough to meet the requirements of consumers. With yard stocks well reduced, it seems likely that the steel in April railroad lists will fetch that price and possibly more. The market is dull in the other grades. The April scrap list of the Norfolk & Western Railroad is exceptionally heavy, containing 14,334 gross tons. Other roads also have large April lists, but there is little doubt but that the open-hearth grades will be actively wanted and will sell high.

Prices per gross ton delivered consumers' yards in Pittsburgh and points taking the Pittsburgh district freight rate:

Basic Open-Hearth Furnace Grades:	
Heavy melting steel	$15.00 to $15.50
Scrap rails	14.50 to 15.00
Compressed sheet steel	14.75 to 15.00
Bundled sheets, sides and ends	13.50 to 14.00
Cast iron carwheels	14.50 to 15.00
Sheet bar crops, ordinary	15.00 to 15.50
Heavy breakable cast	13.50
No. 2 railroad wrought	15.00 to 15.50
Heavy steel axle turnings	13.00 to 13.50
Machine shop turnings	10.50
Acid Open-Hearth Furnace Grades:	
Railroad knuckles and couplers	16.50 to 17.00
Railroad coil and leaf springs	16.50 to 17.00
Rolled steel wheels	16.50 to 17.00
Low phosphorus billet and bloom ends	18.50 to 19.00
Low phosphorus, mill plate	17.50 to 18.00
Low phosphorus, light grade	16.50 to 17.00
Low phosphorus sheet bar crops	17.50 to 18.00
Heavy steel axle turnings	13.00 to 13.50
Electric Furnace Grades:	
Low phosphorus punchings	16.50 to 17.00
Heavy steel axle turnings	13.00 to 13.50
Blast Furnace Grades:	
Short shoveling steel turnings	10.50 to 11.00
Short mixed borings and turnings	10.50 to 11.00
Cast iron borings	11.00 to 11.25
No. 2 busheling	10.00 to 10.50
Rolling Mill Grades:	
Steel car axles	18.00 to 19.00
No. 1 railroad wrought	11.00 to 11.50
Sheet bar crops	17.00 to 17.50
Cupola Grades:	
No. 1 cast	14.50 to 15.00
Rails 3 ft. and under	15.00 to 15.25
Malleable Grades:	
Railroad	15.00 to 15.50
Industrial	14.50 to 15.00
Agricultural	14.00 to 14.50

D. A. Schulte Resigns as Arbitrator in Tutein-Hudson Valley Case

D. A. Schulte, who was selected by Charles M. Schwab, president American Iron and Steel Institute, as the third arbitrator in the case of E. Arthur Tutein, Inc., against the Hudson Valley Coke & Products Corporation, has resigned and another will be appointed in his place. A preliminary hearing had been held when Mr. Schulte decided he would not continue. The litigation comes under an arbitration clause in the contract which the Tutein company had for the sale of Hudson Valley coke and pig iron.

Upset hex. cap screws, S.A.E. thread	85 and 5
Upset set screws	80, 10 and 10
Milled studs	70 and 5

Chicago

Ingot Output Remains High—Second Quarter Pig Iron Buying Heavy

CHICAGO, April 3.—Production of steel ingots in the Chicago district remains close to the level—93 to 95 per cent—reached in the early days of March. Revisions downward in operating schedules are scarcely worthy of note, and where they have been made they have occurred more frequently in light tonnage commodities such as wire products. The strength of the Chicago market lies principally in its uniformity. Irregularity in prices is no more pronounced than a week ago. Sales are in larger volume than shipments and specifications exceed production, both factors indicating that deliveries will become more extended. Forward contracting represents a larger portion of total sales than in a number of the preceding quarters, nevertheless the greater number of buyers will take steel only as they require it or in sufficient quantity to assure uninterrupted plant operations.

Compared with recent weeks the past seven days have not been up to par in structural awards. Some in the trade are of the belief that the advancing prices for steel were used to rush out a number of projects that normally would not be quite ready for the market. On this score it is not uncommon to find the opinion expressed that structural awards may be lean in the second quarter. The fact remains, however, that talked-of projects are of large aggregate tonnage and financial arrangements may determine whether they go ahead rather than prices of materials.

Pig Iron.—It is now definitely known that second quarter sales of Northern foundry iron were heavier than in any three-month period for several years. Buyers are now looking forward to piecing out tonnages that will be required near the end of this quarter to take the place of iron that is being shipped ahead of the original schedules. Third quarter inquiry is growing in importance and several contracts for that period have been placed. Shipments for March were the best since last August, and the first days of April show no slackening in the demand. Merchant iron output is steady, with two Iroquois, two Federal and the Zenith furnaces in blast. Occasional carloads of Southern iron are reaching Michigan on an all-rail freight rate from Birmingham. Some buyers in and close to Chicago are taking scattered carloads of high silicon iron that is shipped by rail from Cleveland. The freight rate from Cleveland to Chicago is $4.41. Silvery iron is active only in car lots. The opening of navigation is expected by some to bring about the movement of cargoes of Lake Erie iron into this district.

Prices per gross ton at Chicago:

Northern No. 2 foundry, sil. 1.75 to 2.25		$18.50
N'th'n No. 1 fdy., sil. 2.25 to 2.75		19.00
Malleable, not over 2.25 sil.		18.50
High phosphorus		18.50
Lake Superior charcoal, averaging sil. 1.50		27.04
Southern No. 2 fdy. (all rail)		22.01
Southern No. 2 (barge and rail)		21.18
Low phos., sil. 1 to 2 per cent, copper free	$28.50 to	29.00
Silvery, sil. 8 per cent		29.79
Bessemer ferrosilicon, 14 to 15 per cent		46.79

Prices are delivered consumers' yards except on Northern foundry, high phosphorus and malleable, which are f.o.b. local furnace, not including an average switching charge of 61c. per gross ton.

Ferroalloys.—This market is quiet. A carload and several less-than-carload lots of ferromanganese have been ordered. Specifications for ferrosilicon are heavy.

Prices delivered Chicago: 80 per cent ferromanganese, $107.56; 50 per cent ferrosilicon, $83.50 to $87.50; spiegeleisen, 19 to 21 per cent, $38.76 to $39.76.

Bolts, Nuts and Rivets.—Contracting for the second quarter is practically completed, and it is evident that recent advances in prices have held. Specifications in the week are a shade heavier than for the average seven-day period in March.

Coke.—Shipments of by-product foundry coke are steady, following a slight upturn at the end of March. All ovens in this district are lighted. Prices are steady at $9, local ovens, and $9.50, delivered in the Chicago switching district.

Plates.—Car building programs are moving steadily as indicated by specifications for plates, shapes and bars that aggregate 30,000 tons. Railroad equipment buying is confined to 300 refrigerator cars by the North American Car Corporation. Fresh inquiry is slow. Railroads that have received bids on rolling stock appear to be in no hurry to place contracts. Tank builders in Chicago and in the Southwest are busy, and specifications from that source in the week total 4000 tons. Inquiry before the trade is heavy. Schedules at universal mills are satisfactory and deliveries on that commodity range from five to six weeks. Shipments of sheared plates can be had in three weeks. The bulk of new sales in plates is at 2c., Chicago, but contracts entered before the price advance and which were not specified in full are dragging over into April.

Mill prices on plates per lb.: 2.00c., base Chicago.

Structural Material.—It is reported that the Woolworth Building, State and Washington Streets, Chicago, for which steel already has been purchased for the first four floors, may be extended to the height originally intended, namely, 24 stories. The steel award for the Austin High School, Chicago, requiring 3500 tons, is delayed. About 650 tons will be needed for the approaches to the Crawford Avenue Bridge, Chicago. Structural mills in this district are well engaged, and deliveries are extending slightly as specifications exceed shipments by a small margin. Car builders, fabricating shops and bridges are taking the bulk of tonnage now being shipped from mills. New sales, which for the most part are being made at prevailing prices, namely, 2c., Chicago, are in small volume. Local fabricators are well supplied with work and they have better arranged schedules as a result of a more generous supply of small tonnage awards.

Mill prices on plain material per lb.: 2.00c., base, Chicago.

Bars.—Mild steel bars are the most active of the heavy tonnage steel mill products. Specifications in the week were unusually heavy and sales were proportionately large in the aggregate. Fresh buying represents for the most part users' needs for 30 to 45 days, indicating little or no speculation and that stocks are not being allowed to accumulate in the hands of users. The bulk of new purchases are at 2c., Chicago, but much 1.90c. tonnage contracted for before the advance in prices, will be shipped in April. Mills are receiving orders from well diversified sources. The automobile trade, farm implement manufacturers and makers of cold drawn bars are the largest users. New sales in iron bars are the largest in many months and mill backlogs are heavier than at any time since the turn of the year. Prices on iron bars are steady at 2c., Chicago. The new base price and differentials on alloy steel bars are holding firmly. Local mills are engaged at close to capacity. Buyers' interest in rail steel bars is growing and new sales exceed production. Specifications fully equal shipments and deliveries have been extended to two to three weeks. The bed industry is holding the gain registered in early March, and farm implement manufacturers continue to issue heavy specifications. Prices for hard steel bars are firm at 1.85c., although much 1.80c. steel will be shipped in April against old contracts. Shipments of fence posts are heavy and mill stocks are rapidly being reduced.

Mill prices per lb.: Soft steel bars, 2.00c. base, Chicago; common bar iron, 2.00c., base, Chicago; rail steel bars, 1.80c. to 1.85c., base, Chicago Heights mill.

Wire Products.—Mill shipments are lighter and operations have been adjusted to the range of 70 to 75 per cent of capacity. The nail market continues dull, though such sales as are being made are at the full schedule. Shipments of this commodity probably represent not more than 30 per cent of mill capacity, which gives some idea of the overstocked condition of distributers. A sharp upturn in sales is reported in the Northwest, and improved road conditions in the Missouri River Valley are making distribution easier in the States that lie west of the Mississippi River. Wire products' shipments in March were the best so far this year and they were measurably heavier than in the third month of 1927. Railroad orders are steady but in small aggregate tonnage.

Reinforcing Bars.—The building program in this district continues to grow and concrete reinforcing bar awards are heavier. Shops that 10 days ago were facing a rapid shrinkage in order books are now booking tonnage at a rate that approximates shipments. The urge to take business is resulting in unsettlement of prices. Bars made from billet stock are now quoted 2.20c. to 2.55c., Chicago warehouses. Rail steel reinforcing bars bring 1.85c., mill, for the ordinary run of work and 1.95c. for bridges and culverts. These quotations are stable, but there is more inclination to take small orders without the usual extras.

Cold Rolled Strip.—Prices in this district are steady. Specifications are fully equal to production which stands at 75 per cent of capacity.

Rails and Track Supplies.—Chicago district rail mills are engaged at 90 per cent of capacity, and schedules indicate no lessening in that rate until about July 1. A Western railroad has ordered 4000 tons of standard-section rails. Purchases of light rails aggregate close to 100 tons. The Pennsylvania Railroad is now asking for its second quarter requirements of track supplies. Miscellaneous orders for track fastenings total 2000 tons. Accessory mills are operating close to 70 per cent of capacity.

Prices f.o.b. mill, per gross ton: Standard-section open-hearth and Bessemer rails, $43; light rails, rolled from billets, $36. *Per lb.:* Standard railroad spikes, 2.80c.; track bolts with square nuts, 3.80c.; steel tie plates, 2.25c.; angle bars, 2.75c.

Sheets.—This market may be characterized as steady. Prices are holding and deliveries are three weeks for the blue annealed product and two to three weeks for black and galvanized sheets. Business, which has been dull in the South, now gives some signs of improving, while orders from the Northwest are gradually becoming more numerous. Specifications are fully equal to production, so that hot mill schedules are of the same length as a week ago. New buying, which is not in large volume, is for immediate requirements. Stocks in the hands of buyers are small, and prompt shipment is requested on practically all orders.

Base prices per lb., delivered from mill in Chicago: No. 24 black, 3.05c.; No. 24 galvanized, 3.90c.; No. 10 blue annealed, 2.25c. to 2.35c. Delivered prices at other Western points are equal to the freight from Gary plus the mill prices, which are 5c. per 100 lb. lower than the Chicago delivered prices.

Cast Iron Pipe.—Contracts for cast iron pipe have been numerous, but fresh inquiry is dull. It is evident that prices are stronger at $29 to $31, Birmingham, for 6-in. and larger diameters. The American Cast Iron Pipe Co. has taken 1500 tons of centrifugal pipe for Akron, Ohio. On 2000 tons of 6 to 24-in. pipe at South Bend., Ind., the low bid, made by James B. Clow & Sons, was $29, Birmingham. The United States Cast Iron Pipe & Foundry Co. is reported to have taken 2000 tons at Detroit, 3200 tons at Chicago, 2000 tons at Evansville, Ind., and 1000 tons at Milwaukee. The low bid at Chicago was $30.80 and at Milwaukee $29.75, Birmingham. Waukegan, Ill., opened bids April 2 on 310 tons of 6 to 10-in. class B pipe.

Prices per net ton, delivered Chicago: Water pipe, 6-in. and over, $36.20 to $39.20; 4-in., $40.20 to $43.20; Class A and gas pipe, $4 extra.

Warehouse Prices, f.o.b. Chicago

	Base per Lb.
Plates and structural shapes	3.10c.
Soft steel bars	3.00c.
Reinforcing bars, billet steel	2.20c. to 2.55c.
Cold-finished steel bars and shafting—	
Rounds and hexagons	3.60c.
Flats and squares	4.10c.
Bands	3.65c.
Hoops	4.15c.
Black sheets (No. 24)	3.95c.
Galvanized sheets (No. 24)	4.80c.
Blue annealed sheets (No. 10)	3.50c.
Spikes, standard railroad	3.55c.
Track bolts	4.55c.
Rivets, structural	3.60c.
Rivets, boiler	3.60c.
	Per Cent Off List
Machine bolts	60
Carriage bolts	60
Coach or lag screws	60
Hot-pressed nuts, squares, tapped or blank	60
Hot-pressed nuts, hexagons, tapped or blank	60
No. 8 black annealed wire, per 100 lb.	$3.20
Common wire nails, base per keg	3.00
Cement coated nails, base per keg	2.90

Old Material.—The tendency in the Chicago scrap market continues toward dullness and lower prices, but this change is not as marked as a week ago. A consumer purchase of cast iron borings was made at 25c. below last week's quotation, but a producer sold 1000 tons at $10.25 per gross ton delivered, or 25c. above last week's price. Consumption of practically all grades is large and relatively steady, but supplies are fully adequate and strength is lacking. Users of heavy melting steel are busy, but they recently have built up stocks and therefore are somewhat independent as to quality and rate of deliveries. Steel mills have declined offers of heavy melting steel at $12.75, but dealers continue to pay $12.50 to $13 per gross ton, delivered, for steel that is to be shipped against old contracts. Railroad offerings include 50,000 tons by the Pennsylvania and a blank list by the Michigan Central.

Prices delivered consumers' yards, Chicago:

Per Gross Ton	
Basic Open-Hearth Grades:	
Heavy melting steel	$12.50 to $13.00
Shoveling steel	12.50 to 13.00
Frogs, switches and guards, cut apart, and miscellaneous rails	13.50 to 14.00
Hydraulic compressed sheets	11.00 to 11.50
Drop forge flashings	9.75 to 10.25
Forged. cast and rolled steel carwheels	14.50 to 15.00
Railroad tires, charging box size	15.50 to 16.00
Railroad leaf springs, cut apart	15.50 to 16.00
Acid Open-Hearth Grades:	
Steel couplers and knuckles	13.75 to 14.25
Coil springs	16.25 to 16.75
Electric Furnace Grades:	
Axle turnings	13.00 to 13.50
Low phosphorus punchings	14.25 to 14.75
Low phosphorus plate, 12 in. and under	13.75 to 14.25
Blast Furnace Grades:	
Axle turnings	10.00 to 10.50
Cast iron borings	9.25 to 9.75
Short shoveling turnings	9.25 to 9.75
Machine shop turnings	7.00 to 7.50
Rolling Mill Grades:	
Iron rails	13.50 to 14.00
Rerolling rails	13.75 to 14.25
Cupola Grades:	
Steel rails less than 3 ft.	15.00 to 15.50
Angle bars, steel	14.00 to 14.50
Cast iron carwheels	13.50 to 14.00
Malleable Grades:	
Railroad	12.50 to 13.00
Agricultural	12.00 to 12.50
Miscellaneous:	
*Relaying rails, 56 to 60 lb.	23.00 to 25.00
*Relaying rails, 65 lb. and heavier	26.00 to 31.00
Per Net Ton	
Rolling Mill Grades:	
Iron angle and splice bars	14.00 to 14.50
Iron arch bars and transoms	18.50 to 19.00
Iron car axles	21.50 to 22.00
Steel car axles	15.50 to 16.00
No. 1 railroad wrought	11.00 to 11.50
No. 2 railroad wrought	11.00 to 11.50
No. 1 busheling	9.25 to 9.75
No. 2 busheling	5.25 to 5.75
Locomotive tires, smooth	12.50 to 13.00
Pipes and flues	8.00 to 8.50
Cupola Grades:	
No. 1 machinery cast	14.50 to 15.00
No. 1 railroad cast	12.50 to 13.00
No. 1 agricultural cast	12.50 to 13.00
Stove plate	11.25 to 11.75
Grate bars	11.25 to 11.75
Brake shoes	11.00 to 11.50

---

*Relaying rails, including angle bars to match, are quoted f.o.b. dealers' yards.

The Chicago district sales office of the American Rolling Mill Co., Middletown, Ohio, has been removed from the Peoples Gas Building, 122 South Michigan Boulevard, to the Straus Building, 310 South Michigan Boulevard.

In the rebuilding of No. 4 furnace of the Hanna Furnace Co., Buffalo, a Steinbart washer and mud catcher are to be installed by the Riter-Conley Co., Pittsburgh. The stoves and boilers are to be equipped with Steinbart burners, supplied by the American Heat Economy Bureau, Pittsburgh. Twelve of these burners will be required.

The Erie Foundry Co., Erie, Pa., now is operating day and night shifts as a result of increased activity in the demand for forging shop equipment.

Philadelphia

First Quarter Steel Contracts Carry Over Into April

PHILADELPHIA, April 2.—Shipments of steel on contracts in this district were larger last month than in either of the two preceding months. Many first quarter contracts on plates, shapes and bars were fully specified by the end of last week, but there was a sizable tonnage of uncompleted contracts, with no evident inclination on the part of some mills to take advantage of the cancellation clause. Sellers of bars and plates are maintaining 1.90c., Pittsburgh, for bars and 2.05c., Coatesville, or 2.15c., Philadelphia, for plates on new business, which is limited to small lots. The contract price for this quarter is $1 per ton less. Shapes have not reached the basis of 2.05c., Bethlehem, or 2.18c., Philadelphia, announced last month, so that both contracts for this quarter and new business are at 2c. per lb., Bethlehem, and there has been extension of old contracts at 1.95c., Bethlehem, or 2.08c., Philadelphia. The fabricated steel market is active, but chiefly on large projects. For the general run of small tonnage construction, prices continue low, despite recent advances in the mill price.

Pig Iron.—Furnaces are adhering to $20 per ton, base, and are booking little tonnage. While foundry consumers are reported quite busy, most of this activity is among the larger foundries. Occasional orders for delivery during the present quarter continue to be reported as going to Buffalo furnaces quoting on rail and water shipment. A New Jersey melter is understood to have bought 900 tons of foundry iron from Buffalo at a delivered price figuring back to slightly less than $16.50, base Buffalo. A total of 650 tons of foundry iron bought by the Consolidated Machine Tool Corporation, Rochester, N. Y., for its Hilles & Jones plant, Wilmington, Del., went to a large eastern Pennsylvania producer. Virginia cast iron pipe makers have recently closed on sizable tonnages of Virginia iron, one consumer contracting for about 10,000 tons and another for 3300 tons. There is a steady flow of business in small lots of low phosphorus iron.

Prices per gross ton at Philadelphia:

East. Pa. No. 2 plain, 1.75 to 2.25 sil.		$20.76
East. Pa. No. 2X, 2.25 to 2.75 sil.		21.26
East. Pa. No. 1X		21.76
Basic (delivered eastern Pa.)	$19.50 to	20.00
Gray forge	19.75 to	20.25
Malleable	21.00 to	21.50
Standard low phos. (f.o.b. New York State furnace)	23.00 to	24.00
Copper bearing low phos. (f.o.b. furnace)	23.50 to	24.00
Virginia No. 2 plain, 1.75 to 2.25 sil.	24.54 to	25.04
Virginia No. 2X, 2.25 to 2.75 sil.	25.04 to	25.54

Prices, except as specified otherwise, are delivered Philadelphia. Freight rates: 76c. to $1.64 from eastern Pennsylvania furnaces: $4.54 from Virginia furnaces.

Warehouse Prices, f.o.b. Philadelphia

	Base per Lb.
Plates, ¼-in. and heavier	2.50c. to 2.60c.
Plates, $\frac{3}{16}$-in.	2.80c. to 3.00c.
Structural shapes	2.40c. to 2.60c.
Soft steel bars, small shapes and iron bars (except bands)	2.50c.
Round-edge iron	3.50c.
Round-edge steel, iron finished 1½ x 1½ in.	3.50c.
Round-edge steel, planished	4.30c.
Reinforcing steel bars, square, twisted and deformed	2.50c. to 3.00c.
Cold-finished steel, rounds and hexagons	3.35c.
Cold-finished steel, squares and flats	3.85c.
Steel hoops	3.60c.
Steel bands, No. 12 gage to $\frac{3}{16}$-in., inclusive	3.35c.
Spring steel	5.00c.
Black sheets (No. 24)	4.25c.
Galvanized sheets (No. 24)	5.10c.
Blue annealed sheets (No. 10)	3.15c.
Diamond pattern floor plates—	
¼-in.	5.30c.
$\frac{3}{16}$-in.	5.50c.
Rails	3.20c.
Swedish iron bars	6.60c.

Billets.—Prices are unchanged at $33 per ton, Pittsburgh, for rerolling billets and $38, Pittsburgh, for forging quality. There is a slightly better volume of inquiry and purchasing, but no evidence has appeared of an advance in prices.

Bars.—Very little new business is coming out, but specifications against contracts are fair. There have been some extensions of first quarter contracts, but meanwhile second quarter contracts are effective at 1.85c., Pittsburgh. On new business mills are asking 1.90c., Pittsburgh.

Shapes.—Current quotations of 2.05c., Bethlehem, or 2.18c., delivered Philadelphia, apply only on the smallest lots. Contracts for this quarter are at 2c., Bethlehem, or 2.13c., Philadelphia, and some old contracts at $1 a ton lower have been extended. Much of the pending tonnage of fabricated steel is included in large projects. The Pennsylvania Railroad bridge over Newark Bay requires 5000 tons, on which bids must be in April 26, and all bids are in on the 8000 tons of steel in the Tacony-Palmyra bridge. The Reading Railroad has announced that it will erect a $3,000,000 office and warehouse building on Broad Street. The Sun Shipbuilding Co., Chester, which received contract for four Reading Railroad barges, has placed about 400 tons of shapes with the leading interest. The American Brown Boveri Electric Corporation, Camden, N. J., placed about 400 tons of shapes for two barges with a large independent.

Plates.—New business is limited to small lots, and for such business 2.05c. per lb., Coatesville, or 2.15c., Philadelphia, is maintained. Contracts for the present quarter are at 2c., Coatesville, or 2.10c., Philadelphia. Prospective purchase by the Southern Pacific Co. of 33 locomotives may bring some plate business to this district. The Tacony-Palmyra Bridge includes about 3500 tons of plates, and there is a smaller tonnage of plates in the Newark Bay Bridge, which is up for bids. The Sun Shipbuilding Co., Chester, has closed on about 700 tons of plates for four Reading Railroad barges, and the American Brown Boveri Electric Corporation, Camden, N. J., has purchased about 700 tons for two Reading barges.

Old Material.—Prices are substantially unchanged. About 25,000 tons of No. 1 steel and blast furnace scrap recently purchased was for Sparrows Point, Md. A Harrisburg consumer has closed on a tonnage of cast borings at $10.50 per ton, delivered. Offers by an eastern Pennsylvania user of machine shop turnings of $10 per ton, delivered, are reported not to have been accepted by brokers.

Prices per gross ton delivered consumers' yards, Philadelphia district:

No. 1 heavy melting steel	$13.50 to	$14.00
Scrap T rails	13.00 to	13.50
No. 2 heavy melting steel	11.00 to	11.50
No. 1 railroad wrought	14.50 to	15.00
Bundled sheets (for steel works)		10.50
Machine shop turnings (for steel works)		10.50
Heavy axle turnings (or equivalent)	12.00 to	12.50
Cast borings (for steel works and rolling mill)	10.50 to	11.00
Heavy breakable cast (for steel works)	15.50 to	16.00
Railroad grate bars	12.00 to	12.50
Stove plate (for steel works)	12.00 to	12.50
No. 1 low phos., heavy, 0.04 per cent and under	17.50 to	18.00
Couplers and knuckles	16.00 to	16.50
Rolled steel wheels	15.50 to	16.00
No. 1 blast furnace scrap	10.50 to	11.00
Machine shop turnings (for rolling mill)		11.00
Wrought iron and soft steel pipes and tubes (new specifications)		12.50
Shafting	17.50 to	18.00
Steel axles	19.00 to	20.00
No. 1 forge fire	11.00 to	11.50
Steel rails for rolling	15.00 to	15.50
Cast iron carwheels	15.50 to	16.00
No. 1 cast	16.00 to	16.50
Cast borings (for chemical plant)	14.50 to	15.00

Sheets and Strips.—Mills are quoting 2.90c., Pittsburgh, on black, 3.75c. on galvanized and 2.10c. on blue annealed sheets. There are still occasional concessions of $1 to $2 a ton on black and galvanized sheets. While 2.10c., base Pittsburgh, is firm on blue annealed sheets and strip steel sheets, buyers are registering some objection to paying the current width differentials of 10c. extra for wider than 40-in. or narrower than 24 in. The cold-rolled strip steel market is rather unsteady at 2.90c. per lb., Pittsburgh, and concessions are reported obtainable, ranging up to $2 or more a ton.

Warehouse Business.—March was a good month with heavier shipments from stock than in either January or February. Prices are fairly firm and the quantity differentials are being maintained.

Imports.—In the week ended March 31, a total of 448 tons of pig iron arrived from India. Steel arrivals consisted of 40 tons of bands, 44 tons of bars and 335 tons of structural shapes from Belgium, 26 tons of bars and 44 tons of shapes from France and 55 tons of shapes from Germany.

Cleveland

Heavy Steel Specifications—Pig Iron Sales Make Large Gain

CLEVELAND, April 3.—Specifications against 1.80c. contracts for steel bars, plates and structural material that expired March 31 were fairly heavy and buyers did not allow much tonnage to be cancelled. In some cases contract tonnage has been carried over to the second quarter, but will take the 1.85c. price. Shipments against the 1.80c. material will extend well through April. Mills are getting a fair volume of small-lot orders at the 1.90c. Pittsburgh price from small consumers who do not place contracts, but most buyers are under contract at 1.85c. The Cleveland mill steel bar price of 1.90c., which never was much more than a nominal quotation, has disappeared, producers no longer asking above 1.85c., Cleveland.

Orders for steel from the automotive industry show no falling off, and as yet there is no indication of any slowing down by this industry. Reports indicate a continuance of heavy sales by dealers of low-priced automobiles, but some of the medium and high-priced cars are not moving so well. Automobile companies as a rule are buying steel only far enough ahead to take care of their requirements for a few weeks. Inquiry for structural steel in the building field is rather slow. The Akron, Canton & Youngstown Railroad has placed 6000 tons of standard rails with a Pittsburgh district mill.

Pig Iron.—The market took on new life the past week, during which Cleveland interests sold 65,000 tons of foundry and malleable iron, or as much as during the peak of the second quarter buying a few weeks ago. Much of the business came from Michigan and Indiana, although there was a fair amount of activity in Ohio. The increased buying seemed due to the fact that many foundries had about cleaned up on first quarter contracts and were ready to make commitments for the present quarter. While no third quarter sales are reported, shipments of some of the iron bought will extend into that quarter. Some round-lot purchases were made by automobile parts manufacturers, who look for a continuation of their present good business well into or through the present quarter. Considerable inquiry is pending. Prices remain well stabilized at $17 to $17.50, Lake furnace, for foundry and malleable iron. For Ohio delivery, Lake furnaces are unable to get above $17 and for shipment to highly competitive points $16.75 is still being quoted. In Michigan the $18 price is maintained. Silicon differentials are not being closely adhered to. March shipments were about equal to those in February and April is starting out with good shipping orders. Reports from Detroit indicate that the Ford Motor Co. is planning to place considerable business with jobbing foundries. It is expected that these will be supplied with pig iron from the Ford furnaces.

Warehouse Prices, f.o.b. Cleveland

	Base per Lb.
Plates and structural shapes	3.00c.
Soft steel bars	3.00c.
Reinforcing steel bars	2.25c. to 2.75c.
Cold-finished rounds and hexagons	3.65c.
Cold-finished flats and squares	4.15c.
Hoops and bands	3.65c.
Cold-finished strip	*5.95c.
Black sheets (No. 24)	3.75c.
Galvanized sheets (No. 24)	4.40c. to 4.60c.
Blue annealed sheets (No. 10)	3.25c.
No. 9 annealed wire, per 100 lb.	$2.90
No. 9 galvanized wire, per 100 lb.	3.35
Common wire nails, base per keg	2.90

---

*Net base, including boxing and cutting to length.

Prices per gross ton at Cleveland:

N'th'n No. 2 fdy., sil. 1.75 to 2.25	$18.50
Southern fdy., sil. 1.75 to 2.25	22.00
Malleable	18.50
Ohio silvery, 8 per cent	28.00
Basic, Valley furnace	17.00
Standard low phos., Valley furnace	$26.50 to 27.00

Prices, except on basic and low phosphorus, are delivered Cleveland. Freight rates: 50c. from local furnaces; $3 from Jackson, Ohio; $6 from Birmingham.

Iron Ore.—Ore firms have made quotations on the inquiry for 440,000 tons of Lake Superior ore from the Ford Motor Co., Detroit, which asked that bids be submitted by today. It is known that some of the producers submitted last year's prices, and it is expected that the market will be established at these prices. The Ford business will probably be closed within a week. Last season's prices have been quoted on another round lot of ore, but the prospective buyer is withholding purchase until the season's prices are established.

Semi-Finished Steel.—The present price of $33, Cleveland and Youngstown, for sheet bars, large billets and slabs is expected to prevail through the second quarter, although not yet definitely placed in effect. The leading local producer is making April shipments subject to prices to be established. Specifications continue heavy.

Sheets.—The volume of business from the automotive industry continues heavy, but the demand from other sources is only moderate. Consumers generally are limiting purchases to early requirements and few have placed second quarter contracts. Price irregularities continue on black and galvanized sheets and in that respect the market shows little change from a week ago. On black sheets 2.90c., Valley mill, has become the more general quotation and this is evidently being shaded for attractive lots. On galvanized sheets 3.65c., Ohio mill, is rather commonly quoted. Blue annealed sheets are holding closely to the 2.10c., Pittsburgh base. Auto body sheets are moving in good volume at the regular 4.15c. Pittsburgh price.

Strip Steel.—Some small-lot sales of hot-rolled strip are being made at the regular price, but not much test of the market is expected before the end of the month. Mills have received heavy specifications against low-priced contracts, on which shipments will extend through April. Mills are meeting considerable resistance against present prices on cold-rolled strip. The regular quotations are holding fairly well on the business taken, which is only in small lots. However, buyers in some cases have been able to secure a 2.85c. price, or a concession of $1 a ton.

Reinforcing Bars.—New inquiry is light. Local mills are asking 1.85c., Cleveland, for billet steel bars, but competition is very keen. Rail steel bars are quoted at 1.75c., mill.

Alloy Steel.—The demand from the automotive industry continues heavy and the plant of the leading Ohio producer is running at capacity. Some contracts covering consumers' requirements have been placed for the second quarter. No deviation from the new 2.65c. base price is reported.

Coke.—One producer has reduced by-product foundry coke 50c. a ton to $6, Connellsville base. Connellsville foundry coke is inactive, with prices unchanged at $3.75 to $5.10. Heating coke is weaker, ranging from $2.59 to $2.75.

Bolts, Nuts and Rivets.—Bolt and nut business during March showed a slight gain over February. The recent 10 per cent advance on stove bolts brought out heavy specifications, and the $3 advance on large rivets also stimulated specifications against contracts that expired March 31. The majority of bolt and nut consumers have placed second quarter contracts. Cleveland jobbers have advanced prices 10 per cent to 60 per cent off list on machine and carriage bolts and nuts.

Old Material.—The American Steel & Wire Co., which has not been a buyer of scrap for its Cleveland steel plant for several years, bought about 8000 tons of heavy melting steel and compressed sheet scrap during the week. This purchase gave a little life to an otherwise lifeless market and will enable dealers to move scrap that has been backing up because of restricted shipments to other consumers. Dealers have considerable scrap for which they are trying to find an outlet. While the market does not have a firm tone, no concessions from ruling quotations are reported.

Prices per gross ton, delivered consumers' yards:

Basic Open-Hearth Grades	
No. 1 heavy melting steel	$13.75 to $14.00
No. 2 heavy melting steel	13.25 to 13.50
Compressed sheet steel	12.75 to 13.00
Light bundled sheet stampings	11.50 to 11.75
Drop forge flashings	12.50 to 13.00
Machine shop turnings	9.00 to 9.25
No. 1 railroad wrought	11.50 to 12.00
No. 2 railroad wrought	13.50 to 14.00
No. 1 busheling	11.00 to 11.25
Pipes and flues	9.00 to 9.50
Steel axle turnings	12.50 to 13.00
Acid Open-Hearth Grades	
Low phosphorus forging crops	16.50 to 17.00
Low phosphorus, billet, bloom and slab crops	17.00 to 17.50
Low phosphorus sheet bar crops	16.50 to 17.00
Low phosphorus plate scrap	16.00 to 16.50
Blast Furnace Grades	
Cast iron borings	10.00 to 10.25
Mixed borings and short turnings	10.00 to 10.25
No. 2 busheling	10.00 to 10.25
Cupola Grades	
No. 1 cast	16.50 to 17.00
Railroad grate bars	11.00 to 12.00
Stove plate	12.00 to 12.50
Rails under 3 ft	18.00 to 18.50
Miscellaneous	
Railroad malleable	15.00 to 15.50
Rails for rolling	16.25 to 16.50

New York

Pig Iron Competition Keener—Variations in Bids on Railroad Steel

NEW YORK, April 3.—With the opening of navigation on the State Barge Canal only about two weeks away, increasing interest is being shown in water transportation of pig iron. Buffalo shippers are taking steps to bring about an improvement of transshipment facilities both at Beacon, N. Y., and at Jersey City, N. J. Pig iron for New England delivery will, in most cases, be transferred from barge to freight car at Beacon. The freight rate to most New England points from Beacon is $2 a ton; the transfer charge is understood to be 28c., and the barge rate from Buffalo about $1.50. The combination rate, counting all charges, is expected to be at least $1 a ton below the all-rail rate. Pig iron sales for the week by local brokers totaled 10,000 tons, a gain of about 1000 tons over the previous week. Competition is keen and prices are responding to pressure. One good-sized recent purchase brought out prices of $16, Buffalo, for No. 2X and $16.50 for No. 1X. While no price lower than $16 has been reported on No. 2 plain, the aforementioned quotations indicate a willingness to waive silicon differentials. The Singer Mfg. Co. has bought 1500 tons of New York State iron for its St. Johns, Que., plant. The General Electric Co. has closed for about 2000 tons of various grades for delivery at Bayway, N. J., Schenectady, N. Y., and at its New England plants. The Malleable Iron Fittings Co., Branford, Conn., has placed orders against an inquiry for 800 to 1000 tons of malleable iron for barge shipment. Inquiries are more numerous, although many of them are small, indicating a disposition to buy conservatively. Virtually no third quarter demand is reported. The Worthington Pump & Machinery Corporation, New York, is in the market for 307 tons of Bessemer iron for Harrison, N. J., 80 tons of Bessemer for Holyoke, Mass., 450 tons of foundry for Elmwood Place, Ohio, and 400 tons of various grades for Buffalo. Deliveries over the next 10 weeks are called for. The American Locomotive Co., New York, is inquiring for 500 tons, and the New York Air Brake Co. wants 500 tons of charcoal for Watertown, N. Y. The International Motor Co., New York, is in the market for 125 tons of foundry for its New Brunswick, N. J., plant, and the Gifford-Wood Co., Hudson, N. Y., is asking for prices on 100 tons. A cargo of 3300 tons of Dutch iron is expected to arrive shortly at Bridgeport, Conn. This is said to be the first deep water shipment to that port. Part of the iron has been sold and the remainder will be stocked at the dock of the T. A. D. Jones Coal Corporation.

Prices per gross ton, delivered New York district:

Buffalo No. 2 fdy., sil. 1.75 to 2.25	$20.91 to $21.91
East. Pa. No. 2 fdy., sil. 1.75 to 2.25	20.39 to 22.52
East. Pa. No. 2X fdy., sil. 2.25 to 2.75	20.89 to 23.02
East. Pa. No. 1X fdy., sil. 2.75 to 3.25	21.39 to 23.52

Freight rates: $4.91 from Buffalo, $1.39 to $2.52 from eastern Pennsylvania.

Finished Steel.—Specifications against expiring first quarter contracts for plates, shapes and bars were fairly heavy, but some consumers did not specify their full quotas and most of the mills insisted on cancella-

Warehouse Prices, f.o.b. New York

	Base per Lb.
Plates and structural shapes	3.35c.
Soft steel bars and small shapes	3.25c.
Iron bars	3.24c.
Iron bars, Swedish charcoal	7.00c. to 7.25c.
Cold-finished shafting and screw stock—	
Rounds and hexagons	3.40c.
Flats and squares	3.90c.
Cold-rolled strip, soft and quarter hard,	5.15c. to 5.40c.

---

*No. 28 and lighter, 36 in. wide, 20c. higher per 100 lb.

tion of the unspecified portions. Shipments of bars at 1.80c., Pittsburgh, plates at 1.95c., Coatesville, and shapes at 1.95c., Bethlehem, on these contracts will extend through April. Somewhat similar conditions exist with respect to the low-priced contracts on sheets and strip steel, so the real test of second quarter prices on a number of products will not come until the latter part of this month or early in May. Quotations on plates, shapes and bars opened last week by the New York Central Railroad covering its second quarter requirements showed interesting variations. On plates, the Lukens Steel Co. quoted 1.85c., Newberry Junction; Alan Wood Iron & Steel Co., 2.18½c., Newberry Junction; Central Iron & Steel Co., 2.13½c., Newberry Junction; Bethlehem Steel Co., 1.90c., West Seneca; Youngstown Sheet & Tube Co., 1.90c., Youngstown; Otis Steel Co., 1.85c., Cleveland; Jones & Laughlin Steel Corporation, 1.90c., Youngstown; Illinois Steel Co., 2c., Chicago. On bars, bids were as follows: Carnegie Steel Co., 1.90c., Pittsburgh or Youngstown; Bethlehem, 1.90c., West Seneca; Bourne-Fuller Co., 1.90c., Cleveland; Donner Steel Co., 1.90c., Buffalo; Jones & Laughlin, Republic Iron & Steel Co. and Youngstown Sheet & Tube Co., all 1.90c., Youngstown; Pittsburgh Crucible Steel Co., 2.16½c., Buffalo; Corrigan, McKinney Steel Co., 1.85c., Cleveland; Illinois Steel Co., 2c., Chicago. On shapes bids were: Bethlehem, 1.90c., West Seneca; Carnegie, 2.03c., West Seneca; Jones & Laughlin and Republic, 1.90c., Youngstown; Eastern Steel Co., 2.08c., Newberry Junction; Illinois, 2c., Chicago. On forging billets Inland Steel Co. bid $35, Indiana Harbor; Bethlehem, $38, West Seneca; Alan Wood Iron & Steel Co., $42.80, Newberry Junction; Andrews Steel Co., $41.72, Columbus, Ohio; Illinois, $38, Chicago; Jones & Laughlin, $40.89, Youngstown; Pittsburgh Crucible, $41.53, Buffalo.

Mill prices per lb., delivered New York: Soft steel bars, 2.19c. to 2.24c.; plates, 2.17½c. to 2.22½c.; structural shapes, 2.14½c. to 2.19½c.; bar iron, 2.14c.

Reinforcing Bars.—The Truscon Steel Co. will furnish 500 tons of bars for a warehouse in Manhattan. No other large awards have been reported in the last week and the volume of small business has continued rather small. Pending work is showing more activity, but improvement is not as marked as is usually the case at this season. The 1.95c., Pittsburgh, mill price has not entirely disappeared but distributers generally are quoting 2c. on new business. Warehouse prices are unchanged.

Cast Iron Pipe.—Prices of Northern producers of bell and spigot pipe are at a level slightly below the delivered prices of Birmingham makers. Southern makers, quoting on a basis of $29 to $30 per ton, Birmingham, are unable in most cases to meet the competition of Northern producers, who quote from $36.25 to $37.25 per net ton, delivered New York. There is some small municipal business in the market. Troy, N. Y., has awarded 150 tons of water pipe and Albany, N. Y., 3000 tons of water pipe to B. Nicoll & Co. Middlebury, Vt., is reported to have placed about 600 tons of 10-in., and Somerset, Mass., has taken bids on about 100 tons. The city of New York is reported preparing an inquiry for about 5000 tons.

Prices per net ton, delivered New York: Water pipe 6-in. and larger, $36.25 to $37.25; 4-in. and 5-in., $41.25 to $42.25; 3-in., $51.25 to $52.25; Class A and gas pipe, $4 to $5 extra.

Warehouse Business.—Effective April 2, warehouses in this district have adopted quantity differentials on plates, shapes, bars, diamond pattern floor plates, hoops, bands and blue annealed sheets. The differentials apply to the total tonnage of these products purchased at one time. On 250 to 3999 lb. the base price is applied; 4000 to 7999 lb. a deduction of 15c. per 100 lb.; 8000 to 14,999 lb., a 25c. per 100 lb. deduction, and on 15,000 lb. or more, a 40c. per 100 lb. deduction. On purchases of 249 lb. or less there is a 50c. extra charge on each order. Prices of the products affected by the new quantity differentials have been adjusted by an advance of 1c. per 100 lb. as a convenience in figuring charges. Warehouse prices of zinc sheets have been reduced 1c. per lb. in line with the recent mill reduction. Hot and cold rolled copper sheets have been advanced ¼c. per lb. Shipments from stock were better last month than in either January or February.

Coke.—There is a moderate volume of purchasing. Local by-product coke prices are unchanged, but the New England producer has reduced prices 50c. a ton, now quoting $11 per net ton, delivered in the New England district. An outstanding transaction in this district is the purchase of about 130,000 net tons of by-product coke from the local producer by the Public Service Corporation of New Jersey. Delivered prices on beehive foundry coke are: To northern New Jersey, Jersey City and Newark, $8.71 to $8.81 per net ton; to New York and Brooklyn, $9.59 to $9.69 per net ton. By-product coke is quoted at $9 to $9.40 per net ton, Newark or Jersey City, N. J., and $10.06 to $10.29 per ton, New York or Brooklyn.

Old Material.—The general tendency of prices on all grades of scrap is downward. No. 1 heavy melting steel is unchanged, but yard grade is off about 25c. per ton, $10.50 to $10.75 per ton being paid on deliveries to eastern Pennsylvania consumers. Brokers are offering $10 per ton, delivered Harrisburg, Pa., for cast borings, and stove plate is being purchased at $11.50 per ton, delivered to a Phoenixville, Pa., user. Machine shop turnings are being bought at $10 per ton, delivered Phoenixville. The list of the Pennsylvania Railroad this month offers about 45,000 tons.

Dealers' buying prices per gross ton f.o.b. New York:

No. 1 heavy melting steel	$10.00 to	$10.85
Heavy melting steel (yard)	6.75 to	7.25
No. 1 heavy breakable cast	11.25 to	12.00
Stove plate (steel works)	8.00 to	8.50
Locomotive grate bars	8.00 to	8.50
Machine shop turnings	6.50 to	7.25
Short shoveling turnings	6.50 to	7.25
Cast borings (blast furnace or steel works)	6.25 to	7.25
Mixed borings and turnings	6.50 to	7.25
Steel car axles	15.50 to	16.00
Iron car axles	23.75 to	24.75
Iron and steel pipe (1 in. dia., not under 2 ft. long)		8.25
Forge fire	6.75 to	7.00
No. 1 railroad wrought	10.00 to	10.50
No. 1 yard wrought, long	8.50 to	9.00
Rails for rolling	10.00 to	10.50
Cast iron carwheels	10.75 to	11.25
Stove plate (foundry)	8.50 to	9.00
Malleable cast (railroad)		10.00
Cast borings (chemical)	11.00 to	11.50

Prices per gross ton, delivered local foundries:

No. 1 machinery cast	$13.75 to	$14.25
No. 1 heavy cast (columns, building materials, etc.), cupola size	11.75 to	12.25
No. 2 cast (radiators, cast boilers, etc.)	11.25 to	11.75

Reorganization of Canadian Steel Companies Planned

Information received at Toronto, Ont., from Halifax, N. S., is to the effect that a bill to incorporate the Dominion Steel & Coal Corporation, Ltd., has been prepared and will be introduced in the Provincial Legislature. The incorporators of the proposed new company, as named in the bill, are Sir Herbert Holt, J. H. Gundy, George A. Montgomery and C. B. McNaught, all members of the new coal and steel administration that recently gained control of the British Empire Steel Corporation.

The proposed share capital of the new company will be $65,000,000, divided as follows: 1,000,000 preference class "A" shares of $40 each and 1,000,000 common class "B" shares of $25 each. The plan of the new administration, as stated, is upon reorganization to do away with holding companies and to consolidate at least the greatest part of the operations of the British Empire Steel Corporation and its constituents and their subsidiaries under one big operating company, the incorporation of which is sought. In the course of time, it is proposed, the name and structure of the British Empire Steel Corporation will disappear, as will also the financial structure of most of its constituents and their subsidiaries, with some possible exceptions.

Over 50 members and non-members have enrolled for a 10 weeks' course in the metallography of steel, sponsored by the Indianapolis chapter of the American Society for Steel Treating. The course will consist of 10 lectures by Edward J. P. Fisher, research metallurgist of the Diamond Chain & Mfg. Co., Indianapolis, and treasurer of the chapter.

San Francisco

15,000 Tons of Line Pipe Placed—4300 Tons of Shapes for Store

SAN FRANCISCO, March 31 (*By Air Mail*).—Important developments in the Coast markets during the week included the placing of 4300 tons of structural shapes for the Capwell store in Oakland with the Judson-Pacific Co., the award of 13,387 tons of line pipe for the Pasotex Petroleum Co. to the National Tube Co. and a call for bids by the Santa Fe Railroad, San Francisco, on 700 tons of plates for a carfloat.

Construction activity is holding up well all along the Coast and a number of new projects, involving heavy expenditures, are about ready to come up for figures. Building activity in Los Angeles is ahead of last year.

Pig Iron.—Demand for foundry pig iron is spotty and both sales and inquiries are confined to small lots. Little improvement is noted in foundry operations in the southern part of the State due to the quiet conditions prevailing in the oil fields. No changes in prices are noted.

Prices per gross ton at San Francisco:

*Utah basic	$25.00 to $26.00
*Utah foundry, sil. 2.75 to 3.25	25.00 to 26.00
**Indian foundry, sil. 2.75 to 3.25	24.00 to 25.00
**German foundry, sil. 2.75 to 3.25	24.25

*Delivered San Francisco.
**Duty paid, f.o.b. cars San Francisco.

Bars.—The largest award of reinforcing bars of the week was 1050 tons to the United States Steel Products Co. for Government work at Cristobal. Awards this week totaled close to 2100 tons. Bookings for the first quarter, as reported each week in THE IRON AGE, totaled 13,432 tons. Bids will be opened next week on 5200 tons for a drainage improvement project in Los Angeles. The majority of both sales and inquiries are confined to small lots. In the San Francisco district 2.25c. on out-of-stock material appears to be the minimum, with some business going at 2.50c. and 2.60c.

Plates.—No plate awards of import were noted this week. Pending business totals over 10,500 tons. Prices continue firm at 2.30c., c.i.f.

Shapes.—The past week was active in the fabricated steel market. More than 6200 tons was placed, including the 4300 tons for the Capwell store in Oakland. The Llewellyn Iron Works took 400 tons for an apartment in Los Angeles and the Judson-Pacific Co. secured 400 tons for the Medical-Dental Building addition in San Francisco. Several bridge projects for the State of California are pending, totaling close to 2200 tons. Pending projects total 9000 tons. Prices on plain material are firm at 2.35c., c.i.f. Coast ports.

Cast Iron Pipe.—Cast iron pipe awards aggregated 1000 tons, bringing the total for the first quarter of the year to 21,000 tons. San Diego, Cal., placed 123 tons of 18-in. class C pipe with the United States Cast Iron Pipe & Foundry Co. Red Bluff, Cal., divided 100 tons between the Pacific States Cast Iron Pipe Co. and the Crane Co., the former securing the 6-in. class B and the latter the 10-in. centrifugal pipe. The United States Cast Iron Pipe & Foundry Co. also took 413 tons of 10 to 24-in. class 150 for Santa Ana, Cal. San Bernardino placed 406 tons of 6 and 8-in. class 250 pipe as follows: 135 tons of 6-in. with the Pacific States Cast Iron Pipe Co. and 271 tons of 8-in. with the American Cast Iron Pipe Co. Bids were opened on 181 tons of 6 and 8-in. class B for the improvement of Foothill Boulevard, Azusa, Cal. Bids will be opened next week on 127 tons of 6-in. class B for the improvement of Washington Street, Riverside, Cal. New inquiries include 210 tons of 6 and 8-in. class C for the improvement of Willow Street, San Diego, Cal., and 129 tons of 8 to 24-in. class B for a sewer project at San Bernardino, Cal. Prices are weak and $35 a ton delivered on 6-in. and larger prevails.

Warehouse Prices, f.o.b. San Francisco

	Base per Lb.
Plates and structural shapes	3.15c.
Soft steel bars	3.15c.
Small angles, $\frac{3}{16}$-in. and over	3.15c.
Small angles, under $\frac{3}{16}$-in.	3.55c.
Small channels and tees, ¾-in. to 2¾-in.	3.75c.
Spring steel, ¼-in. and thicker	5.00c.
Black sheets (No. 24)	4.95c.
Blue annealed sheets (No. 10)	3.90c.
Galvanized sheets (No. 24)	5.50c.
Structural rivets, ½-in. and larger	5.65c.
Common wire nails, base per keg	$3.40
Cement coated nails, 100-lb. keg	3.40

Standard Pipe.—The largest pipe tonnage placed this year was obtained by the National Tube Co. and involved 200 miles of 8⅝-in. line pipe of two weights, 25 and 28½ pounds, the tonnage amounting to 13,387 tons. This line is for the Pasotex Pipe Line Co., a subsidiary of the Pasotex Petroleum Corporation, the parent company of which is the Standard Oil Co. of California. Bids will be opened next week on 125 tons of 2 to 8-in. o. d. well casing or Matheson joint pipe for the Armona Public Utility District of Armona, Cal.

Youngstown

Steel Production Holds to 80 Per Cent Rate—Tin Plate Demands Heavy

YOUNGSTOWN, April 3.—Viewing the situation solely from the standpoint of volume of business, there is a goodly amount of satisfaction among steel manufacturers in this district, but from the price angle the outlook is less satisfactory. Local producers do not expect that earnings in the quarter just ended will show a gain over those for the last quarter of last year in keeping with the gain in business. While the average of invoice prices will be slightly higher, the principal source of increased revenue will be in the fuller engagement of productive capacity as compared with the last half of last year, with the consequent saving in production costs. Manufacturers are optimistic over the possibility of a continued good demand from the automotive industry. It is believed that some time in this quarter the Ford Motor Co. will get the production of its new model up to full expectations and there will be a demand for steel from that direction which will counterbalance any decline there may be in the demand from other motor car builders.

General operations of the district have slipped off somewhat from the high rate attained about the middle of March, but ingot production is averaging around 80 per cent of capacity, which is well above the average at this time last year, when the district was feeling the ebb from the extreme activity of March of last year. The Youngstown Sheet & Tube Co. is producing ingots at about 75 per cent of capacity, the Republic Iron & Steel Co., about 80 per cent, the Sharon Steel Hoop Co., between 75 and 80 per cent and the Trumbull Steel Co. at full physical capacity. The latter, which has had all eight of its open-hearth furnaces in production, took one off this week, but is replacing the lost production by purchases of cold ingots from the Republic Iron & Steel Co. Union of these companies has not yet been formally effected, but this will be accomplished shortly as it is understood that the legal matters pertaining to merger are almost completed.

Tin plate demands upon the mills of the district are heavy, particularly for the sizes used in the manufacture of condensed milk cans and for oil, paint, tobacco and dry foods. There is full engagement of the mills in the Shenango Valley, while the Trumbull Steel Co. also is enjoying almost full operation. Wire products, notably nails, are not doing particularly well. Jobbers took full advantage of the low prices of last December to load up on nails. Pipe business is more notable for its steadiness than volume; demand lacks urgency and it is only when the monthly check up takes place that makers realize they have been doing something. The Republic Iron & Steel Co. is shipping about 600 tons of 6-in. and 8-in. line pipe to the Lone Star Gas Co., Dallas, Tex.

Sheet mill activity still is high, but it is largely on low-priced business. J. D. Waddell, vice-president Empire Steel Corporation, the combination of six Ohio sheet companies, reports that 58 of the 60 mills of that company are in production. This explains a rather good movement of sheet bars from local producers, who, however, are insistent that the weakness prevailing in the Cleveland market has not extended to this district. Activity is lacking in pig iron, notably the steel-making grades, which producers in this and the Shenango Valley districts are unable to ship toward Pittsburgh on account of the competition provided by Pittsburgh district steel companies.

The Republic Iron & Steel Co. will resume shortly the manufacture of railroad spikes after having been out of that market for several years. Spike making machines have been installed at its Brown-Bonnell works and will be started on or about April 15. A complete range of sizes will be made. Both large and small spikes are quoted at $2.80, base, per 100 lb. mill, with carload lots the minimum mill shipment order. The Youngstown Sheet & Tube Co. is moving ahead steadily with its new $6,000,000 power plant at the Campbell works. At Sharon, Pa., the Sharon Steel Hoop Co. is making good progress on its new strip mill, the hot mills for which will be furnished by the Morgan Construction Co., Worcester, Mass., and the cold mills by the E. W. Bliss Co. The Carnegie Steel Co. is planning to transfer the manufacture of cotton ties and narrow strips from its Lower Union mills in this city to McDonald, where a new electrically-driven 16-stand 10-in. unit is to be installed.

The Erie Railroad has informed the Interstate Commerce Commission that it is not opposed to the extension of the Pittsburgh, Lisbon & Western Railroad, Pittsburgh Coal Co. subsidiary, which would connect Youngstown with the Ohio River. Other roads which would suffer a loss of business from the construction of this new line have not yet announced intentions as to their course. The steel industry is very much in doubt as to whether the new line will be built and is disposed to see the plan in more definite shape before committing itself to its support.

Birmingham

New Steel Business Develops Steadily—Pig Iron Sales at Even Rate

BIRMINGHAM, April 3.—Spot sales of pig iron for the past week were about equal to the recent weekly average. Foundry iron sales are still on a $16 base. Shipments during March showed a slight increase as compared with the two preceding months. There has been no change in the number of active furnaces during the past three weeks, 18 being in blast. Of this number, nine are on foundry, seven on basic, one on recarburizing iron and one on ferromanganese.

Prices per gross ton, f.o.b. Birmingham district furnaces:

No. 2 foundry, 1.75 to 2.25 sil.	$16.00
No. 1 foundry, 2.25 to 2.75 sil.	16.50
Basic	15.00

Finished Steel.—New business continues to develop at a steady rate. Inquiries are not heavy, but the volume is sufficient to indicate that a fair amount of business is in prospect. Structural steel fabricators and bar manufacturers have a comfortable amount of work ahead, and inquiries are developing at a fair rate. No changes have been made in open-hearth operations during the past several weeks. The Tennessee company is operating 13 or 14 and the Gulf States Steel Co. four.

Cast Iron Pipe.—New business of pressure pipe manufacturers during March was confined largely to small-lot orders from private consumers, but was large enough to keep plants operating at 75 to 80 per cent capacity. Inquiries indicate that municipal buying during April will be in satisfactory volume. Local plants are expected to share in the new contracts being placed by several cities in Michigan and Illinois. Prices are showing more firmness with the base still at $29 to $31 for 6 in. and larger.

Coke.—With foundry coke consumers' requirements for the second quarter largely covered, the demand has dropped somewhat and sales consist largely of spot orders. Some inquiries are being received on third quarter coke. Around 2000 tons of coke from this district is en route to the West coast by way of Pensacola, Fla. Both spot and contract quotations are unchanged from $5 base.

Old Material.—Consumers are showing very little interest in buying and the market remains quiet and below normal. Shipments are light. Prices are unchanged.

Prices per gross ton, delivered Birmingham district consumers' yards:

Heavy melting steel	$9.50 to $10.00
Scrap steel rails	11.00 to 11.50
Short shoveling turnings	8.00 to 8.50
Cast iron borings	8.00
Stove plate	14.50
Steel axles	19.00 to 20.00
Iron axles	20.00 to 21.00
No. 1 railroad wrought	10.00 to 10.50
Rails for rolling	13.00
No. 1 cast	14.50
Tramcar wheels	12.50 to 13.50
Cast iron carwheels	12.00 to 13.00
Cast iron borings, chemical	13.50 to 14.00

St. Louis

Pig Iron Sales Lighter—Some Grades of Scrap Off 25c. to 50c.

ST. LOUIS, April 3.—The pig iron market quieted down somewhat during the last week, sales of the St. Louis Gas & Coke Corporation totaling about 4500 tons, while a leading Southern interest sold about 850 tons, including one lot of 500 tons. The local maker's principal sale was 2000 tons, and there were two sales of 1000 tons each, one of the latter to an Evansville melter. Shipping orders against contracts are satisfactory to makers. Prices are unchanged.

Prices per gross ton at St. Louis:

No. 2 fdy., sil. 1.75 to 2.25 f.o.b. Granite City, Ill.	$19.50 to $20.00
Northern No. 2 fdy., delivered St. Louis	20.66
Southern No. 2 fdy., delivered	20.42
Northern malleable, delivered	20.66
Northern basic, delivered	20.66

Freight rates: 81c. from Granite City to St. Louis; $2.16 from Chicago; $4.42 from Birmingham.

Coke.—The market for domestic grades is exceedingly quiet. Dealers are awaiting the announcement of new prices next week. Buying of foundry grades is light.

Finished Iron and Steel.—While railroads are issuing no important new inquiries, specifications for tie plates, bolts and spikes are well up to contracts and rails are being called for ahead of specified delivery dates. Orders for second quarter delivery of plates, shapes and bars are coming in, and specifications against contracts are satisfactory. Structural fabricators report business is quiet. Warehouse business is light.

Old Material.—Mills are using up stocks of scrap on hand or contracted, and in the absence of buying further weakness has developed. Dealers are buying from one another and from railroad lists only to cover contracts. Heavy melting steel, heavy shoveling steel, No. 2 railroad wrought are 25c. a ton off, and railroad springs, No. 1 machinery cast, railroad malleable, No. 1 railroad cast and stove plate are 50c. lower. Railroad lists include: Baltimore & Ohio, 14,829 tons; Pennsylvania, 4893 tons; Big Four lines, 1220 tons; Chicago,

Warehouse Prices, f.o.b. St. Louis

	Base per Lb.
Plates and structural shapes	3.25c.
Bars, soft steel or iron	3.15c.
Cold-finished rounds, shafting and screw stock	3.75c.
Black sheets (No. 24)	4.45c.
Galvanized sheets (No. 24)	5.25c.
Blue annealed sheets (No. 10)	3.60c.
Black corrugated sheets (No. 24)	4.50c.
Galvanized corrugated sheets	5.30c.
Structural rivets	3.75c.
Boiler rivets	3.75c.
	Per Cent Off List

Less than 100 lb.	65
Machine bolts	60
Carriage bolts	60
Lag screws	60
Hot-pressed nuts, square, blank or tapped, 200 lb. or more	60
Less than 200 lb.	50
Hot-pressed nuts, hexagons, blank or tapped, 200 lb. or more	60
Less than 200 lb.	50

Indianapolis & Louisville, 587 tons; Missouri Pacific, 73 carloads; Frisco Lines, 7 carloads.

Prices per gross ton, f.o.b. dealers' yards and delivered St. Louis district consumers' works:

Heavy melting steel	$11.00 to $11.50
No. 1 locomotive tires	12.25 to 12.75
Heavy shoveling steel	11.00 to 11.50
Miscellaneous standard-section rails, including frogs, switches and guards, cut apart	12.50 to 13.00
Railroad springs	13.50 to 14.00
Bundled sheets	8.75 to 9.25
No. 2 railroad wrought	11.00 to 11.50
No. 1 busheling	9.75 to 10.25
Cast iron borings	9.00 to 9.50
Iron rails	13.00 to 13.50
Rails for rolling	12.75 to 13.25
Machine shop turnings	7.00 to 7.50
Steel car axles	18.50 to 19.00
Iron car axles	23.50 to 24.00
Wrought iron bars and transoms	21.00 to 21.50
No. 1 railroad wrought	10.00 to 10.50
Steel rails, less than 3 ft	15.00 to 15.50
Steel angle bars	11.50 to 12.00
Cast iron carwheels	13.00 to 13.50
No. 1 machinery cast	13.50 to 14.00
Railroad malleable	10.75 to 11.25
No. 1 railroad cast	13.00 to 13.50
Stove plate	12.50 to 13.00
Agricultural malleable	12.00 to 12.50
Relaying rails. 60 lb. and under	20.50 to 23.50
Relaying rails, 70 lb. and over	26.50 to 29.00

Canada

Pig Iron Sales Have Gained—Railroads to Buy Steel

TORONTO, ONT., April 3.—Business done in pig iron during March showed the highest monthly average this year, while for the first quarter the improvement in sales was 10 to 15 per cent compared with the first quarter of 1927. Advance contract placing was active during the past two weeks with the result that the majority of those melters who place contracts are now covered up to the end of June. One feature of advance buying is that higher tonnages are involved in second quarter orders. Pig iron prices are firm in the Toronto market, but shading continues in Montreal.

Prices per gross ton:

Delivered Toronto	
No. 1 foundry, sil. 2.25 to 2.75	$23.60
No. 2 foundry, sil. 1.75 to 2.25	23.60
Malleable	23.60
Delivered Montreal	
No. 1 foundry, sil. 2.25 to 2.75	$24.50 to $25.00
No. 2 foundry, sil. 1.75 to 2.25	24.50 to 25.00
Malleable	24.50 to 25.00
Basic	24.00
Imported Iron at Montreal Warehouse	
Summerlee	33.50
Carron	33.00

Rails.—The Canadian Pacific and Canadian National have announced extensive track laying programs for this year. The Canadian Pacific intends to lay 247 miles of new track. The Canadian National Railways purpose to spend $19,000,000 on general betterments, which will include the purchase of 160,000 tons of new rails to cost upward of $9,000,000; upward of 7,000,000 tie plates will be purchased at a cost of $2,350,000, and 1,000,000 rail anchors costing $255,000 will be ordered. Rail mills at Sault Ste. Marie, Ont., and Sydney, N. S., are now running practically at capacity and will continue at this rate well into June. New business to be placed will supply sufficient business to keep these mills in operation practically through the year.

Structural Steel.—Structural steel sales show steady improvement. Some large tonnages are involved in proposed new structures in the leading cities of the Dominion. The Robert Simpson Co., Toronto, has announced a building program, for which upward of 5000 tons of steel will be required. It is estimated that 25,000 tons of structural steel will be required for Canadian Pacific and Canadian National bridge building operations for Ontario and Quebec.

Old Material.—Sales show improvement. During the past week or 10 days, second quarter buying was strongly featured in addition to a good demand on spot delivery account. While much of the new business is coming from Hamilton consumers, melters throughout Ontario are buying more extensively. Export demand for old material is improving steadily and large shipments are now being made to United States buyers. Prices continue firm but unchanged.

Dealers' buying prices:

	Toronto	Montreal
Per Gross Ton		
Heavy melting steel	$9.00	$8.00
Rails, scrap	10.00	10.00

Malleable scrap	13.00	....

Cincinnati

Pig Iron Prices Weaken—Black Sheets and Nails Lower

CINCINNATI, April 3.—Severe competition between furnaces in northern and southern Ohio for second quarter pig iron business in this district has resulted in the shading of prices. On sizable inquiries Lake Erie producers are reported to have quoted $16.50, base Cleveland, with a silicon differential of 25c. a ton and in at least one instance the base price was under that figure. An Ironton maker in the past week sold 500 tons of high phosphorus iron to a Hamilton, Ohio, company at about 50c. less than the regular schedule of $19, base furnace. The seller, however, insists that this constituted a special transaction which does not disturb the price structure, which has stood at $19 for a number of months. Other outstanding sales have been 2000 tons of northern Ohio foundry to a melter in this territory, 500 tons of northern Ohio foundry iron to a Hamilton, Ohio, consumer, and 800 tons of malleable to a Kokomo, Ind., company. Inquiries are more numerous and include 3000 tons for an Ohio company, 1000 tons for a Louisville melter and 450 tons for the Laidlaw Works of the Worthington Pump & Machinery Corporation. Tennessee and Alabama irons are quoted at $16, base Birmingham, but sales north of the Ohio River have been unimportant.

Prices per gross ton, delivered Cincinnati:

So. Ohio fdy., sil. 1.75 to 2.25	$20.89
So. Ohio malleable	$20.14 to 20.89
Alabama fdy., sil. 1.75 to 2.25	19.69
Alabama fdy., sil. 2.25 to 2.75	20.19
Tennessee fdy., sil. 1.75 to 2.25	19.69
Southern Ohio silvery, 8 per cent	26.89

Freight rates, $1.89 from Ironton and Jackson, Ohio; $3.69 from Birmingham.

Finished Material—Interest in the past week has centered largely in second quarter prices, which in certain directions are failing to stand up under test. Black sheets, which have been quoted consistently at 2.90c., base Pittsburgh, for a number of weeks, are being purchased by large consumers at $3 a ton under that figure, although manufacturers claim to be holding to the

Warehouse Prices, f.o.b. Cincinnati

	Base per Lb.
Plates and structural shapes	3.40c.
Bars, soft steel or iron	3.30c.
New billet reinforcing bars	3.15c.
Rail steel reinforcing bars	3.00c.
Hoops	4.00c. to 4.25c.
Bands	3.95c.
Cold-finished rounds and hexagons	3.85c.
Squares	4.35c.
Black sheets (No. 24)	4.05c.
Galvanized sheets (No. 24)	4.90c.
Blue annealed sheets (No. 10)	3.60c.
Structural rivets	3.85c.
Small rivets	65 per cent off list
No. 9 annealed wire, per 100 lb	$3.00
Common wire nails, base per keg	2.95
Cement coated nails, base 100 lb. keg	2.95
Chain, per 100 lb	7.55
	Net per 100 Ft.
Lap-welded steel boiler tubes, 2-in	$18.00
4-in.	38.00
Seamless steel boiler tubes, 2-in	19.00
4-in.	39.00

regular schedule in accepting orders for small lots. Irregularities also have cropped out in common wire nails, which are being offered in the southern Ohio district by an Ironton, Ohio, mill at $2.55 per keg, base Ironton. While on the surface this appears to be a concession of only 10c. a keg, the reduction actually is more than that when figured on a Pittsburgh base because of the freight differential in favor of Ironton. Furthermore, at Ohio River points to which delivery can be made by barge from Ironton, jobbers and consumers are obtaining nails at a price equivalent to about $2.40, Pittsburgh. Aside from nails, the wire goods market has been fairly firm and bookings have been of moderate volume. The number of orders for fencing has been normal for this time of the year. Outstanding in structural steel has been the award to the McClintic-Marshall Co. of 18,000 tons by the Big Four Railroad for a bridge spanning the Ohio River at Louisville, Ky. This is the largest structural steel job placed in this district in many years. Bars, structural shapes and plates are quoted at 1.90c. to 2c., base Pittsburgh, and specifications against old contracts at lower prices have been heavy. New orders, however, have not been impressive. Sheet mills report that bookings have continued to be large and are well diversified, although automobile companies are the most important single factor from a buying standpoint. Automobile body sheets are steady at 4.15c., base Pittsburgh, galvanized at 3.75c. and blue annealed stock at 2.10c.

The Stacey Mfg. Co., Cincinnati, will receive this week the first barge load of structural steel to be shipped by water to a steel consumer in Cincinnati. The shipment, which is being made by the Carnegie Steel Co., consists of about 830 tons of material to be fabricated for a gas holder to be erected at Granite City, Ill. The new river rail terminal constructed by the Cincinnati River Rail Terminal Co. will be utilized for transferring the steel from barges to railroad cars for delivery to the Stacey plant.

Reinforcing Bars.—New billet bars are quoted at 1.90c. to 2c., base Pittsburgh, and rail steel stock at 1.80c. to 1.85c., base mill.

Warehouse Business.—Shipments out of local warehouses in the first quarter of 1928 were slightly less than in the corresponding period in 1927. Prices are firm and unchanged.

Coke.—Weakness has appeared in both by-product and beehive coke prices. Makers of by-product coke at Indianapolis, Ashland and Portsmouth have announced a reduction of 50c. a ton on foundry grades, effective April 1, the new quotation calling for $7 per net ton f.o.b. ovens, or $9.02, delivered Cincinnati. Domestic grades are now selling at $3.50, ovens, for walnut; $4.50 for egg, and $3 for No. 2 nut. This represents a drop of $1.50 a ton on walnut and $1 on egg. At Detroit by-product foundry coke remains at $8.50, Detroit ovens, for outside shipment and $9, delivered in Detroit, but egg and nut domestic coke have been cut to $5.50, Detroit ovens, for outside delivery and to $6, delivered in Detroit. Beehive foundry coke from the Wise County district is being sold at $4.50, ovens, with furnace coke bringing $3.75, but these prices are weak and concessions of 25c. a ton are likely to be made in the immediate future. In the New River district reports are current that at least one producer is quoting $6.50, ovens, a drop of 50c. a ton.

Foundry coke prices per net ton, delivered Cincinnati: By-product coke, $9.02; Wise County coke, $7.09 to $7.59; New River coke, $9.09 to $9.59. Freight rates, $2.14 from Ashland, Ky.; $2.59 from Wise County and New River ovens.

Old Material.—There has been practically no change in the past week. Steel plants continue to release shipments on current contracts at a satisfactory rate, but forward buying is negligible. Prices are showing more stability, but because of the absence of transactions quotations in many items are regarded as nominal.

Dealers' buying prices per gross ton f.o.b. cars, Cincinnati:

Heavy melting steel	$11.00 to $11.50
Scrap rails for melting	11.75 to 12.25
Loose sheet clippings	8.50 to 9.00
Bundled sheets	9.50 to 10.00
Cast iron borings	8.00 to 8.50
Machine shop turnings	7.50 to 8.00
No. 1 busheling	10.00 to 10.50
No. 2 busheling	7.00 to 7.50
Rails for rolling	12.50 to 13.00
No. 1 locomotive tires	12.75 to 13.25
No. 1 railroad wrought	10.00 to 10.50

No. 1 machinery cast	15.50 to 16.00
No. 1 railroad cast	13.00 to 13.50
Burnt cast	7.50 to 8.00
Stove plate	8.25 to 8.75
Brake shoes	9.50 to 10.25
Railroad malleable	12.00 to 12.50
Agricultural malleable	11.50 to 12.00

Warehouse Prices, f.o.b. Buffalo

	Base per Lb.
Plates and structural shapes	3.40c.
Soft steel bars	3.30c.
Reinforcing bars	2.75c.
Cold-finished flats, squares and hexagons	4.45c.
Rounds	3.95c.
Cold-rolled strip steel	5.85c.
Black sheets (No. 24)	4.30c.
Galvanized sheets (No. 24)	5.15c.
Blue annealed sheets (No. 10)	3.80c.
Common wire nails, base per keg	$3.65
Black wire, base per 100 lb.	3.90

Buffalo

Lower Prices on Scrap Sales—Steel Demand Sustained

BUFFALO, April 3.—The pig iron market is very quiet. One company with a plant east of here and another in Buffalo is inquiring for 700 to 800 tons of foundry, malleable and Bessemer grades, but this is about the only inquiry aside from carload lots. The General Electric Co. is believed to have purchased the 2900 tons it inquired for from furnaces outside of this district. One maker continues to quote $17 for delivery in the district or outside, while the others are holding at $17 in the district. A small lot of 3.50 to 4 per cent silicon foundry was sold at $20.25, furnace.

Prices per gross ton, f.o.b. furnace:

No. 2 plain fdy., sil. 1.75 to 2.25	$17.00
No. 2 foundry, sil. 2.25 to 2.75	17.50
No. 1X foundry, sil. 2.75 to 3.25	18.50
Malleable, sil. up to 2.25	$17.00 to 17.50
Basic	16.50 to 17.00
Lake Superior charcoal	27.28

Old Material.—Several sales of No. 1 heavy melting steel have been made at $15 and a considerable tonnage of No. 2 heavy melting steel has been sold at $13.25. Prices realized on this material are lower than the market has been recently. More buying within the near future is seen by the dealers in view of the continuity of mill operation around 80 per cent, and the comparative shortage of material in dealers' yards. Most of the shipments are going direct to the consumers from outside sources. There have been a few sales of No. 1 machinery cast around $15. This was strictly No. 1 grade.

Prices per gross ton, f.o.b. Buffalo consumers' plants:

Basic Open-Hearth Grades	
No. 1 heavy melting steel	$14.50 to $15.00
No. 2 heavy melting steel	12.75 to 13.25
Scrap rails	13.75 to 14.25
Hydraulic compressed sheets	13.00 to 13.50
Hand bundled sheets	9.00 to 9.50
Drop forge flashings	12.00 to 12.50
No. 1 busheling	13.25 to 13.75
Heavy steel axle turnings	12.50 to 12.75
Machine shop turnings	8.25 to 8.75
Acid Open-Hearth Grades	
Railroad knuckles and couplers	15.50 to 16.00
Railroad coil and leaf springs	15.50 to 16.00
Rolled steel wheels	15.50 to 16.00
Low phosphorus billet and bloom ends	17.00 to 17.50
Electric Furnace Grades	
Heavy steel axle turnings	12.75 to 13.25
Short shoveling steel turnings	10.75 to 11.25
Blast Furnace Grades	
Short shoveling steel turnings	10.50 to 11.00
Short mixed borings and turnings	9.50 to 10.00
Cast iron borings	9.75 to 10.25
No. 2 busheling	9.00 to 9.50
Rolling Mill Grades	
Steel car axles	17.00 to 17.50
Iron axles	22.00 to 23.00
No. 1 railroad wrought	12.50 to 13.00
Cupola Grades	
No. 1 machinery cast	14.50 to 15.00
Stove plate	13.00 to 13.50
Locomotive grate bars	12.00 to 12.50
Steel rails, 3 ft. and under	16.50 to 17.00
Cast iron carwheels	13.00 to 13.50
Malleable Grades	
Railroad	15.00 to 15.25
Agricultural	15.00 to 15.25
Industrial	15.00 to 15.25

Finished Iron and Steel.—Prices of bars, shapes and plates are holding firm and specifications have been excellent during the past few weeks, lending weight to the expectation that the second quarter will see some good business in these departments. The prevailing price is 1.95c. to 2c., depending on the nature and size of the tonnages. Sheets are firm at 2.90c. for black; 3.75c. for galvanized and 4.15c. for automobile body. A Buffalo maker has taken 900 tons of reinforcing bars for a Rochester, N. Y., high school and a 190-ton garage job for Rochester has been figured. Reinforcing bar makers report the closing of numerous smaller jobs, running about 50 tons each. Mill operations are averaging 80 to 85 per cent.

Boston

Foundry Coke Reduced 50c. a Ton —Low Pig Iron Prices

BOSTON, April 3.—Pig iron sales the past week approximated 7000 tons, of which 4500 tons was sold by the Mystic furnace. Included in the Mystic sales were 1000 tons of No. 2 plain, 1000 tons of No. 2X, 500 tons of No. 1X and smaller tonnages, not all for New England consumption, however. The company took all the General Electric Co. business with the exception of the low phosphorus iron. Some low prices were made during the week. The Universal Winding Co., Providence, R. I., bought several hundred tons of No. 2X at a reported price of $20.50 a ton, delivered, or $18.50 at furnace, and 400 tons Buffalo No. 1X on a water freight at $21.28, delivered, or $17, furnace. The No. 1X, on a $4.91 all-rail freight rate would have cost the consumer $21.91. Buffalo iron, figured on an all-rail rate, is still available at $16 a ton, furnace, for No. 2 plain and $16.50 for No. 2X.

Prices of foundry iron per gross ton, delivered to most New England points:

Buffalo, sil. 1.75 to 2.25	$20.91 to	$21.91
Buffalo, sil. 2.25 to 2.75	21.41 to	22.41
East, Penn., sil. 1.75 to 2.25	23.15 to	23.65
East. Penn., sil. 2.25 to 2.75	23.65 to	24.15
Virginia, sil. 1.75 to 2.25		25.71
Virginia, sil. 2.25 to 2.75		26.21
Alabama, sil. 1.75 to 2.25	22.91 to	24.77
Alabama, sil. 2.25 to 2.75	23.41 to	25.27

Freight rates: $4.91 from Buffalo, $3.65 from eastern Pennsylvania, $5.21 all rail from Virginia, $6.91 to $8.77 from Alabama.

Bars.—Mill representatives are securing more steel bar business, although the average consumer is buying in small lots. The only prospective reinforcing bar business of importance is 4000 tons for the New England Building, Boston, which probably will be closed within a week. Current buying is in 5 to 50-ton lots, mostly 5 to 25 tons, at 1.90c. to 1.95c. per lb., base Pittsburgh. The local out-of-stock price of 2.90c. per lb., base, is being shaded.

Warehouse Prices, f.o.b. Boston

	Base per Lb.
Plates	3.365c.
Structural shapes—	
Angles and beams	3.365c.
Tees	3.365c.
Zees	3.465c.
Soft steel bars and small shapes	3.265c.
Flats, hot-rolled	4.15c.
Reinforcing bars	3.265c. to 3.54c.
Iron bars—	
Refined	3.265c.
Best refined	4.60c.
Norway, rounds	6.60c.
Norway, squares and flats	7.10c.
Spring steel—

Crucible	12.00c.
Tire steel	4.50c. to 4.75c.
Bands	4.015c. to 5.00c.
Hoop steel	5.50c. to 6.00c.
Cold rolled steel—	
Rounds and hexagons	*3.45c. to 5.45c.
Squares and flats	*3.95c. to 6.95c.
Toe calk steel	6.00c.
Rivets, structural or boiler	4.50c.
	Per Cent Off List
Machine bolts	50 and 5
Carriage bolts	50 and 5
Lag screws	50 and 5
Hot-pressed nuts	50 and 5
Cold-punched nuts	50 and 5
Stove bolts	70 and 10

*Including quantity differentials.

Cold-Rolled Strip.—Orders for cold-rolled strip for second quarter shipment are coming in more freely, and mills in general are holding to 3.15c. per lb., base Pittsburgh. The American Steel & Wire Co., Worcester, Mass., quotes 3.30c. per lb., base, on lots of 1 to 3 tons.

Coke.—The New England Coal & Coke Co. and the Providence Gas Co. have reduced by-product foundry coke 50c. a ton to $11, delivered within a $3.10 freight rate zone. Specifications by foundries against first half contracts are more numerous than at any previous time this year, but individual tonnages are small. Domestic coke also has been reduced 50c. a ton to $8 a ton on cars at Everett ovens. The New England Coal & Coke Co. has also reduced retail domestic coke prices 50c. a ton.

Warehouse Business.—Business is only fair. Consumers continue to order material on a hand-to-mouth basis, and the weekly warehouse turnover of stock is smaller than it was a month ago. Competition for business remains keen, but prices hold firm owing to the attitude of steel mills. Warehouse stocks are broken and there is considerable buying from each other to complete orders.

Old Material.—Brokers report no difficulty in selling material, but some difficulty in securing scrap at prevailing prices. Weirton, W. Va., is taking quite a lot of New England scrap, and a fair tonnage was shipped to the Pittsburgh territory the past week. The Mystic Iron Works is still in the market for stove plate and miscellaneous material. The market for railroad wrought is easier, and offers of $9.10 for No. 1 heavy melting steel seem to have disappeared, $9 being the prevailing price. Slightly lower prices are noted on borings and turnings for steel plants, car axles and rails for rerolling, but in contrast there is a little firmer market for skeleton, forged flashings and chemical borings. Textile machinery cast continues to move slowly, but there was a fair turnover in No. 1 machinery cast the past week at slightly higher prices. Long bundled cotton ties are moving at $6 a ton on cars shipping point, and heavy cast at $11.

Buying prices per gross ton f.o.b. Boston rate shipping points:

No. 1 heavy melting steel		$9.00
Scrap T rails	$8.00 to	8.50
Scrap girder rails	7.50 to	8.00
No. 1 railroad wrought	9.50 to	10.00
No. 1 yard wrought	7.50 to	8.00
Machine shop turnings	5.00 to	5.50
Cast iron borings (steel works and rolling mill)	6.00 to	6.25
Bundled skeleton, long	5.75 to	6.25
Forge flashings	6.25 to	6.75
Blast furnace borings and turnings	5.75 to	6.00
Forged scrap	6.00 to	6.50
Shafting	13.00 to	13.50
Steel car axles	15.00 to	15.25
Wrought pipe (1 in. in diameter, over 2 ft. long)	7.50 to	8.25
Rails for rolling	10.00 to	10.25
Cast iron borings, chemical	9.50 to	10.00

Prices per gross ton delivered consumers' yards:

Textile cast	$13.50 to	$14.00
No. 1 machinery cast	15.00 to	15.50
No. 2 machinery cast	13.00 to	13.50
Stove plate	9.50 to	10.00
Railroad malleable	13.00 to	13.50

Boilers and finishers in mid-Western puddle mills plan to abandon the sliding wage scale agreement which has been in effect 40 years. At the annual wage conference with manufacturers to be held in May at Middletown, Ohio, workers will submit a proposal that a flat rate system be adopted. Introduction of mechanical puddling devices, the dwindling number of puddlers and other changed conditions are responsible for the request.

A general conference of consumers, technicians, distributers and manufacturers interested in coated abrasive products will be held at the Department of Commerce, Washington, on April 11, to consider drafting a simplified practice recommendation for this commodity.

The Newton Steel Co. plans to install continuous rolling mills at its plant at Newton Falls, Trumbull County, Ohio.

*Refinery quotation; delivered price ¼c. higher.

NEW YORK, April 3.—Copper sales have been very heavy and prices have advanced. Purchases of tin have been fairly large, with quotations firm. Lead has been advanced and buying has been quite heavy. Demand for zinc is light and prices are steady.

Copper.—Purchases of copper, both for foreign and domestic consumption, were so heavy last week that the March total sales are probably second to the largest on record. Estimates place the amount which changed hands at 150,000 to 160,000 tons, with 60,000 to 70,000 tons of this sold for export. All the domestic business was done at 14.12½c., delivered in the Connecticut Valley. The price was then advanced by all producers to 14.25c., delivered, and since then the domestic market has been very quiet. Export business is still being done on the basis of 14.50c., c.i.f. European ports, which has been the official quotation of Copper Exporters, Inc., since early in December. Buying for foreign consumption continues heavy, the total for yesterday and today having been at least 6000 tons. The Lake copper market is quiet but firm at 14.30c., delivered.

Copper Averages.—The average price of Lake copper for the month of March, based on daily quotations in THE IRON AGE, was 14.24c. The average price of electrolytic copper was 13.90c., refinery, or 14.15c., delivered in the Connecticut Valley.

Tin.—Sales for the week ended Saturday, March 31, were 1100 to 1200 tons. There was some consumer buying, but most of it was business done between dealers. The principal buying was for April-May-June delivery, with other positions neglected. There is very little interest among the rank and file of consumers. Yesterday, Monday, the market was quiet, with about 150 tons sold, and today there has been very little activity, with spot Straits tin quoted at 53.50c., New York. Prices in London today were but little changed from those of a week ago, with spot standard quoted at £239 15s., future standard at £239 10s. and spot Straits at £243 15s. per ton, and the market easy. The Singapore price today was £244. Chief features of March statistics are the large shipments of Straits tin, 8005 tons, and small Banca shipments of only 513 tons. Deliveries into American consumption were unusually large at 7960 tons, with metal in stock and landing on March 31 at 2078 tons. The total visible supply on April 1 was 15,586 tons, a decrease of 2059 tons from that on March 1. Metal in sight for use in United States was 9707 tons.

Lead.—Partly because of the gradually strengthening market in the West and a fairly heavy demand from all quarters, lead has finally advanced. The American Smelting & Refining Co. yesterday raised its contract price from 6c. to 6.10c., New York, and in the West the metal sold as high as 5.95c., St. Louis, which is now regarded as the market in that district.

Zinc.—Buying of prime Western zinc is not active, but prices are turning stronger. This is due largely to the ore situation, which at present is the key to the market. It is believed by metal producers that the sellers of ore are sincere in restricting output. Statistics for last week indicate this, with both production and sales at the lowest point in some weeks. The price was unchanged at $38, Joplin. Slab zinc sold as low as 5.65c., St. Louis, last week, but, with the clearer knowledge of the ore situation, prices this week are firmer

Brass Rods	16.50c.

at 5.72½c., St. Louis, or 6.07½c., New York, for April delivery, with premiums on futures.

Nickel.—Wholesale lots of ingot nickel are quoted at 35c., with shot nickel at 36c. and electrolytic nickel at 37c. per lb.

Antimony.—The market is weaker and Chinese metal for all positions is quoted at 9.50c., New York, duty paid. This is due to lack of demand by consumers and eagerness to sell by dealers. This price is said to figure back to a level close to cost of production in China.

Aluminum.—Virgin metal, 98 to 99 per cent pure, is quoted at 23.90c. per lb., delivered.

Non-Ferrous Metals at Chicago

Chicago, April 3.—Sales are moderately active. Prices for copper are steady. Tin has advanced and lead and zinc have weakened. A fair volume of business is being done in old metals.

Prices, per lb., in carload lots: Lake copper, 14.25c.; tin, 55.50c.; lead, 5.95c.; zinc, 5.80c.; in less-than-carload lots, antimony, 12.50c. On old metals we quote copper wire, crucible shapes and copper clips, 10.50c.; copper bottoms, 9.50c.; red brass, 9.25c.; yellow brass, 7c.; lead pipe, 4.75c.; zinc, 3.25c.; pewter, No. 1, 30c.; tin foil, 36c.; block tin, 45c.; aluminum, 11.75c.; all being dealers' prices for less-than-carload lots.

Old Metals, Per Lb., New York

The buying prices represent what large dealers are paying for miscellaneous lots from the smaller accumulators and the selling prices are those charged consumers after the metal has been properly prepared for their use.

	Dealers' Buying Prices	Dealers' Selling Prices
Copper, heavy crucible	12.00c.	13.50c.
Copper, heavy and wire	11.75c.	12.875c.
Copper, light and bottoms	10.00c.	11.25c.
Brass, heavy	7.00c.	8.50c.
Brass, light	6.00c.	7.50c.
Heavy machine composition	9.50c.	10.625c.
No. 1 yellow brass turnings	7.75c.	9.00c.
No. 1 red brass or composition turnings	8.75c.	9.75c.
Lead, heavy	5.00c.	5.50c.
Lead, tea	4.00c.	4.50c.
Zinc	3.00c.	3.50c.
Sheet aluminum	12.50c.	14.50c.
Cast aluminum	12.50c.	14.00c.

REINFORCING STEEL

Building in Boston Will Take 4000 Tons—Awards of 9000 Tons

Awards of concrete reinforcing bars, as reported to The Iron Age in the last week, amounted to 9000 tons. None of the lettings was of outstanding size. Included in the 6000 tons called for in new projects was a building at Boston requiring 4000 tons. Awards follow:

New York, 500 tons, warehouse, to Truscon Steel Co.

Rochester, N. Y., 900 tons, Benjamin Franklin High School, to a Buffalo maker.

Philadelphia, 800 tons, addition to Alden Park Manor, reported to Concrete Steel Co.

Harrisburg, Pa., 350 tons, Market Street subway, to McClintic-Marshall Co.

Pittsburgh, 100 tons, Stanley East Liberty Theater, to Carlem Engineering Co.

Quantico, Va., 600 tons, Marine barracks, to McClintic-Marshall Co.

Waycross, Ga., 125 tons, hotel building, to Connors Steel Co., Birmingham.

Shreveport, La., 700 tons, Market Street viaduct, to Laclede Steel Co.

Elyria, Ohio, 325 tons, to Bourne-Fuller Co.

Chicago, 1100 tons, Produce Market, to Joseph T. Ryerson & Son.

Chicago, 100 tons, addition to building for Sears, Roebuck & Co., to Joseph T. Ryerson & Son.

Chicago, 570 tons of rail steel bars, apartment building at 14 West Elm Street, to Calumet Steel Co.

St. Louis, 190 tons, metropolitan police gymnasium, to Laclede Steel Co.

Poplar Bluff, Mo., 110 tons, Court House, to Laclede Steel Co.

San Diego, 100 tons, pier foot of E Street, to unnamed jobber.

Long Beach, Cal., 115 tons, administration building for Board of Education, to unnamed jobbers.

Seattle, 100 tons, apartment building, Boren and Olive Streets, to Pacific Coast Steel Co.

Seattle, 100 tons, garage, Ninth and Virginia Streets, to Pacific Coast Steel Co.

San Francisco, 250 tons, factory, Tenth and Howard Streets, to unnamed jobber.

Oakland, Cal., 100 tons, garage, Hobart and Harrison Streets, to unnamed jobber.

Seattle, Wash., 225 tons, physics building, University of Washington, to Pacific Coast Steel Co.

Seattle, 190 tons, Fire Department headquarters, to Pacific Coast Steel Co.

Spokane, Wash., 123 tons, viaduct over Great Northern Railroad, to unnamed jobber.

Springfield, Ore., 150 tons, bridge over McKenzie River; general contract to Lindstrom & Feigeson.

Cristobal, Canal Zone, 1050 tons, Panama Canal, to United States Steel Products Co.

Reinforcing Bars Pending

Inquiries for reinforcing steel bars include the following:

Boston, 4000 tons, New England Building.

Long Island City, N. Y., 290 tons, warehouse for Bayonne Steel Ceiling Co.

Philadelphia, 200 tons, deck for Tacony-Palmyra bridge; bids in.

Bocaratone, Fla., 500 tons, club house; bids being taken.

Chicago, 117 tons, building for Chicago Portrait Co.; N. Max Dunning, architect.

Chicago, tonnage being estimated, Northwest Side Y. M. C. A.; Perkins, Chatten & Hammerland, architects.

Chicago, tonnage being estimated, North-West Tower apartment building; Perkins, Chatten & Hammerland, architects.

Chicago, 200 tons, completion of Soldier Field Stadium; John Griffith & Son, general contractors.,

Stickney, Ill., tonnage not stated, sewer project.

Aurora, Ill., tonnage being estimated, sewer.

St. Louis, 250 tons, Mark Twain Hotel.

Phoenix, Ariz., 263 tons, highway work between Globe and Safford; bids April 5.

Sacramento, Cal., 212 tons, highway work near French Camp; bids opened.

RAILROAD EQUIPMENT

Inquiries for 1050 Freight Cars—300 Refrigerator and 260 Ballast Cars Purchased

The Southern Pacific has inquired for 500 flat cars and 50 gondolas and the North American Car Corporation will buy 500 tank cars. The latter company has purchased 300 refrigerator cars and the Canadian National has ordered 260 ballast cars. Included in the week's passenger equipment purchases are 69 miscellaneous items for the Canadian National. Details of the week's business follow:

North American Car Corporation has ordered 300 refrigerator cars from Pressed Steel Car Co. Company is also inquiring for 500 tank cars in addition to 300 poultry cars previously noted in these columns.

Norfolk & Western will rebuild 250 all-steel gondola cars at its Roanoke, Va., shops.

Canadian National has ordered 12 snow plows from Eastern Car Co. and 69 passenger train cars distributed as follows: Five cafe parlor cars, two buffet club cars and 30 colonist cars from Canadian Car & Foundry Co., and 12 baggage and 30 colonist cars from National Steel Car Corporation. This road has also ordered 60 ballast cars from Canadian Car & Foundry Co. and 200 ballast cars from Eastern Car Co.

Pond Creek Colliery Co. has ordered 60 mine cars from Hockensmith Wheel & Mine Car Co.

Ringling Brothers have ordered 65 all-steel circus cars of special construction from Warren Tank Car Co.

Southern Pacific will buy 500 flat cars and 50 gondola cars.

Chicago Rapid Transit Co. has revised its inquiry and is now asking for either 50 or 100 motor cars and 50 or 100 trailers.

FABRICATED STRUCTURAL STEEL

Bridge at Louisville Takes 18,000 Tons—Total Awards of 46,000 Tons

WITH a bridge across the Ohio River at Louisville requiring 18,000 tons and a section of the subway in New York taking 7800 tons, structural steel lettings amounted to 46,000 tons in the past week. About 20,800 tons is called for in new pending projects, the largest of which is a bridge at Newark, N. J., for the Pennsylvania Railroad. Awards follow:

WEST BOYLSTON, MASS., 130 tons, bridge, to Boston Bridge Works, Inc.

SPRINGFIELD, MASS., 550 tons, hotel, to Palmer Steel Co.

ALBANY, N. Y., 600 tons, office building, to Levering & Garrigues Co.

BOSTON, 125 tons, Working Boys' Home, to New England Structural Co.

NEW YORK, 2970 tons in the following awards as reported by Structural Steel Board of Trade: High school at Roslyn, L. I., to Lehigh Structural Steel Co.; Mansion Theater at Fifty-eighth Street and Lexington Avenue and new roof for Medical Center building at 168th Street and Broadway, to Taylor-Fichter Steel Construction Co.; alteration to building at 81 Fifth Avenue, service building at Sixth Avenue and Seventh Street, Brooklyn, and Oddfellows Temple at 105 East 106th Street, to George A. Just Co.

NEW YORK, 160 tons, alteration to residence at 15 East Eighty-fourth Street, to Fassler Iron Works.

NEW YORK, 7800 tons, section of subway, route 106, to McClintic-Marshall Co.

ROSELAND, N. J., 280 tons, switching station for Public Service Production Co., to Archibald Brady Co.

TRENTON, N. J., 120 tons, store and loft building for N. A. K. Bugbee Co., to American Bridge Co.

PHILADELPHIA, 490 tons, building for Terminal Title & Trust Co., to Bethlehem Fabricators, Inc.

PENNSYLVANIA RAILROAD, 470 tons; 245 tons for bridge at Baltimore to Fort Pitt Bridge Works, 125 tons for bridge at Akron, Ohio, to Bethlehem Steel Co., and 100 tons for bridge at Stoney Brook, Pa., to American Bridge Co.

NEW CASTLE, DEL., 200 tons, mill building, to Belmont Iron Works.

BALTIMORE, 550 tons, North Avenue market, to McClintic-Marshall Co.

WASHINGTON, 950 tons, administration building for Department of Agriculture, to McClintic-Marshall Co.

BUTLER, PA., 169 tons, residence for B. D. Phillips, to Jones & Laughlin Steel Corporation.

ECONOMY, PA., 300 tons, crane runway roof for Central Tube Co., to Jones & Laughlin Steel Corporation.

PITTSBURGH, 1025 tons, six steel barges for Union Barge Line, to American Bridge Co.

PITTSBURGH, 2200 tons, 10 covered barges for Carnegie Steel Co., to American Bridge Co.

CORAOPOLIS, PA., 600 tons, County bridge repairs, to American Bridge Co.

LOUISVILLE, KY., 18,000 tons, Big Four railroad bridge across Ohio River, to McClintic-Marshall Co.

NASHVILLE, TENN., 110 tons, sheet metal manufacturing plant, to McClintic-Marshall Co.

SHARONVILLE, OHIO, 525 tons, four subway structures for Big Four railroad, to McClintic-Marshall Co.

ARGO, ILL., 205 tons, building for Corn Products Co., to Gage Structural Steel Co., Chicago.

SANTA FE RAILROAD, 300 tons, bridges, to Kansas City Structural Steel Co.

MISSOURI-KANSAS-TEXAS RAILROAD, 300 tons, bridges, to Kansas City Structural Steel Co.

SOUTH CHICAGO, 380 tons, building for Federal Furnace Co., to Worden-Allen Co.

ROCK ISLAND, ILL., 500 tons, repairs to Rock Island Railroad bridge across Mississippi River, to Fort Pitt Bridge Works.

ST. LOUIS, 365 tons, metropolitan police gymnasium, to St. Louis Structural Steel Co.

KELLOGG, ORE., 280 tons, bridge over Umpqua River, to Clyde Catching, Reedsport, Ore.

OAKLAND, CAL., 4300 tons, Capewell store, to Judson-Pacific Co.

SAN FRANCISCO, 400 tons, addition to Medical-Dental Building, to Judson-Pacific Co.

SAN FRANCISCO, 140 tons, steel joists, Junior beams, apartment building, Stockton near California Street, to Judson-Pacific Co.

PITTSBURG, CAL., 125 tons, for Columbia Steel Co., to Pacific Coast Engineering Co.

LOS ANGELES, 400 tons, apartment building at 8225 Sunset Boulevard, to Llewellyn Iron Works.

Structural Projects Pending

Inquiries for fabricated steel work include the following:

MAINE CENTRAL RAILROAD, 275 tons, five bridges.

BANGOR & AROOSTOOK RAILROAD, 315 tons, bridge at Monticello, Me.

STATE OF VERMONT, 200 tons, three highway bridges.

BROOKLYN, 1000 tons, Tilden Theater.

NEW YORK CENTRAL RAILROAD, 1275 tons, baggage subway and bridge at South Bend, Ind.

NEWARK, N. J., 5000 tons, Newark Bay bridge for Pennsylvania Railroad; bids April 26.

STANDARD OIL CO. OF NEW JERSEY, 250 tons, 80,000-gal. tank at McCamey, Tex.

CENTRAL RAILROAD OF NEW JERSEY, 165 tons, bridge at Scranton, Pa.

CAMDEN, N. J., 250 tons, Catholic church and school.

PENNSYLVANIA RAILROAD, 115 tons, bridge at Cartersburg, Ind.

GLENDALE, PA., 300 tons, theater.

BALTIMORE & OHIO RAILROAD, 1800 tons, bridges.

SEABOARD AIR LINE RAILROAD, 120 tons, bridge at Calhoun Falls, S. C.

SOUTHERN RAILWAY, 700 tons; 500 tons for viaduct at Cloude, Tenn., and 200 tons for miscellaneous bridges.

ATLANTA, GA., 1000 tons, viaducts.

HUNTINGTON, W. VA., 200 tons, three barges for United States Engineers; Howard Shipyards & Dock Co., Jeffersonville, Ind., low bidder.

MEMPHIS, 3500 tons, 31 barges for Mississippi River Commission; Riter-Conley Co., low bidder.

DAYTON, OHIO, 500 tons, Dayton-Biltmore Hotel.

CHICAGO, 650 tons, approaches to Crawford Avenue bridge.

CHICAGO, 700 tons, warehouse for Illinois Central Railroad, temporarily postponed.

CHICAGO, 1200 tons, 15-story office building.

CHICAGO, 2000 tons, warehouse for Buick Motor Co.

CHICAGO, tonnage being estimated, four-story addition to Sheridan Trust & Savings Bank.

AURORA, ILL., 250 tons, public school; Rochester Bridge Co., Rochester, Ind., low bidder.

BESSEMER, MICH., 200 tons, interstate bridge between Iron County, Wis., and Gogebic County, Mich.; bids close April 19.

MARINETTE, WIS., 250 tons, two-leaf draw span between Menominee, Mich., and Marinette, Wis.; bids close April 10.

WAUSAU, WIS., 150 tons, Marshfield-Athens highway span; bids close April 5.

SACRAMENTO, CAL., 947 tons, bridge over San Joaquin River near Herndon; bids April 18.

SACRAMENTO, 606 tons, bridge over Sacramento River at Freeport; C. J. Nystedt, Stockton, low bidder on general contract.

SAN FRANCISCO, 700 tons, car float for Santa Fe; bids being received.

REEDSPORT, ORE., 530 tons, bridge over McKenzie River; general contract to Linstrom & Feigeson, Portland, Ore.

Employment in Ohio Better in February

February employment in the iron and steel industries of Ohio was 9 per cent greater than in January, and was the same as in February, 1927, according to the bureau of business research of Ohio State University. Twenty-five of the 42 reporting companies shared in the increase, 11 showed a decline and six indicated no change. The blast furnace group revealed a sharp decrease in workers, the number of employees being 26 per cent less than in January, and 47 per cent less than in February, 1927.

Steel works and rolling mills, on the other hand, had 8 per cent more men on their payrolls in February than in January and 2 per cent more than in the corresponding month last year. In this group 10 of the 14 reporting concerns participated in the improvement. February employment in 148 machinery companies averaged 2 per cent ahead of January, but 8 per cent less than in February, 1927. The betterment was shared by all cities except Dayton, while Cincinnati was the only city showing an increase from February, 1927. Within the machinery group the foundry and machine shop section, with 101 reporting firms, revealed an improvement of 5 per cent from January, while 12 machine tool companies showed an upward movement of 8 per cent.

PERSONAL

CHARLES STAMM

Charles Stamm, whose appointment as sales manager of the Empire Steel Corporation, Mansfield, Ohio, was announced in THE IRON AGE, March 1, started in the steel industry with the Carnahan Tin Plate & Sheet Co., Canton, Ohio, in 1903, as a tracer. Later he became weigh master. He was a shipping clerk at the Zanesville, Ohio, works of the American Rolling Mill Co. from 1905 to 1908, going from there to the Massillon Rolling Mill Co., where he was in charge of the finishing and some other departments from 1908 to 1914. From 1914 until his recent advancement he was employed by the Mansfield Sheet & Tin Plate Co., first as a finishing department superintendent, then as production manager and later as special representative.

Justin G. Smeby has been appointed welding engineer South Philadelphia Works, Westinghouse Electric & Mfg. Co. He was graduated in mechanical engineering from the University of North Dakota in 1922 and since has been attached to the South Philadelphia plant.

Dr. Edward E. Marbaker has been appointed to a fellowship recently established by the Whiting Corporation, Harvey, Ill., at the Mellon Institute of Industrial Research, University of Pittsburgh. The fellowship was established for the purpose of carrying on research on cast iron and the results will be published for the benefit of the foundry industry. Dr. Marbaker was graduated from the Towne Scientific School of the University of Pennsylvania in 1910 and four years later received his doctor's degree from the same university. He was first employed by the Westinghouse Lamp Co., Philadelphia, where he carried on original investigation of the platinum metals. He later became chief chemist for the company and had charge of its metallurgical laboratory. In 1917 he became associated with Alexander Brothers, Philadelphia, manufacturers of leather belting, as chief chemist and later as chief engineer. In 1920 and 1921 he was chief chemist for the Cleveland wire division of the National Lamp Works of the General Electric Co., specializing in problems incident to the manufacture of non-sag tungsten wire and molybdenum metals. Since 1921 he has been a fellow of the Mellon Institute, conducting various chemical and metallurgical work.

O. G. Simmons, of the National Tool Co., Cleveland, gave an address on the development of gears and the machinery required to manufacture them at the March meeting of the Tri-City chapter of the American Society for Steel Treating, held at the Chamber of Commerce, Davenport, Iowa.

W. J. Bruce, of Worcester, Mass., will have charge of the plant of the Bromwell Wire Goods Co. at Greensburg, Ind., which has recently been acquired and will be operated by the Cyclone Fence Co., Waukegan, Ill.

F. Baackes, Jr., has been appointed sales agent at Cincinnati for the American Steel & Wire Co., succeeding S. A. Felix, who has retired after 25 years of active service with that company. Mr. Felix started to work for the American Steel & Wire Co. in its St. Louis office. In 1915 he was transferred to the St. Paul, Minn., office and in 1918 took charge of the Cincinnati office.

H. B. Maguire, formerly assistant manager of the Detroit office of the American Steel & Wire Co., has been appointed assistant to D. A. Merriman, general manager of sales, 208 South LaSalle Street, Chicago.

Dwight Ruth has resigned as assistant treasurer of the Saranac Machine Co., Benton Harbor, Mich., to become associated with the Moulds Brass Foundry Co., of that city.

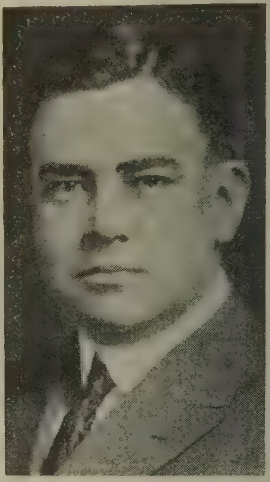
L. E. Gilmore, metallurgical engineer Crane Co., Chicago, will address the Chicago Foundrymen's Club at its monthly meeting at the City Club on April 5. His subject will be "Cupola and Air Furnace Practice."

Dr. Zay Jeffries, consulting metallurgist for the Aluminum Co. of America and General Electric Co., will address the New York Chapter American Society for Steel Treating, in the Merchants' Association auditorium, Woolworth Building, Monday, April 16, on "The Hardening of Steel."

W. H. Norrington, until recently general sales manager of the Robins Conveying Belt Co., New York, has been appointed representative in New York and vicinity of the C. O. Bartlett & Snow Co., Cleveland. His headquarters will be at 30 Church Street. Mr. Norrington was graduated from the engineering department of the University of Michigan, and then served two years in the manufacturing department of the Republic Rubber Co., Youngstown. He became associated with the Robins Conveying Belt Co. in 1914 and was made general sales manager in 1921.

W. H. Foster, whose election as chairman of the board of the General Fireproofing Co., Youngstown, was announced in THE IRON AGE last week, has been president of the company since 1912. He was at one time general sales manager of the Youngstown Sheet & Tube Co., later joining the Fireproofing company as secretary. George C. Brainard, who has succeeded Mr. Foster as president of the company, became associated with it in 1923 and was most recently vice-president in charge of operations. He attended Northwestern University, Evanston, Ill., and Cornell University, Ithaca, N. Y., and in 1913 became identified with the Hydraulic Steel Co., Cleveland. He served as factory manager of that company until 1920, with the exception of an interval during the war when he was on the staff of the Chief of Ordnance. From 1920 until 1923 he was vice-president of the Hydraulic company.

W. H. FOSTER



G. C. BRAINARD

Caleb Davies, Jr., has resigned as assistant general superintendent Republic Iron & Steel Co., Youngstown, Ohio, to become vice-president American Tar Products Co., Pittsburgh, a subsidiary of the Koppers Co.

David R. Sieber, for the past five years Pittsburgh district manager of sales for the General Refractories Co., Philadelphia, has been elected a vice-president of that company.

J. C. Gillette, works manager National Carbon Co., Cleveland, has been elected chairman of a plant engineers' division recently organized by the Cleveland Engineering Society. McRae Parker, chief engineer Cleveland Worsted Mills Co., has been named vice-chairman, and Paul H. Voth, equipment engineer Willard Storage Battery Co., recorder. These officers will serve until the annual meeting in May.

A. R. Hauschel, of Paris, France, has arrived in Racine, Wis., to assume his new duties as general foreign sales manager of the J. I. Case Threshing Machine Co. with headquarters at the main offices in Racine. Mr. Hauschel, a native of Alsace Lorraine, became associated with the Case company in 1900 and for several years he has been general European sales manager, with headquarters in Paris.

Bertram D. Quarrie has been elected president of the Oliver Iron & Steel Corporation, Pittsburgh, succeeding Henry Oliver, who assumes the newly created office of chairman of the board of directors. Except for a brief period spent in the chemical industry, the new head of the Oliver corporation has been actively identified with the iron and steel industry continuously since his graduation in 1903 from Case School of Applied Science, Cleveland. For 15 years he was with the American Steel & Wire Co., serving successively as assistant and then superintendent Central furnaces, Cleveland, and superintendent Newburgh works, leaving the latter position in 1922 to become general manager Otis Steel Co., Cleveland. For the past four years he has been vice-president Paper & Textile Machinery Co., Sandusky, Ohio. Before joining the American Steel & Wire Co., Mr. Quarrie was with the Cleveland Furnace Co., the Inland Steel Co., and the Grasselli Chemical Co.

B. D. QUARRIE

D. D. Francis, secretary-treasurer Marvel Carbureter Co., Flint, Mich., has been made president of the Wheeler-Schebler Carbureter Co., Indianapolis, following the purchase of the Indianapolis company by the Marvel organization.

A. P. Dowell has been appointed general superintendent of Plant No. 1, body division, Murray Corporation of America, Detroit. He has been associated with the manufacture of automobile bodies at Detroit for 19 years, having begun with the Briggs Mfg. Co., of which company he was later vice-president nad assistant general manager. For the last seven years he has been associated with the Fisher Body Corporation.

John G. Platt has been elected president of the Hunt-Spiller Mfg. Corporation, Boston, succeeding the late Walter B. Leach.

J. L. Spitzer is manager of a new brokerage department which has been established by L. Schiavone & Bonomo Brothers, Inc., Jersey City, to handle scrap iron and steel bought and sold in the Eastern district. The department will be operated separately from the company's activities as a dealer.

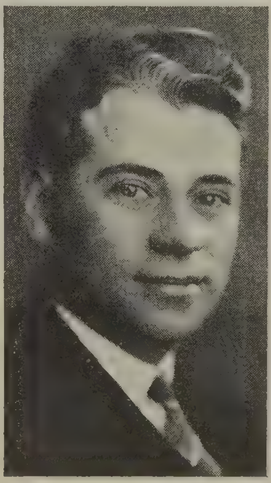
Clement J. Hardy, consulting engineer, Chicago, spoke on "New Foundries for Old" at the monthly meeting of the Wisconsin Gray Iron Research Group at the Republican House, Milwaukee, on April 4.

Robert K. Greaves has been appointed Detroit district manager in charge of sales of tool and special steel and metal cutting saws for Henry Disston & Sons, Inc., Tacony, Philadelphia. His headquarters will be at 620 East Hancock Street.

Dr. Arthur D. Little, president of Arthur D. Little, Inc., chemist and engineer, Cambridge, Mass., delivered the Aldred lecture at the Massachusetts Institute of Technology on March 23. His subject was "Chemical Industry."

William O. Lange has been elected secretary of the Phoenix Iron Co., Philadelphia, succeeding the late George Gerry White, who had filled the office for 58 years and who had been connected with the company for 71 years. Mr. Lange has been connected with the company for over 23 years and for the past two years has been general manager of sales.

H. L. McCauley, since 1924 assistant district sales manager at Milwaukee for the Inland Steel Co., Chicago, has been appointed district sales manager for the company in that city, succeeding C. M. Easterly who has resigned. Mr. McCauley became associated with the Inland company in 1920, serving in the order department before going to the Milwaukee office in 1924. Previously he had been associated with the American Sheet & Tin Plate Co. at Gary, Ind., Pittsburgh and Saltsburg, Pa. M. E. Gregg, who succeeds Mr. McCauley as assistant district manager at Milwaukee, has served in a similar capacity in the company's St. Paul, Minn., office since 1925. His previous business associations were with the Bethlehem Steel Co., the Lackawanna Steel Co., the Republic Iron & Steel Co. and the Basset-Presley Co.



H. L. MC CAULEY

M. E. GREGG

H. J. Hair, recently engineer in the railroad sales department of the Whiting Corporation, Harvey, Ill., has been appointed manager of railroad sales for the Watson-Stillman Co., 75 West Street, New York. He was graduated from Purdue University and served for a time as mechanical engineer for the Baltimore & Ohio Southwestern Railroad. Later he was Pittsburgh district manager for Manning, Maxwell & Moore, Inc.

J. A. Claussen, Rogers Brown & Crocker Brothers, New York, sailed from New York April 2 on a vacation trip to Havana, Cuba.

William J. Chapin, recently associated with the Peoples Gas, Light & Coke Co., Chicago, and the Peerless Heat Co., Pittsburgh, has been appointed engineer for heat resisting alloys manufactured by the Chicago Steel Foundry Co., Chicago.

OBITUARY

Col. William Henry Morgan, president Morgan Engineering Co., Alliance, Ohio, and a pioneer in the electric traveling crane industry, died at Union Memorial Hospital, Baltimore, March 29, following an operation. He was 63 years of age. Colonel Morgan was born in Pittston, Pa., June 1, 1865. His parents moved to Alliance in 1871 where in that year his father, Thomas R. Morgan, Sr., founded the Morgan Engineering Co. to manufacture steel mill and handling equipment. After attending the Alliance High School and Mount Union College, Alliance, Colonel Morgan went into the Morgan plant and, after the death of his father in 1897, became president of the company. In 1888 he designed one of the first electric traveling cranes built by the Morgan company and also developed considerable other equipment. After he became president, he continued to spend much of his time in the engineering department designing mill equipment. He was active in the company until about two years ago, when poor health compelled him to give up most of his business duties. He was a member of the American Iron and Steel Institute and of the (British) Iron and Steel Institute. He acquired the title of Colonel a number of years ago when he served on the staff of George K. Nash, governor of Ohio. He is survived by his widow and one son, William H. Morgan, Jr., the latter connected with the Morgan plant.

COL. W. H. MORGAN

—

Charles S. Smith, for many years vice-president A. O. Smith Corporation, Milwaukee, maker of pressed steel automobile frames and oil well equipment, died, March 28 in Bermuda, aged 67 years. As a youth he became associated with his father and brother in the C. J. Smith & Sons Co., manufacturer of bicycle parts, the business later becoming the A. O. Smith Corporation.

—

Albert A. Dowd, specialist in tool engineering, died in Detroit March 15, of pneumonia. At the time of his death he was connected with the Chrysler Corporation, and before that had been engaged in consulting work. He was born in North Granville, N. Y., Oct. 2, 1872. Among a number of other companies he had been employed by the Pratt & Whitney Co., Hartford, Conn., and the Bullard Machine Tool Co., Bridgeport, Conn. He was a contributor to The Iron Age and other publications and was author and co-author of a number of books on tool engineering and related subjects.

—

David H. Darrin, president Automatic Switch Co., New York, died on March 29 at his home in New Rochelle, N. Y., aged 60 years. He was a life member of the American Society of Mechanical Engineers and a member of the Engineers' Club, New York.

—

Dr. W. F. M. Goss, in 1914 president of the American Society of Mechanical Engineers and long dean of the schools of engineering of both Purdue University and of the University of Illinois, died at the Waldorf Astoria Hotel, New York, on March 23. He was born at Barnstable, Mass., in 1859 and attended the Massachusetts Institute of Technology. He established the course in mechanic arts at Purdue University. In 1907 he left Purdue to become dean of the College of Engineering and director of the School of Railway Engineering and Administration at the University of Illinois. He resigned from this position in 1917 to become president of the Railway Car Manufacturers Association, having held that position until his retirement in 1925. He was honored by the degree of Doctor of Engineering by the University of Illinois in 1904 and had received recognition from many other sources for his work in transportation and engineering.

RAIL PRODUCTION IN 1927

Falling Off from 1926 in All Sections, but Above 10-Year Average

STEEL rails produced in the United States in 1927 are reported by the American Iron and Steel Institute at 2,806,390 gross tons, a decline of 12.78 per cent from the 3,217,649 tons of 1926, but a gain of 8 per cent over the 10-year average (1917-1926) of 2,598,436 tons. The year's total was close to the 2,812,079-ton average of the three years 1924-1926. All sections participated in the decline from 1926, rails of 100 lb. and over recording the smallest loss—1.66 per cent. Those of under 50 lb. dropped 18 per cent; those of 50 to 84 lb., 33.4 per cent; those of 85 to 99 lb., 33.4 per cent.

More than two-thirds of all the rail tonnage in 1927 was of 100-lb. section or heavier. The ratio, 68.84 per cent, is the highest ever reached. Both 1926, with 61.12 per cent, and 1925, with 58.76 per cent, had previously held the high record in this respect. So pronounced has the preponderance of heavy rails become that the institute has this year started a new classification, separating the rails of 100 lb. and over into two weight groups. Rails weighing 120 lb. or more are now separately listed, at 617,524 tons, or 22.01 per cent of the total. This follows the action of 13 years ago, when the 100-lb. rails were separated for the first time from the previous heavy group, weighing 85 lb. and over. At that time the new heavy section contributed 27.18 per cent to the total year's tonnage.

Alloy-treated steel rails dropped in 1927 to 1265 tons, much the smallest amount in over 20 years. All but 77 tons was manganese—10 per cent and over. The maximum tonnage under this heading came in 1910, with 257,324 tons, nearly all of which was titanium-treated. Only one year since 1917, however, has seen over 6500 tons of alloy-treated rails produced. No electric steel rails have been made since 1923, and less than 650 tons, total, since 1913.

Rails rolled from ingots in 1927, either with or without reheating of blooms, totaled 2,719,431 tons. Of this amount all were open-hearth with the exception of a small fraction (0.058) of 1 per cent. This marks the highest open-hearth percentage ever reached, for Bessemer rails have never, heretofore, been below 0.35 per cent of the total of steel rails. In 1921 and all earlier years they were over 2.7 per cent.

Except for 1925, the 1927 tonnage of rails rerolled from old rails was the smallest since these figures were first reported separately, for the 1911 production. Compared with the 10 years, 1917-1926, when an average of 108,586 tons was so produced, the 86,959 tons of 1927 represents a drop of 19.9 per cent.

PRODUCTION OF STEEL RAILS IN THE UNITED STATES

(In Gross Tons)

Weight per yard:	1927	1926	1925
120 lb. and over	617,524	1,966,440	1,636,631
100 lb. to 119 lb.	1,314,424		
85 lb. to 99 lb.	539,445	797,662	765,371
50 lb. to 84 lb.	173,257	256,287	219,648
Under 50 lb.	161,740	197,260	163,607
Total	2,806,390	3,217,649	2,785,257
Percentage weighing 100 lb. and over	68.84	61.12	58.76
Included above:			
Open-hearth	2,717,865	3,107,992	2,691,823
Bessemer	1,566(a)	12,533	9,687
Rerolled from old rails	86,959(b)	97,124	83,747
Alloy-treated	1,265	4,216	4,009

(a) All under 50 lb. (b) All under 100 lb.; 80 per cent under 50 lb.

Machinery Exports at Higher Rates

Total in Two Months 13 Per Cent Ahead of 1927—Imports Larger in February

WASHINGTON, March 31.—Exports of machinery of all kinds in February were valued at $35,955,176, against $36,183,571 in January, a decline of $228,395. Based on working days, however, the average shipments in February exceeded those of January, the daily rates having been $1,438,207 and $1,391,676 respectively. For the two months ended with February the total was $71,218,747, compared with $63,031,507 for the corresponding period of last year, an increase of $8,187,240, or almost 13 per cent.

Power-driven metal-working tools to the number of 623, valued at $1,242,234, were exported in February, comparing with 686, valued at $1,315,771 in January, as listed in THE IRON AGE table. Total exports of industrial machinery, as classified by the division of statistics, Department of Commerce, amounted to $16,173,666 in February, against $16,202,582 in January and $13,762,055 in February of last year. For the two months ended with February, 1928, they were valued at $32,456,248, compared with $31,316,610 for the corresponding period of last year.

Exports of agricultural machinery in February were valued at $8,035,812, against $7,855,000 in January. For the two months ended with February they were valued at $15,890,503, against $10,118,660 for the corresponding period of last year.

Machinery imports, as listed in THE IRON AGE table, were valued at $1,714,648 in February, against $1,157,964 in January and $1,483,713 in February, 1927. For the two months ended with February they were valued at $2,918,848, against $3,123,990 for the corresponding period of last year. Imports of industrial, office and printing machinery in February were valued at $1,369,249, against $1,074,638 in January and $1,324,521 in February of last year. For the two months ended with February the values were $2,748,363 in 1927 and $2,443,887 in 1928.

River Shipments of Iron and Steel Products Rising

Increased use of the inland waterways for the transportation of iron and steel products continues to be indicated in the February report of the Pittsburgh office, United States Engineers, which covers the waterborne movement on the Ohio, Monongahela and Allegheny rivers in the Pittsburgh district. The shipments on the Monongahela River fell off somewhat last month from those of the previous month, but even so were almost two and one-half times those of February last year, while steel products carried on the Ohio were almost 18,000 tons greater than in January and very nearly triple those of February last year. The figures in net tons compare as follows:

	Allegheny	Monongahela	Ohio
February, 1928	385	73,360	87,635
January, 1928	330	78,069	69,750
February, 1927	—	29,529	29,211

Production of Pig Iron and Ferroalloys in the United States in 1927

OFFICIAL figures of the American Iron and Steel Institute show a total production of pig iron and ferroalloys in 1927 of 36,565,645 gross tons. Of this amount 35,858,232 tons was pig iron and 707,413 tons was ferroalloys. The latter is the largest figure in some years. Pig iron shows a reduction from the 38,698,417 tons of 1926 and is slightly below the 36,116,311 tons in 1925. Details are shown in the tables below, all figures being in gross tons.

Machinery Markets and News of the Works

BUYING AT A GOOD RATE

Machine Tool Orders Show No Falling Off—First Quarter Sales Large

Toledo Plant for Making Shock Absorbers for Ford Automobiles One of the Heaviest Buyers

MACHINE tool buying continued through March at a good rate, and the total for the first quarter of the year runs fully 25 per cent ahead of the corresponding period in 1927, and some companies report a gain of fully 50 per cent. The volume of business pending gives promise that April buying will show little, if any, falling off.

One of the heaviest buyers is the Dana Mfg. Co., Toledo, Ohio, affiliated with the Spicer Mfg. Corporation, South Plainfield, N. J., which is equipping a plant for the manufacture of shock absorbers for Ford automobiles. A production of 6000 a day by July 1 is the schedule planned for. A considerable amount of equipment has been bought and more is under negotiation.

Buying on a large scale is an exception, however, and most of the current business is in single machines from companies in many different lines of manufacture. A fair amount of business is coming from the automobile industry.

Among the week's purchasers were the International Harvester Co. for its Rock Island, Ill., plant, the Allis-Chalmers Mfg. Co., Milwaukee, and the National Transit Pipe Co., Oil City, Pa. The latter bought a number of turret lathes. The Cleveland Board of Education will receive bids up to April 16 on nine woodworking machines.

The Union Pacific Railroad has issued a partial list of its machine tool requirements. The Santa Fe is tabulating bids received on recent inquiries, but it will be three or four weeks before the orders are placed.

Several large inquiries for locomotive cranes are pending. Dwight P. Robinson & Co., New York, are inquiring for 11 and also for seven steam shovels for export. The Amtorg Trading Corporation, New York, has taken bids on six crawl-tread cranes and 10 locomotive cranes for the Dneiper River hydroelectric project in Russia.

New York

NEW YORK, April 3.

MACHINE tool sellers in New York have closed one of the best three-month periods in years. Almost without exception, sales for the quarter have exceeded those for any similar period since 1923 and probably since 1920. At the end of March there had been no marked falling off in the volume as compared with February. January was in most instances the best month of the three. Prospects for a continued good business this month appear promising.

Among the week's sales were the following: A 16 x 60-in. lathe to Portsmouth Navy Yard; 16 x 36-in. lathe to an electric company in Ohio; five hand-production milling machines to a Cleveland company; 6-in. vertical shaper, two 7 x 32-in. bench lathes and a No. 3 universal milling machine to a motor car company; Pratt & Whitney No. 2 jig borer to an electrical manufacturer in New England; 6-in. vertical shaper to a Youngstown company; 13 x 30-in. lathe to a Syracuse, N. Y., manufacturer; 800-lb. Bement single-frame steam hammer to Department of Water and Power, Los Angeles; 7-in. United States grinder and 11-in. x 4-ft. Blount speed lathe to Pratt & Whitney Aircraft Corporation, Hartford, Conn.; Cincinnati high-speed tapping machine to a company in Indiana; 36-in. x 44-ft. Time-Saver lathe to a Connecticut company.

Kent Automatic Parking Garage, Inc., 350 Madison Avenue, New York, has begun work on a twenty-four-story service, repair and garage building, 50 x 200 ft., at 209-11 East Forty-third Street, to cost $1,300,000 with equipment. Jardine, Hill & Murdock, 347 Madison Avenue, are architects.

Bronx Gas & Electric Co., 43 Westchester Square, Bronx, New York, has plans for a two-story power substation, 64 x 188 ft., to cost approximately $110,000 with equipment. Thomas E. Murray, 55 Duane Street, New York, is engineer.

Guilderland Water District Commissioners, Guilderland, N. Y., are asking bids until April 11, for two 75-gal. per min., automatic electrically operated centrifugal pumps, with accessories, and one 50,000-gal. elevated steel tank. Arnold G. Chapman, 100 State Street, Albany, N. Y., is engineer.

New York Edison Co., Irving Place and Fifteenth Street, New York, has plans for installation of third unit of 160,000 kw. capacity, at its power plant at Fourteenth Street and East River. Other units will be provided for later, to comprise nine generating units in all, with gross rating of 1,250,000 kw. Present station has capacity of 120,000 kw. Ultimate project will cost more than $75,000,000.

P. B. Nichols, Depot Plaza, West Plains, N. Y., architect. has plans for a one-story shop for an automobile trade school at Dobbs Ferry, N. Y., to cost close to $40,000 with equipment.

A. Riegel & Sons, Inc., 2 Hamilton Avenue, White Plains. N. Y., has asked bids on general contract for a one-story automobile service, repair and garage building, to cost about $100,000 with equipment.

United Hardware & Tool Corporation, 74 Reade Street, New York, has acquired the five-story and basement building at 50-52 Howard Street and will improve and occupy for a new distributing plant.

Moore & Landsiedel, Third Avenue and 148th Street, New York, architects, have filed plans for a two-story automobile service, repair and garage building, 95 x 125 ft.. to cost close to $100,000 with equipment.

Noma Electric Corporation, 340 Hudson Street, New York, manufacturer of electric lighting specialties, is disposing of stock issue to total $2,150,000, a portion of the proceeds to be used for expansion.

Department of Public Works, Perth Amboy, N. J., J. V. Smith, commissioner, contemplates construction of an additional unit at municipal electric light and power plant.

Following recent acquisition of Eastwood Wire Mfg. Co., Joralemon Street, Belleville, N. J., manufacturer of brass wire screens, etc., by new interests, arrangements are being made for change of name to Eastwood Wire Corporation. New company plans expansion, to include production of new lines, including valve manufacture.

Public Service Electric & Gas Co., Public Service Terminal Building, Newark, has plans for a two-story power switching station at Metuchen, N. J., to cost in excess of $150,000 with equipment. A similar plant will be built at West Orange, N. J. Plans are also in progress for a two-story power substation at Princeton, N. J., to cost more than $80,000.

V. and R. Tedeschi, Newark, care of J. B. Accocella, 9 Clinton Street, Newark, architect, have filed plans for a two-story machine shop, 70 x 100 ft., to cost about $45,000 with equipment.

Lawrence Motor Car Co., 390 Halsey Street, Newark, has plans for a three-story service, repair and sales building on adjoining site, to cost $170,000 with equipment. Nadel & Fort, 32 Hill Street, are architects.

Hygienic Tube Co., 88 McWhorter Street, Newark, will soon begin superstructure for a one-story plant on Avenue L, 52 x 130 ft., for which general contract has been let to Abraham Axel, 114 Gruman Avenue, to cost $45,000 with equipment.

A. E. Sleight, Romaine Building, Paterson, N. J., architect, has asked bids on general contract for a two-story automobile service, repair and garage building, 215 x 250 ft., to cost about $180,000 with equipment.

Board of Education of South Orange, Parker Avenue, Maplewood, N. J., has approved plans for a one-story equipment maintenance and repair building, to cost about $70,000 with equipment. Guilbert & Betelle, 24 Branford Place, Newark, are architects.

H. B. Salmon Co., 357 Grafton Avenue, Newark, building materials and supplies, has plans for a three-story addition for storage and distribution, to cost $100,000 with mechanical handling equipment, etc. W. O. Bartlett, 738 Broad Street, is architect.

Leeds, Tozzer & Co., Inc., 75 West Street, New York, has been appointed distributer in railroad field of electric lift trucks and steel bound platforms manufactured by Stuebing Cowan Co., Cincinnati. Appointment also includes electric lines and steamship companies.

T. P. Steinmetz, former sales promotion manager of Commercial Investment Trust Corporation, automobile finance company, has formed Paul Murchison Co., Inc., 280 Broadway, New York, to act as sales representative and distributer in New York for several manufacturers of automotive products.

Fumaro Metal Spinning & Metal Specialty Co., 116 West Thirty-ninth Street, New York, has been incorporated to engage in spinning metal products. Company has plant at 215 Washington Street, Binghamton, N. Y., and is prepared to begin operation.

Atlas Mfg. Corporation, 1465 Broadway, New York has been formed to manufacture automobile accessories, particularly radiator ornaments. Part of work will be done under contract and part in company's own shop.

James Beggs & Co., 149 Church Street, New York, engines and boilers, grate bars, pumps and general boiler supplies, who some months ago announced their intention of discontinuing business, have changed their plans and are now prepared to take care of usual requirements in lines handled.

Conrad Foundry Co., Montgomery Street, Elizabeth, N. J., is again operating after being shut down for six months, owing to theft of aluminum, master patterns and core boxes

New England

BOSTON, April 2.

SALES are few and usually consist of one machine to a user. A horizontal boring machine to a Massachusetts shop was the most important transaction reported. There are still a sizable number of quotations outstanding which dealers hope to close soon. New England railroads offer the most promising field just now, but none has issued any real lists. Inquiries from Massachusetts manufacturers include a gear hobber and a 24-in. planer. New England machine tool builders collectively are fairly busy with orders received from other parts of the country. Makers of grinding equipment and high priced lathes are especially busy.

Small tool business has dropped, an indication that activity among metal working shops is less than was anticipated April 1. There is still a large surplus of machinists and other skilled help in New England.

Leominister Tool Co., 96 Mechanic Street, Leominster, Mass., has awarded contract for a one-story plant, 40 x 100 ft. Plans are private.

Work has started on a one-story, 30 x 135 ft. plant for Waterhouse Co., Tracy Street, Webster, Mass., bus and automobile bodies.

Gulf Refining Co., Barrington Parkway, East Providence, R. I., has started erection of a one-story garage and repair shop, 100 x 140 ft. W. J. K. Kennedy is manager.

Hopkins Mfg. Co., Allston district, Boston, laundry machinery, is moving to Philadelphia, where it will operate under name of Hopkins-Tull Co.

Hedstrom Union Co., 319 Main Street, Gardner, Mass., baby carriages, has plans for a four-story, 40 x 60-ft., and three-story, 60 x 130-ft. additions. G. Adolph Johnson, 16 Norwich Street, Worcester, Mass., is architect.

Conlon Mfg. Co., 42 Baldwin Street, Bridgeport, Conn., has been formed to manufacture shoe machinery. Company has purchased tools, patterns, plant machinery and equipment and will buy castings and other materials locally.

Furnace Improvement Co., 511 Westminster Street, Providence, has been appointed New England representative for National Flue Cleaner Co., Groveville, N. J., manufacturer of soot blowers for fire tube boilers.

G. L. Gray Sheet Metal Works, New Haven, Conn., will establish plant at 509 Grand Avenue, to specialize in production of blow piping, special fittings and kindred products.

Peerless Pressed Metal Co., 14 Electric Avenue, Brighton, Boston, has asked bids on general contract for a new one-story plant, 75 x 300 ft., at Watertown, Mass., to cost upward of $65,000 with equipment.

Fuller Brush Co., Hartford, Conn., is arranging for expansion in facilities for new lines of production, including manufacture of portable electrically-operated dish-washing machine.

Municipal Light Board, Chicopee, Mass., has awarded general contract to La France Construction Co., Holyoke, Mass. for one-story municipal service and repair shop, with garage facilities, to cost about $80,000 with equipment.

Frank B. Perry, Inc., 44 Franklin Street, Providence, R. I., architect, has plans for an eight-story automobile service, repair and garage terminal, to cost about $850,000 with equipment.

Northern Connecticut Power Co., Thompsonville, Conn., is said to have plans for a hydroelectric power plant at Windsor Locks, Conn., including construction of power dam and transmission lines, to cost in excess of $650,000. J. G. White Engineering Corporation, 43 Exchange Place, New York, is engineer.

New England Transportation Co., New Haven, Conn., has plans for a one-story repair shop, with garage facilities, at Danbury, Conn., to cost approximately $50,000 with equipment. W. T. Dorrance, Avon Street, New Haven, is architect.

Bryant Electric Co., Bridgeport, Conn., manufacturer of electrical equipment, has purchased local factory and business of Benco Mfg. Co., manufacturer of similar devices, and plans to increase line of production. R. A. Carson is vice-president and general manager of purchasing company.

Cleveland

CLEVELAND, April 2.

MACHINE tool sales were rather slow the past week. Total business taken during March was about the same as in February. Inquiry has come out for considerable equipment for a new plant being erected in Toledo by the Spicer Mfg. Corporation, South Plainfield, N. J., to be operated by a separate company known as the Dana Mfg. Co. This will include automatic screw machines and other types of tools. The National Transit Pipe Co., Oil City, Pa., has purchased four turret lathes from a Cleveland manufacturer and three or four similar machines from another source. There is not much activity in the Detroit market, as inquiry from the automotive industry is still light.

Cleveland Board of Education will receive bids April 16 for the following metal and wood-working equipment for the Alexander Hamilton Junior High School.

One 11-in. x 5-ft. lathe.
Two 2-wheel electric grinders.
One wood turning lathe, 7-ft. bed.
One wood turning lathe, 4-ft. bed.
One 12-in. hand jointer.
One 30-in. band saw.
One saw bench.
One portable sanding machine.

Acme Auto Radiator Co., 7707 Carnegie Avenue, Cleveland, is considering plans for a two-story addition, to cost in excess of $40,000 with equipment.

Butler Mfg. Co., 1812 East Twenty-fourth Street, Cleveland, manufacturer of street-sweeping machinery and parts, is completing arrangements for a one and two-story plant in Mogadore Valley section, Akron, Ohio, to cost approximately $100,000 with equipment. Bids have been asked on revised plans by Harpster & Billman, Flatiron Building, Akron, architects.

Firestone Tire & Rubber Co., Akron, plans construction of new two-story factory branch and distributing plant at Richmond, Va., to cost in excess of $200,000 with equipment.

The Crane Market

DEMAND for electric hoists has been quite large recently and several sizable lists have been closed. The Mergenthaler Linotype Co., Brooklyn, N. Y., has closed on 54, the Bethlehem Shipbuilding Co., Wilmington, Del., was reported last week to have closed on nine and the Campbell Soup Co., Camden, N. J., is about to place 25 half-ton electric hoists. In electric overhead cranes the New York Central Railroad is expected to issue an inquiry soon for a 100-ton crane for Harmon, N. Y. There is a fair volume of current inquiry. The locomotive crane market, with the addition of the list of Dwight P. Robinson & Co., New York, has an extraordinary number of large lists under quotation. There is an inquiry from the Amtorg Trading Corporation, 165 Broadway, New York, for six crawl-tread locomotive cranes and one 25-ton standard gage crane for Russia, on which the exporter is seeking shorter terms of payment from the Russian Government and a later inquiry of the same company for nine 40-ton locomotive cranes for the Dneiper River hydroelectric project. The list of Dwight P. Robinson & Co., originally for eight locomotive cranes and seven steam shovels for export has been increased to 11 locomotive cranes. The Carnegie Steel Co. is taking prices on four cranes to serve the new bar mill to be installed at McDonald works, McDonald, Ohio.

Among recent purchasers are:

Lukens Steel Co., Coatesville, Pa., 10-ton, 84-ft. 11½-in. span electric crane from Niles Crane Corporation.

Reading Railroad, Reading, Pa., two 225-ton and one 50-ton overhead traveling cranes from unnamed builder.

Todd Shipyards Corporation 25 Broadway, New York, two crawl-tread locomotive cranes with 100-ft. booms for steel erection from Western builder.

Mergenthaler Linotype Co., Brooklyn, N. Y., 52 1-ton and four 2-ton electric hoists from the American Engineering Co.

E. L. Phillips & Co., 50 Church Street, New York, 5-ton, single I-beam hand power crane for Long Island Lighting Co., from H. D. Conkey & Co.

International Harvester Co., Milwaukee, 5-ton Gantry crane from Whiting Corporation.

Sellers Mfg. Co., Chicago, 22-ton, 8-wheel locomotive crane from Orton Crane & Shovel Co.

Hinde & Dauch Paper Co., Sandusky, Ohio, manufacturer of corrugated fiber boxes, etc., is reported planning a new mill at Kansas City, Mo., for its subsidiary, Kansas City Fibre Box Co., to cost more than $750,000 with machinery.

North American Mfg. Co., 8918 Frederick Avenue, Cleveland, manufacturer of oil burning equipment and devices, has awarded general contract to Philip Kirschner Co., 2725 Pittsburgh Avenue, for a one-story plant to cost about $35,000 with equipment.

Ohio Public Service Co., Hanna Building, Cleveland, will soon take bids for a one-story equipment storage and distributing plant at Elyria, Ohio, to cost approximately $80,000 with equipment. R. S. Silsbee, Elyria Savings & Trust Building, Elyria, is architect.

International Harvester Co., 606 South Michigan Avenue, Chicago, is said to have plans under way for a one-story service and distributing and factory branch at Cleveland, to cost about $100,000 with equipment. Local offices are at 2905 Chester Avenue.

Philadelphia

PHILADELPHIA, April 2.

A THREE-STORY building, 18 x 120 ft., at 1327 Girard Avenue, has been purchased by National Airoil Burner Co., Ninth and Thompson Streets, Philadelphia, manufacturer of oil burners, etc., be used for expansion.

Richmond Machine Co., 3445 Richmond Street, Philadelphia, has awarded general contract to N. Hoffman, 1924 East Monmouth Street, for a one-story machine shop, to cost about $21,000 with equipment.

Sprout, Waldron & Co., Muncy, Pa., have been making inquiries for a grinding machine, about 30-in. swing, for installation at their plant.

Reading Co., Reading Terminal, Philadelphia, is arranging for establishment of motor bus lines in Schuylkill County to replace several short line steam railroads, with initial investment estimated at $1,000,000, to include construction of large multi-story service, repair and garage terminals at Doylestown and Pottsville, Pa. Similar plants will be built in other cities on route at a later date.

Board of Trustees, University of Delaware, Newark, Del., has plans for a new engineering building, to cost in excess of $150,000 with equipment. Charles Z. Klauder, Franklin Bank Building, Philadelphia, is architect.

Edward H. Reuss, Jr., Thirtieth and Race Streets, Philadelphia, manufacturer of pipe, heating equipment, etc., is taking bids on general contract for a one-story pipe-bending and fabricating plant, to cost about $150,000 with equipment. Philip H. Johnson, Widener Building, is architect.

State Board of Education, Trenton, N. J., is reported planning a one-story manual training and industrial school at Bordentown, N. J., to cost in excess of $175,000 with equipment. Charles N. Leathem, Jr., State Office Building, Trenton, is architect.

Viscose Co., Marcus Hook, Pa., is said to be contemplating a new mill at Meadville, Pa., for production of cellulose acetate, to cost more than $850,000 with machinery. Plant will include a steam power house, machine shop and other mechanical departments. Ballinger Co., Twelfth and Chestnut Streets, Philadelphia, is architect and engineer.

Board of Trustees, Lehigh University, Bethlehem, Pa., has awarded general contract to Irwin & Leighton, 1505 Race Street, Philadelphia, for a three-story mechanical and electrical building and laboratory, to be known as James Ward Packard Memorial, to cost $1,000,000 with equipment. Visscher & Burley, 51 East Forty-second Street, New York, are architects.

American Manganese Steel Co., New Castle, Del., has awarded general contract to John E. Healy & Son, 707 Tatnall Street, Wilmington, Del., for a one-story foundry addition, to cost $50,000 with equipment.

William H. Aretz, 5401 Rising Sun Avenue, Philadelphia, and associates have organized Kirby Iron Works to operate a plant at Lansdale, Pa., for production of ornamental iron specialties. Thornton L. Kirby, 1705 Champlost Avenue, Philadelphia, will be head.

Crane Co., 212 South Thirteenth Street, Philadelphia, manufacturer of pipe, valves, etc., with headquarters at 836 South Michigan Avenue, Chicago, is said to be planning a one-story factory branch and distributing plant at Norristown, Pa., to cost about $40,000.

Bellanca Aircraft Corporation, du Pont Building, Wilmington, Del., recently organized, has awarded general contract to John E. Healy & Son, 707 Tatnall Street, for initial unit of new airplane manufacturing plant near New Castle, Del., to cost in excess of $50,000. First building will be used largely for assembling.

E. R. Bitting, 1104 Hamilton Street, Allentown, Pa., architect, has plans for a three-story automobile service, repair and garage building, 60 x 120 ft., to cost more than $100,000 with equipment.

Sunbury School District, Sunbury, Pa., is considering installation of manual training equipment in new high school, to cost about $190,000, for which plans will be drawn by C. J. Lappley, Parkside Building, Harrisburg, Pa., architect.

Distribution of Peter Stubs' drill rod, files and tools in Philadelphia territory is now handled by James A. Stairs, 322 New Street, Philadelphia.

Chicago

CHICAGO, April 2.

INTEREST in railroad requirements of machine tools has been revived by a list which has been issued by the Union Pacific. The list is not complete and will be augmented at an early date. In the meantime, quotations made to the Santa Fe are being tabulated and it may be three or four weeks before orders are placed. Allis-Chalmers Mfg. Co., Milwaukee, has purchased several 30-in. and one 60-in. boring mills. An electrical appliance manufacturer in Chicago has ordered a 14-in. x 6-ft. engine lathe. International Harvester Co., has made extensive purchases for its Rock Island and two Chicago plants. Buying, although for the most part scattered, is in good volume, and fresh inquiry gives promise that April business will be satisfactory. There is an active demand for used machine tools.

Chicago Pump Co., 2386 Wolfram Street, Chicago, will erect a factory, 116 x 125 ft. Alfred S. Alschuler, 28 East Jackson Boulevard, is architect.

Western Architectural Iron Co., 211 West Schiller Street, Chicago, has filed plans for a one-story unit, 100 x 125 ft., to cost more than $60,000 with equipment.

Greenleaf-Greenwood Garage Corporation, 924 Ainslie Street, Chicago, Joseph Tennes, in charge, has plans for a four-story service, repair and garage building, to cost about $250,000 with equipment. Rissman & Hirschfield, 228 North La Salle Street, are architects.

Diamond Motor Parts Co., St. Cloud, Minn., has arranged for merger with Gill Mfg. Co., 8300 South Chicago Avenue, Chicago, manufacturer of piston rings, and Schleidler Mfg. Co., Milford, Mich., manufacturer of kindred products. Plants will be removed to St. Cloud where operations will be concentrated in future.

Iowa Public Service Co., Waterloo, Iowa, has arranged for bond issue of $1,500,000, a portion of proceeds to be used for expansion in power facilities and transmission lines, including purchase of a substantial interest in Sioux City Gas & Electric Co., Sioux City, Iowa. D. M. Stearns is president.

Noble J. Hursh, 2507 West Harrison Street, Chicago, operating a screw machine products plant, has acquired a one-story plant, 50 x 125 ft., at 4708 Armitage Avenue, for expansion.

Central Plumbing & Heating Supply Co., 731 North Wells Street, Chicago, will soon take bids on revised plans for a two-story plant, to cost about $100,000 with equipment; portion of structure will be used for storage and distributing service. Edmund Grossman, 139 North Clark Street, is architect. M. P. Kaplan is president.

Monighan Mfg. Corporation, Chicago, has been organized to take over and expand Monighan Machine Co., 931 North Kilpatrick Avenue, manufacturer of excavating machinery and parts, including dragline excavators. New company has arranged for stock issue to total $980,000, a portion of fund to be used for extensions and improvements.

Board of Education, Rochester, Minn., will take bids in April for new central steam power plant for high and central school buildings, to cost approximately $65,000. Ellerbe & Co., Endicott Building, St. Paul, Minn., are architects.

John Deere Tractor Co., Miles Street, Waterloo, Iowa, has awarded general contract to Jens Olesen & Son Construction Co., 1522 Lafayette Street, for a one-story addition, 120 x 120 ft., to cost about $40,000.

Kelly Mfg. Co., 131 South Fifth Avenue, Clinton, Iowa, is considering construction of new plant for manufacture of furniture to cost about $50,000 with equipment. A. H. Morrell, Weston Building, is architect.

Standard Oil Co., 910 South Michigan Avenue, Chicago, has filed plans for a one-story storage and distributing plant, 100 x 140 ft., to cost $110,000 with equipment.

Naylor-Hickey Corporation, 643 Washington Boulevard, Chicago, has been appointed representative in that district for National Flue Cleaner Co., Groveville, N. J., manufacturer of soot blowers for fire tube boilers.

Vergan-Schmidt Mfg. Co., Dubuque, Iowa, has been formed by a merger of Dubuque Tractor & Truck Co., Dubuque, and Vergan-Schmidt Co., Champaign, Ill., and will manfacture heavy construction handling equipment, garage tools and woodwork specialties. Equipment at Champaign is being transferred to Dubuque where operations will be concentrated.

Buffalo

BUFFALO, April 2.

BIDS will soon be asked by Great Lakes Portland Cement Co., Marine Bank Building, Buffalo, A. L. Beck, president, for new mill on Cuyahoga River, vicinity of Cleveland, to cost close to $1,000,000 with machinery. F. C. Fisk, Allentown, Pa., is company engineer.

Trico Products Co., 624 Ellicott Street, Buffalo, manufacturer of automobile accessories, has filed plans for an addition to cost upward of $175,000 with machinery.

Buffalo Flour Mills Corporation, Chamber of Commerce Building, Buffalo, plans rebuilding portion of mill destroyed by fire March 27, with loss reported at $200,000 including equipment.

Board of Contract and Supply, City Hall, Syracuse, N. Y., has plans under way for a two-story repair shop, with equipment, storage and distributing facilities for Water Supply Department, to cost approximately $80,000 with equipment. Nelson F. Pitts, Jr., City Hall, is city engineer.

Raymond A. Williams, 506 Delaware Avenue, Buffalo, and associates have organized Harmor & Co., with capital stock of $100,000, to establish and operate a local plant for manufacture of air compressors, parts, and others mechanical equipment.

Division of Standards and Purchase, Executive Department, Capitol Building, Albany, N. Y., is asking bids until April 19 for a pumping plant for Thomas Indian School, Iroquois, town of Collins, Erie County. Plans and specifications at office of school and office of chief engineer, Department of Public Works, Capitol Building, Albany.

Cyclone Fence Co., Waukegan, Ill., has established a branch distributing center and warehouse at 405 North Lowell Avenue, Syracuse, N. Y., with W. J. Murray in charge.

South Atlantic States

BALTIMORE, April 2.

WORK will begin by Bethlehem Shipbuilding Corporation, Key Highway, Baltimore, for new plant unit, with main one-story structure, 80 x 600 ft., for steel fabricating department; machine shops, forge and blacksmith shop, foundry, sheet metal-working shops, pipe shops, etc. Project will include a 7000-ton floating drydock and one-story power house. Entire program will cost about $2,000,000 with machinery. J. M. Willis is general manager.

City Council, Charlotte, N. C., has filed plans for one-story municipal automobile service, repair and garage building, 115 x 310 ft., to cost about $85,000 with equipment.

Southern Light & Power Co., Centreville, Md., has acquired plant and system of Millington Electric Light & Power Co., Millington, Md., and plans extensions and improvements, including transmission line construction.

Quartermaster Supply Officer, Washington, will receive bids until April 13 for one bench lathe, circular 94.

Virginia Cellulose Co., Inc., Hopewell, Va., has approved plans for one-story steam power house, to cost about $125,000 with equipment.

Virginia Electric & Power Co., Richmond, Va., has plans for new power house at Norfolk, Va., to cost $250,000 with equipment. Stone & Webster, Inc., 49 Federal Street, Boston, is engineer. Company is arranging for bond issue of $8,000,000 and preferred stock to total about $5,000,000, a considerable portion of proceeds to be used for expansion, including transmission line construction.

Board of District Commissioners, District Building, Washington, is asking bids until April 23 for metal-working machinery for public schools, including lathes, band saws, jointer, surfacers, grindstones, drill press, sanders, three electric glue heaters, drills, trimmers, etc.; until April 12 for six distributing transformers for McKinley Technical High School.

Newman Ice & Fuel Co., Raleigh, N. C., has authorized construction of one-story ice-manufacturing plant at Sanford, N. C., to cost about $35,000 with equipment.

Consolidated Electrical Appliances, Pratt and Concord Streets, Baltimore, has acquired for expansion factory heretofore held by Liberty Yeast Corporation.

Patapsco Power, Light & Mineral Co., Marriottsville, Md., recently organized, with capital of $100,000 by Wade H. D. Warfield, Sykesville, Md., and associates, is planning for development of feldspar and limestone properties at Marriottsville. A quarrying plant, grinding and pulverizing mill will be installed, to cost about $70,000.

Stoneform Corporation of America, Inc., 1253 Twenty-third Street, N. W., Washington, has acquired property at Loughborough, Md., as site for new plant for manufacture of fabricated stone, to cost about $45,000 with machinery. L. E. Harter is general manager.

General purchasing officer, Panama Canal, Washington, is asking bids until April 13 for 36,000 ft. wire rope, two power hacksaw machines, one steam hammer, five air motor hoists with trolley, 16 buffing and grinding machines, two arbor presses and other tools and equipment, Panama schedule 1868.

Kelly-Springfield Tire Co., Cumberland, Md., has taken out a permit for a one-story addition, to cost about $100,000 with equipment.

Central Atlantic Service Corporation, 20 Broad Street, New York, has concluded arrangements for purchase of plant and property of Hygienic Ice & Cold Storage Co., Pulaski, Va., and is said to be contemplating a new ice-manufacturing plant on site, to cost close to $100,000 with machinery.

Atmospheric Nitrogen Corporation, Hopewell, Va., will make extensions and improvements in plant to cost about $180,000. A gantry crane and other equipment will be installed.

Engineers Public Service Co., Richmond, Va., an interest of Stone & Webster, Inc., Boston, engineer, has arranged for preferred stock issue of $32,000,000, a portion of proceeds to be used for extensions and improvements in properties and transmission lines in Virginia, Louisiana, Texas, New Mexico, and other localities.

Greensboro Ice & Fuel Co., Banner Building, Greensboro, N. C., Robert H. Frazier, head, recently organized, has acquired property and is considering erection of a new ice-manufacturing plant, to cost more than $40,000 with equipment.

City Council, Charlotte, N. C., has awarded general contract to Southeastern Construction Co., 210 West Second Street, for one-story municipal service and repair shop, 100 x 300 ft., with garage facilities, to cost about $80,000 with equipment. C. C. Hook, Commercial Bank Building, is architect.

Detroit

DETROIT, April 2.

A NEW company, Michigan Power Shovel Co., is being formed by John Hursh, manager Michigan File Co., Lansing, Mich., and associates, to manufacture a small power shovel for use with tractors. Local building has been leased for parts manufacture and assembling.

Kalamazoo Vegetable Parchment Co., Kalamazoo, Mich., has asked bids on general contract for a two and one-half story addition, to cost close to $900,000 with machinery. Billingham & Cobb, Pythian Building, are architects. Jacob Kindlebarger is president.

Accuralite Co., Muskegon, Mich., manufacturer of pistons, cam shafts, etc., is planning erection of new factory at Muskegon Heights to cost in excess of $60,000, and will remove to new location.

Detroit Gray Iron Foundry Co., Wight Street, Detroit, has filed plans for a new one-story foundry, 115 x 125 ft., to cost upward of $65,000 including equipment.

Michigan Rubber Co., Owosso, Mich., has begun erection of one-story plant unit, to cost close to $75,000 including equipment.

Hill-Curtiss Co., Pitcher Street, Kalamazoo, Mich., manufacturer of wood-working machinery and parts, will soon take bids on general contract for a one and two-story addition to cost about $35,000. Billingham & Cobb, Pythian Building, are architects.

Ward Mail Box Co., Buchanan, Mich., is arranging an expansion and improvement program for increase in output. A building has been leased from Ward Electric Refrigerator Co. and will be used primarily for manufacture of new products, including telephone equipment, suitable for use in apartment houses.

City Council, Northville, Mich., is said to be planning installation of pumping machinery and other equipment in connection with extensions in municipal waterworks. Wellington Roberts is city engineer.

Consolidated Electric Sign Co., Opalume Division, Battle Creek, Mich., will soon take bids on general contract for a two-story plant, to cost about $80,000 with equipment. It will replace a factory destroyed by fire. L. J. Sarvie, Jr., 65 East Main Street, is architect.

Consumers Power Co., Jackson, Mich., has plans for a hydroelectric power development in Mecosta-Newaygo district, to be known as Ox-Bow power station, to cost close to $10,000,000 with power dam and transmission lines. Initial plant will have a capacity of 35,000 hp.

Pittsburgh

PITTSBURGH, April 2.

MACHINE tool business has slumped in this district, and while March as a whole made a good showing compared with February and the same period last year, sales and inquiry have been falling off since about the middle of the month.

Pittsburgh Lamp & Artcraft, Inc., recently organized, has acquired property at Monongahela, Pa., for plant to manufacture metal lamps, art metal furniture and kindred products. C. A. Ross is president.

Ovens, power equipment, conveying and other machinery will be installed in three-story and basement addition, 88 x 130 ft., to plant of National Biscuit Co., 6145 Penn Avenue, Pittsburgh, to cost about $350,000. Headquarters are at 85 Ninth Avenue, New York; L. J. Wirsching, Jr., is company architect.

Sloan & Zook Producing Co., Fullerton, near Bradford, Pa., operating oil plants and properties, has arranged for a bond issue of $500,000 and preferred stock issue of $250,000, a portion of proceeds to be used for expansion and installation of additional equipment. Ralph E. Davis, Union Bank Building, Pittsburgh, is engineer.

Bids will be asked at once by Allegheny Metal Products Co., 1902 Brighton Road, Pittsburgh, for two-story plant, including machine shop, at Verona, Pa. P. C. Gasparin is head.

Board of Education, Lumberport, W. Va., is considering installation of manual training equipment in two-story high school, for which bids will be received on general contract April 26, to cost more than $175,000. S. W. Ford, Latstetter Building, Clarksburgh, W. Va., is architect.

Pittsburgh Heater Co., Pittsburgh, recently organized by R. B. Sattler, 338 Wabana Avenue, and associates, with capital stock of $60,000 and 40,000 shares common stock, no par value, contemplates operation of local plant for production of boilers, radiators, fittings, etc. R. E. Reuss, 1739 Chislett Street, Pittsburgh, is also interested in company.

Shenango Motor Co., New Castle, Pa., has plans for two-story service, repair and garage building, to cost about $130,000 with equipment. F. H. Foulk, Fairmont Cedar Building, Cleveland Heights, Ohio, is architect.

J. M. Carskadon, president Palace Furniture Co., Clarksburg, W. Va., is head of company being organized with capital stock of $150,000 to construct and operate a new furniture and cabinet plant, to cost more than $80,000 with equipment. Property has been acquired adjoining local plant of Fuel City Box & Lumber Co. and work will soon begin. William Rogers, head of last noted company, is interested in new organization.

Electrolux, Inc., Bessemer Building, Pittsburgh, manufacturer of vacuum cleaners, etc., is considering plans for one-story factory branch and distributing plant to cost about $35,000.

William K. Stamets, machine tools and machinery, has moved into larger quarters at 4026 Jenkins Arcade Building Pittsburgh.

McCoy-Brandt Machinery Co., Pittsburgh, has moved from 210 Penn Avenue to 50 Penn Avenue.

Indiana

INDIANAPOLIS, April 2.

WORK is being completed on new plant unit, 300 x 300 ft., by American Steel & Wire Co., Anderson, for manufacture of wire fabric, to cost more than $200,000 with equipment. Harry O'Connor is superintendent.

Richmond Fireproof Door Co., Richmond, is planning a one-story addition, to cost about $35,000 with equipment.

Bishop, Knowlton & Bishop, 312 North Meridian Street, Indianapolis, architects, have taken out permit for a three-story and basement automobile service, repair and garage building, 100 x 170 ft., to cost about $100,000 with equipment.

Sarl Stone Co., Bloomington, is considering plans for one-story mill, to cost approximately $85,000 with cutting, grinding, polishing and other equipment.

Board of Education, Princeton, contemplates installation of manual training department in two-story high school in Patoka Township to cost approximately $100,000. Sutton & Routt, Citizens' Bank Building, Vincennes, Ind., are architects.

Western Oil Co., Indianapolis, care of Bishop, Knowlton & Carson, 312 North Meridian Street, architects, has filed plans for a one-story repair shop, to cost about $45,000 with equipment.

Indiana General Service Co., Muncie, has closed contract with City Council, Anderson, for power supply and will build a 132,000-volt transmission line to that place. A power substation will be constructed near city limits. Anderson municipal power department will also build transmission lines and install switching equipment for service to local industries. Entire project is reported to cost more than $100,000.

Board of Works, City Hall, Indianapolis, plans installation of pumping machinery and other power equipment in connection with sewage disposal plant at Broad Ripple, to cost about $550,000. A. H. Moore, City Hall, is engineer; C. G. Hurd, Merchants' Bank Building, is architect.

Warner Gear Co., Muncie, Ind., will build a factory unit, 50 x 140 ft.

St. Louis

ST. LOUIS, April 2.

PLANS are being considered by Oklahoma City Brass Pipe Co., Oklahoma City, Okla., for a one-story foundry, to cost about $35,000 with equipment.

Modern Products Co., Tulsa, Okla., has approved plans for one-story foundry, machine shop and plating works, 90 x 350 ft., for manufacture of valves and kindred specialties, to cost upward of $90,000 with equipment.

B. & Y. Motor Co., 4517 Troost Street, Kansas City, Mo., is considering a new service, repair and garage building, to cost approximately $100,000 with equipment.

L. J. Kent Boiler & Sheet Iron Works, Inc., Springfield, Mo., is asking bids for excavations and foundations for its new plant; bids will soon be called for superstructure, one story, 80 x 160 ft., to cost about $40,000 with equipment.

Central Oklahoma Service Co., Oklahoma City, Okla., has arranged for bond issue of $1,000,000, a portion of fund to be used for additions and improvements, including transmission line construction. Company is operated by Southwest Utility Ice Co., Oklahoma City.

Great Plains Mill & Elevator Co., 223 East Randolph Street, Enid, Okla., is reported planning a new flour mill, to cost in excess of $450,000 with machinery.

Ovens, power equipment, conveying and other machinery will be installed in four-story and basement plant and distributing station, 100 x 300 ft., to be built by Great Atlantic & Pacific Tea Co., Graybar Building, New York, at St. Louis, to cost about $650,000 with equipment. Austin Co., Arcade Building, St. Louis, is engineer.

Waxide Paper Co., 404 Admiral Street, Kansas City, Mo., is considering a new one-story and basement plant at St. Louis, 150 x 275 ft., for manufacture of processed papers, to cost more than $200,000 with equipment.

Wirt Franklin Oil Co., Ardmore, Okla., plans addition to gasoline refinery, to cost more than $85,000 with equipment.

Jaden Mfg. Co., Hastings, Neb., manufacturer hardware specialties, has filed plans for one-story unit, 120 x 245 ft., to cost approximately $55,000 with equipment.

Curtiss-Robertson Airplane Mfg. Co., St. Louis, care of McDonald & Condie, 205 North Taylor Avenue, architects, has awarded general contract to J. S. Alberici, Boatmen's Bank Building, for a new plant at Anglum, near St. Louis, comprising three units, one story, 60 x 250 ft.; one story, 40 x 60 ft., and two stories, 40 x 60 ft., to cost about $80,000 with equipment.

Usona Mfg. Co., Chouteau Avenue, St. Louis, manufacturer of architectural and ornamental iron, has asked bids for one-story addition, 75 x 80 ft., to cost about $24,000.

Colonial Steel Co., Pittsburgh, has purchased property at 712 Cass Avenue, St. Louis, and has let contract to W. C. Harting Construction Co., St. Louis, for erection of office and warehouse for distribution in Middle West and Southwest for high speed, carbon, alloy and drill steels.

Mideke Supply Co., 100 East Main Street, Oklahoma City, has been appointed representative in Oklahoma City and vicinity of Foote Brothers Gear & Machine Co., 215 North Curtis Street, Chicago, manufacturer of speed reducers, gear products and general transmission machinery.

Cincinnati

CINCINNATI, April 2.

PREDICTION made a week ago that machine tool sales in the first quarter this year will run about 25 per cent ahead of those in the same months of 1927 has been further borne out by developments in the past few days. In fact, a number of prominent companies assert that bookings have been at least 50 per cent ahead of those last year, but this percentage as it applies to the local industry as a whole has been cut in half by the experience of a group of builders which has not fared so well.

Considerable business is coming from automobile manufacturers and buyers in the general industrial field. Seldom, however, are customers purchasing more than one or two machines at a time, absence of individually large transactions being noticeable. Almost without exception companies interested in buying equipment are demanding either standard tools specially adapted to high production work or machines which are entirely of special design for the same purpose.

Plans have been authorized by Board of Trustees, Wilberforce University, Xenia, Ohio, for one-story power house to cost about $150,000 with equipment. Herbert B. Briggs, Hartman Hotel Building, Columbus, Ohio, is State architect in charge.

Columbus, Delaware & Marion Electric Co., Marion, Ohio, is said to have plans under way for rebuilding of car barn, shop and power house at Delaware, Ohio, destroyed by fire several months ago with loss of more than $70,000. G. B. Day is in charge.

Air Corps, Material Division, Wright Field, Dayton, Ohio, is asking bids until April 11, for springs, hub bushings, fuel cock assemblies, etc., circular 234; induction compasses and tachometers circular 285.

Acme Tool Co., 250 North Findlay Street, Dayton, Ohio, has awarded general contract to Hillsmith & Co., Dayton, for one-story machine shop, to cost about $25,000 with equipment.

Hibbler-Barnes Co., 710 East Tenth Street, Chattanooga, Tenn., building materials, is said to be arranging an expansion and improvement program to cost about $200,000, including installation of mechanical-handling and conveying equipment, etc.

United States Foil Co., Thirtieth Street and Grand Avenue, Louisville, has awarded general contract to J. E. Boswell & Co., 1107 East Broadway, for an addition, 112 x 200 ft., with adjoining structure, 100 x 200 ft., for storage and distribution to cost about $400,000 with equipment. Ossian P. Ward, Lincoln Bank Building, is architect.

Xenia Fertilizer Co., Xenia, Ohio, plans new two-story mill, 80 x 160 ft., to replace plant recently destroyed by fire, to cost about $55,000 with equipment. Grinding and mixing machinery, electrical and other power equipment, etc., will be installed.

Board of Trustees, Christ Hospital, Auburn Avenue, Cincinnati, has authorized plans for a new power house and mechanical laundry unit, to cost about $300,000 with equipment. Tietig & Lee, Merchants' Building, are architects.

Rendigs, Panzer & Martin, Southern Ohio Bank Building, Cincinnati, architects, have filed plans for a three-story automobile service, repair and garage building, to cost $150,000 with equipment.

B. J. Wehner Welding Co., Inc., 1725 Mellwood Avenue, Louisville, has been organized to conduct a general welding business, particularly in tanks and boilers. Company will engage in retubing and repairing upright and pressure boilers. Building has been rented and no additional equipment is needed at present.

Gulf States

BIRMINGHAM, April 2.

PLANS are being considered by Wackman Welded Ware Co., Victor and Seventieth Streets, St. Louis, for a one-story branch plant at Houston, Tex., largely for manufacture of steel drums for oil service, to cost $45,000 with machinery.

Texas Water Utilities Co., Cameron, Tex., operating waterworks, ice-manufacturing plants and other utilities, has arranged for a bond issue of $1,000,000, a portion of proceeds to be used for expansion and betterments.

Magnolia Gas Products Co., 506 South Medina Street, San Antonio, Tex., will erect a one-story plant for manufacture of industrial gases, to cost more than $50,000 with equipment.

Hygia Products Co., Houston, Tex., recently formed by D. C. Lingo, 4126 Polk Street, and associates, will build a one-story ice-manufacturing plant to cost about $30,000.

Big Lake Refining Co., Big Lake, Reagan County, Tex., care of Big Lake Chamber of Commerce, has plans for initial unit of oil refinery for output of 1000 bbl. per day. E. B. McKee, San Antonio, Tex., is one of heads of company, which was recently organized.

Holliday Life-Saving Headlight Co., Jackson, Miss., T. C. Holliday, Edwards Hotel Building, head, plans erection of one-story factory for manufacture of special automatic headlighting equipment, reported to cost about $25,000.

Syndicate Power Co., Abilene, Tex., operated by Middle West Utilities Co., 72 West Adams Street, Chicago, is completing plans for hydroelectric power project on Colorado River, vicinity of Abilene, to cost more than $500,000 with power dam and transmission system.

United Carbon Co., Charleston, W. Va., is considering construction of two new carbon black plants at Sanford and Stinnett, Tex., to cost in excess of $100,000 each, with air compressors, boilers and other power equipment. Work is in progress on a similar three-unit plant near Borger, Tex.

Benjamin Sibbitt, head of the Ben Sibbitt Iron & Foundry Co., Wichita, Kan., is at the head of a company being organized at Dallas, Tex., to construct and operate a plant on West Dallas Pike for production of gray iron castings. Initial unit will cost close to $40,000 and is scheduled for completion within three months. Charles Sibbitt, Dallas, formerly connected with Wichita company, will be an official of new organization.

Southwestern Irrigated Cotton Growers' Association, First National Bank Building, El Paso, Tex., Gowan Jones, president, plans construction of one-story cottonseed oil mill, to cost more than $100,000 with machinery.

R. B. George Machinery Co., Dallas, Tex., manufacturer and distributer of oil well machinery and road-building equipment, has work in progress on a one-story plant unit, 60 x 300 ft., to cost more than $80,000 with equipment.

Roman & Talbert, Mercedes, Tex., are considering construction of one-story general machine and repair shop, to cost about $40,000 with equipment.

General Motors Corporation, Detroit, is reported contemplating an assembling plant at Tampa, Fla., to be used largely for export trade to South America, to cost more than $200,000.

John H. Overton and John E. Thorsell, Alexandria, La., have plans for a one-story automobile service, repair and garage building, 195 x 215 ft., to cost about $70,000 with equipment.

Breckenridge Foundry & Supply Co., Mineral Wells, Tex., W. S. Slangerup, president, recently reorganized, is said to be contemplating removal of plant to Breckenridge, Tex., where capacity will be increased.

Southern Ice & Utilities Co., Santa Fe Building, Dallas, Tex., is arranging for a new ice-manufacturing plant, 130 x 275 ft., at Big Spring, Tex., to cost upward of $150,000 with equipment.

Birmingham Pressed Steel Co., First Avenue, Birmingham, is contemplating rebuilding plant unit at Pratt City, Ala., recently destroyed by fire with loss close to $27,000 with equipment.

Anniston Roller Covering Works, Anniston, Ala., manufacturer of textile mill equipment, is said to be planning extensions and installation of additional machinery.

Milwaukee

MILWAUKEE, April 2.

PROSPECTS for April business in machine tools are considered favorable in view of improvement of inquiry in the last ten days of March, and anticipated action on estimates that have been put forth in recent weeks. March trade, while hardly as large as a year ago, represented the best month's volume this year. Demand is urgent, most orders being for one or two machines, delivery of which is pressed. Numerous industrial projects that have been awaiting developments are now giving promise of a broader machine tool market.

Modine Mfg. Co., 1700 Racine Street, Racine, Wis., manufacturer of radiators and cooling systems, contemplates an additional investment of $100,000 in plant extensions and new equipment. Details have not been fully decided upon, but plans will be ready about May 1.

Ormsby Auto Equipment Co., 1116 Wells Street, Milwaukee, has placed general contract with S. M. Siesel Co., 160 Ogden Avenue, local, for construction of a $300,000 automotive sales, service and storage building, 121 x 134 ft., two stories and part basement.

Terminal Warehouse Co., 274 South Water Street, Milwaukee, has plans by W. Fred Dolke, consulting engineer, 1841 Asbury Avenue, Evanston, Ill., for a five-story cold storage warehouse, 160 x 440 ft., costing $1,000,000, and a five-story addition, 50 x 100 ft., to existing warehouse. New unit will contain about 1,000,000 cu. ft. of cold storage space. Fifth floor and roof are designed for automobile storage with a capacity of 950 cars.

Glancy Malleable Iron Corporation, Waukesha, Wis., is having survey made by A. A. Wickland, consulting engineer, 7 South Wabash Avenue, Chicago, of present and future needs of works additions and equipment. Project contemplates an investment of between $50,000 and $100,000. A. R. Glancy, president Oakland Motor Car. Co., Pontiac, Mich., is president.

Ernest Sader Co., Fremont, Wis., dealer in hardware, farm machinery and automobiles, will build a one-story addition, 42 x 80 ft., for service and repairs. Contracts for structure have been awarded and inquiry is being made for miscellaneous equipment.

Board of Education, Neenah, Wis., will close bids April 14 on revised plans for new $300,000 senior high and vocational training school, designed by John D. Chubb, architect, 109 North Dearborn Street, Chicago. Mrs. J. F. Gillingham is secretary.

Cliffs Power & Light Co., Ishpeming, Mich., subsidiary of Cleveland-Cliffs Iron Co., is doing preliminary work on construction of a new hydroelectric generating plant on Escanaba River, three miles northwest of Princeton, Mich., to cost about $500,000. Concrete dam will be 400 ft. long and 15 ft. high. Construction of power house will start about June 1. Inquiry will be made shortly for generating equipment. O. D. McClure is general manager.

Interstate Drop Forge Co., 1857 Twenty-seventh Street, Milwaukee, has started work on a one-story shop and office extension, 50 x 90 ft.

National Equipment Corporation, Wells Building, Milwaukee, has been organized to manufacture road building and construction equipment. Company has purchased property of T. L. Smith Co., builder of concrete mixers and pavers, which will be considerably enlarged. At present company has no plans for erection of new plants or buildings.

Pacific Coast

SAN FRANCISCO, March 28.

CONTRACT has been let by Pratt-Rymer Co., San Leandro, Cal., manufacturer of locks and hardware, to R. E. Nikirk, local, for a one-story factory, to cost about $17,000 with equipment. Additional plant units will be built later.

Pacific Fruit Express Co., 65 Market Street, San Francisco, has approved plans for new refrigerator car repair and reconditioning shops on 150-acre tract at Tucson, Ariz., recently acquired, to cost about $200,000 including equipment.

Methow-Pateros Growers' Association, Pateros, Wash., has authorized plans for a new cold storage and refrigerating plant, to cost about $100,000 with equipment.

West Lake Enginering Works, Seattle, has awarded general contract to J. C. Buchanan, 2017 Warren Avenue, for a one-story machine shop, 35 x 65 ft., to cost about $11,000 with equipment.

Clearwater-Hynes County Water District, Hynes, Cal., is planning early call for bids for pumping machinery and accessories and 100,000-gal. elevated steel tank and tower, for proposed waterworks. A bond issue of $160,000 is being arranged. Burns-McDonnell-Smith Engineering Co., Western Pacific Building, Los Angeles, is engineer.

Great Northern Railway Co., St. Paul, Minn., has plans for a new repair shop at Wenatchee, Wash., for electric locomotives, one story, 82 x 200 ft., to cost upward of $85,000 with equipment. A traveling crane will be installed. T. D. McMahon, Railroad Building, St. Paul, is company architect.

Barde Steel Co., 2709 Utah Street, Seattle, has awarded general contract to H. D. Stewart, 2702 First Avenue, South, for a one-story addition, 66 x 120 ft., to cost about $23,000.

Wenatchee Produce Co., Wenatchee, Wash., will build a one-story cold storage and refrigerating plant, 100 x 100 ft., to cost more than $100,000 with equipment.

Puget Sound Power & Light Co., Seattle, will make extensions in vicinity of Chehalis, Wash., with construction of transmission lines on several highways in Lewis County, for which franchise has been asked. Entire project will cost more than $75,000.

Western Oil & Refining Co., Martinez, Cal., has leased portion of tract of Petroleum Products Co., and will build a new storage and distributing plant, to cost about $350,000 with equipment.

Feenaughty Machinery Co., Portland, Ore., has been appointed distributer in Oregon, Washington and Idaho of products of Sidney Steel Scraper Co., Sidney, Ohio.

San Juan Pulp Mfg. Co., Bellingham, Wash., will double capacity of its local plant at a cost of $200,000.

Ulmer Machinery Corporation, Los Angeles, has purchased plant and business of Acme Pump Co., Los Angeles. Purchasing company formerly operated plants in Santa Ana and Porterville, Cal., but will now consolidate all manufacturing at Los Angeles.

Canada

TORONTO, April 2.

MARCH made a record for the year in increased busines in many lines, including machine tools and other equipment. The automotive industry was responsible for a large portion of the activity although during the past few days orders from this source have fallen off. Considerable buying is still being done for equipment for the mining fields of Manitoba, Ontario and Quebec. In addition to the regular flow of small orders from the railroads, the Canadian National Railways will require a large amount of equipment for its shops at Point St. Charles, Montreal. It will also spend $450,000 for power plants at this location.

Charles A. Smart, of Canadian International Corporation, Ltd., Westmount, Montreal, is taking out a charter at Fredericton, N. B., in name of Antimony Smelting & Refining Co., Ltd., of Lake George, York County, N. B. Engineers are working on plans for a power house and expect to start soon on development of company's property at Lake George. A refinery will also be built.

Hepworth Mfg. Co., Hepworth, Ont., will build a two-story addition to its furniture factory to cost about $50,000. Construction will start as soon as weather permits. Woodworking machinery and tools wil be required.

La Cie. d'Entreprises Publiques Ltd., 107 Mountain Hill, Quebec, has purchased power plant at St. Pierre les Becquets, Que., and proposes to build a station at a cost of $100,000.

Donnacona Paper Co., Donnacona, Que., will start work soon on a machine shop to cost $25,000. It will be two stories 40 x 40 ft.

Copp Clark Co., Ltd., 517 Wellington Street, West Toronto, will build an addition to cost $75,000. It will be four stories and basement, 60 x 74 ft. Wickson & Gregg, Temple Building, Toronto, are architects.

J. Ford Co., Portneuf Station, Que., manufacturer of roofing felt, etc., has awarded contract to Gauthier & Julien, for erection of a plant to cost $150,000.

Western Canada

Winnipeg Electric Co., Winnipeg Electric Chambers, Winnipeg, is having plans prepared for construction of a power plant at Seven Sisters Falls, Man., to cost $15,000,000. Work will include transmission line and 14-mile spur railroad.

City of Nelson, B. C., is contemplating construction of additional unit to power plant at Bonnington Falls, to cost $240,000. A by-law will be submitted to ratepayers.

International Electric Co., Stewart, B. C., contemplates erection of a 2000-hp., hydroelectric power plant to cost $300,000 in the Portland Canal District.

Hinde & Dauch Paper Co. of Canada, Ltd., Toronto, Ont., will start work soon on erection of a paper mill and box factory at Winnipeg, to cost $1,000,000.

Foreign

PLANS have been completed by Russian Soviet Government for an electric generating plant near Artemovsk, Konstantinovka district, for initial capacity of 3000 kw. American-Russian Chamber of Commerce, 50 Broad Street, New York, has information regarding project.

Spanish Council of Ministers, Madrid, Spain, has approved a program of railroad construction and improvement to cost 231,000,000 pesetas (about $39,250,000) for new lines, and 371,000,000 pesetas (about $63,000,000) for betterments, including rolling stock, shops, tools and equipment. Information at office of Bureau of Foreign and Domestic Commerce Washington, reference Spain No. 63476; also, at American Consulate, Madrid, E. D. Hester, assistant commercial attaché.

Stewart & Partners, London, England, have taken contract for construction of a beet sugar refinery at Brigg, Lincs., to cost more than $1,500,000 with machinery. Hallesche Mash-fb., Halle, Saxony, Germany, are engineers for the project.

Public Works Department Government of Persia, Teheran, is considering construction of a blast furnace, steel mill and iron foundry in Somnan district, where surveys have been in progress, to develop iron ore deposits. Entire project is estimated to cost $4,500,000. Plans are also under advisement for construction of aerial cableway from Shamshak, Elburn Range district to Teheran, for coal transportation. Information at office of American Consulate, Teheran, Orson N. Nielsen, consul.

Great Southern Railway Co., Buenos Aires, Argentine Republic, is arranging fund of $853,000 for improvements, including reconstruction of different portions of road, extensions in repair shops, tools, equipment, etc. Henry C. Evans is president.

J. A. M. Burgman, Nieuwe Gracht 83-85, Utrecht, Holland, is interested in securing an agency for hardware and plumbing supplies and for supplies sold to railroads.

Madagascar Government Railways (Chemins de Fer de Madagascar), Tananarive, Madagascar, has approved project for partial electrification of its line from Tananarive to East Coast, to cost close to $5,000,000, including a hydroelectric power development on Mangoro River. American Consulate, Tananarive, Paul D. Thompson, vice-consul, has information regarding the project.

NEW TRADE PUBLICATIONS

Air Filters.—Reed Air Filter Co., Inc., Louisville.. Bulletin 114, dealing with the company's Streamline self-cleaning air filter. Attached is a data and specification sheet for determining size and type needed.

Acetylene Generators.—Alexander Milburn Co., Baltimore. Bulletin B-200C, briefly describing acetylene generators for use with oxy-acetylene welding and cutting apparatus.

Recording Thermometers.—Bristol Co., Waterbury, Conn. Leaflet announcing new recording thermometer, with 4-in. chart, for use in cold storage rooms, electrical refrigerating units, and other places where large size thermometers are not required.

Pumping Equipment.—De Laval Steam Turbine Co., Trenton, N. J. Leaflet describing water works pumping equipment for City of Haverhill, Mass., for which company has installed two electrically driven centrifugal pumps with capacity of 7,000,000 gal. daily.

Hoists.—Union Mfg. Co., New Britain, Conn. Leaflet devoted to company's roller bearing, spur-geared hoist. Special features in construction and operation of hoist are itemized.

Excavating Machinery.—Osgood Co., Marion, Ohio. Bulletin 2707, covering company's line of gasoline and electric excavating machinery. Included are electric shovels, cranes, clamshells, draglines and backhoes.

Flood Lighting.—Crouse-Hinds Co., Syracuse, N. Y. Bulletin 2106, describing various types of floodlight projectors for industrial units. Bulletin 2109 deals with floodlighting in general, and includes a number of interesting and novel installations.

Sheet Steel Products. — Superior Sheet Steel Co., Canton, Ohio. Booklet dealing with lead-sealed sheet steel products manufactured by company. Included are corrugated and other roofing and sidings, flat sheets and formed products, eaves trough, conductor pipe, accessories, etc.

Boiler Nozzles.—Lenape Hydraulic Pressing & Forging Co., Box 66, West Chester, Pa. Bulletin 2, devoted to forged steel boiler nozzles, includes tables of various working pressures. Of particular interest are illustrations of two 4-in. nozzles of the 250-lb. W. S. P. type under a severe test of 4500-lb. hydrostatic pressure.

Rotary Dryers.—Struthers-Wells Co., Warren, Pa. Bulletin devoted to company's line of rotary dryers, kilns and coolers of the steam heated, hot air, direct heat and indirect heat types.

Die Makers' Supplies.—Danly Machine Specialties, Inc., 2104 South Fifty-second Avenue, Chicago. Catalog of 50 pages describing all of company's products. In addition to the die sets, each of which is illustrated by a halftone and blue print, bushings, dowel pins, a line of socket head and fillister hand stripper bolts and flat, rounded and square springs have been added.

Drills.—Sullivan Machinery Co., 122 South Michigan Avenue, Chicago. Bulletin 81-O, providing illustrated description of company's auger drill for drilling very soft ore, coal, soft and broken rock, hardpan, etc., and Bulletin 81-Q, describing the L-3 and L-5 heavy rotator rock drills for medium heavy rock drilling work.

Developments in Steam Generation.—Combustion Engineering Corporation, 201 Madison Avenue, New York. Reprint of an address delivered before the Engineers' Society of Western Pennsylvania by George T. Ladd, president Ladd Watertube Boiler Co. There are eight pages, illustrated, giving a comprehensive survey of some modern achievements. High-pressure steam is discussed, as well as steam generating from dry quenching of coke.

Story of Combustion.—International Combustion Corporation, 201 Madison Avenue, New York. Reprint of an article by Donald Wilhelm, printed as institutional advertising in both *Review of Reviews* and *World's Work*. There are 10 pages illustrated, dealing with the modern problem of getting the most out of each pound of coal.

Soot Blower.—National Flue Cleaner Co., Groveville, N. J. Leaflet of four pages, illustrated, telling about advantages of blowing the tubes of horizontal return tubular boilers at frequent intervals.

Line-Starting Induction Motors.—Allis-Chalmers Mfg. Co., Milwaukee. Bulletin 1145 of four pages illustrates and describes induction motors not requiring current reducing devices for starting.

THE IRON AGE

New York, April 12, 1928

ESTABLISHED 1855

VOL. 121, No. 15

New Method of Making Cast Pipe

Hand Labor Eliminated in McWane Mechanical Process—Unique Multiple-Lip Ladle Pours Metal—Conveyors and Cranes Handle Materials—Plant Scheduled Like a Rolling Mill

A SIGNIFICANT departure in pipe foundry practice is back of the recent announcement of the McWane Cast Iron Pipe Co. that the new mechanically operated unit of its Birmingham, Ala., foundries, which went into production on Jan. 1, 1928, was placed on a double shift basis March 1.

Essentially, the new process of making cast iron pipe at the McWane plant involves the substitution of mechanical equipment for hand labor. The same operations that were formerly used are still employed, but machines and mechanical devices, it is said, effect a far greater economy and rapidity of output than was ever possible with the old manual methods.

This new process embodies features of continuous operation and flexibility of output that have heretofore been unknown in the manufacture of cast iron pipe. It still retains, however, the former McWane features of casting pipe 4 in. and larger in 16-ft. lengths, horizontally, in green sand molds with green sand cores. This former method was based on a pat-

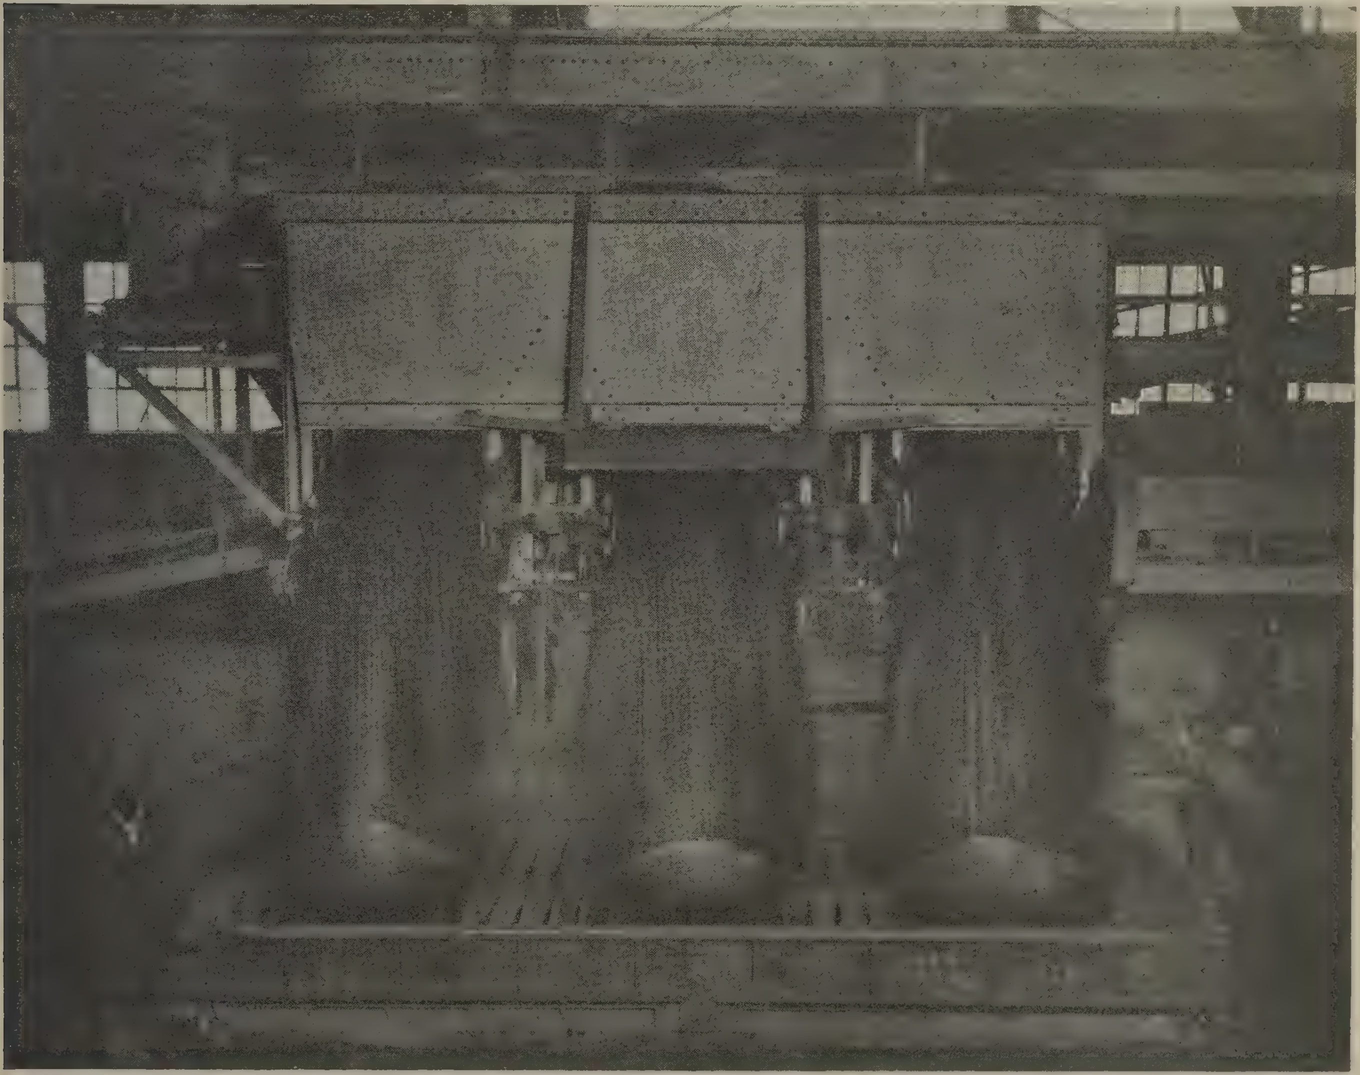

Fig. 1—*After the Pipe Mold Is Placed on a Special Jolt Ramming Machine, It Is Filled with Green Sand. Notice the belt conveyor supplying sand to the service bins*

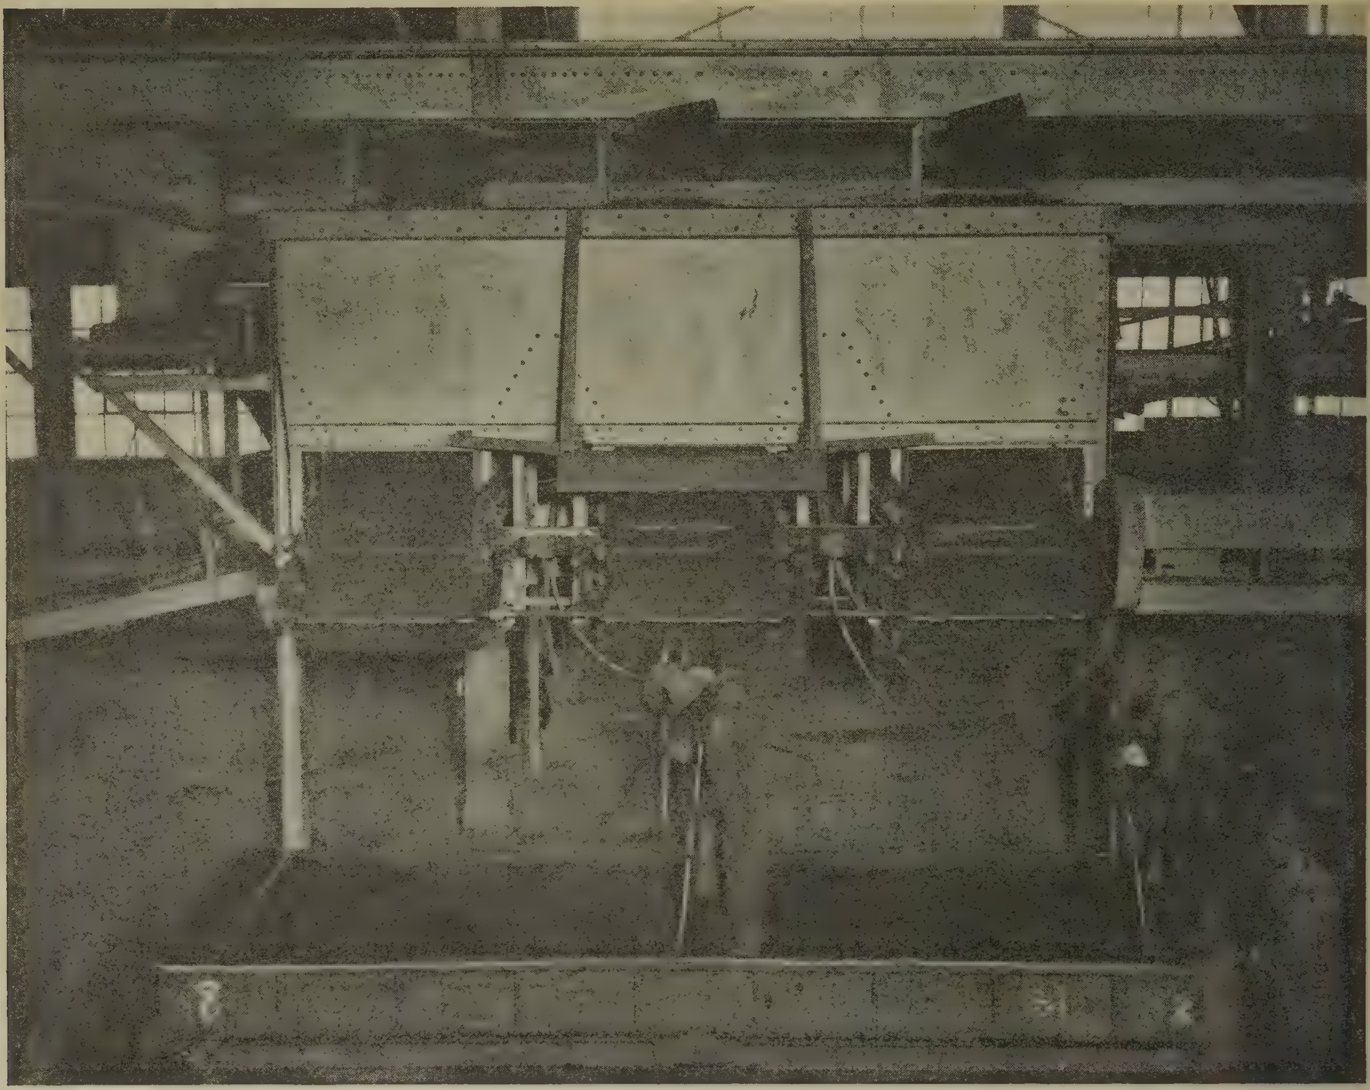

Fig. 2—When the Jolt Ramming Machine Has Finished Its Work, Ramming of the Mold Is Completed with Pneumatic Rammers. This shows four workmen at the mold, which, in this instance, held four 16-ft. lengths of 8-in. pipe

Fig. 3—Here Is Shown a Core Machine Making the Last Core of a Set of Four. When it is completed, the quartet will be picked up by an overhead crane and immediately set in a waiting flask

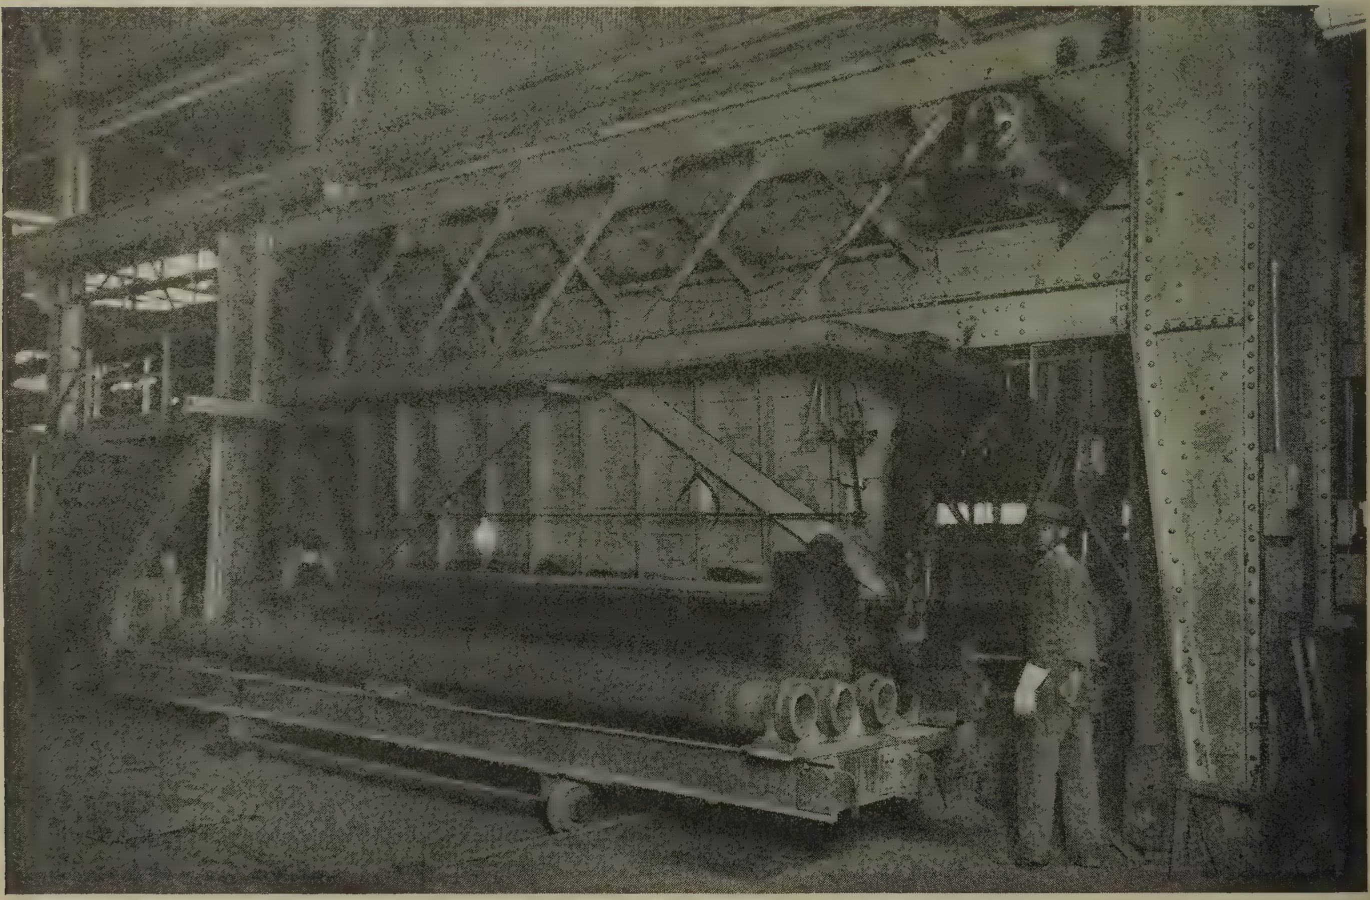

Fig. 4—The Method of Setting Cores Is Graphically Shown on the Left of This Photograph. Notice the two gages. These indicate to a nicety how the cores shall be adjusted in the flask to prevent sagging or floating before and as the molten iron enters the mold. On the right, a completed mold as it looks when ready to be transferred to the casting zone. In both instances a very good idea can be gained of the numerous gates which make it possible to pour two pipes in a few seconds, with the molten iron traveling a minimum distance from the ladle to its final resting place in the mold

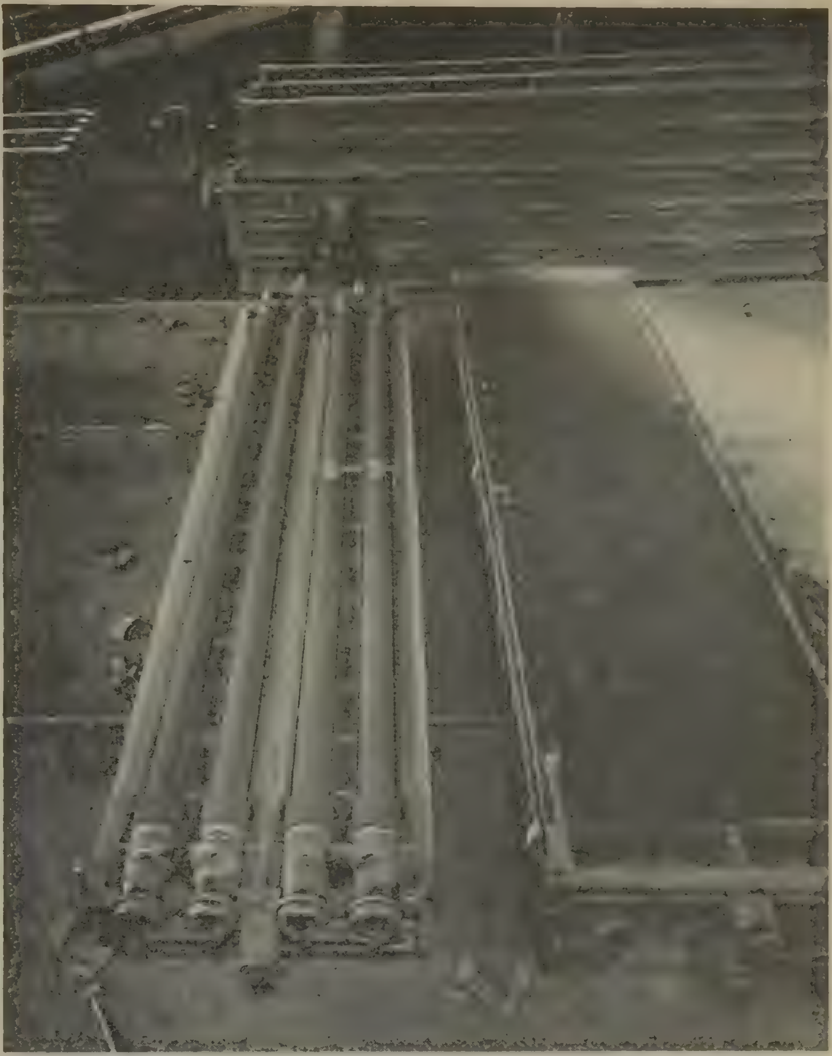
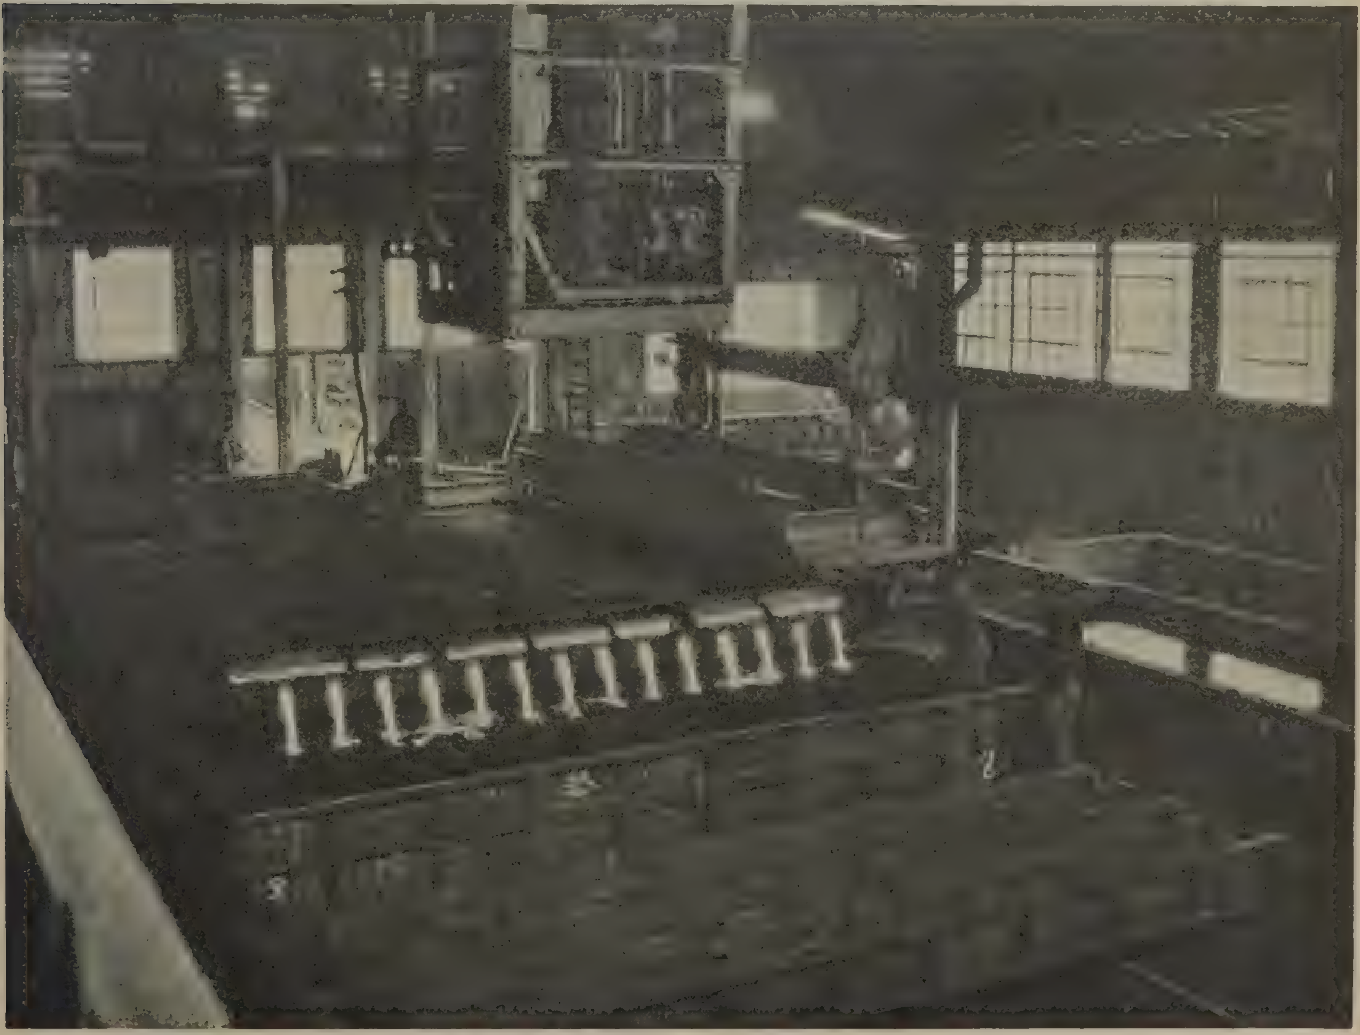


—

Fig. 5 (Below)—This Gives an Excellent View of One of the Large Multiple-Lip Ladles, Which Pours from 14 Spouts at Once. Two pipes are cast at the same time by this process. In the background, to the right, can be seen one of the shake-out machines



ented device for holding long cores central in a mold without chaplets.

Schedule Production Like a Rolling Mill

The layout of the new foundry unit is interesting mainly in that it permits continuous operation of all factors used in this mechanical process of making pipe. Instead of a certain number of molds being prepared and the molten iron subsequently poured into them, ramming, core-making and core-setting, pouring, shaking out, core bar pulling—and the return of the flasks, sand and core bars for immediate re-use—are simultaneous operations.

Perhaps the most outstanding feature of this new process is that, instead of a certain division of classes and sizes of pipe making equipment arbitrarily fixing the relative output of each day's work, the entire mechanical unit of the McWane plant runs on a given size, as in the case of a rolling mill. Thus orders—and not the proportion of plant equipment for given sizes of pipe—determine the scheduling of production.

Sand Handling All Done by Conveyors

Molding sand used in the McWane mechanical process is handled entirely by conveyor equipment. After the sand leaves the shake-out machines, it is carried to reconditioning equipment consisting of screen, pug mill, blender, storage bins and conditioner. Then a belt conveyor, which runs underground to the foundry, returns it to service bins above and behind jolt rammers.

When a mold is placed at a rammer, the sand is discharged directly into it. This is shown in Fig. 1. Then comes the jolt ramming operation, which is finished off with manual pneumatic rammers as shown in Fig. 2. Any surplus sand that may have been discharged on to the rammer from the service bin is shoveled on to floor gratings immediately in front of the rammer. From there it falls to a clean-up conveying system beneath the floor of the foundry and is, in this manner, restored to service.

The output of each mold is from one to six 16-ft. lengths of pipe, depending upon the pipe diameter. All the equipment in this unit of the McWane plant is designed to make pipe from 4 to 12 in. in diameter.

Molds and Cores Handled by Cranes

Overhead cranes play an important part in the McWane process. One of them handles the copes and drags to the assembling zone, where from one to six cores are set simultaneously. These cores are made by a special 16-ft. core machine, shown in Fig. 3.

Another such crane picks up the cores from the device upon which they have been placed by the core-making machine and sets them in the drags. This second crane, after the flasks are closed, carries them in completed form to the casting and shake-out zone.

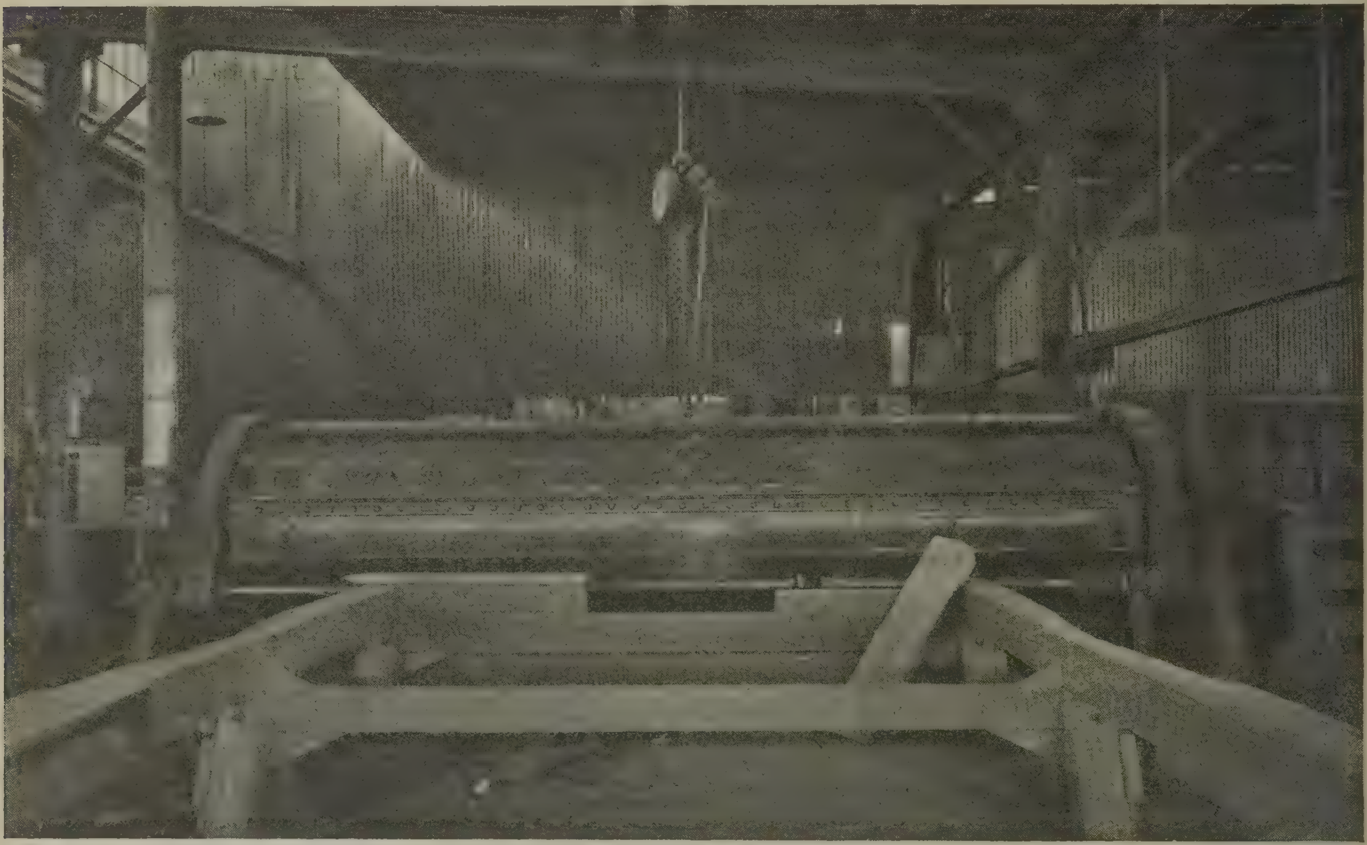


Fig. 6—Here Is Shown One of the Large Rattlers Which Is Included in the Finishing Process of the McWane Plant. This machine is capable of handling approximately 19 *6-in. diameter lengths of 16-ft. pipe*

Throughout the process, these cranes keep from one to six molds ahead of the pouring ladles.

Metal Poured by Multiple-Lip Ladles

Multiple-lip ladles, as shown in Fig. 5, are employed entirely. Each of these large ladles is equipped with 14 spouts and is capable of pouring two 6-in. or two 8-in. pipes at the same time. As previously stated, the number of lengths of pipe to a mold varies with the size being cast.

A third overhead crane handles the ladles and, when this job is completed, places the molds on a car which immediately carries them to a runway leading to the core bar pulling machine. Another duty of the third crane is to place the copes and drags on the shake-out machines. One of these machines can be seen in the background of Fig. 5.

Following the shake-out operation, the endless conveyor system recaptures the sand used in the molding and a smaller wall crane runs the flasks back to storage near the jolt rammers. Then the entire process is repeated.

After they have been removed from the molds, the lengths of pipe, with the core bars in them, are conveyed to the core bar pulling machine. This interesting device extracts the core bars in a few seconds, and the pipe is then rolled to the tumbling mills. Here it is rattled with small steel stars. One of the large rattlers, which is capable of handling 19 lengths of 16-ft. pipe, is shown in Fig. 6.

After leaving the rattlers, the pipe passes through the regular foundry routine of chipping, inspection, hydrostatic testing and, finally, coating—when required.

Thenceforth the pipe lengths pass either directly to the shipping yard or, if they are of special McWane types that are to be equipped with joints, they are diverted to the joint-making department for insertion of the pre-calked lead-and-jute joints. If for high-pressure gas or air service, the pipe is threaded, male and female, at the spigot and the bell ends respectively.

It should be borne in mind that the McWane pipe specifications are of the modern weights and thickness, which factors have been determined by subjecting the product, thus cast in green sand with green sand cores, to tensile and transverse tests and to tests to destruction.

In this manner the weights and dimensions in the various classes of pipe made by the new McWane process are fixed to guarantee the service requirements of older specifications, for both water and gas.

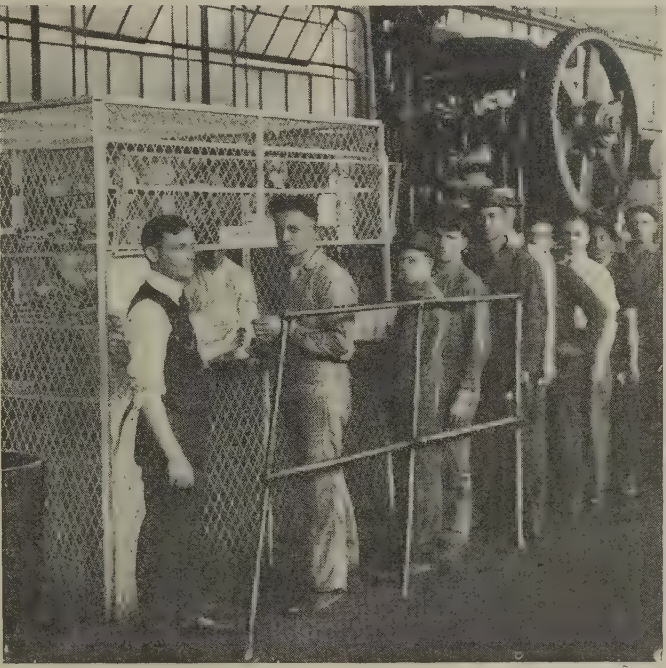
Canteens Placed at Handy Locations in Large Plant

Budd Body Factory Serves Five Million Orders Yearly at Five Cents Each—Everything From a Cup of Coffee to a Full Meal

BY R. W. BAREMORE

AN efficient yet highly specialized lunch system is functioning successfully at the Edward G. Budd Mfg. Co.'s automobile body plant in Philadelphia. Last year it supplied employees with over 5,000,000 food orders. Each one sold at 5c., the standard charge for everything served.

The method of dispensing food is perhaps best described as a canteen system. Distributed throughout the various plant buildings, in convenient locations, are 25 service stations or canteens, all of which are supplied from a central kitchen. As shown in the illustration, each is a wire cage, similar to the modern tool crib, about 6x12 ft. in area, equipped with shelves, counter, cash register and gas stoves. The latter are used only to keep foods hot. At these canteens 7000 persons may be served with one or more food orders in a very short space of time, easily, satisfactorily and economically.



Canteen Brings Lunch and Supper to the Men

At the noon hour the men line up at their respective stations, give their orders, pay for them and are quickly served. It is all done so rapidly that there is hardly any waiting, and the patrons obtain good, substantial food at a low price. Rapid service means that when the whistle blows the men do not need to make a wild dash for a good place in line; furthermore, they are able to take full advantage of their lunch hour for eating, rest or recreation.

This unit cafeteria plan has now proved its usefulness over several years at the Budd plant, and has been found to provide, among other things, the following distinct advantages:

1. It supplies good food at low prices, thus conserving and even improving the health of the workmen.
2. It uses with economy a limited amount of valuable floor space.
3. It gives quick service to all during one lunch hour, thus insuring proper rest and avoiding the necessity of staggering the working periods to prevent overcrowding a central lunch room.
4. It operates as a service department and as an aid to production, as well as a convenience to the employees.

None of these advantages could be obtained, however, were the system lacking in popularity among the employees. To insure this popularity the needs and desires of the patrons are closely studied, their tastes analyzed and their wants anticipated. With every food order priced at 5c. there is a wide variety from soup to ice-cream. A man can supplement the contents of his lunch box with a single order of hot soup or coffee, or, if he does not carry a "nose-bag," he can get a well balanced meal.

Since the Budd company's canteens sold over 5,000,000 orders last year, it stands to reason that the system must be highly thought of by the employees, else it would not be so well patronized.

A glance at the records of the commissary department shows that the canteens used 60 tons of bread last year, 18 tons of sugar, 60,000 qt. of cream, about 700,000 orders of pie, close to 80,000 gal. of coffee and 40,000 gal. of soup. Sandwiches, of course, lead all food orders, over a million having been sold during 1927.

The above figures apply only to lunches served in the shop. In addition to this, the Budd company maintains a restaurant for office employees, where some 50,000 meals are served annually.

For many years past, business organizations have found that it pays and pays well to provide luncheons for their employees, even when the actual food cost is considerably higher than the prices charged. Whether this end can be served by building a central cafeteria, by subsidizing a restaurant on neighboring ground or by installing a central kitchen and a number of canteens, such as described herein, is a matter to be determined by an analysis of the individual circumstances. Where the operations are spread over large floor areas, the canteen will usually be found to appeal to the workmen. It returns dividends in time saved, better health, and therefore better and more efficient production, and is a direct factor in preserving morale and good will.

At least this has been the result at the Budd plant. It has also been found that the curse has been taken from overtime or night work by the willingness to supply an appetizing supper at short notice. As a matter of fact, no service of this kind is refused, irrespective of the cost, if a corresponding benefit accrues to men and production management.

New Drive for Three-High Plate Mills

Driving Center Roll at High Speed Gives Large Torque with Increased Flywheel Stored Energy

BY MAJ. JOHNSTONE TAYLOR

A ROLLING mill slip drive designed and built by Duncan Stewart & Co., Glasgow, Scotland, is stated to possess several advantages. Its arrangement is shown in the accompanying diagram. It has been in existence for some time on two-high reversing plate mills, on both roughing and finishing stands, and is now being applied to three-high mills, where it would appear to have great possibilities.

It will be seen that the customary pinions and pinion housing have been eliminated. Their place is taken by a light nest of gears between the flywheel and the mill spindles. As the usual type of pinions may cost up to $20,000 on a 30-in. mill, the saving in first cost and in renewals is important. The torque is applied to the center roll, which hitherto has not been driven. By this method it is possible to speed up the flywheel about 30 per cent with the same rolling speed, resulting in a great increase of momentary mill power without increasing the size of the mill motor or the weight of the flywheel. In a recent installation an 80-ton flywheel proved of equivalent value to the previous 150-ton unit, due to the greater revolutions for the same rolling speed.

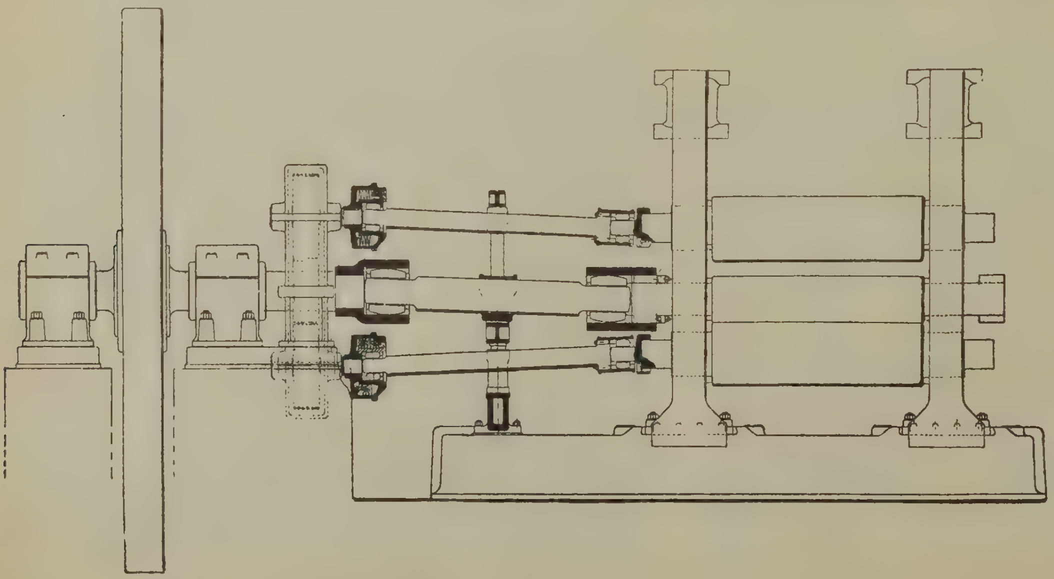
The addition to the plant involves but a new pair of machine-cut double helical gears and a new middle roll having larger necks and chocks. Thus for quite a small outlay an existing mill can be given something like 75 per cent increased mill torque. In addition, the end of the new middle roll can be made suitable for the universal coupling box of the driving spindle, while the top and bottom existing rolls can be made to take the new attachment.

In addition to there being 75 per cent added momentary power, the rolling power consumption is reduced well below the original amount, due to the smaller diameter of the middle roll. If there is to be no increased size of slabs, there may be no need for the increased diameter of roll necks, though the increase of power, as is known, rises more quickly than the increase of roll speed.

Only a mill provided with slip drive can make use of this method for operating a three-high mill. A positive connection between the upper and lower rolls when producing a finished plate is inadmissible. On the finishing stands of a reversing plate mill the upper roll is not driven, with the result that many rolls are broken, due to shock, though little damage is done to the plate; but if both were driven, thin plates would be torn to pieces.

With this new equipment every roll is driven and is under full control. The top and bottom rolls are each driven through a slip drive, which permits them to adapt themselves to the central driven roll speed. The result is a much more powerful machine, its total energy is increased, its speed drop is negligible, while the increased flywheel energy and reduced mill torque insure steady running by reason of the lessened demand from the flywheel.

The Cincinnati chapter of the American Society for Steel Treating held its monthly meeting April 5 at the Cincinnati Milling Machine Co.'s plant. After an inspection of the plant, the members listened to a short talk on "Austenite" by E. P. Stenger of the Queen City Steel Treating Co., and an informal presentation of electric methods of heat treating, normalizing, carburizing, hardening and drawing by H. Stanley Binns of the Cincinnati Milling Machine Co. A film showing methods of electric heating concluded the program.



AS the Torque of the Drive Is Applied to the Center Roll, Heretofore Not Driven, the Flywheel May Be Speeded Up 30 Per Cent, Giving Smoother Operation

Does Price Cutting Help the Buyer?

Destructive Competition Inimical to Interests of Purchaser and Seller Alike, Says Charles F. Abbott in Address to New England Purchasing Agents' Association

"DOES price cutting work out to the buyer's interest?" was the theme of an address delivered before the New England Purchasing Agents' Association at Boston on April 9 by Charles F. Abbott, executive director American Institute of Steel Construction, who has been speaking throughout the country to business organizations on the necessity of curbing price cutting as a means of securing adequate profits for industry.

"In the long run, buyer and seller alike will be adversely affected by any influence which undermines the stability of the other," said Mr. Abbott. "The best assurance for the consistent prosperity and progress of both, and of American business as a whole, lies in active cooperation to foster constructive influences and stamp out those, such as price cutting, which are responsible for destructive competition that menaces the welfare of all concerned.

"Formerly, in periods of active business, practically all organizations except the markedly inefficient could depend upon enjoying a share of the general prosperity. Today this situation does not hold. Considered from most angles, the last few years have been prosperous. Wages have been good, the purchasing power of the public has been at a high level, and the volume of sales has been satisfactory. Why, then, did we average 2000 business failures a month all through 1927? Why do we find adequate profits monopolized by a comparatively small number of organizations while the rank and file struggle along in a welter of red ink figures, passed dividends and complaints about profitless prosperity?

"Much of the responsibility for these situations," Mr. Abbott continued, "can be placed squarely upon the selfish desire to obtain all the business in sight. Business men seem to have lost all sense of proportion in a wild scramble to attain volume at any price. The idea seems to be to keep your competitor from getting any business at all. Greed for volume, without due attention to costs and profits, leads directly to price cutting. Price cutting leads directly to rancorous, cutthroat competition and to obliteration of all semblance of salesmanship.

Price Cutting a Vicious Circle

"In a number of our key industries there is actually severe depression due largely to the practice of slashing prices to meet the terms of competitors who are expert slashers themselves. The whole thing is a vicious circle, and, if the tendency continues at its present rate, it threatens to bring trade prostration of the worst kind.

"The aggregate net income of 385 important railroad, industrial and utility corporations was $2,467,000,000 in 1927 compared with $2,570,000,000 in 1926. The decline amounted to more than 4 per cent. Forty-one of the important industrial concerns reporting showed either a decrease of 50 per cent or more in net income as compared with 1926 or showed a deficit as compared with a net profit in 1926. In six out of the 10 industries listed, lower prices is given as one of the basic causes of the shrinkage.

"The predicament in which the seller finds himself as a result of inadequate prices is an exceedingly uncomfortable one, but is there any reason why the buyer should be particularly worried about the price-cutting activities of the organizations from which he buys? If these organizations want to commit suicide by supplying him with materials at less than cost, is there any reason why he should be concerned? Is there any reason why he should not take the fullest possible advantage of a buyer's market while such a market exists?

"The old-fashioned purchasing agent would have answered 'no' to both of these questions without the slightest hesitation. Practically his sole concern was with price. His tactics were limited to a question and a protest. The first question he put to the salesman invariably was 'What's your price?' The form of the protest was equally invariable: 'Too much. Go home and sharpen your pencil. Then come back and maybe we can talk business.'

"The Bell Telephone System was one of the first large organizations in the country to lift some of the emphasis from price and place it on those other factors where it belonged. Price remained important, but even more consideration was given to the twin elements of quality and service.

"The advantages of the shift quickly became so apparent that a number of other organizations fell into line. Their purchasing agents were lifted from their former positions as official hagglers, and were turned into purchasing engineers whose duties include the study of fundamental factors that control price movements and underlie the production of raw and semi-finished materials.

Many Purchases Made Solely on Price Basis

"Marked progress has been made in the right direction, but there is still plenty of room for more. Although a growing number of concerns are replacing the haggler with the purchasing engineer, there are innumerable organizations throughout the country where the haggler still reigns supreme and where the purchase is made almost solely upon a price basis.

"No one will attempt to condone the actions of the price-cutter. It must be admitted, however, that the buyer is frequently guilty of what might be called purchaser profiteering, in contrast to the seller profiteering that we experience when demand is abnormally high and supplies are short.

"Purchaser profiteering usually takes the form of jockeying one seller against another to force down the price. Each seller, in turn, is told that the buyer would like to give him the business, but that another bidder's price is lower. The bids are progressively forced down until the man who receives the contract obtains it only at a losing figure. As the practice continues over a period of months or years, all transactions are completed at losing prices and the industry involved is headed for the rocks.

"As you know, the National Association of Purchasing Agents has strongly condemned the subterfuge of pitting one seller against another. The seller is, of course, to blame for being too weak-kneed to look the order in the face and say 'no,' when he is fully aware that it will almost certainly entail a loss. Nevertheless, it is to the interest of the buyer to cooperate with him in eliminating this and other forms of the price cutting evil which at the present time is proving a heavy handicap to the prosperity of industry.

"In the first place, quality and service inevitably suffer when the price is cut below the line of a reasonable profit. The seller is almost irresistibly tempted to resort to substitute materials or inferior workmanship. Deliveries lag. The seller tries in every possible way to repair the mistake he made when he submitted a price based, not on a fair profit upon the transaction, but upon the vicious system of trying to beat out competition.

"The buyer does not receive what he ordered. He receives exactly what he pays for—no more and no less. In the end he pays a price much greater than one based upon cost plus a fair profit, while the seller makes another red entry that brings him nearer bankruptcy.

"Sometimes, it is true, the buyer escapes the penalty. Then it is the ultimate consumer who pays. But business of this kind is built on a foundation of sand. It can never be permanent. Quality, reputation, good will, and all the other business building assets must be thrown overboard for the sake of a quick sale on a price basis.

"The maintenance of his source of supply is another factor that makes a fair profit for the seller about as important for the buyer as for the seller himself. The wise buyer realizes that unless those who supply him with essential materials are able to make a reasonable profit they will either be forced out of business altogether, or will turn to the production of other materials in the manufacture of which they can employ their capital and brains to better advantage.

Sheet Steel Industry was Losing $8 a Ton

"About a year ago it was reported that the producers of sheet steel were losing an average of over $8 a ton on every ton of sheets turned out in their plants. Think of it! There is an industry, well established, with heavy investments in plant and machinery, and supplying an essential commodity. Business conditions were generally good throughout the country. The market for sheet steel was expanding. Yet the sheet mills were not only unable to operate at a profit; they were forced to operate at a loss. Price cutting was almost wholly responsible for this condition.

"A large part of the product of the sheet steel manufacturers is used in automobiles. The automobile industry is very nearly dependent upon the sheet steel industry. It is almost impossible to conceive of an automobile without a steel body. If the sheet steel industry were forced out of existence, or if its efficiency were materially reduced, the automobile manufacturers would suffer irreparable injury.

"The automobile manufacturers, however, did not hesitate to take advantage of opportunities to obtain quotations below the cost of production. This attitude, coupled with the weakness of the sheet people, resulted in utter price demoralization that shook the stability of the entire sheet steel industry. Fortunately, the automobile manufacturers appear to have realized the suicidal nature of their policy, and they have announced that they are willing to pay a fair price if they can be assured that the first price quoted will be the last.

"That incident in itself adds tremendous weight to the argument for the one-price policy as opposed to the horse-trading methods involved in price cutting.

Does Buyer Secure a Real Advantage from a Cut Price?

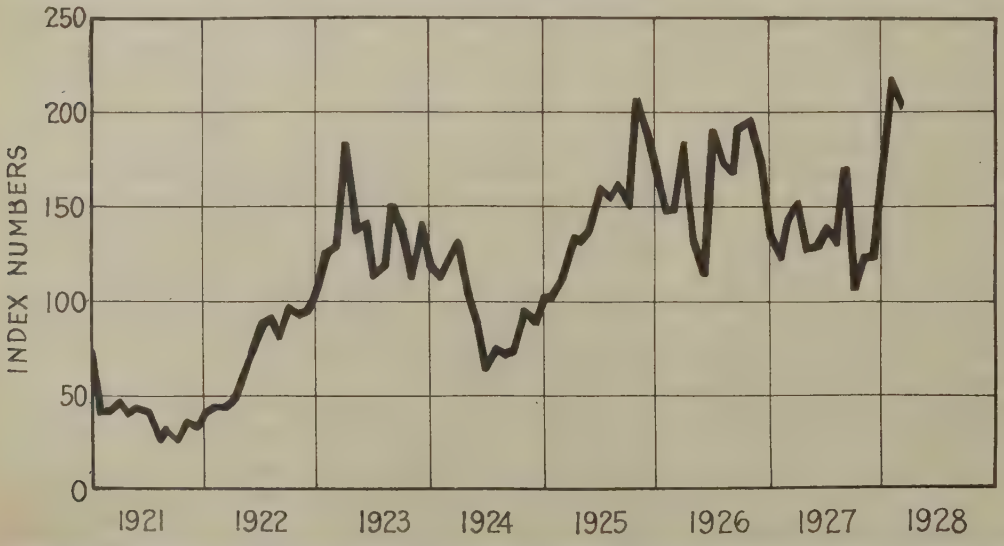
"All that I have said about the admitted disadvantages of price cutting, from both the buyer's and the seller's point of view, might be offset in the eyes of the buyer if, as a result of price cutting, he were able to secure materials at a lower cost than his competitor. There is no question but that the success of a concern is vitally affected by the price at which it is able to obtain raw or semi-finished materials.

"Before it is possible to prove that price cutting is thoroughly inimical to the interests of all concerned, it is necessary to show that the practice cannot give the buyer an advantage over his competitors. Such a demonstration is not difficult. It is even possible to show that in obtaining a price concession which may appear to afford such an advantage, the buyer has in reality handicapped himself in meeting competition.

"Granting that it is sometimes possible to keep a price concession a secret, it is nevertheless true that the salesman who offers one buyer a cut rate will offer his competitor the same cut whenever it is necessary to do so in order to obtain the business. Who profits then? Neither concern will possess any advantage over the other. But, you may say, each concern has a wider margin between its costs and its sales price.

"The trouble is that it seldom works out that way. One of the concerns in the industry is practically certain to use the cut price it has been able to obtain on materials to cut its own price. Other organizations will have to follow suit. Price cutting that started in an intermediate industry is transferred to the buyer's own industry. The final result is lowered prices for all.

"The buyer must recognize the essential nature of the function performed by the seller and the threat to the well-being of both buyer and seller which price cutting, with its constant seepage of profits, inevitably entails. The seller must recognize that if he expects the buyer to pay him a fair profit, he owes it to the buyer to cut his costs to the lowest possible level consistent with good quality and good service."



Monthly Index of Gross Orders for Machine Tools Shows Upward Trend

(Average Monthly Shipments 1922-23-24=100)

—

From Data Compiled by National Machine Tool Builders Association

Intricate Spun-Sorbitic Castings

Produced in Great Britain by New Process—Have High Strength, Machinability and Wear Resistance—Useful for Engine Cylinders and Pistons of All Kinds

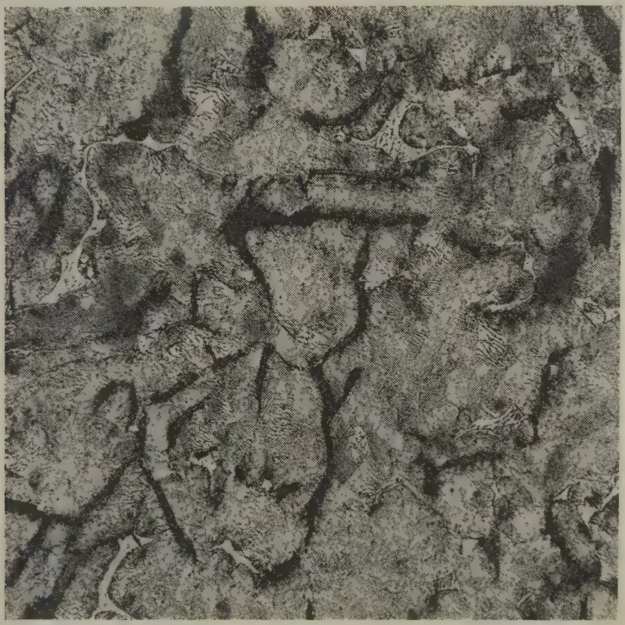
BY J. E. HURST*

DURING the past few years the centrifugal process has been extensively applied to the production of cylindrical castings in cast iron, such as piston ring drums, cylinder barrels for pump and motor engines, and sleeve valves. In Great Britain today approximately all the piston rings used in automobiles are produced from centrifugal castings.

Desirable Structure to Resist Wear

It is generally accepted by internal combustion engine designers that the best material to withstand the wear and heat conditions to which the cylinder liner is subjected has the lowest silicon and total carbon contents compatible with commercial machinability and soundness. In the ordinary centrifugal process the silicon must have fairly high values.

It has been established in connection with the lower-carbon alloys—steels—that the sorbitic condition is one which is highly resistant to wear. It is reasonable to expect that this structure will be accompanied by similar results in cast iron. If the tensile strength can be taken as an index of the resistance to wear of cast iron, it will be seen from the typical results quoted below for sorbitic iron that this conclusion is amply justified.



Structure of Spun-Sorbitic Casting, Magnified 200 *Diameters*

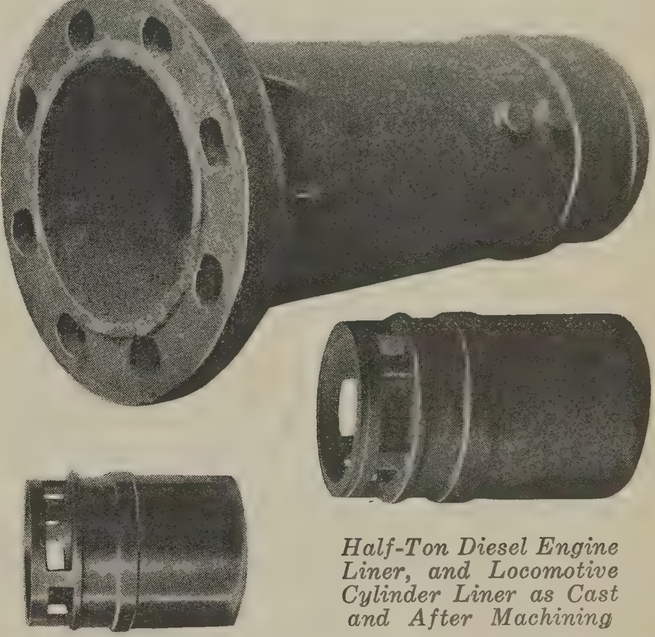
As is well known to metallurgists, the sorbitic structure is one of the intermediate structures between the hard unmachinable martensite which occurs in quenched iron-carbon alloys, and the pearlite which occurs in these alloys when slowly cooled.

The "spun-sorbitic" process, now in operation at Thorncliffe Ironworks, near Sheffield, England, is a special improvement (for which patents have been applied) in certain details of the Hurst-Ball centrifugal casting process, described in THE IRON AGE, June 11, 1925, page 1704. It is so devised that the cooling of the casting is under close control while rotating in the machine, and the result is that the combined carbon in the alloy is retained in the sorbitic condition. Such control of the cooling rate also enables us to adjust the silicon according to the mass, radial thickness and other chemical elements present, as would be done in sand casting, and permits equally low silicon contents.

A typical chemical composition, taken from a series of spun-sorbitic piston valve liners, is given below:

	Per Cent
Total carbon	3.00
Combined carbon	0.97
Graphite	2.03
Silicon	1.31
Manganese	0.42
Sulphur	0.11
Phosphorus	0.34

Two tensile strength determinations made after the manner laid down in the British Engineering Standards Association Specification No. 5004 are as follows:



Half-Ton Diesel Engine Liner, and Locomotive Cylinder Liner as Cast and After Machining

28.9 tons per sq. in. (64,800 lb. per sq. in.)
26.4 tons per sq. in. (59,200 lb. per sq. in.)

These test results are obtained from test rings machined from the actual castings, it being impossible to cast separate test bars by the centrifugal method. The above tests therefore represent the actual strength of the castings.

The microstructure illustrated demonstrates the sorbitic character of this material. It has been etched in picric acid and photographed at 200 diameters. Small areas of pearlite, with the laminations accurately focused, may be observed, but the bulk of the gray-toned ground mass is entirely too fine in structure to be resolved. It is definitely a sorbitic constituent.

Intricate Castings Made

One feature of the newly developed spun-sorbitic process is that larger and more intricate castings may be made. This extends the centrifugal casting process to the production of the larger cylinders required by heavy gas, oil and Diesel engines, piston valve liners for locomotive and steam engines operating on high degrees of superheat, and similar cylindrical castings of more intricate type. Typical examples of spun-sorbitic castings are illustrated. The view shows a cylinder liner weighing about half a ton for an internal combustion engine and a piston valve liner both before and after machining.

---

*Newton, Chambers & Co., Ltd., Thorncliffe Ironworks, Sheffield, England.

These castings are of greater intricacy than the simple cylindrical forms hitherto produced. The heavy flange, with the cored-out waterway passages, the ribs, bosses and belts are clearly shown in the cylinder liner casting and the ports in the piston valve liners have all been produced by cores inserted in the rotating molds. These products have the characteristics of centrifugal castings, as ordinarily understood, being close in grain and free from internal defects, as well as being correct in microstructure and external form.

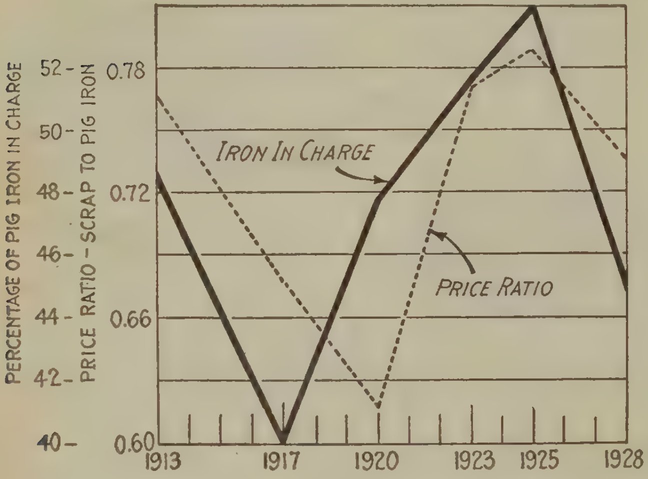
The rapid development in motor transport during recent years has been reflected in the greatly increased annual mileage done by automobile engines. This fact has drawn attention to the wear in the engine cylinders. It is realized that in the generally accepted monobloc cylinder design, the primary consideration in determining the character of the cast iron is the production of sound castings free from defects. The resistance to wear of the material is of secondary nature only. Under these circumstances increasing attention is being paid to the construction of automobile engine cylinders by inserting a previously machined cylinder barrel or liner into a water jacket casing. This is exactly the same method of cylinder construction as is adopted in the heavier internal combustion engine design. It allows the use of cylinder barrels of material specially designed to withstand the wear conditions, and this forms an additional application of the spun-sorbitic process of great promise.

Smaller Use of Pig Iron in Open-Hearth Furnaces

Charge Proportioning as Affected by Price Ratio Between Iron and Scrap Shows Close Watching of Markets

CALCULATIONS of the proportion of pig iron and of scrap used in open-hearth charges in the first quarter of 1928 indicate that the pig iron constituted under 45 per cent of the charge and scrap over 55 per cent. The fact that steel ingots in the first quarter of the year made a new high record in tonnage, whereas the output of pig iron was more than 10 per cent below a high record and was exceeded on nine previous occasions, suggested an inquiry into the situation. This study has covered the first quarters of six separate years—1928, 1925, 1923, 1920, 1917 and 1913.

Without going into details year by year, the figures for 1928 may be analyzed to show the method of approach. Total ingot output is placed at 12,644,000 tons. Of this amount, Bessemer steel accounted for 1,644,000 tons, open-hearth steel for 10,900,000 tons, and crucible and electric steel for about 100,000 tons. Steel-making iron in the quarter aggregated 7,018,000 tons. Of this the Bessemer converter absorbed 1,770,000 tons, on the basis of a 9 per cent loss in conversion, with 2 per cent of the ingot tonnage made up by use of scrap. This left 5,248,000 tons to be used in the open-hearth furnace. Castings have averaged recently 2.8 per cent of the total steel output. On this basis, 148,000 tons of the steel-making iron may be assigned to castings.



Close Parallelism Is Shown Between the Calculated Percentages of Pig Iron Used in Open-Hearth Furnaces and the Ratio of Scrap Prices to Those of Pig Iron

There is left for open-hearth steel ingots a total of 5,100,000 tons of steel-making iron. If we assume an 8 per cent conversion loss from this iron, most of which, of course, is a loss of weight through oxidation of metalloids, the amount of pig iron represented in the ingots was 4,692,000 tons.

Figuring a 2 per cent conversion loss on account of the scrap used in the open-hearth furnace, we find a total scrap consumption of 6,439,000 tons indicated. Adding this to the steel-making iron going into the ingots gives a total charge of 11,539,000 tons, of which 539,000 tons, or 4.7 per cent, represents the total loss in conversion. Of the total charge, pig iron represented a little under 45 per cent and scrap a little over 55 per cent.

Similar figures for the five other years' study show pig iron at a maximum in 1925, when the cost of scrap with relation to the cost of pig iron was considerably higher than in 1928, and a minimum in 1917, when the cost of scrap. with relation to pig iron, was considerably lower than in 1928. Other years showed varying percentages of pig iron used in the charge, as indicated in the diagram. Alongside the curve of iron in the charge is the curve of price ratios of the two commodities.

CHARACTERISTICS OF FIRST QUARTER-YEARS

	Open-Hearth Charge		*Prices of Components*		Price
	Pig Iron	Scrap	Pig Iron	Scrap	Ratio
1928	44.3%	55.7%	$18.59	$13.69	0.736
1925	54.1	45.9	23.35	18.42	0.789
1923	51.6	48.4	28.76	22.16	0.770
1920	47.7	52.3	41.42	25.54	0.617
1917	40.2	59.8	32.87	22.23	0.678
1913	48.5	51.5	17.45	13.39	0.767

In establishing the price ratio the average of heavy melting steel at Chicago, Pittsburgh and Philadelphia was placed against an average of three steel-making pig iron prices—Bessemer iron at Pittsburgh and basic iron at Valley furnace and in eastern Pennsylvania. The scrap average was $13.69 in 1928—the lowest in the entire list, except for the $13.39 in 1913. Similarly, the pig iron average of $18.59 in 1928 was lowest, with the exception of the $17.45 in 1913. The ratio between the two in 1928 was 0.736 (scrap price divided by pig iron price) which compares with a maximum of 0.789 in 1925 and a minimum of 0.617 in 1920. The table gives these ratios and prices, alongside the calculated percentages of pig iron and of scrap in the charges year by year.

Useful Copper Alloys, Old and New

High-Copper Brasses Needed to Resist Corrosion Cracking—Copper Hardened with Silicon and Manganese or Nickel Has Strength of Mild Steel—Copper-Nickel Alloys Favored for Quality Hardware

BY WILLIAM H. BASSETT*

PRACTICALLY every article made from sheet copper is made by mass production methods. Faulty material disturbs the orderly sequence of operations and, in addition, requires expensive inspection and unbearable rejection of finished product.

Rolled and Drawn Copper Requires Rigid Control of Ingot Metal

Modern electrolytic refineries have their methods so well under control that the product meets all requirements if properly fire-refined and cast. The "if" in this case is important. It is necessary that the melted cathodes should be saturated with oxide to dispose of sulphur and that the copper should then be poled to the proper pitch or set. Sometimes these operations are slighted; the result is that the rolling mill produces seamy or slivered sheets or strips.

The condition of the molds, their temperature, and the temperature of the metal are all important to good copper cakes, wedges or wire bars. Cracked and burned molds leave rough places and porous spots. Molds which are out of shape or cracked make shrinkage cracks which gap open when hot-rolled. Dampness means porosity. Drops of oil mean porous or honeycombed areas. Poor or irregular dressing means mold wash in the castings. Cold copper or slow pouring means cold sets.

"Low set" copper means high mill scrap and trouble in subsequent processing. It produces shrink holes, which change in the sheet mill to blisters and slivers. High oxygen may increase tensile strength to a slight degree, but it decreases toughness, perfection of surface and, to some extent, resistance to corrosion. Oxygen in copper is not in solid solution. The oxygen eutectic separates between the large bladed crystals and is the source of the dark or dull patterns on polished copper sheets. These matters were carefully and thoroughly worked out years ago, and the experience which has followed confirms the wisdom of the conclusions then arrived at.

High Copper Alloys Do Not Season-Crack or Dezincify

Yellow brass does not easily corrode, but when used in engineering work and exposed to outside atmosphere it has two bad habits: One is season or corrosion cracking, and the other is dezincification. Experience shows that brass which season-cracks also dezincifies in the presence of slowly acting corroding agents. The opposite statement, that brass which will not dezincify will not readily season-crack, is likewise true.

We have observed season-cracking under atmospheric corrosion at the seashore in brass containing 75 per cent copper, and we have also observed dezincification at the same composition. We have never observed either season-cracking or dezincification in brass containing 80 per cent copper and, consequently, are of the opinion that at 80 per cent copper brass is actually a solid solution of zinc in copper at all temperatures, and behaves in all respects as we believe a solid solution should. It is evidently best not to approach too nearly a saturated solid solution.

Perhaps under the extreme conditions of internal stress and corrosive attack, all metals are subject to the intercrystalline fracture which we know as season-cracking. Copper when extremely hard-drawn will not season-crack when attacked by mercurous nitrate or ammonia. But the effect of the corona discharge from high tension conductors on the atmosphere produces compounds which, if absorbed by moisture and held by fibrous material in long contact with very hard-drawn copper, may produce such cracking. Long exposure to moist ammonia salts may bring about cracking in 80:20 brass under severe internal stress. Conditions of this kind are so seldom met in actual service that, in spite of the misgivings of some engineers as to the reliability of alloys containing any zinc whatever, the low or red brasses are good engineering materials and safe under atmospheric or aqueous conditions.

Bronzes are somewhat less corrosion-resistant than the red brasses, and are more subject to the stress corrosion fracture.

The length of service to be expected from brass pipe has been questioned. Nearly always the pipe will outlast the building in which it is installed. In some districts the water supply is such that dezincification has been set up in the Muntz metal pipe (60:40) commonly supplied, and on this account a number of the manufacturers are supplying as standard an alloy containing 67 per cent copper. Red brass (85 per cent copper) is being used where the water supply is known to be particularly corrosive in character, and this alloy is advocated by some metallurgists, including the speaker, for a general purpose material, and is being used in increasing volume. We have recently heard of the use of compressed ammonia gas for testing water pipe installations. Red brass would stand it, but of course yellow brass cracked badly.

Various Forms of Hardened Copper

Several new copper alloys not subject to stress corrosion have recently been proposed and seem particularly adapted to new uses in engineering construction, since they have greater strength and rigidity than possessed by the older copper alloys.

I desire to speak particularly of the copper-silicon alloys. In 1905 E. S. Sperry proposed the use of copper-silicon alloys for springs and for other purposes for which the copper-tin bronzes were used, since silicon is about two and one-half times as effective as tin for strengthening copper. But no one succeeded in arriving at a practical alloy containing more than a small fraction of a per cent of silicon. "Silicon bronze" has been made for a considerable time, but this was merely copper-tin bronze fluxed or deoxidized with silicon, and generally contained only 1 or 2 per cent of tin.

On May 26, 1925, Charles B. Jacobs patented an alloy of silicon and manganese with copper. This alloy was called "everdur" and the formula is copper, 94.4 per cent; silicon, 4.5 per cent, and manganese, 1.1 per cent, when it is used for making castings. Copper, 96 per cent; silicon, 3 per cent, and manganese, 1 per cent, is the analysis when it is to be rolled or drawn.

---

*Technical superintendent and metallurgist American Brass Co., Waterbury, Conn. This is a condensed version of an informal after-dinner talk at the Institute of Metals, Feb. 22, 1928.

It is particularly corrosion-resistant to hydrochloric acid and chlorides. It is readily cast in sand molds and takes the place of gun-metal and bronzes. It can be easily hot-rolled, cold-rolled or forged. It can be drawn, spun or worked the same as other ductile metals. Its physical properties in the wrought form are similar to those of mild steel, and it is an excellent engineering material. It makes excellent bolts and rivets and may be either hot or cold-headed.

Another silicon alloy is the hardened copper patented by Corson this year. It has the approximate formula: Copper, 95 per cent; nickel, 4 per cent; and silicon, 1 per cent. The nickel silicide is in solid solution in copper at and above 750 deg. C. The alloy may be readily hot-rolled or forged, and is ductile and easily wrought by cold-working when quenched from temperatures above 750 deg. C. When this silicide solid solution is heated to just below a red heat the nickel silicide is precipitated and the material becomes hard and strong, resembling mild steel. The reaction is similar to that used to harden aluminum in duralumin. The engineering uses for such material are evident.

Unfortunately both the alloys described have high electrical resistance and cannot be used as conductors for power lines. For low resistance and high strength we must continue to employ copper alloyed with cadmium. Copper with 1.25 per cent cadmium can be hot-rolled readily, but this is about the maximum alloy for hot-rolling. This material will make power cables with strength up to 80,000 lb. per sq. in. and with a conductivity 89 per cent that of pure copper. A small percentage of tin or zinc can be used in connection with cadmium in alloying copper, and in this way higher strengths can be obtained but, of course, with some sacrifice of conductivity. Copper with about 2 per cent cadmium as a maximum can be cold-rolled, but the metal is not sufficiently resilient to replace tin or silicon in spring bronze.

Copper-Nickel Alloys Used Increasingly for Hardware

Stronger alloys of copper suitable for engineering and architectural purposes include the copper-nickel alloys. Those carrying 18 to 20 per cent nickel and those carrying about 30 per cent nickel are particularly attractive where easily-worked corrosion-resisting white metal is desired. It is usual to add to these alloys a small amount of a third and, at times, a fourth element which goes into solid solution with the nickel and copper, and acts to deoxidize and desulphurize. They are very malleable and ductile, strong, and of great ornamental value.

These alloys are being used in increasing volume for plumbing and architectural purposes, both in castings and wrought forms as tubes, sheet and rods. They are much superior to plated metal, whatever the plating may be, for they do not have a surface which will wear off with use or change character with the combined action of moisture and scouring.

Urges Performance Standards for Electrical Products

To Supply User with Apparatus of Best Possible Qualities in Respect to Durability, Operating Cost, Etc.

ADOPTION of minimum standards of performance for electrical products, as the next logical step in the standardization program of the electrical industry, was recommended by W. S. Rugg, vice-president Westinghouse Electric & Mfg. Co., East Pittsburgh, Pa., who was the principal speaker at the second general session of the policies division, National Electrical Manufacturers Association, in Chicago recently.

"If electrical manufacturers in the United States are to maintain their place in the world market, and at the same time maintain a scale of wages which will permit our present or an advanced standard of living, this must be done through an increased attention to the costs of production and distribution. To achieve this, there must be a degree of standardization sufficient to maintain a given model, if the expensive machinery necessary for its production in quantity is to be justified," said Mr. Rugg. Successful standardization already accomplished by the industry on apparatus characteristics, such as capacity, speeds and dimensions, should be followed by establishment of quality levels of performance, in Mr. Rugg's opinion.

Regarding the minimum standard of performance as a direct means of achieving economy and efficiency of production, and, above all, of insuring the user of apparatus against unbalanced design and performance, and generally unsatisfactory service, Mr. Rugg described the ideal minimum standard as accomplishing a balance among:

1. Lowest cost of manufacturing and distribution.
2. Greatest adaptability to the purpose for which the apparatus is to be used.
3. Greatest durability, or length of life.
4. Lowest cost of maintenance.
5. Lowest cost of power for operating it.

Such standards should be developed to meet the interests of the major groups concerned. These are the manufacturer, the application engineer, the manufacturer of power and the user. The standards should be so adjusted as to require no immediate undue cost of redesign and retooling, and to permit a gradual raising of the standard as the producer's skill increases.

Minimum standards of performance should be especially advantageous in all lines of electrical apparatus which have been long enough established to have arrived at a more or less stable condition, said Mr. Rugg. "There could be no objection to devices having certain characteristics better than the minimum required standards. There should, however, be a penalty attached to devices in which any characteristic is below the minimum agreed standard."

Cooperative Efforts Urged

Adoption by the National Electrical Manufacturers Association of minimum standards of performance should be made "only after careful consultation with other branches of the industry," said Mr. Rugg, who added: "As time goes on, we will find that the process naturally accelerates by practice and acquaintance, and it would be but a short time when it would become more or less common practice.

"If the various members of the N. E. M. A. could come to a mutual agreement that after a certain date all bids, upon the apparatus for which a minimum standard had been adopted, would contain a statement that the apparatus bid upon conformed to the N. E. M. A. standard, I believe it would effectually bring all manufacturers into line. The salesman of a manufacturer who had adopted the standard would naturally call attention to this fact and would make it a selling argument. The salesman of a manufacturer who had not adopted it would, therefore, continually urge upon his manufacturing plant and engineers to get in line. In other words, a manufacturer who would not conform to this minimum standard would have to make excuses."

German High-Tonnage Furnaces

Details of Construction—Much Greater Weight Than in United States—Exceptional Control Methods

BY F. H. WILLCOX[*]

FURNACE construction in Germany is an inversion of ours, i. e., a brick stack with steel bands with cooling plates set in, and a steel plate bosh and tuyere jacket without plates, water cooled on the exterior. The whole structure is supported on heavy structural framework extending to the top platform. Even on American-type shells, such as we have adopted for our designs abroad, the Germans insist on heavy structural beams running vertically from top of column to top platform.

Their bells are usually smaller. Linings are 0.9 meter (35½ in.) thick in the inwall. They have our conventional type of stockline protection on the top, where they do not resort to metal tops. Inwall cooling is carried right up to the stockline wearing plates. As a rule they use a cast iron box on 3-ft. vertical centers, the plate having a 7-in. depth on the face and 9-in. horizontal spacing between plates. The end is open and the water under no pressure. The plate is about 20 in. in from the face of lining.

Tremendous quantities of water are used on the bosh, tuyere and hearth jacket, with a sort of pigs-in-clover puzzle run-off arrangement on the bottom underneath the operating floor, to prevent breakouts getting into the sewers. There is not infrequent evidence of breakout. Inwall batters are less than ours on the newer furnaces.

Boshes are higher than here, and do not usually go over 78 to 80 deg. angle, though one finds as high as 84 deg. However, the same hearth and bosh diameter seems to hold. It is as if one ran a 10-ft. 80-deg. bosh up to a 13-ft. 84-deg. bosh, the hearth and bosh diameter remaining say 20 ft. 6 in. and 24 ft. in each case. The opinion was frequently expressed that, for their material and rate of driving, it was better not to go beyond 78 deg. bosh angle or over 1300 deg. Fahr. blast temperature.

Large Furnaces Not Uncommon

Furnace sizes vary. Perhaps the best relative tonnage figure was a maintained average of 915 tons on a furnace of 16-ft. 5-in. hearth, 22-ft. 6-in. bosh, 14 ft. 9 in. high, 17-ft. stockline, having a height of 84 ft. and a cubic capacity of 22,300 cu. ft. This was on Swedish, minette and German ores, using eight large tuyeres and 1325-deg. blast. From there one may find increasingly larger hearths, up to the largest encountered during my trip, of 20 ft. 6 in. with a 24-ft. bosh and total cubic capacity of 33,000 cu. ft. on a height of 95 ft. This stack used Swedish magnetites, part nodulized, and was credited with 985 tons average production on about 2050 lb. coke. I might say that I am using American tons; the output is about 1002 metric tons.

Of the plants and operating furnaces seen, I would credit 10 with better than an 800-ton production rate. The remainder would average under 600 tons. I secured no published figures, but would believe the average rate per steel works furnace in the Ruhr to be some 100 or more tons less than a similar American figure of the Chicago-Pittsburgh districts.

High Outputs Being Made

Speaking now of high-tonnage furnaces, some remarkable rates are being maintained. For instance, one plant makes 930 tons a day on a 22,300-cu. ft. furnace, iron notch to within 2 ft. of closed bell. This is done without outside scrap on a yield of 54 per cent. The same size stack in 1914 made 550 tons. The wind volume is 120,000 cu. m. per hour, or 70,000 cu. ft. per minute, blown at 14 lb. pressure through eight tuyeres. A blast temperature of 1300 deg. Fahr. is carried.

Over a million tons had been produced on the lining, with an expectation of 1,500,000 tons. The coke rate of 2080 lb. seemed high, as did the top temperature of 650 or 700 deg. Fahr. But the rate of driving is such that the retention period of gas and stock is abnormally short, and, besides, the coarse burden of Swedish and minette ores would seem to give a restricted gas-to-ore contact factor.

Low-silicon Thomas iron is produced and the slag runs 34 to 35 per cent Si, 10 to 11 per cent Al_2O_3, 5 to 6 per cent MgO and 45 to 46 per cent CO, with sulphur of 1.5 to 2.0 per cent. The furnaces are cast six, seven and even eight times a day, dependent upon the mixer demands. Parts of casts are put into the sand beds, there being no pig casting machines at these plants. In a couple of plants the iron is run out in sheets, as we run into hot slag pits, and broken with a ball for open-hearth charging.

The blast pressure of say 14 lb. is not at all regular, though it moves within narrow limits, and is seemingly quite as much affected by blast volume as by furnace conditions. It was rare indeed to see evidence of hanging after cast. The volume of air delivery is not regular, as we consider it. The blowers seem to follow the furnace more than, as here, the furnace following the blowers. In fact, it is possible to see variations in blast volume of 10 per cent where the high-tonnage furnaces are driven by a group of old blowers, and I would consider a 6 or 7 per cent variation quite characteristic.

German tuyeres are huge affairs, seemingly as big as some of our coolers, and actually having a diameter of 8½ to 11½ in. Three plants were using Venturi tuyeres, with a diverging instead of converging nose. Inspections of cost sheets were quite convincing as to the change in practice effected, notably a decrease of nearly 2 lb. in blast pressure and an increase of 5 per cent in tonnage. They are said to give a week or so of rough practice when introduced, as may be imagined.

Use Much More Coke Than We Do

The foregoing description of practice is typical of those plants where 900 tons—and even 1000 tons—are being produced, and with furnaces up to 32,000 cu. ft. capacity. It always seemed to me that the coke rates were high and this was sometimes agreed to, but followed by the statement that it did not matter particularly, because there was use for all the gas. This is true enough, but it would seem a bit inconsistent with the use of high-efficiency stoves and gas engines and heat research.

One can find creditable records of coke consumption, and at one plant a low rate of 1750 lb., day in and day out, but it seems to me their coke rate is distinctly higher; for basic iron, I would say, easily 200 lb. a ton higher than ours. Three factors probably contribute: very intensive cooling of furnace walls, a somewhat coarse ore and limestone mix, together with refractory ores, and a rather inflexible charging system. Add to this a fast-driving rate, up to 78 lb. coke per cubic foot of furnace capacity (and higher in one or two instances).

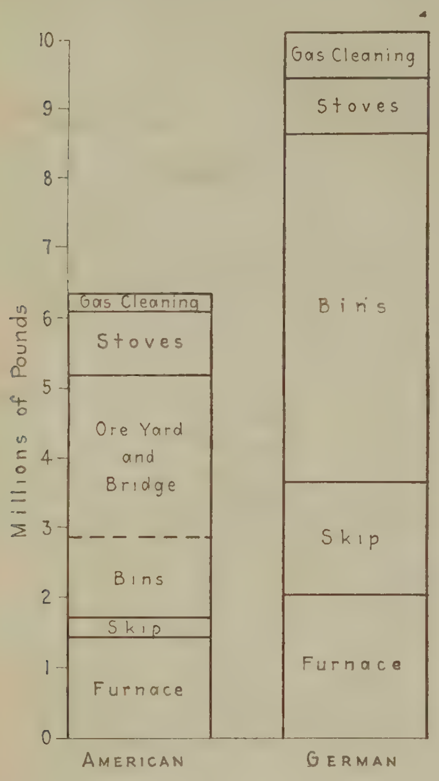
---

[*] Vice-president Freyn Engineering Co., Chicago. This concludes the article at page 803, THE IRON AGE, March 22, being an abstract of an address before the Eastern States Blast Furnace and Coke Oven Association.

In my opinion, it is a mistake to attribute the fast-driving rate of some of the Ruhr furnaces to a single cause—for instance, coke, sinter, slag, open charge, mixture of hematites and magnetites—just as it is a mistake to attribute all of our trouble to coke. Many use only 15 per cent sinter, and even less. One plant uses sinter as a major component and can use higher heat and gets lower coke consumption.

However, there are furnaces on our Eastern seaboard using from 40 per cent sinter, with foreign lump hematites and fine magnetites and hematites, up to 85 per cent sinter, which exceed anything that can be observed abroad on the same ore mixes. This applies to coke consumption, labor rate and cost above.

As to driving rate, you can observe here a rate of 3.4 tons per 100 cu. ft. as against 3.8 tons abroad.



GERMAN Blast Furnaces Are Much More Massive Than American. Only in the case of the stoves do the American weights exceed the German

However, the 3.4-ton rate is with a coke rate of 1700 lb., and the 3.8-ton rate with coke of 2000 lb. "There is more than one road to Rome," and industrial and economic conditions dictate the road to be taken. Germany has virtually reached her pre-war production rate of pig iron, replacing the Alsace-Lorraine tonnage formerly allotted to Germany.

Massive Construction in Europe

Speaking of European plants in general as against American, perhaps our plants do not have the elaborations and refinements that one finds abroad. But they are simpler, and less expensive to build, even though more sturdy in the furnace itself. A comparison of weight is given, both typical, I believe:

	American	German
Cubical contents	20,000 cu. ft.	21,200 cu. ft.
Weights:		
Furnace	1,340,000 lb.	2,012,000 lb.
Skip	260,000	1,580,000
Bins	950,000	5,000,000
Stoves	900,000	800,000
Gas cleaning	250,000	700,000
	3,700,000 lb.	10,092,000 lb.

To compare the bins being used as ore storage we should add the equivalent of an ore yard and bridge, but not including car dumper, as both are hand unloading propositions. This would add about an equivalent 2,300,000 lb. to the American weight, giving 6,000,000 lb., against 10,100,000 lb.

Cost Figures

As to operating costs, if we put raw materials on a parity, labor and supplies on a parity, the cost of a ton of pig iron is approximately $2.10 higher for a Ruhr-type plant than at a modern American plant, using the same materials and labor and material costs.

As to construction cost, the typical Ruhr District plant with its bins, heavy hoist and furnace, elaborate gas cleaning and gas engines, will cost approximately $26 per ton per year, as against $20 per ton per year here.

As to labor, taking a single-furnace plant, they will run 5 tons per man per day, as against our 6 tons per man per day. I am taking modern outfits in both cases and avoiding extremes, though using a 900-ton German base.

Furnace practice itself is, if anything, easier on men and supervision force there, due to physically better average coke and ore and a higher proportion of beneficiated fines and low-grade iron-bearing materials.

The present trend, not only at blast furnaces but in the steel works, is what they call "rationalization." It is another word for "Americanization," or, more properly, "Taylorization." Intensive study is given man-hours, industrial wastes, the number of men carrying 10,000 brick, unloading and loading materials, ultra-microscopic study of cost of above, etc. A considerable number of men of the Waermestelle are engaged in this stopwatch work. It is characteristic. They must be said to put in a broad, solid foundation.

Environment Dictates Many Conditions

From an economic point of view, an opinion on the fundamental conditions may serve to conclude. German furnace design differs strikingly from American. This has arisen from environment. Most works are held within definite limits, being inclosed by growth of cities; they have had to increase output in the existing units with existing equipment. This tendency has been strengthened by the growing invested capital per ton of steel or iron. German ore sources have changed within 10 years and include many inferior materials.

This has afforded an opportunity for development in design and practice with every advantage of modern research and control, which is unique, and has been effectively utilized. Ruhr coke is exceptionally good. Consequently German blast furnace has attained a rate of production, a degree of durability and a heavy type of construction that is, with exception of coke consumption, eminently gratifying and creditable.

Anti-Injunction Bill Condemned by James A. Emery

Denunciation of the anti-injunction bill, introduced in Congress by Senator Shipstead, as fundamentally and constitutionally wrong was voiced by James A. Emery, general counsel of the National Association of Manufacturers, at the twenty-second annual dinner meeting of the Indianapolis branch of the National Metal Trades Association at the Columbia Club April 2. Andrew J. Allen, local branch secretary, reviewed labor conditions in the metal trades of Indianapolis.

In an election conducted by referendum W. D. Hamerstadt, Rockwood Mfg. Co., was named president for the coming year; George P. Torrence, Link-Belt Co., vice-president, and L. M. Wainwright, Diamond Chain & Mfg. Co., treasurer. Fred Hoke, Holcomb & Hoke Mfg. Co.; O. B. Iles, International Machine Tool Co., and James H. Hooker, Sinker Davis Co., will serve for a two-year term on the executive committee. The eleventh district committee during the next 12 months will consist of Eugene Gruenewald, Ross Gear & Tool Co., Lafayette, chairman; John T. Wilkin, Connersville Blower Co., Connersville; D. O. Thomas, Muncie Products Division, General Motors Corporation, Muncie; R. P. Johnson, Warner Gear Co., Muncie; and Henry Langsenkamp, Langsenkamp-Wheeler Brass Works, Indianapolis.

During the afternoon preceding the meeting a State conference of Indiana manufacturers and business men was held at the Hotel Severin, Indianapolis, at which Mr. Emery discussed pertinent legislative matters.

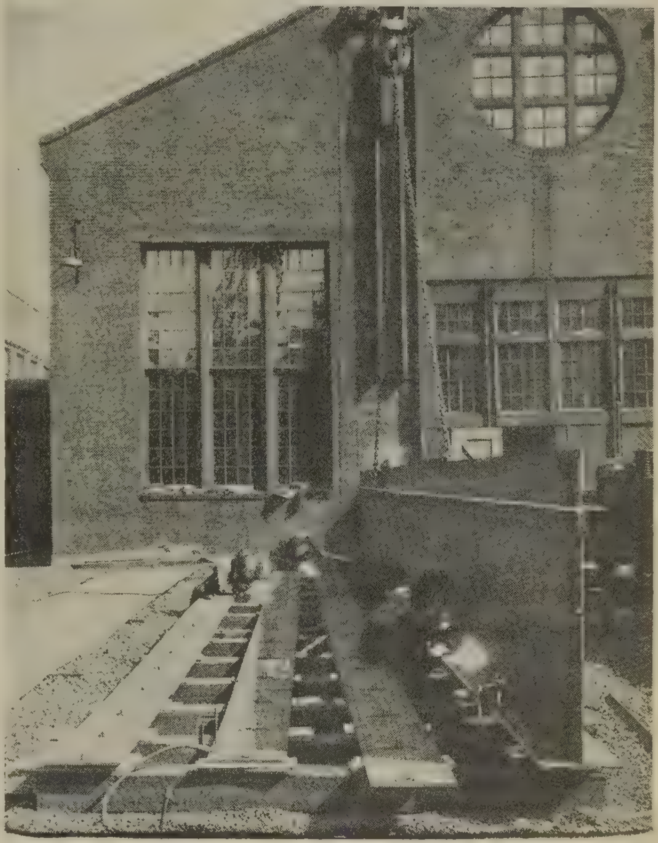
Railroad Bridge Made by Arc Welding

Skew Bridge for Heavy Freight Movement Built of Plates and Standard I-Beams Without Use of Rivets

BY A. G. BISSELL*

ARC WELDING has been used to repair several bridges, both highway and railroad, but the first all-welded bridge to carry rail traffic has just been completed. It is a single-span girder railroad bridge of the through type at Turtle Creek, Pa.

The two main girders used in this bridge are 4 ft. 9¼ in. deep and 53 ft. 9 in. long, and weigh about 11,600 lb. each. These girders were constructed outdoors at the plant of the Westinghouse Electric & Mfg. Co. at East Pittsburgh. Flanges are built up of three plates; the plate attached to the web is ⅝ in. thick by 1 ft. 2½ in. wide. To this plate, by means of a fillet weld along the edges, is attached a cover plate ½ in. thick, 1 ft. 3¼ in. wide and 38 ft. long, and a second cover plate ½ in. x 1 ft. 4 in. x 22 ft. is attached to the first cover plate. The longest plate is the narrowest, and by the methods of construction adopted the slight extra width of the underlying plates forms a little shelf for retaining the molten weld metal.



Building Main Girders. Small clips to aline web and flange removed after joint completed. Stiffener angles at top of web bolted on temporarily

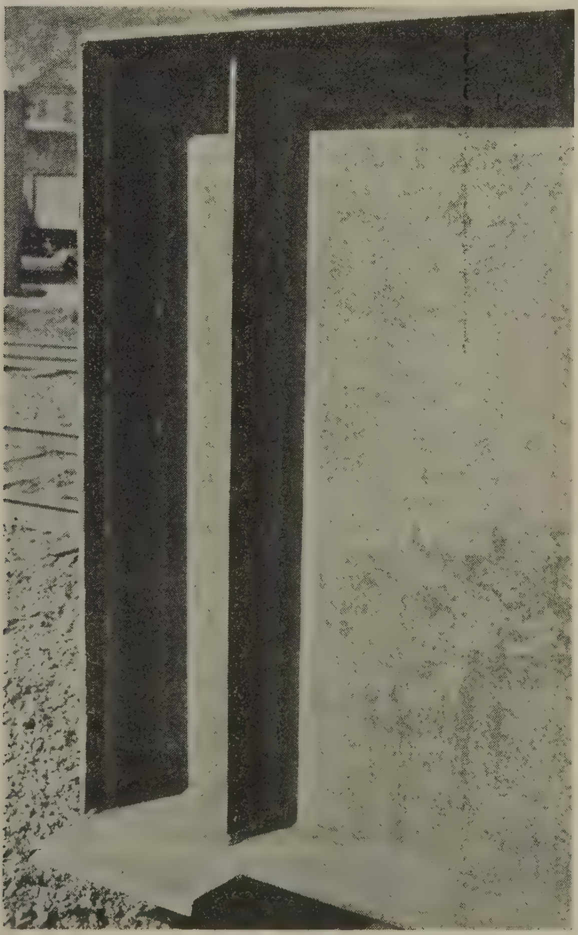
These cover plates were carefully assembled on some long timbers, and edge-welded continuously on both sides. Small angles were then attached along the center line to act as guides for the ⅜ x 54-in. web plate. When the web plate was securely attached to the flange plate, the small clip-angles were removed. The 6-in. angles shown bolted to the web plate were used to stiffen the web during this preliminary work and to make handling easier. They were removed, and the bolt holes were filled with weld metal. Web stiffeners in the form of ⅜ x 4-in. bars, 4 ft. 6 in. long, were then welded in place. Affixing these web-stiffeners before the second flange was attached made it possible to weld the joint between the stiffener and the first flange-plate in the "down-hand" position.

The second flange-plate also had small angles located on it, and the partially completed girder was picked up by a locomotive crane, turned over, and fitted between the angles on the flange, and then welded in place. The end is finished by a ⅜ x 14½-in. plate.

After the two girders were erected on the abutment walls, the floor system of I-beams was erected. Main cross beams rest on the lower flange of the girder, and a continuous weld was run clear around connecting them to the web plate. Stringers for carrying the rails are 18-in. I-beams, resting on the lower flanges of the cross beams. These members were lined up and tacked, then welded solid. To make these stringers continuous, a ¾ x 5 x 24-in. plate is passed through a slot cut in the web of the floor beam at the upper flange of the stringer. These plates are welded solidly to the upper flange of the stringers and to the web of the floor beam, giving a continuous stringer the full length of the bridge to carry the track ties. Three-inch angles are connected between the bottom flanges of the girder and the floor beam for diagonal bracing. Suitable sway bracing was made of plates and welded between top flanges of floor beams and main girders.

In the construction of this bridge, 1067 linear feet of ⅜-in. fillet wells and 501 linear feet of 5/16-in. fillet welds were used, requiring about 500 lb. of electrode material. Welding required 320 man-hours.

Tests were made on this bridge to determine the deflection and vibration by running a 185,000-lb. locomotive over it at various speeds.



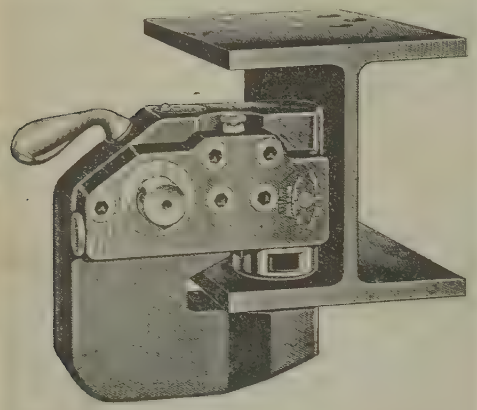
Close-Up of Joints at End of Main Girder

---

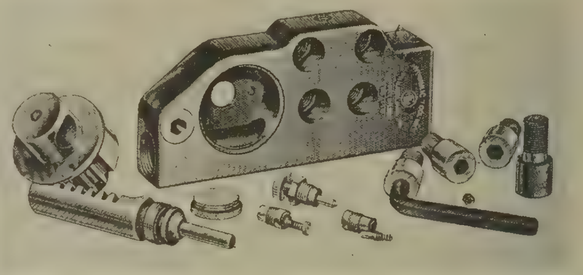
*Arc welding engineer, general engineering department, Westinghouse Electric & Mfg. Co., East Pittsburgh, Pa.

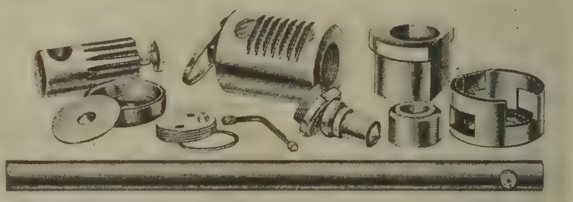
Hydraulic Unit Applied to Portable Punch

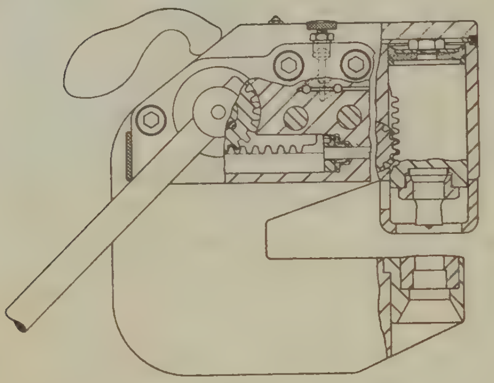
A new hydraulic unit of compact and simple design, one application of which is to the portable punch head here illustrated, has been brought out by the Hydraulic Tool Works, Philadelphia, with sales offices at 350 Madison Avenue, New York. Other applications of the unit include its use on a line of hydraulic jacks which feature light weight in comparison with the power generated, the 100-ton jack weighing approximately 90 lb. The pressure medium is oil, which serves also to lubricate all working parts.



Application of the Punch to an 8-In. H-Section Is Shown at Left. Parts that make up the pump body and the pressure cylinder mechanism are at right, and the assembled mechanism is at lower left







The arrangement of the punch head may be noted from the accompanying illustrations. It is made up of a frame, pump body assembly, pressure cylinder assembly, punch and die and pump handle. All parts are of special steel, heat-treated, and the use of this material, together with the rugged design and self-lubrication of the working parts, is claimed to provide unusual durability.

The type A tool, pictured herewith in operation on an 8-in. 50-lb. H-section, is designed to punch holes up to 13/16 in. in diameter, or a ¾ in. square hole, through a flange ⅝-in. thick. The throat is of a depth that permits punching a hole the center of which is 1½ in. from the web of an 8-in. H-section. The length of the tool is 8¾ in., the width 7 in., and the height 9¼ in. The weight is only 55 lb., which permits the punch to be applied to the work and operated by one man. The tool is operated by pressure at the end of the pump lever, and it is claimed that holes may be punched in less than one minute. The device may be mounted in a vise, or on the floor or bench; for the latter mounting a standard angle plate attachment can be furnished. Means are also provided for securing the tool to the flange of a column, in which position the tool is said to have been used to advantage. The handle shown at the top of the punch head facilitates lifting or other handling of the tool.

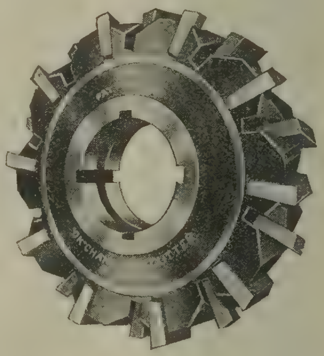
Standard punch and die equipment is employed. All parts are manufactured on an interchangeable basis, and spare working parts may be kept on hand for quick renewal on the job in case of damage. Accessibility of the interior mechanism facilitates replacement of parts when necessary. The valves and other parts contained in the pump body may be taken off the punch merely by removing the five screws shown in the illustration of the pump body parts. The pressure cylinder mechanism, also illustrated, is made up of the ram and its packing, the retracting key, the punch, die holder, stripper, and pump handle.

Fields for which these tools are offered include elevator installation work, structural steel erection, fabrication and erection of outdoor display signs, driving out of rivets and numerous general industrial applications. The hydraulic jacks, to be available later, employ the same type of hydraulic unit and will be offered for a wide variety of application, such as in scale and weighing departments of railroads, for removal of armature shafts on electric locomotive, for removing ingots from molds, etc.

Heavy-Duty Milling Cutters With Blades ¾ In. in Thickness

A heavier line of inserted blade slotting and facing milling cutters than heretofore manufactured by the company has been placed on the market by the O. K. Tool Co., Shelton, Conn. New blades ¾ in. in thickness have been developed, which, as in the previous sizes, are inserted into forged chrome-nickel steel, heat-treated, bodies.

The O. K. milling cutter blade, which is tapered and has a serrated back, fits into a corresponding slot in the body. The tapered surface locks the blade securely in the body, and the serrations permit the blade to be adjusted for wear. The blades are of drop-forged high-speed steel. Any of the standard designs of cutters are made, such as slotting cutters; side mills, either straight or angular; half side mills; face mills, etc. Suitable rake and spiral angle as well as adequate chip clearance are provided, according to conditions.



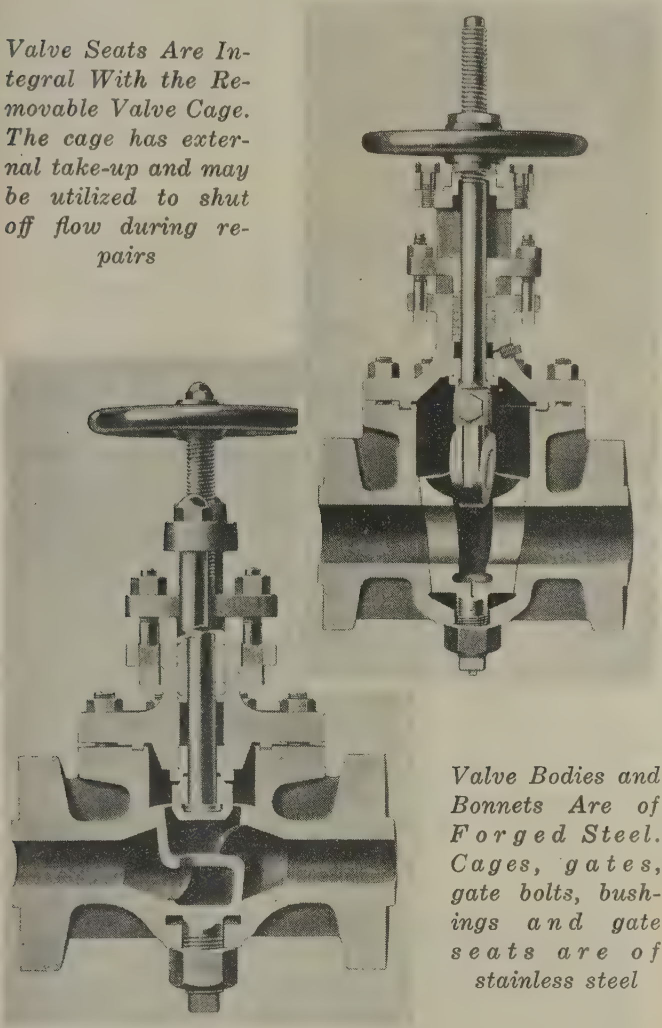
Tapered Surfaces Lock the Blade in the Body and the Serrations Permit Adjustment for Wear

---

Production of electric power by public utility power plants in the United States was 6858 millions of kwhr. in February, according to the Geological Survey. This compares with 7261 in January and 7214 in December. The daily average in February was the highest ever reached. About 37 per cent of the total was produced by water-power.

Valves for High-Pressure and High-Temperature Requirements

Designed for high-pressure and high-temperature service, a new type of globe and gate valve has been brought out by the Wellman-Seaver-Morgan Co., Cleveland. The valve seats are an integral part of a slightly tapered removable valve cage. The valve cage itself has an external take-up adjustment to compensate for expansion or contraction and to prevent leakage between the walls of the cage and the main valve body. Another feature is that the valve cage may be utilized to shut off the flow through the valve while repairs or adjustments are being made, eliminating the necessity of taking the entire valve body out of the line.



Valve Seats Are Integral With the Removable Valve Cage. The cage has external take-up and may be utilized to shut off flow during repairs

Valve Bodies and Bonnets Are of Forged Steel. Cages, gates, gate bolts, bushings and gate seats are of stainless steel

When repairs are to be made the cage is rotated a quarter turn to prevent the passage of fluid through the valve, and to permit the removal of internal parts, if desired. When the valve has been repaired, the valve cage is restored to its normal position. The valve cage has guides corresponding with the slots in the wedge-type gate, which control the path of travel of the gate and prevent rubbing of the surfaces of the gate and seat.

The valve cage is of novel design in that exteriorly it is circular in cross-section, permitting it to be rotated into position or given a quarter turn to shut off the flow during repairs. The valve seats are flat, permitting closing the valves under high pressures and at the same time allowing the valves to be easily opened. The gate faces are removable and may be replaced when worn, or adjusted when desired.

The valve is so designed that the valve surfaces are released from the seat with a slight movement of the valve stem. This is because of the wedge shape with the center guides, which is said practically to eliminate any sliding action. This prevents both wear and the wedging of the valve faces against the valve seats, which would make it difficult to open the valve.

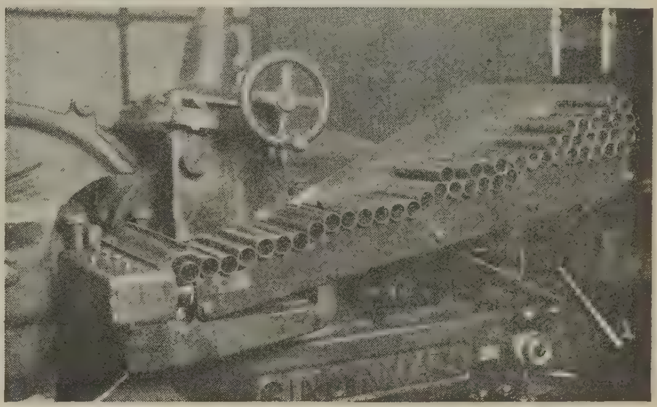
The one-piece valve bodies, as well as the bonnets, are forged steel. The cages, gates, gate bolts, stems, bushings and gate seats are of stainless steel. The gate valve is of the rising stem type and has a straight-way flow, there being no angles at the valve seats. The packing boxes are elevated and have long depth of packing, with a large air chamber below the packing. The body and cover flanges have tongued and grooved joints for soft steel corrugated gaskets. The globe valve has a body and bonnet with either inside screw or outside screw and yoke, and the removable cage construction allows full capacity openings through the valve.

The valves are made in both types to meet the most exacting requirements of the highest temperatures and pressures used in steam plants, oil refineries, pipe lines and in hydraulic air and gas lines. The Globe valve is made in ¾-in. to 3-in. sizes and the gate valve in 1-in. to 6-in. sizes, although larger sizes of the latter, up to 24-in., can be supplied.

Centerless Grinders Equipped with Automatic Feeding Devices

Description of two ingenious feeding devices for use in connection with centerless grinding machines were features of a paper on "Special Machinery for Mass Production," presented by H. L. Blood, chief of machine design division Western Electric Co., Chicago, at the machine shop practice meeting of the Chicago section of the American Society of Mechanical Engineers, held at the Hotel Morrison, Chicago, March 14.

One of the devices, shown herewith, was designed to feed automatically the steel tubes used for desk stand handles. The tubes are stacked on an inclined rack which has a series of steps that keep the tubes parallel as they roll down the incline and also has the effect of preventing any of the tubes from being carried along on top of others. The tubes roll one at a time on to a series of grooved rollers which are driven by power derived from one of the shafts of the grinder. As the weight of the tubes is not sufficient to provide the traction necessary for feeding them into the grinder, the rollers, which are of soft steel, are mounted on permanently magnetized studs. The frame which supports the studs is of bronze, and the studs are connected at the end opposite the rollers by a bar of soft steel. The studs are magnetized in such a way that alternate rollers are of different polarity. When a tube bridges the air gap between two adjacent rollers it completes the magnetic circuit, and the resulting traction between the tube and rollers is ample to feed the tube into the grinder.



In another attachment, devised for feeding tubes into centerless grinders, the tubes, which are of hard rubber, are laid in a V-shaped hopper. At the bottom of the hopper are two rubber-tired disks which revolve slowly and roll the tubes downward against one side of the hopper, dropping them one at a time upon a moving belt. The belt carries them into a nozzle, the inside of which is arranged so that streams of water impinge upon the tubes and carry them into the machine.

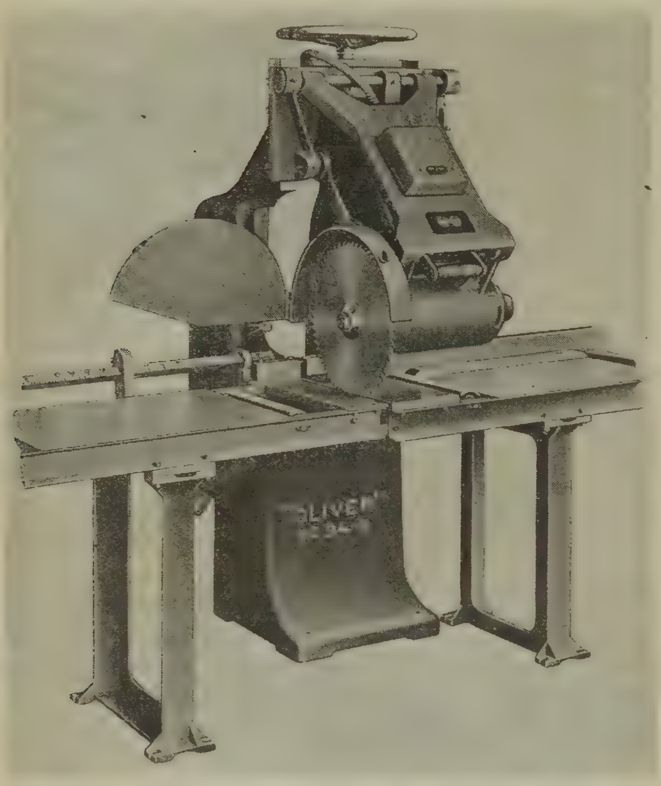
The second annual Indiana heat-treating conference will be conducted by Purdue University at Lafayette, May 10 and 11. The Indianapolis, Fort Wayne and Notre Dame chapters of the American Society for Steel Treating are cooperating with the university authorities in arranging the program for the conference.

Straight Line Cut-Off Saw of Compact Design

Compactness, ease of operation and accuracy are features emphasized by the Oliver Machinery Co., Grand Rapids, Mich., in connection with the straight line cut-off saw shown in the accompanying illustration.

The machine, designated as the No. 94-D Straitline, is self-contained, with the motor mounted directly on the saw arbor. The suspended link mechanism employed for the motor head is said to assure cutting to a straight line and to facilitate operation. Moving parts are light in weight and are arranged to require a minimum amount of movement. Saw tables 20 in. long, 31 in. high and of various lengths are available for use with the machine.

The complete units may be placed back to back, and two of the saws may be located so that the distance between the tables, faced in the opposite directions, is only 18 in. When placed against a wall the distance from the wall to the back edge of the cut-off table is only 18 in. The height of the machine overall is 5 ft. 8 in.



When Two Machines Are Placed Back to Back, the Distance Between Tables Is 18 In. In the unit shown the motor head is locked outwardly and the guard opened for changing the saw

Ball and roller bearings are employed in the suspended link mechanism and pressure-gun fittings are provided for lubricating all bearings. Neither springs nor counterweights are used. It is stated that the balance of the motor head and the design of the linkage returns the motor to its original position and locks it, and prevents rebound of the saw. The entire link mechanism is carried by a yoke with gibbed ways. Vertical adjustment of 3 in. by means of hand-wheel and screw is provided to compensate for wear of saws or for saws of different diameters.

A 5-hp. 3600-r.p.m. ball-bearing motor is mounted directly on the saw arbor. A fan on the motor shaft serves to circulate air and cool the motor. An automatic starter having magnetic contactor with low voltage protection and overload release and push button stop-and-start stations is mounted directly in front of the operator.

Safety features have been given thorough attention. When not in use the saw with its guard is housed inside of the main column. The saw is held back by a safety catch and is only released by a pull on the handle.

Circular saws, dado heads, or solid cutters from 10 to 18 in. in diameter, may be employed, and the machine will carry dado heads up to 2½ in. wide. The maximum thickness of cut by using an 18-in. diameter saw is 4½ in. Stock 2 in. in thickness and up to 20 in. in width can be cut. The automatic cut-off saw tables can be furnished either right- or left-hand. The standard table consists of two sections of 8 ft. each, built up of channels to which steel plates are riveted. Ball-bearing steel rollers are mounted between the steel plates, four rollers to each section. The rollers on the section of the table on which the boards are fed are set ¾ in. higher than the steel plates to enable the operator's hand to catch the boards underneath as well as at the top, assuring quick operation. The opening in the table just beyond the saw provides a chute for end cuttings and short stock to drop into a box below. An 8-ft. gage is provided, the gage being marked in inches and eighth-inches. It is fitted with four adjustable stops.

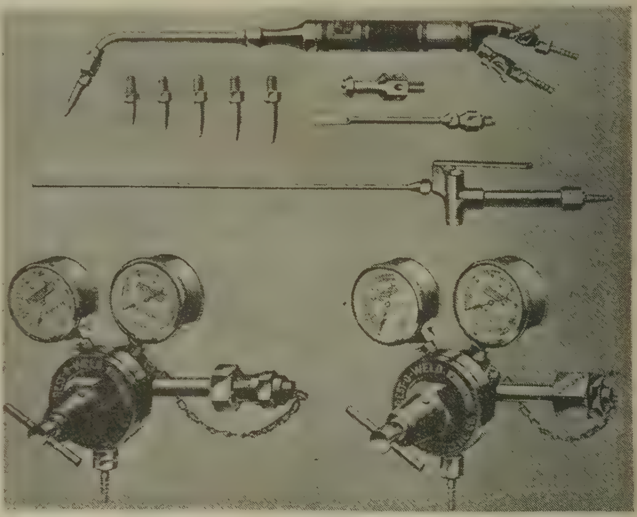
Three New Prest-O-Weld Outfits

Especially to meet the demand of repair shops and sheet-metal shops for inexpensive welding outfits, the Oxweld Acetylene Co., 30 East Forty-second Street, New York, has placed three new sets on the market.

Type W-102-A general purpose outfit, illustrated, is for a repair shop that is equipping itself for any of the modern oxy-acetylene applications—welding, carbon burning, heating and straightening, soldering, brazing, lead-burning and battery work, and radiator repairs. A full line of welding tips, together with a newly designed heating tip and a soldering tip consuming acetylene only, are included. The latter enables the operator to solder the leaves of a radiator in places that would be inaccessible with any other type of equipment.

Another set, called the W-101-A automobile repair outfit, is for the shop which has only an occasional welding job. One large-sized tip is included for frame-straightening or heating. Also an acetylene tip for minor heating and soldering is furnished.

Type W-102-B outfit is recommended for welding light and medium castings; it is also suitable for the sheet-metal shop. This outfit, which includes five welding tips, is adapted to production processes, because the light weight of the blow-pipe with its 3/16-in. hose does not tire the operator even on continuous work.



General Purpose Welding Set

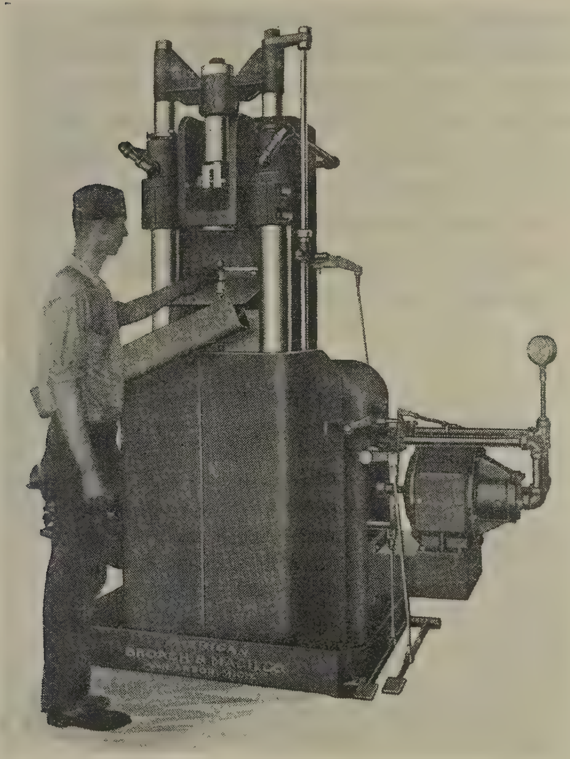
By the addition of a cutting attachment any of these blowpipes may be converted for use in cutting wrought iron or steel.

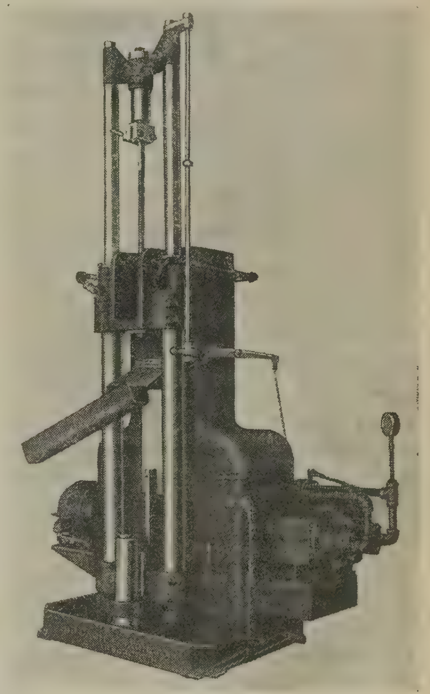
All rights to the gear chamfering machine formerly manufactured by the Peerless Machine Co., Muncie, Ind., have been acquired by the City Machine & Tool Works, Dayton, Ohio. The sale of this machine, as well as of the Bolender gear grinding chuck, also recently acquired by the company, will be under the direction of the City Machine & Tool Works and the National Broach Co., an affiliated organization.

Vertical Pull-Type Broaching Machine With Twin Hydraulic Cylinders

Increase in quantity and quality of work, and longer life of tools, are claimed for a new vertical hydraulic broaching machine of pull type, which has been made available by the American Broach & Machine Co., Ann Arbor, Mich.

The machine, designated at the V-50, is of the same capacity as the company's No. 3 horizontal broaching unit and full broaches similar in design to those on the horizontal machines are employed. Features emphasized include minimum floor space requirements, 4 by 6 ft., and semi-automatic operation, the duty of the attendant being merely to place the work on the end of the broach and operate the foot control pedals. The broach automatically connects with the pulling head, releases the work and returns to its starting position.





PULL Broaches Up to 50 In. in Length, and Similar in Design to Those on Horizontal Machines, Are Used. Placing of the work over the shank of the broach is pictured at the left, but the normal operating position is at the right-hand, adjacent to the control pedals. The view at the right shows the pulling rams in their upper position, after the work has been broached and ejected

Operation may be noted from the accompanying illustrations, one of which shows the machine with splash covers removed. The lower elevating cylinder carries an extending arm which, in turn, carries a soft brass bushing fitted loosely to the back pilot of the broach. As the operator slips the work over the shank of the broach and applies pressure on one of the foot pedals, the lower cylinder rises rapidly, pushing the broach into the automatic connecting bushing in the pulling head. Slight pressure on the other pedal then starts the pulling rams on the upward stroke, pulling the broach through the work. As soon as the tool has passed through the work, the work drops on the angular table and slides out of the chute into a tote box. The pull rams then reverse and when about 5 in. from the bottom position, automatically release the broach by means of a latch that trips the pull head. This permits the broach to drop back into the lower bushing or receptacle, ready for the next cycle of operations.

The second illustration shows the machine with the pulling rams in the upper position, the tool having passed through the work, the work has dropped off and the tool is ready to return to its starting position.

The machine operates by oil pressure. There are two cylinders and two rams, the pressure being applied to the full area of the piston. It is stated that leaks are prevented because there are no packing glands under pressure on the cutting stroke. On the return stroke very little oil is required to fill the cylinder, due to the fact that the pulling rams are 3½ in. in diameter and the bore of the cylinder is 4 in., which arrangement is said to permit high-speed return strokes up to 80 ft. per min. The twin cylinder construction, patents on which are pending, also permits comparatively low construction, the working height required being only 11½ ft.

In arranging the machine so that the operator does not handle the broach, but merely feeds the work and operates the foot pedals, marked increase in production is said to be possible. It is also stated that the broach, in hanging, centers itself, and the work, in being suspended in the same manner, finds its own center much better, and thus prevents troubles encountered in sagging of the broach and the weight of the work. This feature is claimed to result in a better grade of work and increased life of the broach.

The capacity of the machine is 12 tons and the maximum length of broach that can be used is 50 in. The cylinders are spaced 13 in. apart, which permits broaching of pieces up to 13 in. in diameter. Cutting speeds up to 30 ft. per min. are obtainable and return speeds up to 80 ft. per min. The operating pressure is set at 1000 lb. per sq. in. A 10-hp. 900 r.p.m. motor is employed.

The oil tank, of 50 gal. capacity, is in the upper part of the column, and relief valves, surge valves and piping are contained in the lower part of the column. Lubricating pump and piping are provided. The machine weighs 6400 lb.

Manual Alternating Current Motor Starter

A new manual across-the-line alternating current motor starter is being put out by the Cutler-Hammer Mfg. Co., Milwaukee. Designed to meet the need for an inexpensive manual starter, it includes overload cutouts giving complete motor protection; cadmium-plated, double-break, roller-type contacts; and a small safety, dustproof inclosing case.

By breaking the arc in two places the roller-type contacts are said to give several times the life of ordinary contacts. In addition, the contact rollers turn after each operation to present a new contact surface for the next operation. The thermal overload cutouts provide the necessary time interval to take care of starting current inrushes without shutting down the motor. The cover can be opened only when the starter is in the "off" position and all current carrying parts are "dead." Installation can be made without removing the panel from case. All parts are easily accessible for quick inspection.

The McClintic-Marshall Co. will remove its New York offices from 50 Church Street to the 12th floor, 39 Broadway, effective April 14.

Business Analysis and Forecast

BY DR. LEWIS H. HANEY

DIRECTOR, NEW YORK UNIVERSITY BUREAU OF BUSINESS RESEARCH

Statistical Data Concerning the Chief Consuming Industries Indicate That:

Expansion of activity in chief consuming industries is noted, but demand is not insistent.

Car and locomotive buying in March dropped below the unusually low January level.

Automobile production is clearly expanding, but severe competition is apparent and retail sales are lagging.

Building volume continues large, but may slacken; residential building assures good demand for pipe and nails; structural sales are declining.

Some demand for tank plates in petroleum States may come, as storage of oil is becoming a problem.

Iron and steel exports have been only moderately active.

STEEL production in February, on an average daily basis and allowing for the merely seasonal variations, increased so slightly as almost to warrant the statement that it represented no greater annual rate than did the January output, and the March output also held about level. On the other hand, a large gain occurred in the activity of the chief iron and steel consuming industries. These facts lead to the conclusion that the February steel production was moderate compared with the potential requirements of consumers. It was above normal, but so was the rate of production, and presumably the steel requirements, of the building, automobile and general manufacturing industries.

Judging both by logic and by precedent, there is no reason to become bearish on the steel industry so long as its chief customers are doing so well. Nor is there reason to believe that there is any accumulation of total inventories of steel, including both the inventories of the steel makers and those of the consuming industries, so long as the composite demand line is so far above its usual relation with the steel production curve.

Index of Composite Demand Is High

IN February, the latest month for which complete data are available, considerable gains occurred in railroad freight traffic, building activity, automobile production, general manufacturing (other than automobile and steel production) and in exports. The composite activities in mining and oil declined a little, considering the season, and orders for machine tools decreased somewhat. Our estimate of agricultural purchasing power recovered slightly, but remains considerably below the high level attained last fall. The net result is a gain of about 5 per cent in the index of composite demand, which carries it to the highest level since September, 1926, and warrants the hope that the steel ingot output may continue around present levels for a month or two without proving to be excessive.

Two factors, however, serve to limit the probability that this hope will be gratified. In the first place, it will be remembered that February had an extra working day, which is sufficient to explain something like 4 per cent of the gain in the index of activity among the consuming industries. Preliminary indications are that the composite demand line will decline in March. In the second place, prices and profits have to be considered, and unfortunately neither in the steel industry, nor in most of the consuming industries, are these as strong as is the showing made by the physical volume. The natural result is a tendency toward hand-to-mouth operations.

Conditions in Specified Industries

As to the near future, the indications are on the whole favorable to a sustained high level of steel pro-

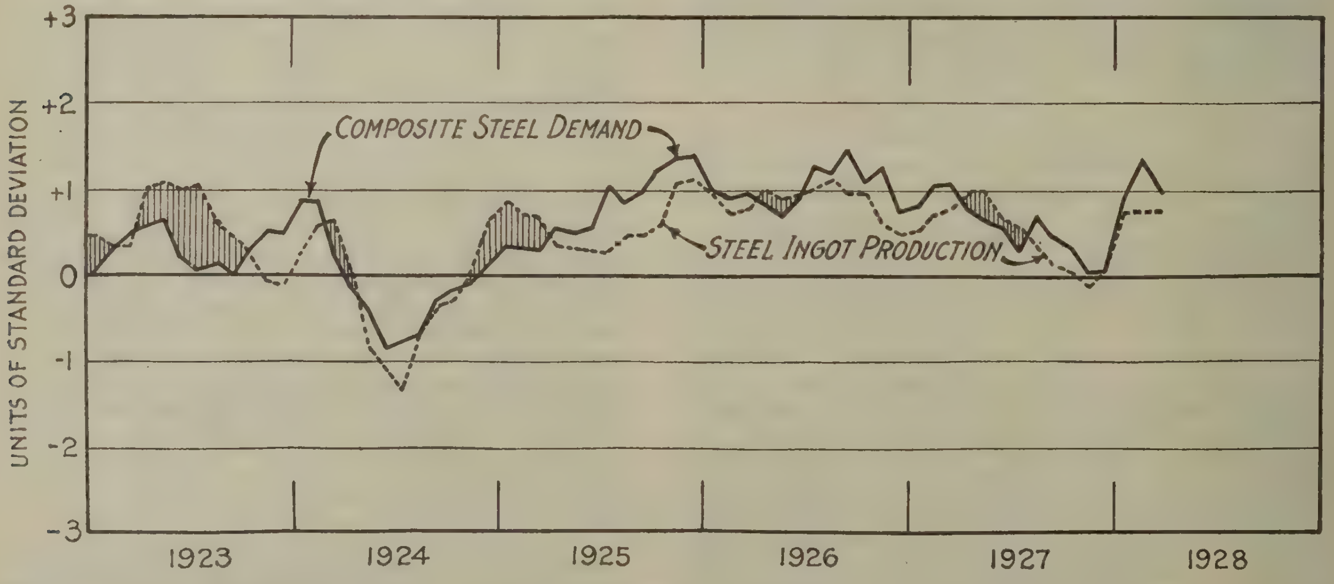


Fig. 1—Steel Production Carried Forward in February and March the High Level of January. But the curve of composite demand has been still higher. The outlook for the immediate future is encouraging

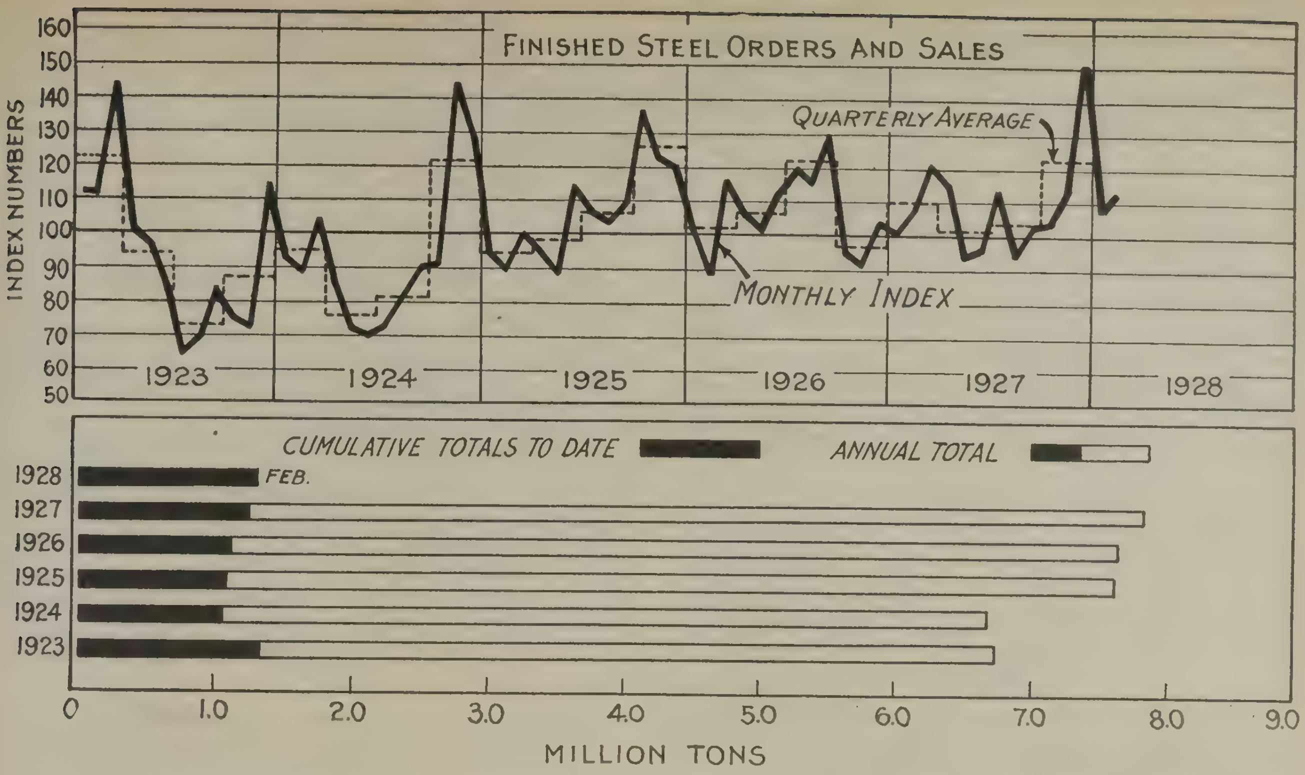

Fig. 2—Buying of Finished Steel Remains Greater Than It Has Been Since 1923. *March showed a loss from February. The peak of resultant production may follow shortly*

duction. The volume of freight traffic hauled by the *railroads* may be estimated for March and, while it is apparent that such traffic has failed to show the usual seasonal increase over the preceding month, this is not surprising, owing to the abnormal gain shown by a leap-year February. Except for February, the March freight traffic appears to have been the highest since last August, though it was of course much below a year ago. As further gains in the total volume of business are probable, the railroads should continue to furnish a fair demand for steel. February earnings showed improvement over recent months and the net operating income of Class I railroads was probably about equal to that of a year ago. Steel makers must remember, however, that this showing represented economies on the part of the railroads and that gross revenues were appreciably lower than last year.

Manufacturing industries, other than iron and steel and automobile production, showed an upward trend, according to the latest information. Judging by the most sensitive barometers, they are likely to continue upward for a few months. Machine tool orders, which are often barometric, declined in February and, as this is contrary to the usual seasonal trend, it is not a favorable indication, but the volume was still large and much above a year ago. March sales of machine tools are currently reported to compare favorably with the two preceding months.

Building activity in March showed a considerable recession from February—one that was so large as to make it practically certain that the index of composite activity for that month will show a decline. This suggests some diminution in the rate of demand for structural steel.

The February output of *motor cars and trucks* showed a recovery nearly to the level of a year ago. Retail sales of passenger cars were reported to be lagging, particularly in the case of high and medium-priced cars, and evidences of keen competition in the industry are not lacking. Estimates for March show little more than a seasonal gain in production. But a large volume of production continues, and heavy sales by the leading companies appear to have developed in March. It still seems probable that the automobile business will not reach a peak before April. A favorable indication is found in the fact that the manufacturers are proceeding cautiously and their large buying of steel is for current requirements.

In general, the *mining and oil industries* are dull and relatively inactive, our composite index continuing on about the same level as during the last seven months. Large coal consumers are drawing on stocks

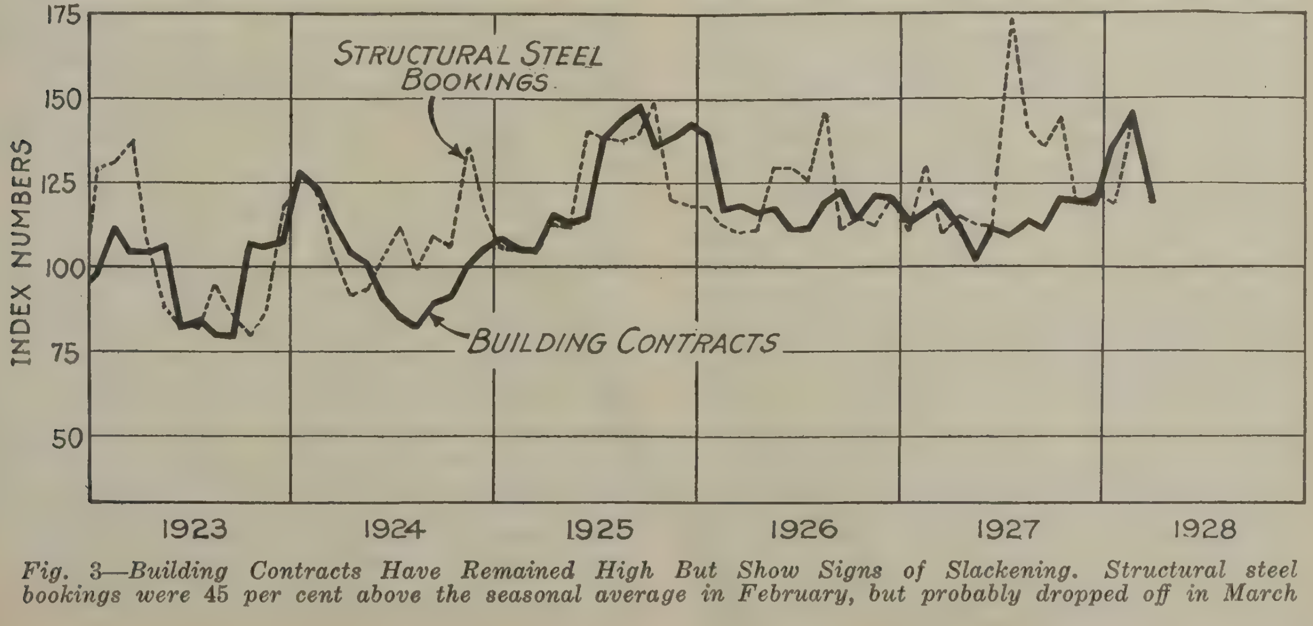

Fig. 3—Building Contracts Have Remained High But Show Signs of Slackening. Structural steel bookings were 45 *per cent above the seasonal average in February, but probably dropped off in March*

and that reduces current demand. Petroleum production has increased lately, in spite of the fact that drilling activity shows little change from the low level that it has kept for several months. The increase in production is not favorable, although it means some demand for storage tank material. Aside from the gasoline branch, the oil industry has not yet turned its corner. Copper production is fairly stable and, considering the season, was off a little in February.

Improvement has occurred during the past month in *farm prices*, which has tended to increase the purchasing power of farmers a little. But the bulk of the crops has now been marketed and the outlook for 1928, though of course highly uncertain at this early date, seems only fair. The farmers unquestionably have entered 1928 in a stronger economic position than they held a year ago and continued activity in agricultural machinery is to be expected.

Iron and steel *exports* declined less in February than usual, perhaps partly due to the extra day in that month, and to this extent made a good showing.

The strongest feature is the recovery of automobile production to levels above a year ago. As long as automobile, building and general manufacturing industries hold at present high levels the railroads must have a fair volume of traffic, and the demand for steel, as to quantity, will be well sustained at a high level.

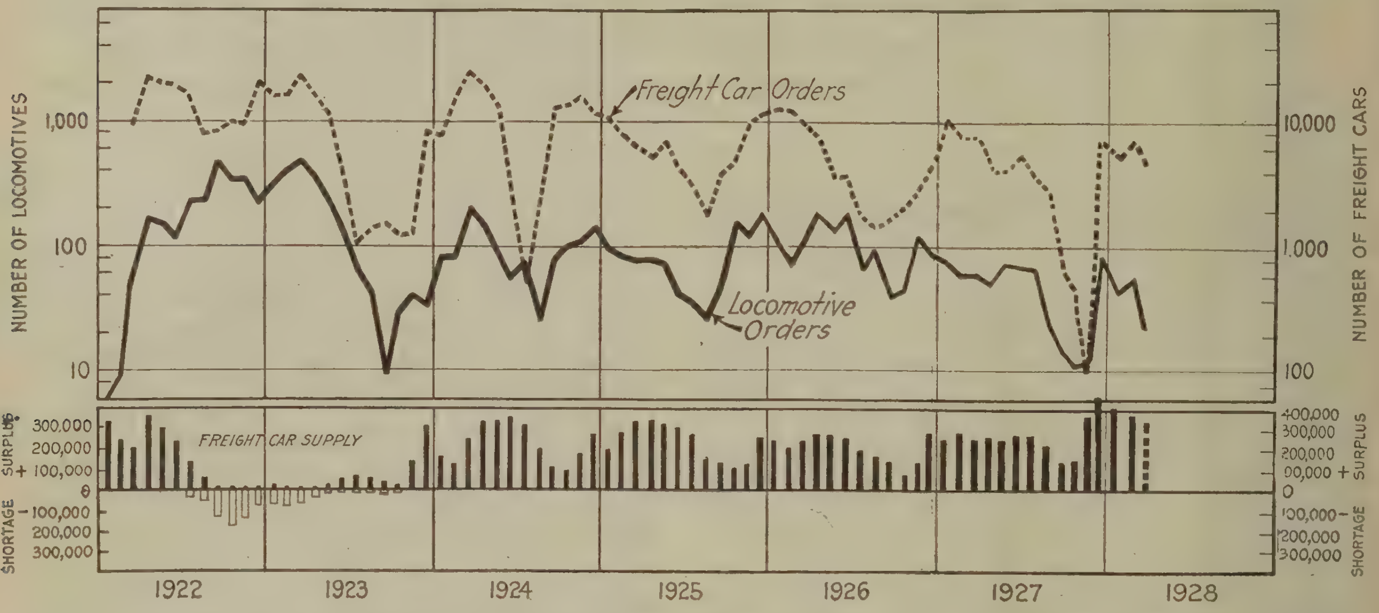

Fig. 4—Locomotive and Railroad Car Orders Have Dropped Below the Low January Levels. And the large surplus of cars does not indicate need for heavy purchases

Finished Steel Orders Remain Large

IN February, the orders for finished steel continued to hold their lead over other years since 1923. The total orders for sheets, structural steel, castings and fabricated plates in January and February were considerably ahead of the preceding four years. This was partly due to the fact that such orders increased in February. In that month the total was actually above any month since last July, with the single exception of December. This is a clear reflection of the large current activity in the steel consuming industries.

The largest items were found in steel sheets and structural steel, orders for which were large not only absolutely but in comparison with previous years. This fact emphasizes the present importance of the two industries, automobile production and building. In fact, it is noteworthy that such items of finished steel as fabricated steel plates and steel castings fell in February considerably behind a year ago.

A glance at the second chart will show that March is normally the month in which a seasonal peak in orders for finished steel is reached. It will be interesting to learn whether 1928 will show its third month maintaining the tradition. If it does, the first quarter of this year will have seen the largest orders for finished steel that have occurred in the first three months of any year since 1923. There seems little chance, however, that the volume will equal that of the 1923 period. Probably the chief question concerns the March business in structural steel, for the average weekly bookings reported currently appear to indicate a total considerably under that reached in January or February.

Slackening of Building Activity Impends

OUR seasonally adjusted indexes of building activity and automobile production came together in March at a point about 18 per cent above the average for 1921-1927. This compares favorably with a year ago, and tends to confirm the conclusion that steel production in March would be justified at last year's level. One cannot overlook the fact, however, that the *trends* in the two industries appear less favorable, and that the trend of building activity has an excellent reputation as a general business barometer. On the whole, these two industries show signs of slackening.

The square feet of floor space in building contracts rose in March to 88,090,000, which compares with 68,847,000 in February and 87,892,000 a year ago. This increase over February, however, is much less than usually occurs, and the adjusted index for March is only 118.6 against 144.1 in the preceding month. Moreover, the value of contemplated new construction dropped below February and below March, 1927. It is low in comparison with contracts awarded.

Bookings of structural steel rose in February and were approximately in the same position with reference to their average as were the building contracts. In that month, both were about 45 per cent above average, making due allowance for seasonal conditions. Probably the index will decline in March. This would conform to the trend of building contracts, and we note that the weekly average awards in March were only about 37,000 tons, against about 41,000 tons in February.

Railroad Purchases Small

AS shown in the fourth chart, railroad equipment orders have tapered off much as in each of the last two years, and in March were the lowest for the season found in recent years. Locomotive orders were particularly small. Domestic steam locomotive orders as reported by *Railway Age* were only 15, against 30 in February and 70 a year ago. Total foreign and domestic shipments of steam and electric locomotives numbered 70, but unfilled orders declined to only 178, which compares with 392 last year and 780 in 1926. Only 4470 freight car orders were reported, against 5896 in February and 5253 a year ago. With freight traffic failing to gain in March and a rather large surplus of freight cars reported by the railroads, the outlook for nearby equipment business is hardly fair.

European Markets Less Active

Britain Quiet During Easter Holidays—Belgian Mills Seek Orders—French Home Demand Good

(*By Cable*)

London, England, April 10.

PIG iron is quiet after the Easter holidays, but Cleveland makers are well sold and foundry and forge iron prices are strong. Hematite iron is dull and prices are maintained with difficulty. Foreign ore is quiet.

Finished steel is inactive, but domestic consumers are busy with existing contracts. Export demand for plates and shapes is still poor.

Tin plate was active up to the holiday period, and with mills in a strong position consumers have bought freely and makers are well sold on the basis of restricted output. Galvanized sheets are quiet and prices have an easy tendency. Black sheets are inactive.

Continental iron and steel is quiet and but little revival is anticipated until prices are more stable. The pig iron entente is maintaining prices at too high a level to permit of sales to the United Kingdom.

The European Rail Makers' Association has increased extras on Siemens-Martin rails by 2s. 6d. (61c.).

FRENCH EXPORTS SMALLER

Domestic Business Active and Semi-Finished Steel Scarce—Pig Iron Prices Firm

Paris, France, March 23.—The domestic iron and steel markets continue firm, but there is some weakness in export prices. The German export quota in the International Steel Cartel has been increased for the second quarter by 50,000 tons a month. The quota is now only 25,000, instead of 75,000, tons a month less than the German monthly average of exports in the second half of 1926. Apparently, in agreeing to this increase in German export tonnage, the French members believed that the present activity in the French domestic market would make up for any export losses to the French mills.

Export business has slackened, and buyers are evidently awaiting lower prices. Steel mills, however, are in most cases well booked with business. There is a scarcity of semi-finished material, and this may be one of the reasons Germany was permitted a higher export quota for this quarter. Exports have been smaller this year than in 1927. In January, shipments of ingots, blooms, billets and bars totaled 208,950 tons, compared with 233,445 tons in January, 1927.

Pig Iron.—At its March 15 meeting, the pig iron entente allotted 38,000 tons of phosphoric foundry and 35,000 tons of hematite to the domestic market for April. Previous domestic prices are being maintained, except on hematite iron delivered in the Ardennes, which has been reduced to 562.50 fr. ($17.10) per metric ton. An increase in export prices is expected, but the market is still unchanged at £3 2s. to £3 3s. ($15.10 to $15.34) per metric ton, f.o.b. Antwerp, for foundry iron and basic is quoted at £2 18s. to £2 18s. 6d. ($14.13 to $14.25) per ton.

Semi-Finished Material.—With little material available for prompt delivery, the selling syndicate has advanced semi-finished material and beams 20 to 30 fr. (79c. to $1.18) per ton, effective March 15. The new prices for the domestic market are: Ingots, 470 fr. ($18.47) per ton, instead of 450 fr. ($17.69); blooms, 535 fr. ($21.03) instead of 510 fr. ($20.04); billets, 565 fr. ($22.20) instead of 540 fr. ($21.22); and sheet bars, 600 fr. ($23.58) instead of 570 fr. ($22.40). Mills, in most cases, are booked for the next 90 days, and extended deliveries are offered. Basic Bessemer steel is particularly scarce, and some mills are resorting to open-hearth steel.

Finished Material.—Beams have been advanced 30 fr. ($1.18) per ton to 650 fr. ($25.55), f.o.b. works. For export, normal specifications range from £4 13s. 6d. to £4 14s. per ton (1.03c. to 1.04c. per lb.). Angles are quoted at £5 1s. 6d. to £5 2s. per ton (1.12c. to 1.13c. per lb.), f.o.b. Antwerp. There is a good volume of business in sheets, and on medium and heavy gages prices are firm. Quotations on light-gage sheets show some unsteadiness. On 1/16-in. black sheets, export prices

British and Continental European prices per gross ton, except where otherwise stated, f.o.b. makers' works, with American equivalent figured at $4.87 per £ as follows:

Durham coke, del'd.	£0 18s.		$4.39

range from £6 15s. to £6 15s. 6d. per ton (1.49c. to 1.50c. per lb.), and for 0.5 mm. the market is £10 10s. to £10 12s. 6d. per ton (2.32c. to 2.34c. per lb.), f.o.b. Antwerp. Exports of sheets in January totaled 28,466 metric tons, compared with 29,103 tons in January, 1927. Negotiations for the establishment of a sheet syndicate are being continued, and about the only obstacle to success seems to be selection of the proper person to head such a cartel.

STEEL CARTEL UNSATISFACTORY

Formation of Selling Syndicates Still Urged—Polish Membership Unsettled

(*Special Correspondence*)

BERLIN, GERMANY, March 24.—Recent reports, apparently from Paris, to the effect that French members of the International Steel Cartel are dissatisfied with its operation and wish to have it dissolved are not given much credence. In the past year and a half of the existence of the cartel, France has not exceeded the quota in any quarter and has received large refunds from the quarterly distribution. In addition, the French mills have been endeavoring to further the interests of the cartel by better internal organization. Lately, however, the trade press in France has been suggesting that French steel, as a result of increasing German competition, may be excluded from many foreign markets.

The cartel is undoubtedly in an unsatisfactory position. No solution has yet been found for the two principal problems that have faced the cartel since its formation. One is the entry of Poland with a quota satisfactory both to the Polish mills and other cartel members; the other is organization of international selling syndicates for different products.

At the recent cartel meeting in Paris it was agreed that Poland might have full protection in the Polish domestic market, but 300,000 tons per quarter was the maximum export quota offered, while Polish mills demanded 350,000 tons with a proviso that it was to be increased by 1 ton for every increase of 3 tons in domestic consumption. Membership was also made contingent upon Poland's reaching an agreement with Germany and the Central European members on exports to the Near East and on Polish membership in the European Rail Makers' Association.

It seems to be generally agreed that the steel cartel cannot become fully effective until the selling syndicates to control prices have been established. Now that the French have formed an entente to control sales of beams and semi-finished material, German mills contend that Belgium is the sole obstacle to this change. It is argued that Belgium sells for export at any price with the chief object of maintaining full works operations. This forces Germany to quote unprofitable export prices, at the same time maintaining a high rate of operation so as to reduce costs. As a result, penalties for overproduction must be paid each quarter.

The belief prevails in Germany that establishment of selling syndicates would aid in the maintenance of prices at a profitable level and, in addition, German domestic and export prices would show much less difference, which would eliminate the agitation against the German Steel Syndicate for maintaining such a high domestic market.

Belgian and Luxemburg Exports Smaller in January

WASHINGTON, April 9.—While the export trade of the combined Belgian and Luxemburg iron and steel industries in January was much smaller than in January of last year, it represented a considerable improvement over the total for December, according to a report received by the Department of Commerce from the commercial attaché in Brussels. The export trade of the month totaled 290,987 metric tons, compared with 346,466 tons in January, 1927. This tonnage consisted principally of billets and sheet bars, 51,646 tons, and sheets, 31,580 tons. Other large exports were structural shapes, hot-drawn rods and wire, blooms and scrap. The month's import trade aggregated 68,743 tons, compared with 50,907 tons in the same month of last year.

BELGIAN PRICES WEAKER

Mills Seeking More Tonnage Offer Concessions —Output Slightly Smaller

ANTWERP, BELGIUM, March 24.—Except for a moderate demand for beams and some semi-finished products, business is light. As a result, the market shows a slight tendency toward weakness, and, if desirable tonnages were offered, lower price levels would probably develop. Production apparently exceeds consumption, and delays in deliveries are growing shorter. Buyers are pressing for lower prices, and exporters are selling at less than the mills are now willing to accept in the belief that they will soon be able to purchase profitably. Makers, however, are resisting the pressure for lower prices, and concessions are not common.

Pig Iron.—Demand continues good, and prices are firm. Quotations on No. 3 phosphoric foundry iron are unchanged at $16.25 per metric ton, f.o.b. furnace, in the domestic market and at £3 3s. ($15.50) per ton, f.o.b. Antwerp, for export. Bessemer hematite is quoted at about $18 per ton at the furnace.

Semi-Finished Material.—Except for slabs, business has been small and some concessions in price have been made. Quotations are £4 3s. to £4 7s. ($20.35 to $21.30) per metric ton, f.o.b. Antwerp, on blooms and £4 9s. to £4 12s. 6d. ($21.80 to $22.70) per ton on billets. Sheet bars are about £4 14s. ($23) per ton, f.o.b. Antwerp.

Finished Material.—The tendency of the market seems to be downward, with only a small tonnage of transactions reported. A number of mills are seeking business and show willingness to make concessions. As a result, buyers are limiting their purchases in expectation of still lower prices. There seems to be a limit, however, to the concessions sellers are willing to offer. Steel bars are quoted at about £5 6s. per ton (1.17c. per lb.), but German exporters are reported to be offering bars at £5 5s. (1.16c. per lb.). Demand in general is smaller than a few weeks ago, and output has been curtailed somewhat. Beams are fairly firm as a result of better demand, so that prices are holding at about £4 15s. per ton (1.05c. per lb.). Hoop prices show some weakness, as production is still at a high level and demand is small. Hoops are quoted at about £6 per metric ton (1.32c. per lb.), f.o.b. Antwerp.

German Exports Larger and Imports Smaller in February

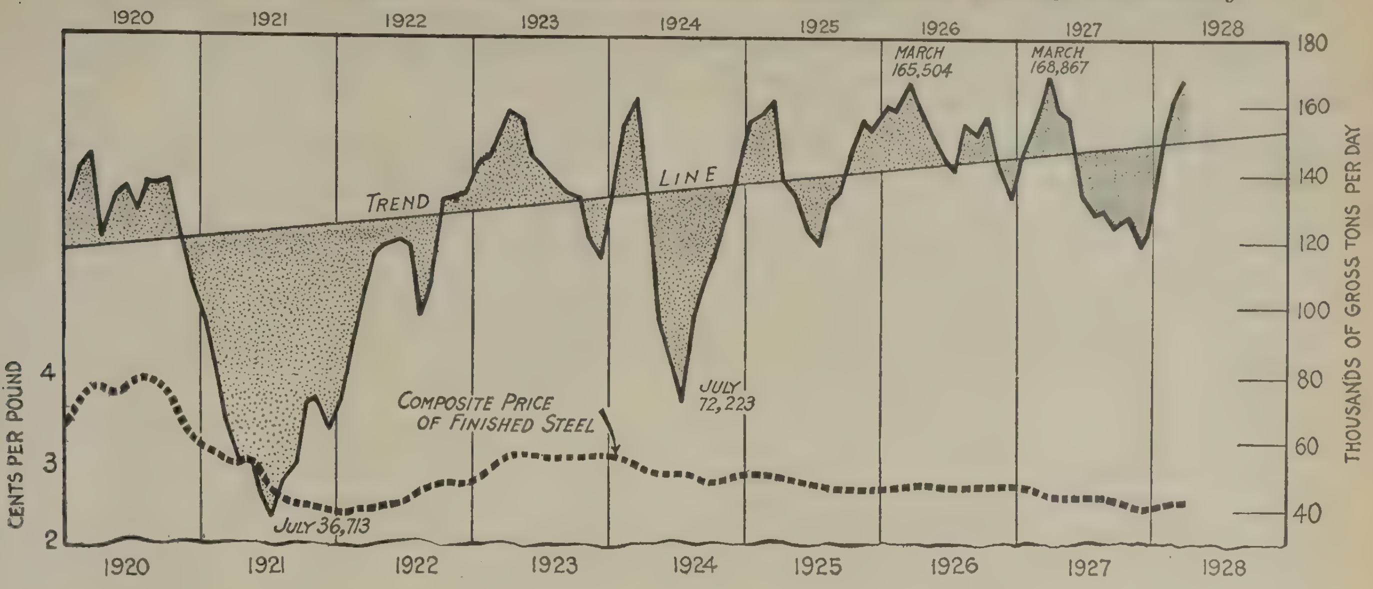
WASHINGTON, April 7.—Exports of iron and steel products from Germany increased to 350,924 metric tons in February, compared with 314,839 tons in January, a gain of 36,085 tons. Imports in February declined to 181,656 tons, compared with 202,469, a decrease of 20,813 tons, according to a radiogram received by the Department of Commerce from the commercial attaché at Berlin. In December there were increases in both exports and imports.

The principal increases in February exports were in rails, totaling 49,953 tons, compared with 33,611 tons in January; plain wire, 35,013 tons, compared with 21,959 tons in January; ingots and semi-finished steel, 39,602 tons, compared with 29,176 tons in January; jig iron and ferroalloys, 21,579 tons, compared with 13,879 tons; and cast iron pipe, 8750 tons, compared with 4215 tons. There was a reduction of 6878 tons in exports of castings and forgings, and a decline of 11,723 tons in exports of iron and steel bars, which totaled 71,922 tons in February, compared with 82,645 tons in January.

In the import movement 14 of 20 items showed reductions, the largest being a decrease of 8667 tons in ingots and semi-finished steel, which totaled 25,367 tons in February and 34,034 tons in January. Other notable reductions included rails and iron and steel bars. The principal tonnages in the February imports were in iron and steel bars and rods, ingots, pig iron and ferroalloys, hoops and bands and plain wire.

The Bratislava Cable Co., Bratislava, Czechoslovakia, has announced that it plans to erect approximately 300 steel dwellings near that city, according to a report from Vice-Consul Frank P. S. Glassey, Prague.

With the Largest Quarter's Ingot Production Ever Recorded, the March Tonnage Fell Less Than 1 Per Cent Below Last Year's High Record. Prices were slightly higher than in January and February



Ingot Production Makes New Record

First Quarter Well Ahead of Best Preceding Quarter—March Slightly Lower Than Last Year

PRODUCTION of open-hearth and Bessemer steel ingots in the United States in March is calculated by the American Iron and Steel Institute at 4,507,520 gross tons. This is based on returns from companies which, in 1927, produced 94.68 per cent of the total. Except for March, 1927, it represents the largest month's output in the history of the industry. It compares with a revised figure of 4,045,304 tons in February and with 4,535,272 tons in March, 1927.

With 27 working days, the estimated output was 166,945 tons a day, the fifth month which has ever exceeded 160,000 tons a day. This compares with 161,812 tons a day in the preceding month and with 167,973 tons in March, 1927. The original estimate for March, 1927, in which crucible and electric steel ingots were included, was 168,867 tons a day, as shown on the diagram.

For the first quarter of the year the calculated output was 12,544,156 tons. This compares with 12,137,192 tons in the first quarter of 1927, which had one day less in February. It compares also with 12,385,878 tons in the first quarter of 1926—the previous high record—in which total the electric and crucible ingots were included. If we estimate roughly that these represented 100,000 tons for the quarter, it follows that the quarter just elapsed was nearly 260,000 tons greater in output than the previous first quarter record. Only one other first quarter, that of 1925 with 12,139,000 tons, had an output of over 12,000,000 tons.

Both open-hearth and Bessemer tonnage improved in March, compared with February, open-hearth tonnage going up 12 per cent and Bessemer tonnage 9 per cent. For the first quarter, open-hearth output showed a gain of 500,000 tons over the first quarter of 1927, this representing more than 5 per cent. Meantime, Bessemer tonnage declined 114,000 tons, or nearly 7 per cent, leaving a calculated total gain of 407,000 tons, or about 3.4 per cent.

Estimating production in March of electric and crucible steel ingots (no longer covered in the institute's monthly figures) at 1200 tons a day, the total March ingot output would appear to have been at the rate of about 168,100 tons for each working day. Details of the past 15 months are shown in the table.

*Excluding crucible and electric steel ingots.

Smaller Production of Magnesite

Production of crude magnesite in the United States in 1927 is reported by the Bureau of Mines at 121,490 net tons, a drop of 12,000 tons from the 1926 total of 133,500 tons. Imports dropped also, from 196,318 tons in 1926 to 149,126 tons in 1927. As a result, the total available supply of the year at 270,616 tons showed a decided shrinkage from the supply of 1926, which was 329,818 tons, the largest total for some years.

Application of safeguards and other safety devices has enabled the Fulton Co., 732 Seventy-fifth Avenue, West Allis, Wis., to operate 580 days without an accident. The company manufactures automotive accessories and operates sixteen punch presses and other machinery rated as high risks. Its average payroll numbers 47 men.

Technical Program for British Steel Institute's Annual Meeting

For the annual meeting of the Iron and Steel Institute in London, May 3 and 4, the following technical papers have been scheduled for presentation:

Second Report on Heterogeneity of Steel Ingots, by a committee of the institute.

"Blast Furnace Data and their Correlation," by E. C. Evans and F. J. Bailey.

"The Influence of Nickel in Iron-Carbon-Silicon Alloys containing Phosphorus," by A. B. Everest and D. Hanson.

"A Study of the Resistance of Over-Stressed Wrought Irons and Carbon Steels to Salt Water Corrosion," by J. Newton Friend.

"A Comparison of the Most Important Methods Employed in the Cleaning of Blast Furnace Gas," by V. Harbord.

"Heat-Resisting Steels. Part II.—Mechanical Properties," by W. H. Hatfield.

"Blast Furnace Practice in Natal," by J. E. Holgate and R. R. F. Walton.

"The Properties of Nickel Steels with Special Reference to the Influence of Manganese," by J. A. Jones.

"Reactivity of Coke," by J. H. Jones, J. G. King and F. S. Sinnatt.

"The Recovery and Sinking-in or Piling-up of the Material in the Brinell Test and the Effects of these Factors on the Correlation of the Brinell with certain other Hardness Tests," by A. L. Norbury and T. Samuel.

"Twin-like Crystals in Annealed Alpha Iron," by H. O'Neill.

"The Effect of Silicon on Tungsten Magnet Steel," by J. Swan.

"Chromium Steel Rails," by T. Swinden and P. H. Johnson.

"The Fatigue Resisting Properties of 0.17 per cent Carbon Steel at Different Temperatures and at Different Mean Tensile Stresses," by H. J. Tapsell.

"The New Plant of the Appleby Iron Co., Ltd.," by T. Thomson.

"On the Structure of the Iron-Chromium-Carbon System," by A. Westgren, G. Phragmén and Tr. Negresco.

"The Rapid Normalizing of Overstrained Steel," by W. E. Woodward.

At the first session on May 3, Benjamin Talbot will be inducted into office as the new president and Charles M. Schwab, chairman of the board, Bethlehem Steel Corporation and president American Iron and Steel Institute, will be presented with the Bessemer Gold Medal.

Arrangements are being made to hold the autumn meeting at Bilbao, Spain, Sept. 25 to 27.

To Discuss Mechanization of Coal Mines

Mechanization of coal mines will be discussed at a meeting in Columbus, Ohio, April 21, under the auspices of the American Institute of Mining and Metallurgical Engineers, the National Coal Association, the American Society of Mechanical Engineers and the Southern Ohio Pig Iron and Coke Association. The program is under the supervision of Ralph H. Sweetser, American Rolling Mill Co., Columbus, and will consist of an inspection trip in the morning, a noon luncheon, an afternoon session at Ohio State University and dinner at the Faculty Club of the university.

A similar meeting under the same auspices will be held at Philadelphia on April 24 at which mechanization relating particularly to the mining of anthracite coal will be considered.

Testing Society to Study Use of Specifications in Market Quotations

As an outcome of a recommendation made by committee B-2 on non-ferrous metals and alloys of the American Society for Testing Materials, the executive committee has authorized the appointment of a special committee of the society "to study and promote the use of specifications covering copper alloys (in ingot form) as the basis of price quotations in the technical and trade journals." It is believed that the usefulness of A.S.T.M. specifications in all fields would be enhanced if they were more generally made the basis of market quotations and purchases. At the same time it is felt that efforts in this direction should for the present be confined to copper alloys in ingot form, where there apparently is particular need for greater definiteness in price quotations, and that it be extended into other fields only after some experience has been gained in this method of promoting the use of A.S.T.M. specifications.

Past-President Guilliam H. Clamer has accepted an invitation to become chairman of the proposed committee, which will consist of five producers of copper alloys, five consumers, and five representatives of technical and trade journals. Considerable interest has been shown by representatives of all three groups in the possibilities of this work, and it is planned if possible to organize the committee before the next annual meeting of the society.

Exhibit to Show Possibilities of Castings

As one means of assisting in the education of foundrymen to realize the possibilities of castings for engineering purposes, the American Foundrymen's Association is to sponsor a special exhibit at the Philadelphia convention May 14 to 18, showing examples of castings having the highest standards in engineering properties. Some of the possibilities of properties which it desires to emphasize are:

Strength
Machinability
Uniformity of grain structure
Hardness for special purposes
Corrosion resistance
Resistance to abrasion
Surface appearance of finish
Electrical

The exhibit of steel castings is being organized under the direction of the Steel Founders' Society of America; secretary W. J. Corbett, 511 Magee Building, Pittsburgh. The exhibit of malleable castings is being organized under the direction of the Malleable Iron Research Institute; secretary Robert E. Belt, Union Trust Building, Cleveland. The exhibit of gray iron castings is being organized under the direction of a committee of gray iron foundrymen; D. M. Avey, chairman, Penton Building, Cleveland. The exhibit of non-ferrous castings will be sponsored by a committee organized under the direction of W. M. Corse, secretary institute of metals division, A.I.M.M.E., 810 Eighteenth Street, Washington.

Any foundry organization making castings with exceptional values of the above properties, or of other engineering qualities, is invited to correspond with the committees mentioned above or with the secretary of the American Foundrymen's Association.

Foundrymen to Hold Apprentice Contests

The committee on apprentice contests of the American Foundrymen's Association, at a recent meeting, outlined rules and regulations to govern the annual national apprentice molding and pattern making contests, which will be held in connection with the 1928 meeting of the association at Philadelphia, May 14 to 18.

As in the past, local foundry associations and individual plants have been asked to cooperate by holding elimination contests, sending to the Philadelphia meeting the winning patterns and castings of the local contests. The entries sent to Philadelphia will be judged by a committee appointed by the association and prizes awarded to the makers of the best patterns and castings. The awards committee has set aside a sum of money to be used as prizes, which shall consist of a wrist watch, value $50, as first prize; of $25 as second prize and $10 as third prize for pattern making, iron molding and steel molding.

A bibliography on mechanical springs has been prepared by a research committee of the American Society of Mechanical Engineers. It covers some 600 references, which are indexed both by authors and chronologically, and a subject index is included.

NEW RAILROAD FAVORED

Line from Youngstown to Ohio River Approved by Shippers in Reply to Commerce Commission

WASHINGTON, April 10.—Reply was made public last Saturday by the Interstate Commerce Commission of its questionnaire regarding the proposed new line of the Pittsburgh, Lisbon & Western Railroad, controlled by the Montour Railroad, the latter's capital stock being owned by the Pittsburgh Coal Co. It is proposed to construct approximately 40 miles of new railroad. The existing line of the Pittsburgh, Lisbon & Western would be utilized in conjunction with the new construction to afford a through line from the Youngstown iron and steel manufacturing district to the Ohio River near Smiths Ferry, Pa., which is on the outskirts of East Liverpool, Ohio. About 13 miles would be constructed south of the present Lisbon line and 23 miles north of the present Lisbon line, and in conjunction with the 23-mile construction to Youngstown there would be a branch of about five miles to Struthers, Ohio, if the commission approves the project.

The answer to the questionnaire says that the traffic from Smiths Ferry is expected to be principally bituminous coal. The traffic from Youngstown to the Ohio River is expected to be principally iron and steel products. The shipment of bituminous coal from Smiths Ferry to Youngstown and beyond, the reply says, would be entirely ex-river coal. In its proposed location the line would be a north and south railroad, traversing Mahoning and Columbiana counties in Ohio and Beaver county, Pennsylvania, with a population of substantially 500,000 people. At Youngstown this carrier would provide a belt line on the west and south sides of the city, opening up an entirely new territory for manufacturing development.

The reply says that the proposal is expected to meet with substantial approval and support of the industries concerned in the utilization of the Ohio River waterway, which has been intensively developed for transportation purposes by the United States Government through the expenditure of large sums of money and in accordance with a policy of many years standing. The belief is expressed that the additional facilities would be well patronized by shippers of the Youngstown industrial district and by coal shippers along the canalized Ohio and tributary rivers. It is expected to haul 1,334,000 tons of coal the first year, 1,500,000 tons the second year, 1,667,000 tons the third year, 1,830,000 tons the fourth year, and 2,000,000 tons the fifth year at an averate rate of 60c. per ton for an average haul of 40 miles. The answer does not make an estimate of the steel tonnage it is expected to carry from the Youngstown district.

"The market for Youngstown's iron and steel in the South is now considerably hampered and restricted because of the necessity of shipment by rail lines, whereas the competitors of Youngstown are able to ship via river routes for all or a large part of the distance to destination at considerably less transportation cost," says the reply. "It is expected that the construction and operation of the proposed line will permit the shipment of Youngstown iron and steel products to the South with the necessity of but 40 miles of rail transportation, enabling the Youngstown iron and steel manufacturer to utilize beyond Smiths Ferry the cheaper river transportation which will then be available to him.

"Under such circumstances, it is expected that new business will be developed in the Youngstown district by the construction of the proposed new lines and the tonnage of iron and steel articles from Youngstown over the proposed new line will, therefore, be created business and will not be business diverted from existing railroads."

Construction of the new line would be begun promptly after the issue of the necessary authority of the commission, the answer says, and it is expected that the entire work would be completed within two years from the date authority is issued. The rails of the line would be 115 lb. per yd.

Department of Commerce Bulletin on French Machinery Industry

WASHINGTON, April 10.—The value of machinery made in France in 1926 is estimated at $130,000,000, which is three times that of 1913 figured on a gold basis, according to a report prepared by Assistant Trade Commissioner F. P. Waller, which has just been issued by the Industrial Machinery Division, Department of Commerce. In the case of machine tools, the value in 1926 was four times that of the pre-war year. The bulletin says the French machinery industry has advanced over its pre-war position largely because of four factors: (1) the country's increased capacity for iron and steel production resulting from the acquisition of Alsace-Lorraine, (2) the growth of French industries in general, (3) the depreciating exchange value of the franc, and (4) low labor costs.

The progress of the machinery industry in France, the bulletin points out, is strikingly reflected in its foreign trade. In 1926, imports on a quantity basis were 43 per cent less than in 1913, while exports had risen 268 per cent. Comparing the value of imports for the two periods, 1926 showed a drop from $35,000,000 in the pre-war year to less than $31,000,000 in 1926. French machinery exports in 1926 had a value of more than $20,000,000, compared with less than $7,000,000 in 1913. In 1927, the same favorable trend continued, the quantity of imports decreasing more than 18 per cent compared with 1926 and the quantity of exports rising 7 per cent.

Prior to the war, the bulletin says, Germany was by far France's most important supplier of industrial machinery, its share amounting to more than 46 per cent of total French imports in 1913. In that year the share of the United States was something under 6 per cent, total imports of American machinery being valued at around $3,000,000. In 1926, the value of French machinery imports from the United States had risen to $6,450,000 and its ratio of total imports to 18.4 per cent. During that year imports of German machinery into France had a value of $8,000,000, about 24 per cent of the total imports. The three chief suppliers of the French market in the order named were Germany, Great Britain and the United States. The bulletin points out as an interesting fact that while during the past few years the quantity of machinery imports from the United States has declined the value has risen, proving that French consumers are buying more special and high-class American machinery. Mr. Waller expresses the view that this trend will continue. While he states that the French are expanding their own machinery industry and furnishing the domestic market with increasing quantities of ordinary types of machines, the demand will grow for American high-production equipment, such as cannot be obtained from home manufacturers.

The publication is known as Trade Information Bulletin No. 543, "French Market for Industrial Machinery," and may be obtained for 10c. from any of district offices of the Department of Commerce, or from the Superintendent of Documents, Government Printing Office, Washington.

The Mystic Iron Works operated at full capacity throughout the year, says the 1927 report of the Massachusetts Gas Co., Boston. The designed capacity of the stack is 150,000 gross tons, and production was 175,244 gross tons. Notwithstanding unfavorable market conditions for pig iron, shipments totaled 74 per cent of furnace output. The New England Coal & Coke Co. produced 673,110 gross tons of fuel, contrasted with 534,450 in 1926. The Mystic Iron Works was furnished with 143,000 tons of coke. The battery of 55 Wilputte ovens, put in operation in December, 1926, ran throughout 1927, and 100 of the Otto Hoffman ovens were shut down permanently in April, 1927.

FLUORSPAR TONNAGE OFF

Drop of 13 Per Cent in 1927—Open-Hearth Furnaces Used Seven-Ninths of Total

WASHINGTON, April 7.—Showing a decline of 13 per cent both in quantity and value, fluorspar shipments from mines in the United States decreased to 112,546 net tons, valued at $2,034,728, in 1927, against 128,657 tons in 1926, according to a report issued by the Bureau of Mines. Shipments were made from Colorado, Illinois, Kentucky and New Mexico last year, with the last-named State the only one to record an increase.

Shipments to steel plants last year totaled 93,196 tons, valued at $1,523,915, an average of $16.35 a ton, f.o.b. shipping points. This compares with 105,614 tons, valued at $1,744,085, in 1926, an average of $16.51 a ton. Shipments to foundries amounted to 4533 tons, valued at $84,724, in 1927, an average of $18.69, compared with 6212 tons, valued at $121,453, in 1926, an average of $19.55. The general average value shipped to steel plants in 1927 from the Illinois-Kentucky district was $16.59 a ton and from the Colorado-New Mexico district $13.72 a ton. These values compare with $16.98 for the Illinois-Kentucky district and $12.69 for the Colorado district in 1926.

Total shipments from Kentucky mines in 1927 amounted to 57,495 tons, valued at $1,040,338, an average of $18.09, while shipments from Illinois mines totaled 46,006 tons, valued at $863,909, an average of $18.78. Shipments from Kentucky mines in 1926 amounted to 62,494 tons, valued at $1,167,129, an average value of $18.69, while shipments from Illinois mines that year aggregated 53,734 tons, valued at $1,012,879, an average value of $18.85.

According to reports of producers, the stocks of fluorspar at mines or at shipping points on Dec. 31, 1927, amounted to 21,208 tons of gravel spar, 1857 tons of lump and 385 tons of ground spar. In addition, there was in stock piles at the mines at the close of 1927 about 49,000 tons of crude spar, equivalent to about 29,000 tons of merchantable material. These stocks compare with 20,731 tons of "ready-to-ship" spar and 48,266 tons of crude spar on Dec. 31, 1926, making an increase of about 13 per cent in the stocks of merchantable spar and 2 per cent in crude spar over 1926.

Total imports in 1927 were 71,515 tons, a decrease of 5 per cent from the record year 1926, but the second largest ever recorded. The imports last year were equivalent to 64 per cent of the total shipments of domestic fluorspar and compared with 59 per cent in 1926. The United Kingdom, which has been the chief source of the imported fluorspar, supplied only 26 per cent in 1927, the 18,449 tons coming from that country showing a decrease of 37 per cent from 29,407 tons in 1926. Germany was the chief source of imports in 1927, supplying 31,829 tons, or 45 per cent of the total, and comparing with 20,465 tons in 1926.

The basic open-hearth furnaces, the largest users of fluorspar, consumed 138,000 tons in 1927 and had 85,000 tons in stock at the end of the year, as compared with 142,000 tons consumed and 70,000 tons in stock in 1926. Electric furnaces consumed 4700 tons and had 1200 tons in stock last year, against 4800 tons and 2000 tons respectively in 1926. Foundries consumed 3400 tons and had 1000 tons in stock in 1927, against 4335 tons and 1400 tons respectively in 1926. Other industries, combined, used 30,100 tons in 1927. The figures for the basic open-hearth furnaces include data for the 72 companies that make 99 per cent of the total basic open-hearth steel, and estimates for the other three companies.

Slight Recovery in Locomotive Shipments in March

WASHINGTON, April 7.—Seventy railroad locomotives were shipped from the principal manufacturing plants in March, against 59 in February and 137 in March of last year, according to reports received by the Department of Commerce. Of the March shipments 59 were for domestic use, 44 being steam and 15 electric locomotives. Of the 11 locomotives exported nine were steam and two electric. Unfilled orders at the end of March totaled 178 locomotives, of which 160 were for domestic use, 123 being steam and 37 electric. Foreign orders totaled 18 locomotives, 16 being steam and two electric.

Automotive Business Continues at a High Rate

Automotive Industries this week will say:

"Continuance of automotive business on an even keel is indicated for the second quarter of 1928, now two weeks gone. National Automobile Chamber of Commerce members during the first quarter went ahead of the same period in 1927 both in sales and in production, but the total number of passenger cars delivered at retail by the industry, including Ford, appears to have been slightly less during the first three months of this year than during the first three of last. Total passenger car production, however, including that of Ford, was nearly 5 per cent ahead of last year's first quarter.

"As a whole, there can be no question that 1928 is going along better than did 1927, and that the second quarter will continue to show similar favorable aspects. Ford is gradually getting into larger and larger production, as is generally known, but had not reached a sufficiently large volume at the end of March to come anywhere near meeting the accumulated or even the current demand for his products. Consequently, a better picture of the general progress of the industry is available for the moment from a consideration of performance of National Automobile Chamber of Commerce members, with Ford excluded, than from discussion of total 1928 figures as compared to 1927 totals.

"On this basis the sound foundation on which current optimism is based is revealed by the fact that first quarter passenger car production this year exceeded that of last by something like 26 per cent, while truck output for the same period was 19 per cent in excess of last year's first three months. Exact sales figures are not available, but partial data indicate that retail deliveries of cars built by National Automobile Chamber of Commerce members were somewhere between 15 and 20 per cent ahead of last year for the first quarter."

Increasing Shipments of Sheet-Metal Ware Reported

February shipments of galvanized sheet-metal ware, as reported to the Department of Commerce by 15 concerns comprising a large proportion of the industry, were 188,487 dozens, valued at $727,257, as compared with 184,993 dozens in January, valued at $691,348, and 201,830 dozens, valued at $735,878, in February of last year.

February shipments of enameled sheet-metal ware, as reported by 18 manufacturers comprising approximately 80 per cent of the industry, were 372,885 dozens, valued at $1,457,425, as compared with 319,871 dozens, valued at $1,093,329, in January, and 372,452 dozens, valued at $1,335,312, in February, 1927.

Wheeling Steel Corporation to Blow in a Riverside Furnace

The Wheeling Steel Corporation will soon blow in No. 2 blast furnace at Benwood, W. Va., the larger and more modern of the two furnaces acquired in its purchase of the Riverside Works, National Tube Co. One of the Steubenville furnaces is going out this week for relining.

Hot Blast, Powdered Coal in Cupolas

Phases of the Recent Advance of Science in the Foundry Considered at Ann Arbor Meeting—Sand Testing More Highly Developed

SOME present day foundry problems and recent developments in the industry, including the use of powdered coal for cupolas, also hot-blast cupolas and the testing of foundry sands, were discussed at a meeting of the Ann Arbor Division, Detroit Chapter of the American Society for Steel Treating, held April 3 in the East Engineering Building, Ann Arbor. The general subject of discussion was foundry control. Prof. William P. Wood of the University of Michigan was chairman of the meeting. Three speakers were on the program and general discussion followed their talks, which were of much interest.

"The greatest competition in industries is bound to come from new methods," declared Prof. A. E. White, director of engineering research, University of Michigan, who was called on to close the discussions. "The only way to meet conditions as they develop is to keep on your toes and bring out the best product that it is possible to produce."

Rapid Changes Affecting Steel Foundries

Doctor White pointed out that industries are in a state of transition due to the adoption of new methods. Rigid restrictions on steel castings have been proposed by the National Electric Light Association. Steel castings, he said, are facing competition with forge shops and with plants developing the manufacture of steel tubing in large diameters. Germany is now making steel tubing up to 24 in. in diameter and one mill has been erected in this country to make tubing of the same size. While visiting the plant of the A. O. Smith Corporation in Milwaukee recently he saw pipe 15 ft. in diameter with 2-in. wall thickness welded so perfectly that when broken none of the ruptures occurred in the electric welds. Steel foundries, he said, are facing the competition of fabricated parts made from forgings and by the use of the welding process. Automobile cylinder blocks in the future may be forgings instead of castings. He understood that one automobile company was doing experimental work in this direction at present.

Marked Progress in Sand Testing Devices

Much interest was shown in a discussion of the control of foundry sand by Prof. H. L. Campbell, University of Michigan. He emphasized the importance of testing and checking cores and core sands and declared that much attention is now being given to this part of foundry control. Some of the latest devices for testing foundry sands were shown and their operation described by the speaker.

Professor Campbell declared that great progress has been made in the control of processes in the foundry because of the application of science. Turning to materials used in the making of molds and cores he said that they must have high refractory properties and permeability and must provide a smooth surface to give a good finish on the casting. Foundry sand has certain characteristics that must be watched. Various devices have been developed to check foundry sand. One of the latest instruments is for measuring the green bond strength. The sand is packed in a sleeve and the cylindrical specimen thus made is put in an instrument that, operating under compression, registers the pressure required to break the sand. A machine for testing permeability in green sand mixtures was shown. With this air is forced through the specimen and a register indicates the time and pressure required for forcing a certain amount of air through. Smoothness of sand is tested for fine finish. However, finish of surface is determined largely by experiment.

A Late Method for Measuring Permeability

Dry sand cores have certain very definite requirements, Professor Campbell pointed out. The first is permeability. The entire core should be permeable to allow gases to escape freely. A method was developed recently by which that property can be easily determined. A standard specimen is prepared and placed in a mercury sealed cup. Then two leaders of air are passed through the core under standard pressure and the time required for forcing the given amount of air through the core is recorded.

Another important quality in cores is strength, as this must be enough to resist the buoyancy of the molten metal. Professor Campbell adopted a 1-in. x 1-in. x 8-in. standard core specimen to test strength. The core box is placed on a plate on which the core is made and baked. A hopper is placed on the core box. The formed core is subjected to a ramming action with ten blows. In this way uniform cores are produced. Then they are given a transverse test on a testing machine, the core being supported near the two ends and the load applied at the center.

Standard green sand specimens for testing strength are made in the form of a hemisphere. The specimen is placed under a cone and pointer device and the load falls on the specimen, the force required to fracture it being recorded. The speaker pointed out the necessity of finding the green bond sand strength in weak sand. Various core binders are used to produce green bond strength. He considered raw linseed oil the best core sand binder in use today. Where intricate cores are made, additional materials are used for binders such as flour, cornstarch and molasses.

The various methods of measuring the properties of cores have been developed in research laboratories, according to the speaker, and this core testing apparatus is now being used in about thirty foundries to safeguard their cores. Professor Campbell referred to the cylinder block of the Dodge automobile, which he described as simply an assembly of cores forming a dry sand mold. Research work is being conducted on various types of sand to determine which gives the best finish to castings.

Methods That Have Been Used Effectively in the Wilson Foundry

One factor in foundry operations that is not stressed as much as it should be is the human element, in the opinion of Fred Walls, chief metallurgist of the Wilson Foundry & Machine Co., Pontiac, Mich. While much foundry testing equipment has been developed, he holds that only 10 per cent of the foundry troubles are due to the material element, 90 per cent being on the human side. The technical college graduates that are now going into foundries will find a way of controlling the human element. The foundry, he said, has been greatly neglected from a techincal standpoint.

Mr. Walls explained the method of chart control of the cupola used in the Wilson foundry. A positive pressure blower is used and a constant stream of air is provided. The pressure, which is shown on a recording chart, indicates whether other conditions in the cupola are constant or varying. He had found this method very satisfactory.

Mr. Walls laid stress on the importance of checking weights of materials going into the cupola The practice at Pontiac is to make a test bar every hour. An analysis of this bar is completed within an hour, and thus a quick change can be made in the cupola mixture.

Fairly accurate cupola control can be secured by using optical pyrometers, declared John Grennan, foundry instructor in Michigan University, who was the last scheduled speaker. He said that thermocouples did not work so well in the foundry as in some other lines of work. He stressed the advantages of large ladles in pouring as an aid to uniformity in the metal.

Experience with Hot Blast and Powdered Coal

There has been little improvement in cupola operation until recently, said Mr. Grennan, and some of this is in the use of old methods that are now made to work. The hot blast has not been worked out until recently. The change to continuous operation and long blast has made the hot blast cupola desirable. The Griffin Wheel Co. has installed hot blast cupolas in practically all of its plants. The temperature of the blast is 400 deg. Fahr. and with the use of the hot blast the coke requirement for a ton of iron has been reduced from 262 to 192 lb.

Another important innovation referred to by Mr. Grennan is the use of powdered coal in the cupola. This has been developed in Germany, with a material cutting down of the carbon monoxide that passes from the stack, this being 12 to 15 per cent in an ordinary cupola operation. The result, he said, had been a 30 per cent saving in fuel cost. In the German powdered coal cupola the fuel is blown into the cupola at high velocity, being introduced through special small tuyeres located 6 in. or 7 in. above the regular cupola tuyeres.

The American Radiator Co. has operated powdered coal cupolas with even better results. The use of powdered coal, the speaker said, may revolutionize cupola practice.

Alloys for High-Strength Castings

In a general discussion following the talks Mr. Walls said that he believed that only the surface has been scratched in alloying cast iron. In his foundry castings containing molybdenum had shown tensile strength of 55,000 lb. per sq. in. and could be machined. The heat treatment properties of cast iron containing molybdenum are good. The corners of the castings do not chill much. In his opinion molybdenum in cast iron offers many possibilities, although one of the disadvantages of this alloy is its high cost.

The superheating of cast iron to increase its strength was a subject that has been discussed considerably, said Professor Campbell. Some authorities recommended the use of a large fore-hearth or ladle where oxides can be removed and the slag separated. The Ford Motor Co. is following this practice in a way in heating iron in a mixer after leaving the cupola.

Mr. Walls remarked that he liked to get iron out of the cupola as hot and as fast as possible. In the Wilson foundry they get iron up to a temperature of 2725 to 2750 deg. Fahr. and have made as much as 254 tons in one run. He declared that they get stronger and better iron with a gas pressure of 20 oz.

Carnegie Steel Co. Opens New Warehouse at Houston, Tex.

The Carnegie Steel Co. has completed and has in operation its new warehouse at Houston, Tex., which is located on the Houston Ship Channel. The site has a total acreage of 97.64 acres, of which 18 acres on the channel are developed for warehouse purposes. The main warehouse comprises eight parallel buildings or bays, totalling 650 ft. by 500 ft., all under one roof. It is of steel construction with galvanized, corrugated steel roof and siding, each bay being equipped with an overhead electric traveling crane. Natural light and ventilation are provided in the design of the building, and modern machinery equipment for cutting and performing other operations has been installed. In auxiliary buildings, located conveniently to the warehouse building are the offices, electric sub-station, store room, sanitary station, hospital room, oil house, engine house and garage. The warehouse is served by approximately 1½ miles of standard gage railroad trackage with connections to the Southern Pacific and Public Belt Railroads.

The engineering features were handled by the engineering department Carnegie Steel Co., Pittsburgh, working in conjunction with the warehouse management. R. J. Cummins was the consulting engineer on dock construction and M. J. Sullivan was the architect on the office and other auxiliary buildings. The warehouse is ideally located to receive shipments either by rail or water, as the Houston Ship Channel will take deep sea craft drawing up to 30 ft. of water, and there are connections to all trunk railroad lines entering Houston.

On the west side of the warehouse is a barge slip dredged to a depth of 10 ft. Over this operate three high speed traveling cranes, arranged to transfer materials from barges directly onto the warehouse floor or into railroad cars. These facilities enable the warehouse to receive consignments direct from the mills by water with one handling. Direct connection with the Southern Pacific lines and, through the Port Terminal Railroad, with all railroads entering Houston permit prompt delivery to all points in the territory served by the railroads. For quick and efficient local deliveries, a fleet of trucks is available.

Conforming to the long established policy of the United States Steel Corporation, relating to safety, sanitation and welfare, an attractive building has been provided so that each individual employee may profit by healthful surroundings. Each man has a locker for his private use, while in adjacent rooms are lavatory, shower baths and sanitary facilities of the most modern type. Immediate medical attention in case of sickness or accident is provided by an emergency hospital, constructed and equipped in the most up-to-date manner.

A well, 800 ft. deep, furnishes an abundant supply of pure drinking water. It is cooled by electrical refrigeration and is distributed by numerous fountains conveniently located throughout all the buildings. Power is supplied by Houston Light & Power Co. through a 12,000-volt transmission line to the substation, which contains three 250-kva. power transformers, three 50-kva. lighting transformers and two 500-kw. motor-generator sets.

Among the firms which did the construction and furnished the equipment are:

American Bridge Co., Pittsburgh—main warehouse, building steelwork, roof, siding, doors and windows.

Cleveland Crane & Engineering Co., Wickliffe, Ohio—main warehouse building cranes.

Brown Hoisting Machine Co., Cleveland—dock crane.

Chicago Bridge & Iron Works Co., Chicago—water tank.

Westinghouse Electric & Mfg. Co., Pittsburgh—electric equipment in sub-station.

Buffalo Scale Co., Buffalo—track scale.

United Engineering & Foundry Co., Pittsburgh—cold saw and tables.

General Motors Corporation, Detroit—trucks.

Clark Tructractor Co., Buchanan, Mich.—Tructractors.

Cyclone Fence Co., Waukegan, Ill.—fence and gates.

Suburban Electric Development Co., Pittsburgh—Frigidaire drinking water coolers.

Steel Transportation Requirements Expected to Be Higher This Quarter

WASHINGTON, April 10.—Iron and steel transportation requirements for the second quarter of the present year are estimated at 479,533 carloads, as against 467,359 carloads for the corresponding period of last year, according to reports received by the car service division of the American Railway Association from the 13 shippers' regional advisory boards throughout the United States. This estimated increase of 2.6 per cent is identical in percentage with the estimated increase of coal and coke loading, which is fixed at 2,545,375 cars, as against 2,481,637 cars during the second quarter of 1927. Requirements for castings, machinery and boilers are estimated at 59,977 cars, a decrease of 1.8 per cent from the 61,102 cars required during the second quarter of last year. Agricultural implements are estimated to require 42,458 cars, as against 38,530 cars, an increase of 10.2 per cent, while requirements for automobiles, trucks and parts are estimated at 312,777 cars, as against 242,566 cars, an increase of 28.9 per cent.

Total transportation requirements for 29 of the principal commodities in the second quarter of the present year are estimated at approximately 9,035,963 cars, an increase of about 323,250 cars, or 3.7 per cent, over the corresponding period of last year. The 10 regional bodies estimating an increase were the Atlantic States, Allegheny, Great Lakes, Northwestern, Central Western, Southeastern, Southwestern, Middle Western and Pacific Northwest boards. Those estimating a decrease were the Ohio Valley, the Trans-Missouri-Kansas and the New England boards. In addition to castings, machinery and boilers, decreased requirements were estimated for hay, straw, alfalfa, cotton, cottonseed and products, and citrus fruits.

Flexible Provision of Tariff Act Sustained

WASHINGTON, April 10.—A decision of the United States Supreme Court yesterday sustaining the constitutionality of the flexible provision of the tariff act is of great interest to the iron and steel industry. The holding means that action taken by the President in changing duties in the metals section under this provision is valid. No appeal, therefore, can be successfully made against changes in rates. The principal change in the duties in the metals section, so far as the iron and steel industry is concerned, relates to the increase of 50 per cent in the rate on pig iron. The decision also means that investigations and reports under way will be completed. Reports regarding changes in duties on fluorspar and manganese ore are among those expected shortly.

Two Continuous Reheating Furnaces to Serve New Bar Mill

The Timken Roller Bearing Co., Canton, Ohio, will install two continuous bloom-reheating furnaces to serve a new bar mill now under construction. These furnaces, to be furnished by the Rust Engineering Co., Pittsburgh, will each heat 40 gross tons of alloy blooms an hour, the blooms being 10 x 10 in. and 18 ft. in length.

Blooms will be charged in one end of the furnace and pushed throughout its length of 69 ft., being discharged by gravity to the roller table. The furnaces are of Rust triple-fired type, for which patents have been applied, utilizing a soaking chamber at the discharge end which is separate from the main portion of the heating furnace and is independently controlled as to temperature. This feature permits the condition of the steel being discharged to be uniform and independent of rate of firing and tonnage output.

The Rust refractory tile recuperator will be utilized on these furnaces, to deliver highly preheated air to the main furnace firing ports. The fuel will be natural gas.

Producto Machine Co. Takes Over Bilton Machine Tool Co.

The Producto Machine Co., 990 Housatonic Avenue, Bridgeport, Conn., has been organized and has purchased the entire assets of the Bilton Machine Tool Co., Bridgeport, from Homer Cummings, receiver of that company. The same organization which has operated through the receivership of the Bilton company is continuing with the Producto organization and financing has been provided to carry on the business without interruption. The Producto-matic milling machine will continue to be the company's principal product and cam millers, gear millers, Bristol hand millers, die sets, special cutters and gray iron castings will also be manufactured.

Officers of the company are William J. Grippin, chairman; N. M. Marsilius, president and general manager; Frederick Rhodes, first vice-president; E. A. Harper, vice-president in charge of Detroit sales; E. G. Rogers, vice-president in charge of foundry sales; A. J. Cummings, vice-president in charge of Eastern machinery sales; George H. Weber, secretary, treasurer and assistant general manager, and R. S. Lathe, assistant secretary and assistant treasurer.

National Bearing Metals and American Brake Shoe Propose Consolidation

Stockholders in the American Brake Shoe & Foundry Co., New York, and the National Bearing Metals Corporation, St. Louis, have been asked to ratify a proposed combination of the two companies. The plan calls for a mutual purchase of interest in each company by the other, but with both organizations retaining their identities. The Brake Shoe & Foundry company manufactures brake shoes for railroad cars and iron castings. Its plants are located at Norwood, Mass.; Mahwah, N. J.; Buffalo; Baltimore; Portsmouth, Va.; Chattanooga, Tenn.; Pittsburgh; New Richmond, Ohio; Chicago, Burnside and Melrose Park, Ill.; Minneapolis; Kansas City, Mo.; Houston, Tex., and Denver, Colo.

The National Bearing Metals Corporation was organized last June as a merger of the More-Jones Brass & Metal Co., St. Louis; the Keystone Bronze Co. and the Bronze Metal Co., Pittsburgh; the Brady Brass Co., Jersey City, N. J., and the Southern Brass Works, Portsmouth, Va. It manufactures brass and bronze products of all kinds.

Pittsburgh and Ohio Mills Oppose Cut in Chicago-New Orleans Freight Rate

PITTSBURGH, April 10.—A proposal of the Illinois Central Railroad to reduce the freight rate on iron and steel products moving from the Chicago district to New Orleans, for trans-shipment via the Panama Canal to Pacific Coast ports, from 55c. per 100 lb. to 31c., effective June 1, is vigorously opposed by Pittsburgh, Youngstown and Cleveland district steel companies. Traffic managers of the steel companies in these districts met here yesterday at the Chamber of Commerce, and it was decided that each representative present would immediately file a request in writing with the traffic executives of the trunk lines urging them to prevail upon the Illinois Central to withdraw its proposal. It was further decided that if this is not accomplished the carriers be asked to reduce the rates from Pittsburgh, Youngstown and Cleveland to Baltimore by a relative amount. On this basis, with a rate of 31c. from Chicago to New York, the Pittsburgh-New York rate would be 60 per cent thereof or 18½c. per 100 lb. With the usual differentials to Philadelphia and Baltimore of 2c. and 3c., respectively, the rates to those points from Pittsburgh would be 16½c. and 15½c., respectively.

The present rate from Pittsburgh to Baltimore, a distance of 311 miles, is 31c. per 100 lb. and applies on traffic for trans-shipment to Pacific Coast ports. The identical rate proposed by the Illinois Central from Chicago to New Orleans would apply on shipments for a distance of 912 miles, or approximately three times the Pittsburgh-Baltimore mileage.

This Issue in Brief

Employees' lunchroom pays in improved morale, even if food is served at a loss. One large organization has canteens placed at handy locations through the plant. No order is over 5c., and 5,000,000 orders are served yearly.—Page 1003.

Buyer ultimately suffers when sellers indulge in price-cutting orgy. Selling below cost often induces skimping in quality and frequently results in bankruptcy, with consequent disruption in sources of supply.—Page 1005.

Activity of steel consuming industries is favorable to a sustained high level of steel production, Dr. Haney indicates. Index of composite steel demand is at the highest level since September, 1926.—Page 1018.

Powdered coal cupola saves 30 per cent of fuel cost. Fuel is blown into new German cupola at high velocity, being introduced through special small tuyeres 6 in. or 7 in. above the regular cupola tuyeres.—Page 1028.

Is there a tendency toward lessened emphasis on price? Yes, says trade association executive, pointing out that several large organizations have taken the lead in allowing the supplier a fair price, and giving more consideration to quality and service.—Page 1005.

Applies rolling mill slip drive to three-high plate mill. Customary pinions and pinion housing are eliminated, and in their place is a light nest of gears, between flywheel and mill spindles. Mill torque is increased about 75 per cent.—Page 1004.

Intricate cylindrical castings may now be made by centrifugal means. "Spun-sorbitic" process produces a casting highly resistant to wear, and therefore suitable for piston ring drums, cylinder barrels for pumps and motor engines, and sleeve valves. It may be used for automobile engine cylinders.—Page 1008.

Proportions of scrap and pig iron used in open-hearth charges change in parallel with price relation of scrap and iron. In first quarter of 1928 the average proportions were calculated to be 45 per cent pig iron to 55 per cent scrap, showing that more scrap and less pig iron is being used.—Page 1008.

New record in steel ingot output set in the first quarter. Production was 12,544,156 tons, 1.3 per cent above the previous quarterly record made in 1926. March output of 166,945 tons a day was within less than 1 per cent of the previous monthly record established in March, 1926.—Page 1023.

To protect the buyer as well as the seller, provide performance standards for electrical products, Westinghouse executive urges. Would bring about economy and efficiency in production and would insure the user against unsatisfactory service.—Page 1010.

American blast furnaces produce more iron per man and have lower coke consumption than German furnaces, engineer finds. Here the average daily output per man is 6 tons, and in Germany, 5 tons. Operating costs are relatively higher in Germany.—Page 1011.

Difficulties confront European steel cartel. Germans say Belgium sells for export at any price to obtain full works operation, forcing Germany to quote unprofitable export prices. Formation of selling syndicates to control prices is urged.—Page 1022.

No season-cracking in brass containing 80 per cent copper, declares metallurgist. But brass of 75 per cent copper, he says, will season-crack under atmospheric corrosion, and will also dezincify.—Page 1009.

Human element is accountable for 90 per cent of foundry troubles, says Wilson Foundry executive. Research in foundry materials is valuable, but the human side should not be neglected. He expects much from the technical college graduates now going into foundries.—Page 1027.

First welded railroad bridge is ready to carry traffic. Two main girders are nearly 54 ft. in length and 4 ft. 9¼ in. deep. Welding of the entire construction required 320 man-hours.—Page 1013.

Hand labor gives way to mechanical equipment in new method of making cast iron pipe. Multiple lip ladles, each with 14 spouts, can pour two 6-in. or two 8-in. pipes at the same time. Sand is handled entirely by conveyor equipment.—Page 1002.

Automobile output for first quarter was about 26 per cent above same period in 1927, and prospects for the second quarter are favorable.—Page 1026.

The Proposed Zinc Cartel

IN 1927 there was a major decline in the price for spelter, and during the last nine months it has stood only a little above pre-war average. This has been satisfactory to users of the metal but very disagreeable to producers. The explanation of this condition, as indicated in an IRON AGE editorial of Jan. 26, is a sudden and huge increase in ore supply that began in 1926 as a consequence of the widespread application of the new process of selective flotation. At no time has the statistical position of the metal looked bad; the market has suffered from the incubus of a huge accumulation of ore stock which may be converted into metal.

The producing interests have been so unhappy in their situation that they have been giving much thought to amelioration of it by the regulation of production. In Europe especially has there been much conversation about the organization of a cartel. American participation in this has been desired, for it is the exportation of a relatively small quantity of American spelter that spills the beans in Europe. It has been rather hard to make Europe understand that American zinc production is derived mainly from such a multiplicity of small mines that any concert of action among them would be impossible, and that anyway our laws do not permit concert of action for any effect upon price. There is some doubt also regarding the British attitude. The present outlook is that the Continental producers at a meeting in May will try tentatively to do something alone.

One answer for the present predicament in zinc is *laissez faire*, just as it is for the similar situation in petroleum. In the long run low prices effect their own cure. There is, however, a broader social view in that the resources of mineral substances are by no means endless, and the reckless squandering of them now, with the consequent production of too low a price, may result in an inordinately high price later on. Dr. W. R. Ingalls, who is an authority in the zinc industry, expressed the opinion in an address last January that the present plethora of zinc ore will be but temporary and that the owners of zinc mines who are minded to hold them in reserve will reap larger profits by so doing. The administrations of some of the most important mining enterprises agree with this idea and have adopted such a policy.

This leads right up to the thought that the real trouble with the zinc industry is that it knows too little about itself. If the producers of zinc took the trouble to study their facts, cooperating for that purpose, their own intelligence would tend to restrain them from spendthrift behavior. The situation of copper could quickly be made as bad as that in zinc. Formerly copper producers used to emulate each other in making it so; but they have acquired a better economic perception, based on the ascertainment of facts.

In the course of time the zinc producers of the world will learn the same lesson, but this will require several years even if they begin now. In the meanwhile they want some speedy adjustment. Hence the hopes for a European cartel. Assuming the consummation of such a plan there will probably be no illusions among its participants. Rather there will be a spirit of curiosity to discover how it will work.

If zinc were more largely produced by concerns that smelt their own ore the chance of regulation would be better, but inasmuch as smelters buy the larger part of their ore supply their objective must be to better the price for metal while keeping the ore price low, which is not so easy. This leads back to the idea that the only real solution is to make an increasing proportion of ore producers averse to sacrificing their resources at little or no profit.

DESPITE the fact that pig iron production in the first quarter of 1928 had been exceeded by nine preceding first quarters, steel ingot production in the first quarter was the largest on record. Dependence on scrap in larger and larger proportions has accounted for this change in the ratio between the two great tonnage movements in the industry. It is estimated that open-hearth charges in the first quarter of this year were below

45 per cent in pig iron content, compared with considerably more than 50 per cent in a number of recent years. Study of the factors shows close accord between the price ratio of scrap against pig iron, on the one hand, and the operating ratio involving percentage of pig iron in the charge, on the other. For the most part, these curves (shown in another column) are almost parallel, as traced over a period of some fifteen years.

More Students, Not More Schools

NOT long ago the faculty at Purdue University decided to create a department of metallurgy, sensing a well defined demand for men trained in metallography, heat treatment, and physical metallurgy and believing that no institution in the immediate vicinity of Chicago (from which region the demand appeared to spring) is prepared to educate these specialists. Another piece of news is that one of the older eastern colleges is considering whether a languishing mining department cannot be rejuvenated by grafting on to it a course in metallurgical engineering.

Without doubting that there is a great need for educated men in the metal-working industries, it is very doubtful whether it would be advisable just now to establish more schools to teach metallurgists. Off-hand one would say that there is already a great over-expansion of capacity. Over-expansion in the educational industry is as harmful as over-expansion in any other line of production. Both mean high overhead and far from adequate return on the effort expended.

In order to verify the impression that the available facilities are by no means fully utilized, a personal letter was addressed to 22 men at colleges and universities known to have competent teachers and adequate equipment for the fundamentals of iron and steel metallurgy. Two of them did not answer; four of them replied that all instruction on metals was incidental to other degrees; and 16 of them gave statistics on upper class attendance. In all, these sixteen schools will graduate 81 metallurgical engineers specializing in iron and steel. One hundred and seven juniors are following along. This is just about enough to keep three faculties reasonably busy and happy, let alone sixteen!

These attendance figures would appear to indicate that the number of graduates will grow. It may also be argued that the growth of the American Society for Steel Treating indicates a demand for far more men than these 16 schools are actually preparing. Or, if we concede that there are 5000 engineers in charge of heat treating or other distinctively metallurgical work on the production of alloys and articles manufactured therefrom, it follows that these should be replaced in one generation, or at the rate of 250 per year. Furthermore, several professors say they have places offered for from two to four times as many graduates as are available.

Granted all this, the fact remains that the situation cannot be bettered by a further increase in educational plant when the existing capacity is working at only a 20 per cent rate. If the existing capacity is inadequate or antiquated, it should be scrapped and replaced; but it is safe to say that the new courses proposed will not be better than most of the ones now operating. This does not mean that the present facilities are the pink of perfection, but it is sure that what we now have cannot be improved materially as long as the classes are starved in attendance.

If this situation is to be changed it can be done by State universities campaigning among the high schools, or by manufacturers encouraging bright young men in their employ to take up the new profession in greater numbers. It is one college course where the attendance is not embarrassingly large, and leads to a type of work for which there is and will be for many years a steadily increasing demand. But it would be better to populate the metallurgical courses now existing, than to go about starting others.

Much More Pig Iron to the Stack

NEWS is not uncommon nowadays of particularly large production by individual blast furnaces. Daily outputs now and then run into four figures and a case of this sort, in which the furnace used no scrap but its own, was recorded in last week's IRON AGE, page 965.

A study of averages is prompted. No selection can be made that would cover periods of identical circumstances, but it would appear that in 20 years outputs per stack have fully doubled and in nine years they have increased by one-half. The two periods here taken for comparison with last month are March, 1908, and June, 1919.

There was record high pig iron production in October, 1907, the stock panic month. The following March production was less than half as great. Our report for that month showed a mean of 150½ stacks in blast, with a total daily production of 39,619 tons, or 263 tons per stack. Certainly it must be assumed that furnaces running at such a time were in the main the very best in the country.

After the war there was a great decline in production. In the following June, 1919, with a mean of 187½ furnaces in blast there was total daily production of 70,495 tons, or an average of 357 tons a stack. Again the furnaces in blast must be taken as very largely the pick of the industry.

Last month there was heavy production, but it was not a month of picked furnaces, production being 19 per cent above the low of 1927. There was a mean of 192 stacks in blast, with a total daily production of 103,215 tons, and an average of 538 tons per stack, making 51 per cent gain over June, 1919, and 104 per cent gain over March, 1908; yet with the advantage in favor of the previous periods, for then it was rather only the picked furnaces that were running.

Numerous influences have contributed to these increasing outputs. It is not a matter of iron ore, as the average content of Lake Superior iron ores as shipped has not varied materially. Gradual exhaustion of the richer ores has been met by increased beneficiation of lean ores.

It is substantially a matter of furnace lines and furnace practice. With the Duquesne blast furnaces of over 30 years ago there was ushered in a period of giving furnaces more air; but by 20 years ago that improvement was fairly well in vogue. A surprising increase occurred by widening hearths. The best furnaces themselves are somewhat larger, and with building of new stacks and abandonment of smaller furnaces the average size has increased. All along the line practice has improved. Coke consumption per ton of iron has gone down, but the typical furnace manager makes no special effort to save by-product coke, which on account of gas and by-products does not cost him much.

The plain prospect, therefore, is that the building of blast furnaces in future will be chiefly for replacement of less fit furnaces than by way of addition to the total number.

A Thought for the Ultra-Conservative

YOU have met the "way-back-when" executives —the men who fend off a new proposal by recalling and reminding you of things that happened in years gone by at such-and-such a place, and how the plan can't work because so-and-so then tried it and failed. We have lots of them now. There always have been lots of them.

There was a fair sprinkling of them at a British Iron and Steel Institute meeting in 1878, listening to the dean of British ironmasters read a paper describing large-scale but unsuccessful experiments in eliminating phosphorus from pig iron. Eminent authorities had agreed that phosphorus is almost entirely inert to oxygen at steel making temperatures. A respected Swedish metallurgist and teacher was saying, "It is well known that phosphorus must be removed from iron as a salt of phosphoric acid passing into the cinder and neither the Bessemer nor the refining hearth process admits of this."

Naturally the audience lifted its eyebrows with tolerant amusement, and doubtless the chairman was slightly embarrassed, when a young unknown (who later turned out to be a police clerk) arose in open meeting and remarked that he had been successful in slagging off phosphorus in a Bessemer converter.

The police clerk promptly sent a paper to the institute describing the method, but the then equivalent of the Meetings and Papers Committee contained a majority of "way-back-when" men; for this remarkable contribution was neither read nor discussed, nor published for nearly a year. By that time Sidney Thomas, his cousin Percy Gilchrist, and the friendly steel maker E. Windsor Richards, had worked out most of the problems of a basic refractory lining and the control of the bessemerizing operation. The Germans pounced upon the basic Bessemer as being the very thing for high-phosphorus Lorraine ores, and in 1926 this process (foolish and theoretically impossible in 1878) made about 16,000,000 tons of "Thomas" steel, throwing off as a by-product some 3,000,000 tons of phosphate slag for fertilizer.

Some artist should paint a picture of the Meetings and Papers Committee in 1878 sitting in deliberation upon this paper by Thomas and Gilchrist. It should be reproduced. It would make a wonderful gift for your "way-back-when" friend.

CORRESPONDENCE

"Wanted: Generals for America's Industrial Army"

To the Editor: This caption is quoted for the reason that it concisely puts a vital industrial need. Industrial leaders seem to be in a quandary as to how to create a more intelligent class of men within the ranks. They wonder how and where to get men who will measure up to a higher standard of leadership. All manner of methods are being suggested and many of them are being tried, but the problem is not yet solved.

It seems to me that the whole matter is too vague. Industry is calling for a higher standard of intelligence and leadership, but fails to answer the question, "What is the present standard and how was it established?"

The question might be raised whether industry is not establishing too high a standard—possibly a false standard—and expecting the college graduate to measure up to it. A successful man is prone to forget his earlier contact with industrial affairs and to lose sight of the fact that possibly he showed much less promise than many of the young college men of today whom he chooses to criticize or possibly condemn. This results in the often heard statement that industry needs men of higher intelligence, but that college graduates will not measure up to such requirements. If the young men graduating from our institutions of learning do not measure up to the needs of industry, then through what channel or by what process are we to secure men who can in any manner measure up to the standard being set?

Judging by the general trend of comment, the impression is fixed that industrial training cannot be imparted to the student mind except by industry itself. Without doubt this belief is based on the theory that intelligence follows in the wake of experience. Even in this advanced day, when seeking men for positions of responsibility, the antiquated inquiry is still made, "How much experience has he had in our particular line of work?"

Here is where industry and the college graduate cross swords. It must be granted that the college graduate has shown but little inclination to adapt himself to industrial pursuits or prior to graduation to give serious thought to what may be expected of him in such activities. In fact, it is hard to determine his state of mind, when with diploma in hand he steps out to face the world. It is quite evident, however, that his expectations are at marked variance with the offerings.

It is more than possible that the young graduates are attaching too much importance to the equipment they have acquired in college. Consequently they are not altogether free from blame for the present situation. Possibly they are expecting to be accepted on higher terms than it is possible to offer. This leads some of them to sacrifice their years of study and enter professional athletics; yet it must be admitted that the latter hold out tempting inducements to those especially skilled.

Here is the nut of the situation. Any industry will offer special inducements for special skill. Rightly or wrongly, industry attaches a lot of importance to working up from the ranks, thus acquiring the necessary skill to assume positions of responsibility. "From water boy to president" makes a great slogan; but the college graduate can't subscribe to such a policy, for the reason that he believes that his years of study and his higher mental attainments fit him to assume responsibilities on more favorable terms than are offered.

The college graduate rightly feels that his mental training should allow him to assume responsibilities of a higher order. I recall a man of ability and high intelligence who entered the employ of an industrial corporation when it was suffering from mismanagement. This man brought about economic results beyond expectations. One of the officers of the company in reviewing the accomplishments remarked: "The trouble with our company has been that it never had a practical boss until it got you." This official got the surprise of his life when the "boss" explained that he had never done work of this nature before. Here is a case in which good thinking solved industrial problems where experience failed.

Industry now puts a premium on "practical experience" because industry has been built to its present proportions on a foundation of experience, experience gained through rule of thumb activity, rather than intelligent planning by educated minds. It would appear that if our industrial position is to advance, it must have men who can grasp the details of its operation more quickly and more effectively. Time will not permit a commercial organization to take crude human material and train it to understand and handle a vast amount of detail. College graduates should provide the necessary recruits and doubtless would, if a clearer formulation of the requirements could be made.

James B. Orbison.

Springfield, Ohio.

SCRAP PRICES AVERAGE HIGHER

First Quarter 2 Per Cent Above Last Quarter of 1927 but Recent Trend Downward

AVERAGE prices of heavy melting steel scrap at Chicago, Pittsburgh and Philadelphia have been higher during the first months of 1928 than they were in the last three months of the preceding year. At a $13.69 average for the quarter, however, they were more than $1 below the $14.80 average of the first quarter of 1927. The high point of the recent quarter was reached in February. The March average of $13.65 is just $1 below the corresponding average of one year ago.

COMPOSITE PRICES ON IRON AND STEEL PRODUCTS

	(Per Gross Ton) Steel Scrap	Pig Iron	Finished Steel, Per Lb.
1925 average	*$17.12*	*$20.58*	*2.465c.*
January, 1926	16.97	21.79	2.447c.
February	15.50	21.77	2.428c.
March	15.83	21.65	2.433c.
April	15.27	20.96	2.439c.

March	14.65	19.03	2.367c.
April	14.71	19.21	2.360c.
May	13.95	19.09	2.360c.
June	13.60	18.92	2.369c.
July	13.48	18.56	2.367c.
August	13.80	18.17	2.367c.
September	13.92	18.03	2.357c.
October	13.48	17.96	2.319c.
November	13.18	17.59	2.299c.
December	13.48	17.55	2.310c.
Year's average	*14.00*	*18.55*	*2.357c.*
January, 1928	13.70	17.63	2.318c.
February	13.71	17.73	2.361c.
March	13.65	17.73	2.362c.
Quarter's average	*13.69*	*17.70*	*2.347c.*

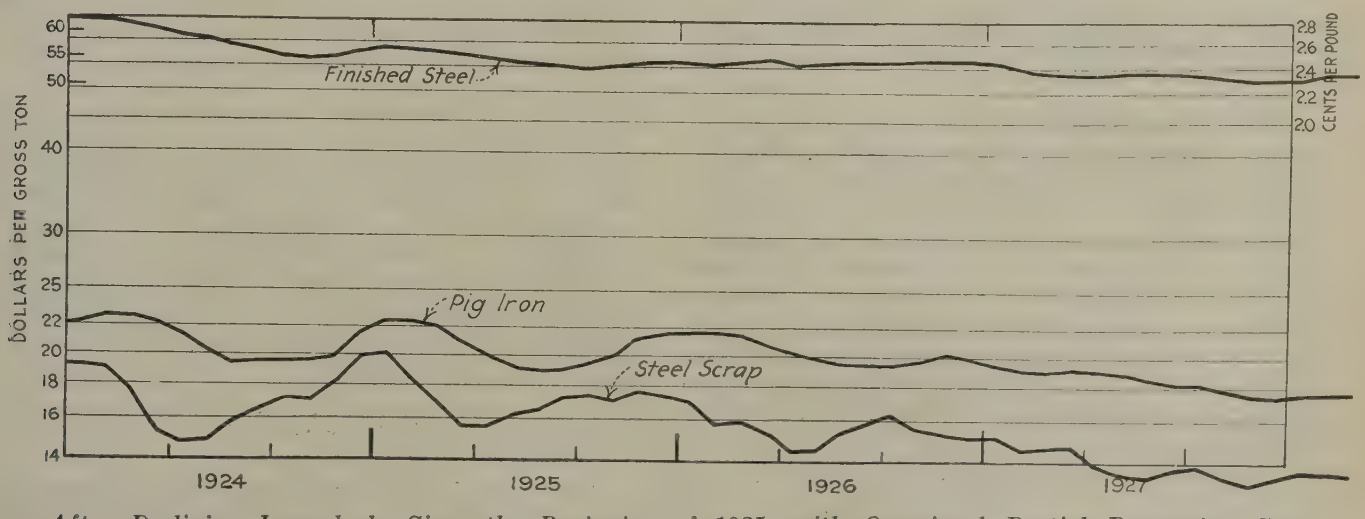
Meantime pig iron has shown a fair recovery from the low levels of November and December, having stood at a monthly average of $17.73 in both February and March, or 1 per cent above the December figure. For the quarter the average was $17.70 against $19.18 for the first quarter of 1927.

Finished steel has been subject to slight fluctuations only, since early 1927. For the recent quarter it has shown a distinct advance above the last quarter of the preceding year, however, having averaged 2.347c. a lb., against 2.309c. a lb. The recent figure is well below the average for the first quarter of 1927, which stood at 2.392c. a lb. February and March showed a good recovery from the low figure of November, as indicated in the table.

Comparative figures for a considerable number of months, covering steel scrap, pig iron and finished steel, are given in the table. The diagram carries the story of these changing prices over a period of more than four years.

Edgar Thomson Works Sets New Plant Records in Steel Production

Sixty-three daily, weekly and monthly plant production records were established during March by the Edgar Thomson Works, Carnegie Steel Co., Braddock, Pa. Production of 132,894 gross tons of pig iron from seven blast furnaces bettered by almost 3000 tons the best previous seven-stack output of 129,943 tons made in May, 1927. From 16 open-hearth furnaces there was tapped last month 98,146 tons of steel, which compares with a previous record of 87,160 tons in October, 1920, from 14 furnaces. The blooming mill in March rolled 101,357 tons, comparing with a previous high mark of 95,414 tons in October, 1916, while the four rolling mills, Nos. 1 and 4 on sheet bars, and Nos. 2 and 3 on rails, turned out 98,004 tons against 91,114 tons in October, 1916, the previous record production for one month.



After Declining Irregularly Since the Beginning of 1925, *with Occasional Partial Recoveries, Scrap Prices Have Lately Been Slightly Higher. Pig iron and finished steel have fallen during the same period, but much less abruptly*

Iron and Steel Markets

Output Holds After Record Quarter

Mill Operations Continue at High Rate—Advance in Pipe Drives in Tonnage—Automobile Body Sheets Decline—Melting Scrap Price at Pittsburgh Up 50c.

FOLLOWING a record output in the first quarter, steel mills are maintaining operations at the high rate reached in March. Heavy specifications late last month, particularly in plates, shapes and bars, assure a good mill engagement through April. Meanwhile, with little buying of heavier rolled products at second quarter prices and no unusual pressure to sell, price tests are still deferred.

Such changes in steel prices as have occurred have been discordant. Weakness in lighter products, notably sheets, is balanced by greater strength in steel pipe. The advance of a week ago in pipe drove in a large tonnage at the previous prices, since jobbers were given a week in which to cover 30 to 60 days' requirements.

Unsettlement in the sheet market was brought about by a reduction of $3 a ton on automobile body sheets, bringing prices down to 4c. per lb., Pittsburgh, or the same level at which buyers bought for the first quarter. Weakness has extended to other finishes, particularly black sheets, which are now rather generally available at 2.80c., Pittsburgh, or $2 a ton below the last advance. Consumers expect the decline in automobile body sheets to result in a similar revision of quotations on strip steel fender stock, since prices of the two products usually move together.

Prices of primary materials remain substantially unchanged except on scrap. Heavy melting steel at Pittsburgh has advanced for the second time in three weeks and is now 75c. a ton above its low point in the first quarter. Melting scrap has also gone up 50c. at Cincinnati, but has declined 25c. at St. Louis.

A decline of 62,983 tons in March reduced the unfilled orders of the Steel Corporation to 4,335,206 tons, which, however, is much larger than the total of 3,553,140 tons, as of March 31, 1927. The reduction last month was surprisingly small in view of the high rate of production. Estimated ingot output for the entire industry in March, at 4,507,520 tons, was the second highest monthly production, falling short of the record made in March, 1927, by only 28,000 tons. Output for the first three months of this year was a quarterly record, surpassing the previous high mark, that of the first quarter of 1926, by 260,000 tons.

Steel production so far in April has held its own. Sheet mill operations, at 80 to 85 per cent of capacity, are about five points lower than in the last half of March. On the other hand, the week has seen the blowing in of two more steel works blast furnaces, one at Johnstown, Pa., and the other at Haselton, Ohio.

Unfilled orders are probably undergoing further reduction this month, since mills are so largely engaged in rolling steel specified at lower than current prices and most buyers are not yet ready to add to their commitments.

The automobile industry is taking more steel than in March, and it is predicted that the seasonal slowing down in motor car manufacture will come at least a month later than last year.

Railroad buying is again of sizable proportions. Of 17,000 tons of rails bought at Chicago, 13,800 represented a supplementary purchase by the Burlington. Bridge work awarded by the Chicago & North Western calls for 6000 tons of structural steel, and fully 50,000 tons of plates, shapes and bars will be rolled for 4450 freight cars placed by the Chicago, Milwaukee, St. Paul & Pacific.

Structural steel inquiries totaling 37,000 tons include 17,000 tons for an office building in New York. Contracts awarded require 32,000 tons of steel, the largest, 8000 tons, for a bridge over the Delaware River. Among reinforcing steel projects pending is sewer work at Stickney, Ill., requiring 5000 tons.

Tin plate prices for the second half will soon receive more active consideration, since in another week specifications against June quotas are due, winding up contract business for the first six months of the year. It is commonly expected that quotations will remain unchanged.

With the opening of navigation on the Great Lakes and on the New York State barge canal, increased water shipments of pig iron are being planned. At Milwaukee, 6000 tons has been sold for shipment by boat from Lake Erie furnaces. New England consumers will benefit by reduced rail-and-water rates from Buffalo, and at some points even the Everett, Mass., furnace will be somewhat at a disadvantage, considering the lower f.o.b. quotations at Buffalo.

Domestic gravel fluorspar has been advanced $1 a ton to $16 at mines.

THE IRON AGE composite price for finished steel has advanced to 2.362c. per lb. from 2.357c. The composite price for pig iron remains for the third week at $17.67 a gross ton.

*The average switching charge for delivery to foundries in the Chicago district is 61c. per ton.

On export business there are frequent variations from the above prices. Also, in domestic business, there is at times a range of prices on various products, as shown in our market reports on other pages.

Pittsburgh

Uncertainty Over Prices Clouds Otherwise Good Steel Situation—Sheets Weaken

PITTSBURGH, April 10.—The March rate of steel production is maintained, and in most finished products the tabulation discloses such free ordering against expiring first quarter contracts toward the close of last month that manufacturers are confident that this month will show little or no falling off in steel ingot output.

There is, however, fresh uncertainty about prices. This is because of the fact that producers have weakened again on automobile body sheets, which, having stood at 4.15c., base, for several weeks, are no longer quotable at more than 4c. on actual business. This break of $3 a ton, which appears to have developed not from pressure on the part of consumers, but from a desire for business by a few small producers, has not only shaken the sheet market, but the generally more confident feeling in all lines that began to be apparent a week or 10 days ago. If the automotive industry were less exacting as to quality, the large demands upon producers from that quarter might be some excuse for price concessions, but the common report is that motor car builders, while not now exerting pressure against prices, are unrelenting in rejections on the score of what steel manufacturers regard as slight imperfections.

Shipments of finished steel products are heavy, but as there has been a noticeable falling off in new business, there is no doubt that order books are being reduced. The principal outlet still is the automobile industry, with building and construction and agricultural implement manufacturers following in line. Tin plate continues to give a good account of itself, and the advance in merchant pipe appears to have stimulated business in that product. But the oil industry still is buying little, and the lack of railroad rolling stock business still is commented upon. Nails are making the poorest showing among wire products because of the heavy deliveries early in the year against low-priced orders taken in December.

Among the primary materials, interest centers in the steel works grades of scrap, which have advanced another 50c. a ton, and heavy melting steel now is 75c. a ton above its price of a month ago. This advance is not due so much to fresh consumer buying as to the insistence on deliveries against old orders in keeping with the high rate of steel production. Dealers, in trying to cover, have not only found supplies scant, but have been alarmed by the fact that the April scrap list of the Baltimore & Ohio Railroad went to a steel company not regularly a scrap buyer on a direct bid. Higher prices may be seen, but the more common belief is that the upswing is merely a flurry to be halted by lessened steel works' requirements with the approach of summer. Pig iron shows neither life nor strength and the same statement applies to coal and coke.

Pig Iron.—Additional purchases of pig iron by the company reported last week to have bought 5000 tons of No. 3 foundry have swelled its takings to 20,000 tons, about half of which was Bessemer iron. This grade sold at $17.50, Valley furnace, the price which has ruled for some time on smaller lots. At least 1000 tons more of this grade has been sold at the full price. The No. 3 foundry appears to have been sold at somewhat above the regular price of that grade. Nothing more than the usual carload lot business has been done in other grades of foundry or in malleable iron. Basic iron also has been inactive. Valley furnaces still are quoting basic at $17, but as there have been no sales, that quotation is merely nominal and is admittedly impossible to obtain in the Pittsburgh district. While local steel companies appear sold up or have no iron for sale, there are offerings by middlemen of Pittsburgh district steel company basic at delivered prices which are equivalent to about $16 at Valley furnaces. The Republic Iron & Steel Co. has put on its one idle Haselton blast furnace, and Bethlehem Steel Co. has added a furnace at its Cambria Works, Johnstown, Pa., making seven of the 10 furnaces at the latter plant active.

Prices per gross ton, f.o.b. Valley furnace:

Basic	$17.00
Bessemer	17.50
Gray forge	16.75
No. 2 foundry	17.25
No. 3 foundry	16.75
Malleable	17.25
Low phosphorus, copper free	27.00

Freight rate to the Pittsburgh or Cleveland district, $1.76.

Ferroalloys.—Steel works operations are holding well up to the March rate, and in consequence there is a sustained rate of specifications against contract tonnage of the commonly used ferroalloys. New business does not amount to much. Prices are unchanged.

Semi-Finished Steel.—There is a fairly good movement of billets, slabs and sheet bars, but it is largely on arrangements which have long been in force between producers and non-integrated manufacturers. Open market activity is limited. Some users of wire rods who failed to get in specifications against first quarter contracts before they expired have been obliged to pay the present price, but not much tonnage is involved.

Fluorspar.—One of the larger domestic producers has announced a price of $16 per net ton, f.o.b. mines, for gravel spar analyzing 85 per cent calcium fluoride and not over 5 per cent silica, effective April 9. About a week ago, several producers announced a withdrawal of prices of less than $15, and the advance by one producer, which will probably be followed by others, is not altogether an unexpected development. Most producers still have contracts taken at $14 to $14.50 to complete.

Bars, Plates and Shapes.—Heavy specifications in the last week of March against first quarter contracts appear to have supplied much of this month's requirements of these products, and in the past week new business has been rather light. The mills are well supplied with orders against which they can ship and also have written a good deal of second quarter contract business. There is no pressure to sell and no pressure on the part of buyers against prices; consequently, there is no talk of prices lower than 1.85c., base Pittsburgh, except in reference to current deliveries on late first quarter contract specifications.

Rails and Track Supplies.—The railroads are taking out rails and track supplies in good volume against old orders, and in the latter item seem more disposed to carry moderate stocks instead of ordering in strict accord with track-laying programs. Light-section rails still are very dull.

Wire Products.—Makers have been fairly successful in getting second quarter contracts signed at the full quotations, but specifications against them are light and will probably remain so during this month because of the fact that buyers took full advantage of the opportunity to specify late last month on first quarter commitments carrying lower prices. The market does not appear as well established as to prices on nails as on the other products, in spite of the fact that many jobbers have signed second quarter contracts at $2.65 per keg, base Pittsburgh. The heavy shipments of the first two months of the year have left jobbers with big stocks and in reducing them they are setting up considerable competition for the mills, some of which are adding to preferential customer lists in getting new business.

Tubular Goods.—The recent revision in prices of standard-weight and line pipe has had the effect of materially stimulating the demand. Jobbers were given one week in which to specify 30 or 60 days' requirements at the old prices. Reports about business in standard-weight pipe are much more cheerful than recently. There is a very fair business in line pipe in small lots, but the larger tonnage projects do not appear to be moving with much speed toward the mills. The new quotation on line pipe to jobbers is card less one point and three fives on sizes larger than 3½-in. outside diameter. On 3½-in. and smaller, the standard-weight pipe list applies with one point less discount on line couplings. On seamless oil well casing, the former discount of 20 per cent to jobbers has been revised to 10, 5 and 5 per cent. Demand for oil country goods still is slow, but in spite of the fact there is some talk of an upward revision of prices.

Sheets.—Prices have become somewhat unsettled as a result of the weakness that has developed in the Detroit district in automobile body sheets. One maker is reported to have made a quotation of 4c., base, on body sheets, a cut of $3 a ton, and it was necessary for others to follow to hold their accounts. The market on the common finishes is threatened by this development, as it rarely happens that black sheets can hold up in the face of weakness in the full finished stock, and galvanized sheets have been weak for some time, chiefly because jobbers were so heavily stocked with them at prices that permit a profitable resale at less than 3.75c. While sheet business has been good over the past week —and no small part of it outside of the body sheets has been at full prices—demand is not strong enough to sustain the recent rate of mill engagement and operations of between 80 and 85 per cent of capacity are about five points lower than in the last half of March.

Tin Plate.—Makers still report cheerfully about business and mill operations. In another week, specifications against June quotas are due, winding up first half contract business and bringing into the foreground probable prices on last half contracts. The common impression now is that there will be no change in prices. While makers have held that the first half price reduced

Long Ternes

No. 24, 8-lb. coating, f.o.b. mill primes	4.10c.

Tin Plate

	Per Base Box
Standard cokes, f.o.b. P'gh district mills	$5.25
Standard cokes, f.o.b. Gary	5.35

Terne Plate

(*F.o.b. Morgantown or Pittsburgh*)

(Per package, 20 x 28 in.)

8-lb. coating I.C.	$11.20	25-lb. coating I.C.	$16.70
15-lb. coating I.C.	14.00	30-lb. coating I.C.	17.75
20-lb. coating I.C.	15.30	40-lb. coating I.C.	19.85

Alloy Steel Bars

(F.o.b. maker's mill.)

S.A.E. Series Numbers		*Per* 100 *Lb.*
2000	(½% Nickel)	$2.90
2100	(1½% Nickel)	3.20
2300	(3½% Nickel)	4.15
2500	(5% Nickel)	4.90
3100	Nickel Chromium	3.20
3200	Nickel Chromium	3.65
3300	Nickel Chromium	6.45
3400	Nickel Chromium	5.85
4100	Chromium Molybdenum (0.15 to 0.25 Molybdenum)	3.15
4100	Chromium Molybdenum (0.25 to 0.40 Molybdenum)	3.35
4600	Nickel Molybdenum (0.20 to 0.30 Molybdenum, 1.25 to 1.75 Nickel)	3.70
5100	Chromium Steel (0.60 to 0.90 Chrome)	3.00
5100	Chromium Steel (0.80 to 1.10 Chrome)	3.10
5100	Chromium Spring Steel	2.85
6100	Chromium Vanadium Bars	3.85
6100	Chromium Vanadium Spring Steel	3.60
9250	Silicon Manganese Spring Steel	2.90
Chrome Nickel Vanadium		4.15
Carbon Vanadium		3.60

Above prices are for hot-rolled steel bars, forging quality. The ordinary differential for cold-drawn bars is 1c. per lb. higher. For billets 4 x 4 to 10 x 10 in., the price for a gross ton is the net price for bars of the same analysis. For billets under 4 x 4 in. down to and including 2½ in. squares, the price is $5 a gross ton above the 4 x 4 billet price.

Slabs with sectional area of 16 in. or over carry the billet price; slabs with sectional area of 12 in. to 16 in. carry a $5 extra above the billet price and slabs with a sectional area under 12 in. carry the bar price.

Band sizes are 40c. per 100 lb. higher.

Rails

	Per Gross Ton
Standard, f.o.b. mill	$43.00
Light (from billets), f.o.b. mill	36.00
Light (from rail steel), f.o.b. mill	34.00
Light (from billets), f.o.b. Ch'go mill	36.00

Track Equipment

	Base Per 100 *Lb.*
Spikes, $\frac{9}{16}$ in. and larger	$2.80
Spikes, ½ in. and smaller	2.80
Spikes, boat and barge	3.00
Tie plates, steel	2.15
Angle bars	2.75
Track bolts, to steam railroads	$3.80 to 4.90
Track bolts, to jobbers, all sizes, per 100 count	70 per cent off list

Welded Pipe

Base Discounts, f.o.b. Pittsburgh District and Lorain, Ohio, Mills

Butt Weld

Steel			*Iron*		
Inches	Black	Galv.	Inches	Black	Galv.

3 in.	51	4½, 5 and 6 in.	51

Less carloads, 4 points less. Add $8 per net ton for more than four gages heavier than standard. No extra for lengths up to and including 24 ft. Sizes smaller than 1 in. and lighter than standard gage to be held at mechanical tubes list and discount. Intermediate sizes and gages not listed take price of next larger outside diameter and heavier gage.

Seamless Mechanical Tubing

	Per Cent Off List
Carbon, 0.10% to 0.30%, base	55
Carbon, 0.30% to 0.40%, base	50

Plus differentials for lengths over 18 ft. and for commercial exact lengths. Warehouse discounts on small lots are less than the above.

the margin of profit, it is believed this opinion was predicated on pig tin at a higher price than has prevailed. A remarkable feature of the present situation is the smallness of stock lists. Tin plate manufacturers have operated their mills with an eye to keeping production close to readily marketable stock.

Cold-Finished Steel Bars and Shafting.—Parts makers serving builders of the medium-priced motor cars are not ordering as freely as they did recently, but those which supply low-priced car builders are taking shipments freely and the total movement compares favorably with that of last month. Prices are steady at 2.20c., base Pittsburgh or Chicago.

Hot-Rolled Flats.—Strictly new business is light in comparison with that of the two previous weeks, but this reflects no contraction in consumption, but is due rather to the heavy releases on first quarter contracts, shipments against which are amply meeting consumers' needs. Makers were obliged to concede something on prices to large consumers in getting second quarter contracts, but on smaller business the full quotations appear to have prevailed.

Cold-Rolled Strips.—Important consumers still are meeting their requirements from shipments on first quarter contracts and new business is moderate. Prices are still irregular, but extensions or additions to first quarter contracts permitted by manufacturers cause some doubt as to the attainment of the prices announced Jan. 25, last. The drop in automobile body sheets will probably mean a revision of strip steel fender stock, since the two grades usually move together in price.

Bolts, Nuts and Rivets.—Buyers seem to have generally covered their needs for this month in late specifications against first quarter contracts and business so far this month has been rather light. Prices are well maintained.

Coke and Coal.—The market still is extremely dull. Little demand exists for spot furnace coke even for other than blast furnace use and producers who run production a little ahead of their orders find that the surplus is hard to move even at $2.65 per net ton at ovens. There is plenty of spot foundry coke. There is no Lake business to take the place of lighter demands for household coal, and the market is dull and weak. Since not much lump coal is being shipped, the production of slack grade is light and prices are somewhat higher on that grade.

Old Material.—This market has advanced again on the open-hearth grades, with heavy melting steel now quotable at $15.50 to $16, and compressed sheets not obtainable in quantity at under $15.50. The explanation is partly found in a scramble by dealers to cover short sales, induced by insistence of melters for shipments, and the fact that when these demands developed there were few dealers who had any large amounts of scrap in their yards. A contributory factor in the advance is that a steel company which has long been out of the commercial scrap market secured most of the scrap in the April list of the Baltimore & Ohio Railroad on a direct bid, paying $15.50, delivered. Assuming that this may be a permanent policy of the company which bought, dealers have scurried to cover and have paid as much as $15.25 for heavy melting steel for delivery on orders taken at $14.75 and even $15.50 for ordinary heavy melting steel. The heavy steel scrap in the Pennsylvania Railroad April list sold within a few cents of $16 per gross ton, delivered to two points in this district, with a little going to the Youngstown district. There is not much activity in other directions, but sentimentally the market is strengthened by firmness in the open-hearth grades.

Prices per gross ton delivered consumers' yards in Pittsburgh and points taking the Pittsburgh district freight rate:

Basic Open-Hearth Furnace Grades:	
Heavy melting steel	$15.50 to $16.00
Scrap rails	15.00 to 15.50
Compressed sheet steel	15.00 to 15.50
Bundled sheets, sides and ends	14.00 to 14.50
Cast iron carwheels	14.50 to 15.00
Sheet bar crops, ordinary	15.50 to 16.00
Heavy breakable cast	13.00 to 13.50
No. 2 railroad wrought	15.50 to 16.00
Heavy steel axle turnings	13.00 to 13.50
Machine shop turnings	10.50
Acid Open-Hearth Furnace Grades:	
Railroad knuckles and couplers	16.50 to 17.00
Railroad coil and leaf springs	16.50 to 17.00
Rolled steel wheels	16.50 to 17.00
Low phosphorus billet and bloom ends	18.50 to 19.00
Low phosphorus, mill plate	17.50 to 18.00
Low phosphorus, light grade	16.50 to 17.00
Low phosphorus sheet bar crops	17.50 to 18.00
Heavy steel axle turnings	13.00 to 13.50
Electric Furnace Grades:	
Low phosphorus punchings	16.50 to 17.00
Heavy steel axle turnings	13.00 to 13.50
Blast Furnace Grades:	
Short shoveling steel turnings	11.00 to 11.25
Short mixed borings and turnings	11.00 to 11.25
Cast iron borings	11.00 to 11.25
No. 2 busheling	10.50 to 11.00
Rolling Mill Grades:	
Steel car axles	18.00 to 19.00
No. 1 railroad wrought	11.00 to 11.50
Sheet bar crops	17.00 to 17.50
Cupola Grades:	
No. 1 cast	14.50 to 15.00
Rails 3 ft. and under	15.50 to 16.00
Malleable Grades:	
Railroad	15.50 to 16.00
Industrial	15.00 to 15.50
Agricultural	14.50 to 15.00

Common wire nails, per keg	3.00
Cement coated nails, per keg	3.05

Government Appeals Decision on Reinforcing Bar Duty

An appeal has been filed by the Government from the decision of Justice I. F. Fischer of the United States Customs Court, Second Division, that reinforcing bars are dutiable as construction material under paragraph 312 instead of as steel bars under paragraph 304 of the tariff act. As a result of Justice Fischer's decision, the duty on reinforcing bars would be reduced from 0.30c. per lb. to 0.20c. per lb.

Following the decision early in February, the Government had 60 days in which to file an appeal, but did not act until March 31. As 60 days more must elapse before action may be taken before the Customs Court of Appeals in Washington, final decision is not possible until after June 1. The Customs Court of Appeals generally adjourns about the middle of June so that unless action is taken soon after the expiration of the 60-day time limit, the case may carry over to next fall.

Newton Steel Co. Refunding Will Provide $1,000,000 for Improvements

Stockholders of the Newton Steel Co. have approved new financing, authorizing $4,000,000 6 per cent preferred stock to replace present 7 per cent preferred, which will be called at $110. Of the new authorization 22,500 shares of $100 par value stock will be issued at this time. After retiring the outstanding preferred, about $1,000,000 will be available for plant improvements.

Semi-Finished Steel, Raw Materials, Bolts and Rivets

Mill Prices of Semi-Finished Steel

Milled studs	70 and 5

Chicago

Steel Specifications Third Largest for Any Week This Year

CHICAGO, April 10.—Ingot output in this district in the first quarter was larger by a fair margin than in the corresponding period a year ago. The total for the month just closed, however, did not quite equal the record made in March, 1927.

The character of this market has not changed in the week unless it is a trifle stronger. Orders now on mill books, plus the tonnage which producers feel will come to them in the next two months, lead to the belief throughout the trade that a substantial volume of business is assured in the second quarter. Specifications for finished steel are the third largest for any week so far this year and they stand second to the best week of last year. Sales, not counting rails and track accessories, bulk large and are in excess of shipments. Long range buying is almost wholly absent, and this fact readily leads to the general belief that current orders are non-speculative and are for actual consumption. Steel mill backlogs average well up to the six weeks' mark, and deliveries on finished steel products range from four to six weeks.

Notwithstanding the favorable condition of order books, prices on bars, shapes and plates still show some variation, usually about $1 a ton. Some sellers, feeling that they must compete against shipments being made against old contracts taken at prices below 2c., are willing to take attractive business at 1.95c.

Pig Iron.—Shipments of Northern foundry iron continue to creep up, and the average so far in April shows a material improvement over that of March. New sales are large when consideration is given to the uniformity of purchases over the last four or five weeks. A large portion of this business is spot iron or tonnages that are needed to fill out the second quarter. Third quarter inquiry and sales are gaining in importance. It is reported that a mixed cargo of pig iron and finished steel left Buffalo by water for Chicago April 4. It is considered highly probable by many that shipments from Cleveland to Chicago soon will be made. Orders for iron to come by boat to Milwaukee are said to aggregate not less than 6000 tons. Two cargo vessels have already come to Milwaukee and Chicago from Detroit, showing that passage ways between the Lakes are now cleared of ice.

Prices per gross ton at Chicago:

Northern No. 2 foundry, sil. 1.75 to 2.25	$18.50
N'th'n No. 1 fdy., sil. 2.25 to 2.75	19.00
Malleable, not over 2.25 sil.	18.50
High phosphorus	18.50
Lake Superior charcoal, averaging sil. 1.50	27.04
Southern No. 2 fdy. (all rail)	22.01
Southern No. 2 (barge and rail)	21.18
Low phos., sil. 1 to 2 per cent, copper free	$28.50 to 29.00
Silvery, sil. 8 per cent	29.79
Bessemer ferrosilicon, 14 to 15 per cent	46.79

Prices are delivered consumers' yards except on Northern foundry, high phosphorus and malleable, which are f.o.b. local furnace, not including an average switching charge of 61c. per gross ton.

Ferroalloys.—This market is quiet in new sales, but specifications are heavy. Prices are steady.

Prices delivered Chicago: 80 per cent ferromanganese, $107.56; 50 per cent ferrosilicon, $83.50 to $87.50; spiegeleisen, 19 to 21 per cent, $38.76 to $39.76.

Fluorspar.—Sales of this commodity are small, and prices are well established at $15, f.o.b. Illinois mines, for the 85 per cent grade. Shipping orders against recent contracts are of good size.

Bolts, Nuts and Rivets.—Specifications for these commodities are a trifle heavier. Automobile plants and manufacturers of farm machinery are the largest users. The railroads are taking normal quantities for this time of the year. Output for the industry as a whole is estimated at a shade under 70 per cent of capacity.

Coke.—Shipments of by-product foundry coke are large, being a shade heavier than in the closing week of March. Prices are firm at $9, f.o.b. local ovens, and $9.50, delivered in the Chicago switching district.

Plates.—Over 50,000 tons of plates, shapes and bars will be required for the 4450 freight cars ordered this week by the Chicago, Milwaukee, St. Paul & Pacific from eight Western car shops. This business wipes out the last of the large inquiries that have been before the trade this year. There is still talk that the Illinois Central and the Rock Island will come into the market for freight car equipment, but there is no assurance that they will do so before the early summer months. Car builders are losing interest in the 500 cars, on which prices were asked some weeks ago by the Chicago & Eastern Illinois, as it is generally believed that these cars will be built in the railroad's own shops. Two oil producers in the Southwest have ordered a total of 3200 tons of plates. Fresh inquiry from this source is for 500 tons, bringing the total of unclosed business in tankage materials to 4500 tons. Recent car orders and requirements of local fabricators are adding sizable tonnages to local mill books, and deliveries now range from four to six weeks. Prices are steady at 2c., Chicago, though some sellers, in meeting competitors who are still delivering steel against contracts at 1.90c., are shading the local market at least $1 a ton. This concession is usually made on attractive tonnages when prompt delivery is not insisted upon.

Mill prices on plates per lb.: 2.00c., base Chicago.

Structural Awards.—Notwithstanding that awards are normal for this time of the year and that shops are in a fair position in the matter of backlogs, there is still a scramble to take small fill-in orders, and the result is that such business is now bringing no better prices than fabricators have recently obtained on tonnages running well above 1000 tons each. Of special note this week is the award by the Chicago & North Western of 6000 tons of bridge work, of which 5400 tons went to the American Bridge Co. and 600 tons to the Clinton Bridge Works, Clinton, Iowa. Steel for the first 14 stories of the Palmolive-Peet Co. Building, Chicago, has been definitely awarded to the American Bridge Co. This was previously reported as having been taken by an unnamed bidder. The American Bridge Co. has also taken 1100 tons for the Chicago Motor Club Building. New projects include 3000 tons for a 24-story apartment building and 1000 tons for an office building at La Salle and Lake Streets, Chicago. New orders for structural material are in excess of shipments and deliveries have been pushed ahead to an average of five weeks.

Mill prices on plain material per lb.: 2.00c., base, Chicago

Bars.—A gage of activity among local manufacturers is clearly given by the current demand for soft steel bars. For the third week sales have topped shipments and specifications have come in at such a rate that deliveries have been extended a week. Forgers, whose business is largely tied in with the automobile trade, are unusually busy, but they are cautious in placing orders for only such quantities of steel as will cover their actual scheduled requirements. There is no indication of a change in the rate of demand by farm implement manufacturers, and automobile builders continue to operate at a pace that in many instances is ahead of a year ago. Because of longer deliveries on steel products and the outlook in the automotive field, parts makers are scheduling their May and early June steel requirements. This market is quotable at 2c., Chicago, though irregularities to the extent of $1 a ton are reported. Iron bar prices are steady at 2c. New business in iron bars is light, but specifications against old business are of fair size. New buying in alloy steel bars is more active and makers now have the heaviest orders since the first of the year. Specifications are large, affording production at full capacity of local mills. New orders for rail steel bars are at close range. Specifications continue to run ahead of shipments, but the margin is small and deliveries are satisfactory, the range being 10 days to two weeks. Barn equipment manufacturers remain busy, but the bed industry is settling to a slower pace. Prices of rail steel are steady at 1.85c., Chicago district mills.

Mill prices per lb.: Soft steel bars, 2.00c. base, Chicago; common bar iron, 2.00c., base, Chicago; rail steel bars, 1.80c. to 1.85c., base, Chicago Heights mill.

Wire Products.—Recession in orders noted a week ago has been checked and shipments from local wire mills represent about 72 per cent of capacity. Heavy rains in rural districts are putting roads in bad condition and thus are slowing distribution. A bright spot appears in the market, however, by a sharp upturn in demand from the Northwest, where the spring trade is now swinging into a better stride. There is also a better tone to the nail market. Over-expanded stocks in the hands of jobbers appear now to have been reduced to the point where new orders are being sent to mills. It is conceded by the trade that the peak of the spring demand is passed. Specifications for wire from the manufacturing trade are heavy. Prices for wire and wire products are given on page 1039.

Rails and Track Supplies.—New orders for standard-section rails total 17,000 tons. The bulk of this tonnage, or 13,800 tons, represents the secondary requirements of the Burlington, which awarded 7500 tons to the Illinois Steel Co., 3800 tons to the Inland Steel Co. and 2500 tons to the Colorado Fuel & Iron Co. Miscellaneous track accessory business totals 4000 tons, while inquiry now before the trade is for not less than 15,000 tons. Although local mills are heavily engaged, shipping schedules are well arranged and there is little or no complaint as to deliveries.

Prices f.o.b. mill, per gross ton: Standard-section open-hearth and Bessemer rails, $43; light rails, rolled from billets, $36. *Per lb.:* Standard railroad spikes, 2.80c.; track bolts with square nuts, 3.80c.; steel tie plates, 2.25c.; angle bars, 2.75c.

Sheets.—This market is very quiet except in blue annealed sheets in the heavier gages. Demand for black and galvanized sheets is slack, and the none too heavy backlogs of local mills are rapidly being cut down. Prices in and close to Chicago are holding, but in outlying districts and in the Southwest concessions are being offered freely. Backlogs of blue annealed sheets average four weeks rolling, while in black and galvanized the average is less than two weeks.

Base prices per lb., delivered from mill in Chicago: No. 24 black, 3.05c.; No. 24 galvanized, 3.90c.; No. 10 blue annealed, 2.25c. to 2.35c. Delivered prices at other Western points are equal to the freight from Gary plus the mill prices, which are 5c. per 100 lb. lower than the Chicago delivered prices.

Sheet Bars and Billets.—Prices are steady. New business is fully equal to shipments.

Hot-Rolled Strip.—Local mills are operating at capacity. New business is being taken at the full schedule.

Cast Iron Pipe.—Although this market is only moderately active, such business as has been taken clearly indicates that prices are strengthening. James B. Clow & Sons have taken 450 tons of 4 to 10-in. pipe for Oshkosh, Wis., at $29, Birmingham. Miscellaneous orders for carloads are being taken at $31. The only fresh inquiry of note comes from Oak Park, Ill., for 330 tons of 6 to 12-in. class B pipe. Public utilities have ordered a few scattered lots and several Western railroads are inquiring for carloads. Sellers have booked a fair tonnage from contractors. Several public projects are in the making.

Prices per net ton, delivered Chicago: Water pipe, 6-in. and over, $36.20 to $39.20; 4-in., $40.20 to $43.20; Class A and gas pipe, $4 extra.

Warehouse Prices, f.o.b. Chicago

	Base per Lb.
Plates and structural shapes	3.10c.
Soft steel bars	3.00c.
Reinforcing bars, billet steel	2.20c. to 2.55c.
Cold-finished steel bars and shafting—	
Rounds and hexagons	3.60c.
Flats and squares	4.10c.
Bands	3.65c.
Hoops	4.15c.
Black sheets (No. 24)	3.95c.
Galvanized sheets (No. 24)	4.80c.
Blue annealed sheets (No. 10)	3.50c.
Spikes, standard railroad	3.55c.
Track bolts	4.55c.
Rivets, structural	3.60c.
Rivets, boiler	3.60c.
	Per Cent Off List
Machine bolts	60
Carriage bolts	60
Coach or lag screws	60
Hot-pressed nuts, squares, tapped or blank	60
Hot-pressed nuts, hexagons, tapped or blank	60
No. 8 black annealed wire, per 100 lb.	$3.20
Common wire nails, base per keg	3.00
Cement coated nails, base per keg	2.90

Reinforcing Bars.—Fresh inquiry in this market bulks large, and includes 5000 tons of bars needed for a sewage project at Stickney, Ill., a suburb of Chicago. The Central Engineering Co. has ordered 400 tons of rail steel bars for Illinois State road work. Sellers of this commodity have submitted figures on 4000 tons of road work, of which fully 2000 tons may be closed in the coming week. Ground has been broken for the Edgewater Athletic Club, this being an old project which will take close to 1200 tons of bars. New estimates now being made on the Chicago *Daily News* Building may cut the reinforcing bar requirements to slightly less than 1000 tons. Prices for bars made of billet stock are irregular. Hard steel bars are strong at 1.85c., Chicago Heights mills. New awards and fresh inquiry are shown on page 1055.

Old Material.—The Chicago scrap market is lacking in interest. Brokers are busy filling old contracts and the larger consumers, having made heavy purchases, are now content to stay out of the market and let recent purchases care for immediate needs. A melter has bought 1000 tons of cast iron borings at $10 a gross ton, delivered, 25c. above recent quotations. Dealers are offering $9.75 for this grade. Early in the week forged wheels were sold to a user at $15.50 a gross ton, delivered, an advance of 50c. a ton. By the end of the week, however, prices had settled back to $15. The movement of scrap is heavy and railroad shipments are prompt. Country scrap is coming in at a more rapid rate and manufacturers scrap is being offered in large quantities.

Prices delivered consumers' yards, Chicago:

Per Gross Ton	
Basic Open-Hearth Grades:	
Heavy melting steel	$12.50 to $13.00
Shoveling steel	12.50 to 13.00
Frogs, switches and guards, cut apart, and miscellaneous rails	13.00 to 13.50
Hydraulic compressed sheets	11.00 to 11.50
Drop forge flashings	9.50 to 10.00
Forged, cast and rolled steel carwheels	14.50 to 15.00
Railroad tires, charging box size	16.25 to 16.75
Railroad leaf springs, cut apart	16.25 to 16.75
Acid Open-Hearth Grades:	
Steel couplers and knuckles	13.50 to 14.00
Coil springs	16.00 to 16.50
Electric Furnace Grades:	
Axle turnings	12.75 to 13.25
Low phosphorus punchings	14.00 to 14.50
Low phosphorus plate, 12 in. and under	13.75 to 14.25
Blast Furnace Grades:	
Axle turnings	10.00 to 10.50
Cast iron borings	9.50 to 10.00
Short shöveling turnings	9.50 to 10.00
Machine shop turnings	7.00 to 7.50
Rolling Mill Grades:	
Iron rails	14.00 to 14.50
Rerolling rails	13.75 to 14.25
Cupola Grades:	
Steel rails less than 3 ft.	15.00 to 15.50
Angle bars, steel	13.75 to 14.25
Cast iron carwheels	13.50 to 14.00
Malleable Grades:	
Railroad	12.75 to 13.25
Agricultural	12.00 to 12.50
Miscellaneous:	
*Relaying rails, 56 to 60 lb.	23.00 to 25.00
*Relaying rails, 65 lb. and heavier	26.00 to 31.00
Per Net Ton	
Rolling Mill Grades:	
Iron angle and splice bars	14.00 to 14.50
Iron arch bars and transoms	18.75 to 19.25
Iron car axles	21.50 to 22.00
Steel car axles	16.00 to 16.50
No. 1 railroad wrought	11.00 to 11.50
No. 2 railroad wrought	11.00 to 11.50
No. 1 busheling	9.00 to 9.50
No. 2 busheling	5.00 to 5.50
Locomotive tires, smooth	12.50 to 13.00
Pipes and flues	8.00 to 8.50
Cupola Grades:	
No. 1 machinery cast	14.00 to 14.50
No. 1 railroad cast	12.50 to 13.00
No. 1 agricultural cast	12.50 to 13.00
Stove plate	11.25 to 11.75
Grate bars	11.00 to 11.50
Brake shoes	11.00 to 11.50

---

*Relaying rails, including angle bars to match, are quoted f.o.b. dealers' yards.

Rogers Brown & Crocker Brothers, Inc., seller of pig iron, ferroalloys and coke, has moved its New York offices from the seventeenth to the thirteenth floor of the building at 21 East Fortieth Street.

Philadelphia

Sheet Prices Lower—Warehouses Establish Quantity Differentials on Sheets

PHILADELPHIA, April 9.—Black, galvanized and blue annealed sheet prices are weaker, and quotations range from 2c. to 2.10c., Pittsburgh, on blue annealed, 2.75c. to 2.90c. on black and 3.70c. to 3.75c. on galvanized. One maker has announced these reductions on blue annealed and black sheets and has reduced second quarter contracts accordingly. Plates and bars continue firm, but there is only a small volume of current buying at 1.90c. per lb., Pittsburgh, on bars and 2.05c., Coatesville, on plates. Shapes are quoted at 2c., Bethlehem, both on effective contracts and new business and uncompleted first quarter contracts have been rather generally extended through the present month.

Although new business is limited to small tonnages of plates, shapes and bars, mills are receiving a fair volume of specifications against contracts and operations continue at 60 to 65 per cent of capacity in this district. Bridge projects are the outstanding feature of the structural steel market. Prices for fabricated material are still at a low level.

Local warehouses have revised quotations on black and galvanized sheets and have established quantity differentials, extras being applied on orders for 10 to 50 bundles and on less than 10 bundles.

Pig Iron.—Foundry consumers in this district are reported to be melting more iron than in several weeks, but purchasing is still limited to carload lots. Prices, however, are being maintained at $20 per ton, base, for foundry iron. Low phosphorus is unchanged. The Washington Navy Yard will open bids April 14 on 357 tons of low phosphorus, and the Lorain Steel Co. is inquiring for about 1000 tons. The Brooklyn Navy Yard is in the market for 95 tons of No. 3 foundry iron. No sales of basic are reported.

Prices per gross ton at Philadelphia:

East. Pa. No. 2 plain, 1.75 to 2.25 sil.		$20.76
East. Pa. No. 2X, 2.25 to 2.75 sil.		21.26
East. Pa. No. 1X		21.76
Basic (delivered eastern Pa.)	$19.50 to	20.00
Gray forge	19.75 to	20.25
Malleable	21.00 to	21.50
Standard low phos. (f.o.b. New York State furnace)	23.00 to	24.00
Copper bearing low phos. (f.o.b. furnace)	23.50 to	24.00
Virginia No. 2 plain, 1.75 to 2.25 sil.	24.54 to	25.04
Virginia No. 2X, 2.25 to 2.75 sil.	25.04 to	25.54

Prices, except as specified otherwise, are delivered Philadelphia. Freight rates: 76c. to $1.64 from eastern Pennsylvania furnaces; $4.54 from Virginia furnaces.

Bars.—Prices are firm and mills seem to be in a satisfactory position, with a steady flow of specifications against contracts. For current delivery, orders are small and 1.90c., Pittsburgh, is being maintained. Contract shipments are at 1.85c., Pittsburgh, or 2.17c., delivered Philadelphia. In some cases extensions of first quarter commitments have been granted, so that some tonnage is still moving at 1.80c., Pittsburgh.

Shapes.—Quotations on new business and shipments on second quarter contracts are at 2c., Bethlehem, or 2.13c., delivered Philadelphia, and some first quarter contracts at 1.95c., Bethlehem, or 2.08c., Philadelphia, have been extended through the present month. The New York Central Railroad has revived an inquiry for 10 steel barges to be constructed of 12-in. channels. The Tacony-Palmyra bridge has been awarded to the American Bridge Co.

Plates.—The market ranges from 2c. to 2.05c., Coatesville, or 2.10c. to 2.15c., delivered Philadelphia, with some uncompleted contracts carried over at 1.95c., Coatesville, or 2.05c., Philadelphia. Mills are fairly well booked with business, and some additional tonnage may be in prospect if Delaware River shipyards obtain the Pennsylvania Railroad contract for 10 steel barges and carfloats, including a tugboat hull.

Sheets.—Blue annealed and black sheet prices seem to be definitely lower, with most mills offering concessions from 2.90c., Pittsburgh, on black, and 2.10c., Pittsburgh, on blue annealed; one producer of both grades is quoting 2c., Pittsburgh, for blue annealed and 2.75c., Pittsburgh, for black, having reduced second quarter contract prices to the new bases. Galvanized sheets are nominally 3.75c. per lb., Pittsburgh, but concessions of $1 a ton are not uncommon.

Warehouse Business.—Effective April 9, jobbers in this district have established quantity differentials on black and galvanized sheets. Base prices have been revised to 3.75c. per lb. on black and 4.75c. on galvanized, the base price applying on purchases of 50 bundles or more, a bundle ranging from 140 to 150 lb., depending upon the gage and size. For 10 to 49 bundles there is an extra charge of ½c. per lb., and on orders for less than 10 bundles the extra is 1c. per lb. There is an additional charge of 1c. per lb., or 2c. per lb. over base for broken bundles.

Imports.—In the week ended April 7, 2000 tons of pig iron arrived at this port from the United Kingdom. Ore imports consisted of 226 tons of chrome ore from Portuguese Africa. Steel arrivals were 339 tons of shapes, 24 tons of steel bars, 51 tons of steel skelp and 5 tons of hoops from Belgium; 21 tons of shapes and 15 tons of steel bars from Germany and 22 tons of galvanized strip steel from the United Kingdom. Steel scrap arrivals totaled 107 tons, of which 85 tons were from Germany and 22 tons from the United Kingdom.

Old Material.—Prices of most grades show little change, but demand is light, and there is a downward trend to prices. On the Pennsylvania Railroad list of about 40,000 tons of material the heavy melting steel and rails, about 20,000 tons, are reported to have gone to a large Eastern broker, who bid for delivery at Midland, Pa. The Carnegie Steel Co., Pittsburgh, is reported to have taken about 9000 tons of No. 1 steel and old rails on the Baltimore & Ohio list at $15.35 per ton, delivered Munhall, Pa. A Harrisburg consumer has purchased a tonnage of stove plate at $12 per ton, delivered, and heavy breakable cast at $15.50 per ton, delivered. Specification pipe has been sold to a Columbia, Pa., user at $12 per ton, delivered.

Prices per gross ton delivered consumers' yards, Philadelphia district:

No. 1 heavy melting steel	$13.50 to	$14.00
Scrap T rails	13.00 to	13.50
No. 2 heavy melting steel	11.00 to	11.50
No. 1 railroad wrought	14.50 to	15.00
Bundled sheets (for steel works)		10.50
Machine shop turnings (for steel works)		10.50
Heavy axle turnings (or equivalent)	12.00 to	12.50
Cast borings (for steel works and rolling mill)	10.50 to	11.00
Heavy breakable cast (for steel works)	15.50 to	16.00
Railroad grate bars	12.00 to	12.50
Stove plate (for steel works)		12.00
No. 1 low phos., heavy, 0.04 per cent and under	17.50 to	18.00
Couplers and knuckles	15.50 to	16.00
Rolled steel wheels	15.50 to	16.00
No. 1 blast furnace scrap	10.50 to	11.00
Machine shop turnings (for rolling mill)	11.00 to	11.25
Wrought iron and soft steel pipes and tubes (new specifications)	12.00 to	12.50
Shafting	17.50 to	18.00
Steel axles	19.00 to	20.00
No. 1 forge fire	11.00 to	11.50
Steel rails for rolling	14.75 to	15.25
Cast iron carwheels	15.50 to	16.00
No. 1 cast	16.00 to	16.50
Cast borings (for chemical plant)	14.50 to	15.00

Warehouse Prices, f.o.b. Philadelphia

$\frac{3}{16}$-in.	5.50c.
Rails	3.20c.
Swedish iron bars	6.60c.

New York

Pig Iron Activity Subsides—Heavy Steel Pipe Specifications

NEW YORK, April 10.—Activity has subsided in the pig iron market, and new inquiries are confined mainly to relatively small tonnages. Sales by local brokers during the week totaled 7000 tons, a decline of about 3000 tons from the figure for the previous week. The Worthington Pump & Machinery Corporation, New York, has closed against its inquiry for 1250 tons for various plants. The American Locomotive Co., New York, has placed 500 tons of foundry for its Schenectady, N. Y., works. The General Electric Co. has entered the market for 400 tons of high silicon foundry for delivery at Schenectady during the current quarter. Prices are substantially unchanged. The Colonial Iron Co. furnace, Riddlesburg, Pa., was scheduled to go out for relining today. It has operated on the present lining for four years. The Danish steamer Kirsten Maersk, with a cargo of 3100 tons of Dutch iron, arrived at Bridgeport, Conn., April 7. The iron, which was consigned to Pilling & Co., New York, was unloaded at the T. A. D. Jones Coal Corporation docks. Part of the tonnage was sold prior to its arrival. The shipment is chiefly of interest because of the selection of Bridgeport as an unloading point, instead of Boston, New York or Philadelphia.

Prices per gross ton, delivered New York district:

Buffalo No. 2 fdy., sil. 1.75 to 2.25	$20.91 to $21.91
East. Pa. No. 2 fdy., sil. 1.75 to 2.25	20.39 to 22.52
East. Pa. No. 2X fdy., sil. 2.25 to 2.75	20.89 to 23.02
East. Pa. No. 1X fdy., sil. 2.75 to 3.25	21.39 to 23.52

Freight rates: $4.91 from Buffalo, $1.39 to $2.52 from eastern Pennsylvania.

Finished Steel.—The chief development of the week has been in connection with merchant pipe, on which all producers announced an advance on April 2 and 3. Distributers were given one week in which to specify at the former prices. Some mills gave the privilege of specifying 60 days' requirements, while others held to 30 days' supply. The result was that orders for pipe during the past week have been very large. In other steel products, except sheets, which have weakened in price, conditions are unchanged. Prices on plates, shapes and bars are holding at the second quarter contract levels, namely 1.85c., Pittsburgh, on bars, 2c., Coatesville, on plates and 2c., Bethlehem, on shapes. Quotations $1 higher remain in effect, but are applying mostly on small lots from consumers not covered by contract. Buying against second quarter prices has not yet taken place to any extent because of the large specifications in the last week of March on expiring first quarter contracts. Shipments against these specifications will keep most consumers well supplied this month at least. Demand for structural steel in this market is enlarged considerably by the inquiry for 17,000 tons for the Reynolds Building, Lexington Avenue and Forty-second Street. The Structural Steel Board of Trade of New York reports total March bookings by its members at 32,200 tons—8200 tons larger than February contracts, but 5800 tons less than the total for March, 1927.

Mill prices per lb., delivered New York: Soft steel bars, 2.19c. to 2.24c.; plates, 2.17½c. to 2.22½c.; structural shapes, 2.14½c. to 2.19½c.; bar iron, 2.14c.

Warehouse Business.—There is a good volume of purchasing of structural material, and other products are moderately active. Most jobbers report April business as large as March's and in some cases, should present activity continue to the end of the month, it will exceed that of last month. The new quantity differentials are being maintained.

Cast Iron Pipe.—Purchasing of bell and spigot pipe is light. Delivered prices of Northern foundries continue lower than Birmingham makers are willing to meet. The largest current inquiry in this district is 2700 tons of 4, 6, 8, 10, 12, 16 and 20-in. water pipe for New York City, bids on which will be opened April 17. New York City is also in the market for about 200 tons of high pressure pipe. Jersey City, N. J., has closed on 175 tons of 8-in. water pipe with the United States Cast Iron Pipe & Foundry Co.

Prices per net ton, delivered New York: Water pipe 6-in. and larger, $36.25 to $37.25; 4-in. and 5-in., $41.25 to $42.25; 3-in., $51.25 to $52.25; Class A and gas pipe, $4 to $5 extra.

Reinforcing Bars.—Lettings during the last week have been few and in small tonnages. Several hundred tons will be required in a number of road contracts in New Jersey, few of which have yet been placed. Distributers continue to quote 2c., Pittsburgh, on new business, but few projects large enough to test the price have come out recently. New York and Youngstown warehouse prices are unchanged.

Coke.—Buying of both foundry and furnace grades continues light. Connellsville furnace coke is quoted at about $2.75 per ton, Connellsville, for standard grade. Delivered prices on beehive foundry coke are: To northern New Jersey, Jersey City and Newark, $8.71 to $8.81 per net ton; to New York and Brooklyn, $9.59 to $9.69 per net ton. By-product coke is quoted at $9 to $9.40

per net ton, Newark or Jersey City, N. J., and $10.06 to $10.29 per ton, New York or Brooklyn.

Old Material.—Prices of most grades of scrap still show a downward tendency. No. 1 heavy melting steel is unchanged at $13.50 per ton, delivered eastern Pennsylvania, and a good tonnage is moving to the larger consumers. Stove plate is being purchased by brokers at $11.50 to $12 per ton, delivered, the lower quotation being for delivery to a Harrisburg consumer. Specification pipe has been purchased at $12 per ton, delivered Columbia, Pa., and brokers are offering $11.50 per ton for that delivery. The heavy melting steel and old rails on the Pennsylvania Railroad list, a total of close to 20,000 tons, are understood to have gone to Midland, Pa., at $15.96 per ton, delivered.

Dealers' buying prices per gross ton f.o.b. New York:

No. 1 heavy melting steel	$10.00 to $10.85
Heavy melting steel (yard)	6.75 to 7.25
No. 1 heavy breakable cast	11.25 to 12.00
Stove plate (steel works)	7.75 to 8.00
Locomotive grate bars	8.00 to 8.50
Machine shop turnings	6.50 to 7.25
Short shoveling turnings	6.50 to 7.25
Cast borings (blast furnace or steel works)	6.25 to 7.25
Mixed borings and turnings	6.50 to 7.25
Steel car axles	15.50 to 16.00
Iron car axles	23.75 to 24.75
Iron and steel pipe (1 in. dia., not under 2 ft. long)	7.75 to 8.25
Forge fire	6.75 to 7.00
No. 1 railroad wrought	10.00 to 10.50
No. 1 yard wrought, long	8.50 to 9.00
Rails for rolling	10.00 to 10.50
Cast iron carwheels	10.75 to 11.25
Stove plate (foundry)	8.50 to 9.00
Malleable cast (railroad)	10.00
Cast borings (chemical)	11.00 to 11.50

Prices per gross ton, delivered local foundries:

No. 1 machinery cast	$13.75 to $14.25
No. 1 heavy cast (columns, building materials, etc.), cupola size	11.75 to 12.25
No. 2 cast (radiators, cast boilers, etc.)	11.25 to 11.75

Cleveland

Auto Body Sheets Decline $3 a Ton—Other Grades Weaker

CLEVELAND, April 10.—Mills took a good volume of business the past week, although a lull after the heavy specifications of the previous week against expiring 1.80c. contracts for steel bars, plates and structural shapes would not have caused surprise. Mills have a large tonnage in orders entered at the end of the month that will be shipped at their convenience this month.

Orders received from the automotive industry indicate that it will take more steel this month than in March. Optimistic reports continue to come from the motor car manufacturers, and it is predicted that the seasonal slowing down in this industry this year will not start until a month later than last year. One manufacturer of medium-priced cars is curtailing shipping orders with a view of discontinuing its present line and bringing out new models.

Operations in industries outside of the automotive field show an upward trend. On current orders, the market is established at 1.85c., Pittsburgh, for bars, plates and structural material, at which most consumers have placed contracts. The 1.90c. price is maintained for small miscellaneous lots. Some inquiry for contracts is coming from very small-lot buyers who evidently hope to get advantage of the minimum price by making contracts. Local mills quote steel bars at 1.85c., Cleveland.

Attempts to get higher prices than prevailed last quarter for sheet bars and strip steel have met sharp resistance from the automotive industry in Detroit, and auto body sheets have declined $3 a ton to the first quarter price. Prices on cold-rolled strip to large buyers show a wavering tendency. The lull in structural steel lettings in this territory continues.

Pig Iron.—The market was fairly active the past week, although the sales of foundry iron by Cleveland interests, amounting to 26,000 tons, showed a sharp falling off from the previous week. Activity was well distributed among Ohio, Michigan and Indiana territories. Prices are holding fairly steady at recent quotations. The ruling Lake furnace price is $17, except for shipment to the more competitive points in southern Ohio, where Lake furnaces are quoting $16.75, with reports indicating that this price is being shaded. In Michigan the market is firm at $18. With the approach of Lake navigation, some activity is looked for in water shipments. The sale of a small tonnage of iron for shipment from Cleveland to Milwaukee is reported, and some inquiry has developed at Cleveland for boat shipment to Detroit. Last year producers were able to get a rate as low as $1.50 a ton for water shipment from Cleveland to Chicago, including handling charges at each end. Shipping orders indicate that shipments during April will show a slight gain over March. The automotive industry is taking as much iron as last month, but a slowing down in the demand from this source would not be surprising next month, as some of the automobile companies are not expected to keep up their present production schedules through May. The foundry melt outside of the automotive industry shows a slight gain. Conditions in the industries making various types of heating equipment are reported to show an improvement.

Prices per gross ton at Cleveland:

N'th'n No. 2 fdy., sil. 1.75 to 2.25	$18.50
Southern fdy., sil. 1.75 to 2.25	22.00
Malleable	18.50
Ohio silvery, 8 per cent	28.00
Basic, Valley furnace	17.00
Standard low phos., Valley furnace	$26.50 to 27.00

Prices, except on basic and low phosphorus, are delivered Cleveland. Freight rates: 50c. from local furnaces; $3 from Jackson, Ohio; $6 from Birmingham.

Iron Ore.—Iron ore producers are awaiting action of the Ford Motor Co. on their bids submitted April 3 for 440,000 tons of Lake Superior ore. Some other business will be closed as soon as prices are named. Nothing has developed to change the belief that last season's prices will be reestablished.

Iron Ore Stocks.—The dock balance of Lake Superior ore at Lake Erie ports April 1 was 5,568,098 tons, compared with 5,239,687 tons on the same date a year ago. Shipments from docks are light, amounting to 426,008 tons in March, compared with 830,826 tons during the same month last year.

Coke.—By-product foundry coke has been reduced 25c. a ton to $7.75, Painesville. This coke is now $8.76, delivered Cleveland, compared with $8.77 for Ashland coke, which was recently reduced 50c. a ton. Heating coke is weak, with a range of from $2.50 to $2.75. Connellsville foundry coke is unchanged at $3.75 to $5.10. By-product coke for domestic use is moving very slowly.

Semi-Finished Steel.—Specifications continue heavy against second quarter contracts, and while there are reports of concessions, the market appears to be holding closely to $33, Cleveland, for sheet bars, billets and slabs. The leading local producer is still operating at 100 per cent of capacity.

Wire Products.—Nails are moving somewhat better than recently and the $2.65 price appears firm in northern Ohio, but in the central and southern sections of the State $2.55 is still rather commonly quoted.

Reinforcing Bars.—A fair amount of new work is coming out in small lots, but no large lettings have been made recently. Prices on stock orders are irregular. Rail steel bars are unchanged at 1.75c., mill.

Warehouse Business.—Sales are fairly heavy and prices are well maintained. Galvanized sheets are moving rather slowly, but a seasonal demand is expected to stimulate orders shortly.

Warehouse Prices, f.o.b. Cleveland

	Base per Lb.
Plates and structural shapes	3.00c.
Soft steel bars	3.00c.
Reinforcing steel bars	2.25c. to 2.75c.
Cold-finished rounds and hexagons	3.65c.
Cold-finished flats and squares	4.15c.
Hoops and bands	3.65c.
Cold-finished strip	*5.95c.
Black sheets (No. 24)	3.75c.
Galvanized sheets (No. 24)	4.40c. to 4.60c.
Blue annealed sheets (No. 10)	3.25c.
No. 9 annealed wire, per 100 lb.	$2.90
No. 9 galvanized wire, per 100 lb.	3.35
Common wire nails, base per keg	2.90

*Net base, including boxing and cutting to length.

Sheets.—Auto body sheets have declined $3 a ton to 4c., Pittsburgh, or the same price at which consumers covered late in the year for the first quarter. Strong effort was made by some of the leading producers to maintain the 4.15c. price, at which a moderate amount of business had been placed recently by the automotive industry, but a price break developed in the Detroit market. Weakness has also appeared in blue annealed sheets, which had been holding rather firmly to 2.10c., Pittsburgh. On these a 2c. price has become rather common. Black sheets, which have been irregular for some time, have settled down to 2.75c. to 2.85c., Pittsburgh, and little effort is being made now to get 2.90c. Galvanized sheets are unchanged at 3.65c., Pittsburgh. Demand in this territory is not active but orders from the automotive industry in Michigan continue heavy.

Strip Steel.—Some contracts have been taken at $1 to $3 a ton above those at which larger consumers covered for the first quarter, but somewhat lower than current market quotations. Small lots are moving at regular prices. On cold-rolled strip, concessions of $3 a ton to 2.75c., Cleveland and Pittsburgh, for 3 tons and over have appeared in the Detroit territory, although some business is reported to have been placed by automobile manufacturers at regular prices. The reduction on auto body sheets is expected to have an effect on cold-rolled strip prices.

Bolts, Nuts and Rivets.—Bolt and nut specifications are fair, the volume being about the same as during last month. Orders are heavy from the automotive industry, but only fair from jobbers. Prices are firm. The demand for rivets shows some gain. All specifications for large rivets are now against the new $2.90 per 100 lb. contracts, or $3 a ton above the price that prevailed during the first quarter.

Fluorspar.—Leading producers on April 9 advanced gravel fluorspar $1 a ton to $16 at mines. This price will be quoted for the last half, although most large consumers are covered for that delivery. A few car lot sales were made during the week at $15.

Old Material.—The purchase of a round tonnage of heavy melting steel and compressed sheet scrap by the American Steel & Wire Co., reported last week, failed to add strength to the local market. No additional demand has developed from consumers, and dealers are not buying because they already have purchased considerable scrap which they cannot release for shipment. Steel making scrap has again begun to move by water from Detroit to Cleveland. These shipments are against a 20,000-ton contract placed by a Cleveland mill with a Detroit dealer late last year. Machine shop turnings have declined $1 a ton. As there is no local demand, an out-of-town market must be found for this grade.

Prices per gross ton, delivered consumers' yards:

Basic Open-Hearth Grades	
No. 1 heavy melting steel	$13.75 to $14.00
No. 2 heavy melting steel	13.25 to 13.50
Compressed sheet steel	12.75 to 13.00
Light bundled sheet stampings	11.50 to 11.75
Drop forge flashings	12.00 to 12.50
Machine shop turnings	8.00 to 8.50
No. 1 railroad wrought	11.50 to 12.00
No. 2 railroad wrought	13.50 to 14.00
No. 1 busheling	11.00 to 11.25
Pipes and flues	9.00 to 9.50
Steel axle turnings	12.50 to 13.00
Acid Open-Hearth Grades	
Low phosphorus forging crops	16.50 to 17.00
Low phosphorus, billet, bloom and slab crops	17.00 to 17.50
Low phosphorus sheet bar crops	16.50 to 17.00
Low phosphorus plate scrap	16.00 to 16.50
Blast Furnace Grades	
Cast iron borings	10.00 to 10.25
Mixed borings and short turnings	10.00 to 10.25
No. 2 busheling	10.00 to 10.25
Cupola Grades	
No. 1 cast	16.50 to 17.00
Railroad grate bars	11.00 to 12.00
Stove plate	12.00 to 12.50
Rails under 3 ft.	18.00 to 18.50
Miscellaneous	
Railroad malleable	15.00 to 15.50
Rails for rolling	16.25 to 16.50

J. O. Henshaw, dealer in pig iron and coke, Boston, has removed his office from 79 Milk Street, to 540 Oliver Building, 141 Milk Street.

San Francisco

Building Permits in Coast Cities Gain—Lull in Demand for Steel

SAN FRANCISCO, April 6, (*By Air Mail*).—Little or no improvement in demand for steel products developed during the past week. Bookings were not heavy. The largest lettings involved 800 tons of plates for three lightships for the Government at Portland, placed with the Albina Marine Engine Works, 650 tons of reinforcing bars for Los Angeles, booked by the Blue Diamond Co., and 650 tons of structural shapes for school buildings at Glendale, Cal., taken by the Llewellyn Iron Works.

Building permits issued in the larger cities on the Coast during the past month were, on the whole, slightly in excess of the total for March, 1927. Portland permits numbered 970, with an estimated valuation of $2,907,880. At Seattle, permits aggregated $4,273,490, compared with $3,492,610 for the same period last year. During the first quarter permits set a new high record, being nearly $5,000,000 greater than the first quarter of last year. The totals were $11,092,815 as against $7,345,745.

Pig Iron.—Foundry operations continue at about the level that has prevailed during the past three or four months. Sales and inquiries for pig iron are confined to unimportant lots. A shipment of 850 tons of Indian iron will arrive on the Coast next week. Another lot of 1400 tons is due to arrive the latter part of this month or early in May. Prices are unchanged.

Prices per gross ton at San Francisco:

*Utah basic	$25.00 to $26.00
*Utah foundry, sil. 2.75 to 3.25	25.00 to 26.00
**Indian foundry, sil. 2.75 to 3.25	24.00 to 25.00
**German foundry, sil. 2.75 to 3.25	24.25

*Delivered San Francisco.
**Duty paid, f.o.b. cars San Francisco.

Bars.—Most reinforcing bar bookings call for lots ranging from 20 to 60 tons. Two hundred tons for the Stimson Building, Seattle, was placed with an unnamed interest. Other business included 120 tons for a bridge at Riverside, Cal., and 110 tons for a produce building in San Francisco. Pending business calls for more than 13,000 tons. Bids have been opened on 5200 tons for a drainage improvement project in Los Angeles. Out-of-stock prices in the bay district continue weak and 2.25c. is frequently quoted.

Plates.—In addition to the 800 tons for lightships at Portland, mentioned above, the Government has placed 250 tons for Mare Island and 500 tons for Mare Island and Puget Sound Navy Yards with unnamed Eastern interests. Demand generally is light. Siphons for the Yakima project in Washington for the United States Bureau of Reclamation call for 450 tons. Prices appear firm at 2.30c., c.i.f.

Shapes.—Structural shape bookings fell off this week, and the total, 850 tons, was smaller than for any week so far this year. The California Steel Co. took 200 tons for an office building at Reno, Nev. Bids were opened this week on 600 tons for a bridge over the Smith River, Del Norte County, Cal., and on 250 tons for a hangar at Oakland. The McClintic-Marshall Co. was low bidder on 150 tons for Los Angeles. Pending business exceeds 11,000 tons. Plain material remains firm at 2.35c., c.i.f.

Cast Iron Pipe.—A slight falling off in demand for cast iron pipe is reported. Awards this week totaled over 1000 tons. George H. Oswald, Los Angeles, took 181 tons of 6 and 8-in. class B for the improvement of Foothill Boulevard, Azusa, Cal. Aberdeen, Wash., placed 53 tons of Universal pipe with the Central Foundry Co. and 105 tons of 6 and 8-in. class 15 with the Pacific States Cast Iron Pipe Co., Vancouver, B. C., awarded 500 tons to the American Cast Iron Pipe Co., Astoria, Ore., placed about 100 tons of 6-in. class C with an unnamed interest. The Pan-Pacific Construction Co., Los Angeles, took 148 tons of 8 and 18-in. class B for the improvement of Hermosa Avenue, Her-

(*Concluded on page* 1055)

Boston

Prices on Reinforcing Bars and Structural Steel Shapes Are Easier

BOSTON, April 10.—Pig iron sales the past week were small. A fair tonnage of Alabama iron was sold notwithstanding its higher cost on a delivered basis. Buffalo No. 2 plain iron, on an all-rail freight rate basis, is still available at $16 a ton, furnace, regardless of the tonnage involved or date of delivery, and New York State furnaces and the Mystic Iron Works are endeavoring to meet that price. Interest centers in the new rail-and-water rates from the Buffalo district to New England to be put into effect by the New York, New Haven & Hartford Railroad on April 21. The water rate from Buffalo to Beacon, N. Y., is $1.50 per ton and there is a loading charge of 28c. per ton. The rail rate from Beacon to Brockton, Fall River, Milford, New Bedford, Newton Upper Falls, Somerset, Taunton, Walpole and Whitman, all in Massachusetts, is $2.50 a ton, and to all other New England consuming points $2, so that Buffalo iron will carry a freight rate of $3.78 to $4.28 a ton, instead of the prevailing all-rail rate of $4.91. The Champlain stacks can, it is understood, take advantage of the new water-and-rail rates, but the saving to most New England points will be small, if any. The new rates place the Mystic Iron Works at a disadvantage at most consuming points. To illustrate, the new Buffalo rate to Whitinsville, Mass., is $3.78, while the Mystic rate is $2, with a switching charge of $5 per car. In contrast, the Mystic rate to Westfield, Mass., is $2.39 per ton, while the new Buffalo rate is $3.78.

Prices of foundry iron per gross ton, delivered to most New England points:

Buffalo, sil. 1.75 to 2.25	$20.91 to	$21.91
Buffalo, sil. 2.25 to 2.75	21.41 to	22.41
East. Penn., sil. 1.75 to 2.25	23.15 to	23.65
East. Penn., sil. 2.25 to 2.75	23.65 to	24.15
Virginia, sil. 1.75 to 2.25		25.71
Virginia, sil. 2.25 to 2.75		26.21
Alabama, sil. 1.75 to 2.25	22.91 to	24.77
Alabama, sil. 2.25 to 2.75	23.41 to	25.27

Freight rates: $4.91 from Buffalo, $3.65 from eastern Pennsylvania, $5.21 all rail from Virginia, $6.91 to $8.77 from Alabama.

Cast Iron Pipe.—Boston has closed bids on 550 tons of 24-in. pipe. R. D. Wood & Co. were the low bidders, but no award has been made. Everett, Mass., has closed bids on 200 tons of pipe, on which the Warren Pipe & Foundry Co. was low bidder, but no award has been made. No award has been made by Winthrop, Mass., on 200 tons of 8-in. pipe, bids for which closed April 5, but Quincy, Mass., has awarded 300 tons of 4, 6, 8 and 14-in. pipe to the Warren Pipe & Foundry Co. Wellesley, Mass., closed bids April 9 on 200 tons of 6, 8 and 12-in. pipe. Current business is on a basis of $39.10 a ton, delivered common Boston freight rate points for 6 to 12-in. pipe and at $44.10 for 4-in. On large sizes, however, concessions are being made. The usual $5 differential is asked on class A and gas pipe.

Warehouse Prices, f.o.b. Boston

	Base per Lb.
Plates	3.365c.
Structural shapes—	
Angles and beams	3.365c.
Tees	3.365c.

Machine bolts	50 and 5
Carriage bolts	50 and 5
Lag screws	50 and 5
Hot-pressed nuts	50 and 5
Cold-punched nuts	50 and 5
Stove bolts	70 and 10

*Including quantity differentials.

Coke.—Connecticut foundries are ordering in by-product foundry coke more actively than a month ago, indicating an increase in the melt, but in other New England States there is little improvement. New England producers of this fuel quote $11 a ton, delivered within a $3.10 freight rate zone. A decided slump in demand for domestic by-product coke is reported. Domestic fuel sells on a basis of $8 a ton on cars at ovens, Everett, Mass.

Warehouse Business.—Warehouse business is spotty. Some concerns did a large business in March, but the showing by others was not as good. Current movement of iron and steel out of stock, in the aggregate, is only fair at best. Nails are in slightly better demand. Prices on all materials are firm and unchanged.

Cold-Rolled Strip.—Mill representatives report a noticeable letdown in bookings the last few days. The rollers are in a fairly comfortable position, however, previous second quarter bookings being substantial, and shipments on first quarter specifications extend into this month. The current quotation is 3.15c. per lb., base Pittsburgh. The Worcester, Mass., mill quotes 3.30c. per lb., base, on 1 to 3 ton lots.

Bars.—Current buying of reinforcing bars continues in small tonnages. Competition for business is keener and even small lots sold the past week at 1.85c. to 1.90c., per lb., base Pittsburgh, as compared with 1.90c. to 1.95c. two weeks ago.

Shapes and Plates.—Mill bookings of standard shapes have been comparatively small the past week. While 1.90c. per lb., base Pittsburgh, is openly quoted, some business has been placed at 1.85c. Fabricators report a slight improvement in prospective business, mostly in small individual tonnages. Plates are in moderate demand at 1.90c. per lb., base Pittsburgh.

Importations.—Local importations of pig iron in March totaled 558 tons, made up of 159 tons of Dutch and the rest of Indian. Importations in February, this year, were 1215 tons. So far in April, 110 tons of Dutch iron has been landed here. In addition, 7042 tons of ore from Tunis has been received this month by the Mystic Iron Works.

Old Material.—Most grades of old material are moving in limited quantities. The lighter materials, such as steel turnings and forge scrap, have a better call than heavy melting steel. A fair tonnage of heavy cast was purchased at $10.50 to $11 a ton on cars, shipping point, and quite a little No. 2 machinery cast was shipped to the Pittsburgh district. Scattered cars of forge flashings were taken at $7.25 a ton on cars, but $7 appears to be the average top quotation. Machine shop turnings are moving better and bringing about 50c. a ton more than a week ago. Steel mill borings, on the other hand, are about that much easier. The Mystic Iron Works is still taking in stove plate at $10 a ton, delivered. New England foundries continue to supply their cast requirements from local or nearby yards and still show a preference for No. 1 machinery cast to textile machinery cast.

Buying prices per gross ton f.o.b. Boston rate shipping points:

No. 1 heavy melting steel		$9.00
Scrap T rails	$8.50 to	8.75
Scrap girder rails	7.50 to	8.00
No. 1 railroad wrought	9.50 to	10.00
No. 1 yard wrought	7.50 to	8.00
Machine shop turnings	5.50 to	6.00
Cast iron borings (steel works and rolling mill)	5.50 to	6.00
Bundled skeleton, long	5.75 to	6.25
Forge flashings	6.50 to	7.00
Blast furnace borings and turnings	5.75 to	6.00
Forged scrap	6.00 to	6.50
Shafting	13.00 to	13.50
Steel car axles	15.00 to	15.25
Wrought pipe (1 in. in diameter, over 2 ft. long)	7.50 to	8.00
Rails for rolling	10.00 to	10.25
Cast iron borings, chemical	9.50 to	10.00

Prices per gross ton delivered consumers' yards:

Textile cast	$13.50 to	$14.00
No. 1 machinery cast	15.00 to	15.50
No. 2 machinery cast	13.00 to	13.50
Stove plate	10.00 to	10.50
Railroad malleable	13.00 to	13.50

St. Louis

Steel Bookings Keep Granite City Mill Operating Full—Pig Iron Firmer

ST. LOUIS, April 10.—The pig iron market displayed increased activity this week, and prices are firmer largely because of the southern Illinois coal mine strike and the resultant possibility of higher prices for coal. The Granite City maker sold 12,000 tons, including 10,000 tons of basic to an East Side melter; 500 tons of foundry grades to a southern Illinois stove plant; 350 tons of foundry to an East Side melter, and 150 tons of foundry to a Kansas City company; also 250 tons of malleable to a Pacific Coast user and 150 tons of malleable to an Illinois melter. An inquiry is pending from a radiator company for 5000 tons of foundry iron, and there are several 300-ton inquiries.

Prices per gross ton at St. Louis:

No. 2 fdy., sil. 1.75 to 2.25 f.o.b. Granite City, Ill.	$19.50 to $20.00
Northern No. 2 fdy., delivered St. Louis	20.66
Southern No. 2 fdy., delivered	20.42
Northern malleable, delivered	20.66
Northern basic, delivered	20.66

Freight rates: 81c. from Granite City to St. Louis; $2.16 from Chicago; $4.42 from Birmingham.

Finished Iron and Steel.—Bookings for March by the Granite City Steel Co. were considerably in excess of production and shipments, although shipments were the largest for any month in the history of the company. The demand for tank plates is exceptionally heavy, and the company is in a very comfortable position with respect to unfilled tonnages of this item. Buying of black and blue annealed sheets and tin plate specifications have been sufficient to warrant 100 per cent operation of these mills. The demand for galvanized sheets continues to lag, and this department of the Granite City plant is operating 75 per cent of capacity, while the open-hearth department is at full capacity. The Missouri-Kansas-Texas and Wabash railroads have issued inquiries for second quarter requirements of plates, shapes and bars. The Missouri Pacific has asked for prices on 400 tons of plates, 200 tons blue annealed sheets, 10 tons black sheets, 75 tons locomotive jacket steel and 30 tons galvanized copper bearing sheets for second and third quarter requirements. Business with structural fabricators is dull. Warehouse business is fairly good in the St. Louis industrial district, but this is counteracted by a lack of orders from the oil fields.

Coke.—The leading by-product factor in the district has made new prices on domestic grades at $6.25 ovens for shipments out of town and $7.25 to dealers, and $10.50 to consumers delivered in St. Louis. The same factor's price for foundry coke is $9.75, delivered in St. Louis, and $9 ovens, for outside shipment. Buying is only fair.

Old Material.—The market for old material grows weaker, and prices again are off. Heavy shoveling and melting steel, No. 1 locomotive tires, No. 2 railroad wrought, No. 1 busheling and cast iron borings are 25c. a ton down; miscellaneous rails, railroad springs and machine shop turnings are 50c. lower, and steel car axles have declined $1. Mills are declining to buy until they have used up present stocks, and dealers are trading among themselves to take care of the few unfilled contracts. Railroad lists include: Louisville & Nashville, 14,135 tons; Santa Fe, 5860 tons; Wabash, 2305 tons; Missouri-Kansas-Texas, 2000 tons; Texas & Pacific, 570 tons; Kansas City Southern, 520 tons; Ann Arbor, 144 tons; Great Northern, 54 carloads; Chicago & Eastern Illinois, 20 carloads; Pullman Co., nine carloads.

Prices per gross ton, f.o.b. dealers' yards and delivered St. Louis district consumers' works:

Heavy melting steel	$10.75 to $11.25
No. 1 locomotive tires	12.00 to 12.50
Heavy shoveling steel	10.75 to 11.25
Miscellaneous standard-section rails, including frogs, switches and guards, cut apart	12.00 to 12.50
Railroad springs	13.00 to 13.50
Bundled sheets	8.75 to 9.25
No. 2 railroad wrought	10.75 to 11.25
No. 1 busheling	9.50 to 10.00
Cast iron borings	8.75 to 9.25
Iron rails	13.00 to 13.50
Rails for rolling	12.75 to 13.25
Machine shop turnings	6.50 to 7.00
Steel car axles	17.50 to 18.00
Iron car axles	23.50 to 24.00
Wrought iron bars and transoms	21.00 to 21.50
No. 1 railroad wrought	10.00 to 10.50
Steel rails, less than 3 ft	15.00 to 15.50
Steel angle bars	11.50 to 12.00
Cast iron carwheels	13.00 to 13.50
No. 1 machinery cast	13.50 to 14.00
Railroad malleable	10.75 to 11.25
No. 1 railroad cast	13.00 to 13.50
Stove plate	12.50 to 13.00
Agricultural malleable	12.00 to 12.50
Relaying rails, 60 lb. and under	20.50 to 23.50
Relaying rails, 70 lb. and over	26.50 to 29.00

Warehouse Prices, f.o.b. St. Louis

	Base per Lb.

Hot-pressed nuts, hexagons, blank or tapped, 200 lb. or more	60
Less than 200 lb	50

Buffalo

Pig Iron Shipments Increase—Steel Operations Sustained

BUFFALO, April 10.—The General Electric Co. is in the market for 400 tons of foundry pig iron, an addition to the 2900 tons recently bought. A district consumer seeks 1000 tons of malleable, and a New York State consumer wants 500 tons of foundry. There is another inquiry of 700 to 800 tons of foundry. Several 100 to 300 ton lots of foundry and malleable have been taken by Buffalo furnaces at $17, base, for foundry and $17.50 for malleable. There has been a slight pickup in the melt, and shipments on orders are considerably better. The Hanna Furnace Co. has started tearing down the No. 4 Susquehanna stack preparatory to rebuilding it.

Prices per gross ton, f.o.b. furnace:

No. 2 plain fdy., sil. 1.75 to 2.25	$17.00
No. 2 foundry, sil. 2.25 to 2.75	17.50
No. 1X foundry, sil. 2.75 to 3.25	18.50
Malleable, sil. up to 2.25	$17.00 to 17.50
Basic	16.50 to 17.00
Lake Superior charcoal	27.28

Finished Iron and Steel.—Most of the mills continue a high percentage of operation. The average is about 85 per cent. Bars, shapes and plates are strong at 1.95c. to 2c. Prices were increased 5 per cent on standard pipe during the week and specifications have been heavier. Bolt and nut prices show the same discounts for the second quarter as the first, and business is very good. An ice-skating rink, bids for which will be taken about April 20, will require 750 tons of structural steel. The reinforcing bar market has been devoid of important lettings.

Old Material.—Dealers report one of the quietest weeks in several months. New York Central, Erie,

Warehouse Prices, f.o.b. Buffalo

	Base per Lb.
Plates and structural shapes	3.40c.
Soft steel bars	3.30c.
Reinforcing bars	2.75c.
Cold-finished flats, squares and hexagons	4.45c.
Rounds	3.95c.
Cold-rolled strip steel	5.85c.
Black sheets (No. 24)	4.30c.
Galvanized sheets (No. 24)	5.15c.
Blue annealed sheets (No. 10)	3.80c.
Common wire nails, base per keg	$3.65
Black wire, base per 100 lb	3.90

Michigan Central and Pennsylvania railroad lists have been closed, but little of the scrap came to Buffalo. The heavy melting steel received here brought close to $15. Shipments are going to plants steadily. One Buffalo consumer has a large tonnage of scrap in Detroit which will begin to come in as soon as navigation opens. Short rails, 3-ft. and under, have been sold in small lots, bringing $16.25 to $17.

Prices per gross ton, f.o.b. Buffalo consumers' plants:

Basic Open-Hearth Grades	
No. 1 heavy melting steel	$14.50 to $15.00
No. 2 heavy melting steel	12.75 to 13.25
Scrap rails	13.75 to 14.25
Hydraulic compressed sheets	13.00 to 13.50
Hand bundled sheets	9.00 to 9.50
Drop forge flashings	12.00 to 12.50
No. 1 busheling	13.25 to 13.75
Heavy steel axle turnings	12.50 to 12.75
Machine shop turnings	8.25 to 8.75
Acid Open-Hearth Grades	
Railroad knuckles and couplers	15.50 to 16.00
Railroad coil and leaf springs	15.50 to 16.00
Rolled steel wheels	15.50 to 16.00
Low phosphorus billet and bloom ends	17.00 to 17.50
Electric Furnace Grades	
Heavy steel axle turnings	12.75 to 13.25
Short shoveling steel turnings	10.75 to 11.25
Blast Furnace Grades	
Short shoveling steel turnings	10.50 to 11.00
Short mixed borings and turnings	9.50 to 10.00
Cast iron borings	9.75 to 10.25
No. 2 busheling	9.00 to 9.50
Rolling Mill Grades	
Steel car axles	17.00 to 17.50
Iron axles	22.00 to 23.00
No. 1 railroad wrought	12.50 to 13.00
Cupola Grades	
No. 1 machinery cast	14.50 to 15.00
Stove plate	13.00 to 13.50
Locomotive grate bars	12.00 to 12.50
Steel rails, 3 ft. and under	16.50 to 17.00
Cast iron carwheels	13.00 to 13.50
Malleable Grades	
Railroad	15.00 to 15.25
Agricultural	15.00 to 15.25
Industrial	15.00 to 15.25

Birmingham

Pig Iron Shipments Heavy—Steel Demand Holds Up Well

BIRMINGHAM, April 10.—The pig iron market continues to move along quietly, with merchant producers gradually increasing bookings. Spot buying is holding up to the average of the past few weeks. The melt increased during the past week and shipments were heavier than for any previous week this year. Foundry iron quotations are still on a $16 base. The Woodward Iron Co. blew out furnace No. 1 at Woodward on March 31 for relining. Seventeen furnaces are now in blast—eight on foundry, seven on basic, one on recarburizing iron and one on ferromanganese.

Prices per gross ton, f.o.b. Birmingham district furnaces:

No. 2 foundry, 1.75 to 2.25 sil	$16.00
No. 1 foundry, 2.25 to 2.75 sil	16.50
Basic	15.00

Finished Steel.—Mills are finding a fairly steady demand, in line with market conditions of the past several weeks. No tonnage of any consequence is being booked by structural steel fabricators and concrete bar distriubuters. Open-hearth operations are the same, with the Tennessee company working 13 or 14 and the Gulf States Steel Co. four.

Cast Iron Pipe.—Pressure manufacturers report a good increase in tonnage during the past week. Makers in the district shared in a number of municipal orders, the larger ones being placed by Meridian, Miss., Kansas City, Mo., Evansville, Ind., Fort Wayne, Ind. and Milwaukee, Wis. Central Iron Foundry Co. was awarded 27,000 ft. of pipe by Tuscaloosa, Ala. Inquiries on municipal pipe indicate that a considerable portion of the usual spring tonnage is yet to be placed. Small order business continues to come in at a fair rate. Shipments have increased slightly. Base prices continue at $29 to $31.

Coke.—Practically all of the larger consumers have covered their second and third quarter requirements. A nominal amount of spot sales constitutes the only activity in the market. Shipments during the week showed a slight increase over the average for the past few weeks. No change has been made in prices.

Old Material.—There is no noticeable change in shipments or inquiries. Both continue at the low rate that has prevailed for the past several weeks. Prices are unchanged.

Prices per gross ton, delivered Birmingham district consumers' yards:

Heavy melting steel	$9.50 to $10.00
Scrap steel rails	11.00 to 11.50
Short shoveling turnings	8.00 to 8.50
Cast iron borings	8.00
Stove plate	14.50
Steel axles	19.00 to 20.00
Iron axles	20.00 to 21.00
No. 1 railroad wrought	10.00 to 10.50
Rails for rolling	13.00
No. 1 cast	14.50
Tramcar wheels	12.50 to 13.50
Cast iron carwheels	12.00 to 13.00
Cast iron borings, chemical	13.50 to 14.00

Pacific Northwest

Business Slightly Less Active but Prices Except on Sheets Are Firm

SEATTLE, April 7 (*By Air Mail*).—Inquiries and orders for steel products have slowed down in the past week or 10 days, with the single exception of reinforcing bars, these being quite active with large orders in sight, two of which, totaling about 2500 tons, are scheduled to be placed this week. Prices, except on sheets, are firm, and on steel pipe are higher. Building permits in Seattle for March were over $4,000,000, a record month.

Pig Iron.—Sales are only in small lots. Some foreign iron continues to come into this market. Utah basic and No. 2 foundry are quoted at $24 to $25, Seattle.

Plates.—The contract for the building of the penstock at Cedar River, taking 1550 tons, has been placed with the Puget Sound Machinery Co., Seattle, but the plates are not ordered. The United States Reclamation Service is asking bids on 500 to 1500 tons for work at Ellensburg, Wash. Plates remain firm at 2.30c., Seattle.

Structural Shapes.—Not much new work is in sight. Bids will be opened on April 24 for 1050 tons for a bridge at Kettle Falls, Wash. Another bridge at Quetts River, Wash., will take 650 tons, but bids have not been invited. About 500 tons of bridge work has been placed with a Southern fabricator. Shapes are quoted at 2.35c., Seattle.

Track Materials.—The Pacific Coast Railroad, an interest of the Pacific Coast Co., Seattle, is asking bids on 175 to 200 tons of 75-lb. rails, to be used in laying tracks at its new cement plant.

Reinforcing Bars.—Inquiry is active, and considerable work is being placed. The Pacific Northwest Rolling Mills, Inc., Seattle, has taken 400 tons for the Bolker warehouse here and about 240 tons to go in the new Stimson Building. State work of about 250 tons has been placed. The largest job in sight is the material for the Bon Marche Building, bids on which are in, and which will take 1800 tons or more. Reinforcing bars are more stable now than for some time. Quotations range from 2.20c. to 3c., depending on size and desirability of the order. State work on the market calls for about 300 tons.

Sheets.—Demand is only fair and prices are weaker. Current quotations are: No. 24 black, 3.50c.; No. 24 galvanized, 4.25c.; No. 10 blue annealed, 2.65c., all Seattle.

Warehouse Business.—A leading jobber reports that March was the best month his company has had in some time, but also states that the immediate outlook is not so good. Prices are firm, with the exception of sheets, which are weaker.

Warehouse Prices, f.o.b. Seattle

	Base per Lb.
Plates and structural shapes	3.00c.
Soft steel bars	3.00c.
Tees, bar sizes	3.25c.
Reinforcing bars	3.00c.
Blue annealed sheets (No. 10)	3.90c.
Black sheets (No. 24)	4.90c.
Galvanized sheets (No. 24)	5.65c.
Structural rivets, ½-in. and larger	5.50c.

Detroit

Automobile Production This Month Continues At High Rate of March

DETROIT, April 10.—There is no indication of an early change in automobile production from the peak activity which has characterized the operations in this industry for the past two months. In fact, March figures have indicated new high marks for several of the automobile companies.

The Ford Motor Co. has recently announced a production of 2000 cars a day, with a schedule of 5000 per day to be reached by July 1. The Ford company shipped 25,720 model A cars in March. Approximately 50,000 of these units have been built to date. Ford now has 15 assembly plants in full operation, in addition to the three large plants in this area, namely, Fordson, Highland Park and Lincoln. The Detroit plants are working 97,565 employees—64,379 at Fordson, 28,221 at Highland Park, and 4965 at Lincoln. The increase in Ford production is calculated to more than make up for any falling off in other quarters of the medium-priced field in the next three months.

Hudson-Essex shipped 91,500 units during the first quarter of this year, or about 1500 more than the estimate 30 days ago. This figure compares very favorably with that for 1927, which was 74,000.

Packard set up a new record, with 4428 units shipped during March, compared with 3366 units for the same month a year ago.

Hupp Motor Car Co. also established a new record, with 8034 units for the month. This was more than 1000 units above the estimated production 30 days ago. It compares with 4942 units for the same month in 1927. March production brings the total for the first quarter to 16,862 units, as against 11,803 in 1927. The Hupp Motor Car Co. entered the present month with 4000 unfilled orders.

Chevrolet completed March with 133,657 units, compared with 107,900 units for the same month a year ago, bringing the total for the first quarter to 342,184, or practically 75,000 units ahead of the first quarter of last year. The schedule for the current month contemplates 132,000 units.

Graham-Paige turned out 7623 units in March, bringing the total for the first quarter to 13,139.

Dodge production during March amounted to 26,895 cars and trucks, bringing the total for the first quarter to 60,387, compared with 46,566 in the first three months of 1927. April schedule contemplates a substantial increase over that of March. Approximately 6000 men have been added to the force of the Dodge Brothers plants since Jan. 1. The total now numbers 24,124.

Reo Motor Car Co. added a March production of 3549 cars and trucks—a substantial increase over February production of 2467 units. The Reo company entered April with 5000 unfilled orders, and has set a schedule of 6000 units for the month.

Cadillac and LaSalle production for March amounted to 4500 units, an increase of 20 per cent over February figures. The total first quarter production exceeded by 37 per cent the figure for the corresponding period of 1927.

Employment in Detroit continues to increase, the total gain for the past week amounting to a little more than 1000, and bringing the total to date to nearly 370,000.

There has been no change in the price of automotive steel, the price structure remaining firm. Blue annealed sheets are quoted at 2.10c. to 2.20c. base, Pittsburgh. Auto body sheets are quoted at 4.15c., Pittsburgh. Likewise, there has been no fluctuation in the alloy steel bar list.

The steady increase in industrial production has kept industrial construction active. The small structural shops are carrying a good volume of work. Structural bars, plates and shapes are quoted at 1.90c., Pittsburgh, for small lots and at 1.85c. on contracts.

There has been no change in the market on old material during the past two weeks. Dealers have sufficient orders to cover current production, which is on the highest basis for the year. No sales involving large tonnage have been made. Melters seem to be buying very close to their actual requirements. Prices are the same as were quoted in the March 29 issue.

Dealers' buying prices per gross ton, f.o.b. cars, Detroit:

Heavy melting and shoveling steel	$11.00 to $11.50
Borings and short turnings	7.25 to 7.75
Long turnings	6.75 to 7.25
No. 1 machinery cast	14.00 to 15.00
Automobile cast	19.50 to 21.00
Hydraulic compressed sheets	9.75 to 10.25
Stove plate	11.00 to 12.00
No. 1 busheling	8.50 to 9.00
Sheet clippings	6.00 to 7.00
Flashings	9.25 to 9.75

Canada

Outlook Continues Good for Steel—Railroad Expansion in Prospect

TORONTO, ONT., April 10.—The outlook in the iron and steel industry of Canada for the second quarter is bright. Canadian mills are experiencing one of the best years since the war. Most of the mills are running close to capacity. Robert Dodds, chairman board of directors and president Lake Superior Corporation, and a director of the Algoma Steel Corporation, Sault Ste. Marie, Ont., announced that the Algoma Steel Corporation is now in the best position it has enjoyed in a great many years; that the net earnings of the company are running approximately $500,000 ahead of the corresponding period last year and that all indications point to this figure being increased to around $1,000,000 by the end of June.

The improvement in the steel industry is not confined to the Algoma Steel Corporation. The Dominion Iron & Steel Co., Sydney, N. S., has large orders on hand for rails and various other iron and steel products. The Steel Co. of Canada, Ltd., Hamilton, Ont., is running practically at capacity, and as its products are more diversified than the two companies mentioned, it has been even more favored than the others in securing new business. The programs of the Canadian National Railways and the Canadian Pacific are expected to result in even greater improvement in the steel industry before the end of the year.

Pig Iron.—Following the active buying movement of the past two or three weeks, during which many melters covered for second quarter needs, foundry and malleable pig iron sales declined somewhat during the week. Spot sales are holding at a high level, orders ranging from 100 to 200 tons. The higher melt by foundries is reflected in a stronger demand for foundry and malleable iron, but the low prices prevailing in the United States, together with the strong competition in Canadian markets from that quarter, are holding quotations in this country at a low level.

Prices per gross ton:

Delivered Toronto	
No. 1 foundry, sil. 2.25 to 2.75	$23.60
No. 2 foundry, sil, 1.75 to 2.25	23.60
Malleable	23.60
Delivered Montreal	
No. 1 foundry, sil. 2.25 to 2.75	$24.50 to $25.00
No. 2 foundry, sil. 1.75 to 2.25	24.50 to 25.00
Malleable	24.50 to 25.00
Basic	24.00
Imported Iron at Montreal Warehouse	
Summerlee	33.50
Carron	33.00

Rails.—Hon. C. A. Dunning, Minister of Railways and Canals, informed the Railway Committee of the House of Commons that charters for 3233 miles of railway in Canada were being applied for by companies other than the Canadian National and Canadian Pacific. The cost of this mileage he estimated at about $173,000,000. In addition there are applications before the Provincial legislatures which bring the total mileage up to approximately 4400 miles, with an estimated cost of $242,000,000. This does not include equipment, which would make the total proposed expenditure approximately $300,000,000.

Old Material.—While sales on spot account are holding well up to those of former weeks, business as a whole declined somewhat during the past few days.

Old material prices are firm but unchanged in Montreal and Toronto markets.

Dealers' buying prices:

Per Gross Ton	Toronto	Montreal
Heavy melting steel	$9.00	$8.00
Rails, scrap	10.00	10.00
No. 1 wrought	9.00	11.00
Machine shop turnings	7.00	6.00
Boiler plate	7.00	7.00
Heavy axle turnings	7.50	7.50
Cast borings	7.50	6.00
Steel turnings	7.00	6.50
Wrought pipe	5.00	6.00
Steel axles	14.00	19.00
Axles, wrought iron	16.00	21.00
No. 1 machinery cast	....	16.00
Stove plate	....	12.00
Standard carwheels	....	14.50

Malleable scrap	13.00	....

Cincinnati

Pig Iron Sales Exceed 10,000 Tons—Sheet Prices Weaker

CINCINNATI, April 10.—For the first time in several months, pig iron sales during the past week exceeded 10,000 tons. However, three orders made up a large part of the total, so that the buying is not indicative of widespread consumer interest. In fact, the absence of important inquiries is noticeable and gives little encouragement to dealers who have been expecting a pick-up in bookings. Lake Erie furnaces are reported to be making quotations in this district which range from $16.25 to $16.75, base Cleveland, with somewhat irregular observance of silicon differentials. In the South, both Alabama and Tennessee makers are asking $16, base Birmingham, but are getting little business north of the Ohio River. At Ironton, furnace interests claim to be holding to a base price of $19, but concessions of as much as $1 a ton have been made to obtain tempting orders. It can safely be said that Ironton companies are moving little iron, and even if quotations are shaded their market is still seriously circumscribed by competition from northern Ohio furnaces. Jackson County silvery iron is steady at $25, base furnace, for 8 per cent. The largest pig iron sale of the week was 4000 tons of Southern foundry. Hamilton Coke & Iron Co., Hamilton, Ohio, expects to blow in its new furnace the second week in May. This furnace will supply hot metal to the open-hearth furnaces of the American Rolling Mill Co. at its East Side Works in Middletown.

Prices per gross ton, delivered Cincinnati:

So. Ohio fdy., sil. 1.75 to 2.25	$20.89
So. Ohio malleable	$20.14 to 20.89
Alabama fdy., sil. 1.75 to 2.25	19.69
Alabama fdy., sil. 2.25 to 2.75	20.19
Tennessee fdy., sil. 1.75 to 2.25	19.69
Southern Ohio silvery, 8 per cent	26.89

Freight rates, $1.89 from Ironton and Jackson, Ohio; $3.69 from Birmingham.

Finished Material.—With the opening of the second quarter, there has been somewhat of a let down in the number of orders placed by sheet consumers, and concessions are being made by certain mills to get business. In galvanized stock, for instance, 3.65c., base Pittsburgh, is rapidly becoming the basis for transactions, even though some producers are still nominally adhering to 3.75c. Irregular quotations prevail throughout the South, where competition for the roofing trade is intense. Black sheets are being sold to large customers at 2.80c. and in some cases at 2.75c., but mills still are insisting upon small users paying 2.90c. A leading producer in this district has reduced automobile body sheets to 4c., blue annealed to large buyers to 2c. and black to 2.75c. On the two latter grades $2 a ton higher is asked for the ordinary run of business. The American Rolling Mill Co. reports that its four units are continuing to operate at 100 per cent of capacity. With the coming of mild weather there has been a revival of activities in structural steel, although sizable jobs are scarce. Small fabricators, however, are well pleased with the amount of work which they are obtaining. Sales of bars have been only fair, but specifications against old contracts have been large. Bars, structural shapes and plates are quoted at 1.85c. to 1.90c., base Pittsburgh. Common wire nails are being sold at $2.55 per keg, base Ironton, with a barge rate to this city of 14c., thus making a delivered price in Cincinnati of $2.69. Several Eastern sellers are holding to $2.65 per keg, base Pittsburgh, but cannot get desirable orders at that figure.

Warehouse Prices, f.o.b. Cincinnati

	Base per Lb.
Plates and structural shapes	3.40c.
Bars, soft steel or iron	3.30c.
New billet reinforcing bars	3.15c.
Rail steel reinforcing bars	3.00c.
Hoops	4.00c. to 4.25c.
Bands	3.95c.
Cold-finished rounds and hexagons	3.85c.
Squares	4.35c.
Black sheets (No. 24)	4.05c.
Galvanized sheets (No. 24)	4.90c.
Blue annealed sheets (No. 10)	3.60c.
Structural rivets	3.85c.
Small rivets	65 per cent off list
No. 9 annealed wire, per 100 lb.	$3.00
Common wire nails, base per keg	2.95
Cement coated nails, base 100 lb. keg	2.95
Chain, per 100 lb.	7.55
	Net per 100 Ft.
Lap-welded steel boiler tubes, 2-in.	$18.00
4-in.	38.00
Seamless steel boiler tubes, 2-in.	19.00
4-in.	39.00

Reinforcing Bars.—The Pollak Steel Co. will furnish 500 tons of rail steel bars for the Broadway garage, this city, and a like amount for the new building of the Young Men's Christian Association in Dayton, Ohio. Joseph T. Ryerson & Son Co., Inc., has been awarded 800 tons of new billet bars for the Dayton Biltmore Hotel, Dayton, while bids are being taken on 300 tons of bars for a municipal sewage plant at Dayton. New billet bars are selling at 1.85c. to 1.95c., base Pittsburgh, and rail steel stock at 1.80c. to 1.85c., base mill.

Warehouse Business.—Orders are being received at a moderate rate by local jobbers. Structural steel is in fairly good demand, while bars and tank plates also are active. Prices are unchanged.

Coke.—Specifications for by-product foundry coke from foundries affiliated with the automobile industry have fallen off, and shipments in April are likely to be considerably less than in March. On the other hand, sales of domestic coke have been greatly stimulated by the sharp decline in prices, with the result that dealers are taking advantage of the opportunity. A consumer in this district has taken 2000 tons of Wise County foundry coke for delivery in this quarter. However, the demand for beehive foundry and furnace coke from the Wise County and New River sections has been light.

Foundry coke prices per net ton, delivered Cincinnati: By-products coke, $9.02; Wise County coke, $7.09 to $7.59; New River coke, $9.09 to $9.59. Freight rates, $2.14 from Ashland, Ky.; $2.59 from Wise County and New River ovens.

Old Material.—Heavy melting steel has advanced 50c. a ton, but other items have not changed. Steel plants in the district are operating at a high rate and are accepting a normal amount of material on current contracts. Blast furnace and foundry grades, on the other hand, are slow. Railroads are offering unusually large lists this month, the Southern having 9000 tons, Louisville & Nashville, 14,000; Chesapeake & Ohio, 9400, and Norfolk & Western, 16,400. Included in the total tonnages are approximately 14,000 tons of rails.

Dealers' buying prices per gross ton f.o.b. cars, Cincinnati:

Heavy melting steel	$11.50 to $12.00
Scrap rails for melting	11.75 to 12.25
Loose sheet clippings	8.50 to 9.00
Bundled sheets	9.50 to 10.00
Cast iron borings	8.00 to 8.50
Machine shop turnings	7.50 to 8.00
No. 1 busheling	10.00 to 10.50
No. 2 busheling	7.00 to 7.50
Rails for rolling	12.50 to 13.00
No. 1 locomotive tires	12.75 to 13.25
No. 1 railroad wrought	10.00 to 10.50
Short rails	15.75 to 16.25
Cast iron carwheels	12.25 to 12.75
No. 1 machinery cast	15.50 to 16.00
No. 1 railroad cast	13.00 to 13.50
Burnt cast	7.50 to 8.00
Stove plate	8.25 to 8.75
Brake shoes	9.50 to 10.25
Railroad malleable	12.00 to 12.50
Agricultural malleable	11.50 to 12.00

*Refinery quotation; delivered price ¼c. higher.

New York, April 10.—Market activities have been slowed up both here and abroad by the Easter holidays. There were no markets here or in London on April 6 and 7 and also none in London yesterday, April 9. The markets generally are quiet and prices are firm.

Copper.—Buying, both for foreign and domestic consumption, is very light following the holidays and it has been so during all of the last week. A small amount of electrolytic copper has been obtainable at a slight concession from the ruling quotation of 14.25c., delivered in the Connecticut Valley, but it is likely that nothing can be bought today under the price maintained by leading producers. The quotation of Copper Exporters, Inc., is unchanged at 14.50c., c.i.f. usual European ports. Following the heavy buying in March, a quiet but firm market is anticipated for the immediate future. Lake copper is only moderately active but firm at 14.30c., delivered.

Tin.—With London closed part of the week, the market here has been much quieter and sales have been lighter. The total for the past week was about 700 tons, half of which was taken by consumers. The market generally is featureless. There is, however, one factor hanging over it. It is expected that, because shipments of Banca tin have been so small the past three months, the quantity accumulated will begin to come out this month and the question arises whether the market can take care of it. Prices both here and in London are down from a week ago because of lack of demand and to the Banca situation. In London spot standard today is quoted at £235 7s. 6d., future standard at £235 15s. and spot Straits at £239 7s. 6d. The Singapore price today was £240 5s. Spot Straits tin at New York today was quoted at 52c. in a weak market because of lack of demand. Arrivals thus far this month have been 2735 tons with 5120 tons reported afloat.

Lead.—Buying previous to the holidays was large, but yesterday and today the market has been fairly quiet. The quotation of the leading interest remains unchanged at 6.10c., New York, as its contract price. In the outside market some sales have been made in the East as high as 6.15c. The quotation at St. Louis is firm at 6c. Very little activity is reported from that district.

Zinc.—With consumers of prime Western zinc well covered for nearby needs and with producers not anxious to do business, the market is quiet and the quotation has been firm for the week at 5.75c., St. Louis, or 6.10c., New York. Ore at Joplin was unchanged at the close of last week at $38 per ton, with production still fairly low at about 9500 tons and sales larger than production at close to 11,000 tons. Distress metal, which was pressing on the market in March, is believed to have been practically all absorbed.

Nickel.—Ingot nickel in wholesale lots is quoted unchanged at 35c. with the metal in the form of shot at 36c. and with electrolytic nickel at 37c. a lb.

Antimony.—Chinese metal for all positions is a little higher and is quoted at 9.62½c. to 9.75c., New York, duty paid.

Aluminum.—Virgin metal, 98 to 99 per cent pure, is quoted at 23.90c. per lb., delivered.

Non-Ferrous Metals at Chicago

Chicago, April 10.—This market is quiet. Prices for tin are down while quotations on lead and zinc have

Metals from New York Warehouse

Delivered Prices Per Lb.

Tin, Straits pig	54.50c. to 55.50c.

advanced. Prices for old metals are unchanged in a dull market.

Prices, per lb., in carload lots: Lake copper, 14.25c.; tin, 54c.; lead, 6.15c.; zinc, 5.85c.; in less-than-carload lots, antimony, 11.50c. On old metals we quote copper wire, crucible shapes and copper clips, 10.50c.; copper bottoms, 9.50c.; red brass, 9.25c.; yellow brass, 7c.; lead pipe, 4.75c.; zinc, 3.25c.; pewter, No. 1, 30c.; tin foil, 36c.; block tin, 45c.; aluminum, 11.75c.; all being dealers' prices for less-than-carload lots.

FABRICATED STRUCTURAL STEEL

New York Office Building Will Require 17,000 Tons—Awards Decline to 32,000 Tons

AN office building in New York which will take 17,000 tons brought the total of new projects reported during the week to 37,200 tons. Lettings amounted to 32,000 tons, the largest being 8000 tons for a bridge across the Delaware River at Tacony, Pa., 6000 in bridges for the Chicago & North Western Railroad and 7000 tons for miscellaneous projects in New York. Awards follow:

BOSTON, 100 tons, post office garage to New England Structural Co.

LAWRENCE, MASS., 150 tons, highway bridge, to New England Structural Co.

NEW YORK, 13,500 tons reported to the Structural Steel Board of Trade; 7000 tons in the following awards not previously reported: National City Bank at Jamaica, L. I., factory building for Consolidated Safety Pin Co. at Bloomfield, N. J., and building for Starlight Amusement Park on 177th Street, to McClintic-Marshall Co.; office building at 666 Fifth Avenue, column cores for building at Canal and Hudson Streets, column cores for building at Varick and Dominick Streets and alteration for Borden Building at Hollis, L. I., to Levering & Garrigues Co.; tenement building at 148 East Fiftieth Street, to Hay Foundry & Iron Works; office building at Church and Worth Streets, to Harris Structural Steel Co., and loft building at Fifth Avenue and Twenty-ninth Street, to Post & McCord, Inc.

NEW YORK, 1065 tons, apartment building at Park Avenue and Eighty-third Street, to Easton Structural Steel Co.

NEW YORK, 200 tons, pier No. 34, North River, to McClintic-Marshall Co.

NEW YORK CENTRAL RAILROAD, 125 tons, bridge, to American Bridge Co.

ORANGE COUNTY, N. Y., 200 tons, State highway bridge, to American Bridge Co.

PENNSYLVANIA RAILROAD, 125 tons, bridge in Indiana, to American Bridge Co.

LOCK HAVEN, PA., 250 tons, high school, to Shippers Car Line Corporation.

WILLIAMSPORT, PA., 300 tons, Y. W. C. A., to McClintic-Marshall Co.

PHILADELPHIA 8000 tons, Tacony-Palmyra bridge, to American Bridge Co.

CAMDEN, N. J., 250 tons, plant for Campbell Soup Co., to McClintic-Marshall Co.

McKEES ROCKS, PA., 100 tons, church, to Pittsburgh-Des Moines Steel Co.

NEW CASTLE, PA., 400 tons, Shenango Motor Co. building, to Guibert Steel Co.

WILKENSBURG, PA., 500 tons, office building, to American Bridge Co.

OXFORD, OHIO, 100 tons, grandstand, to Pittsburgh-Des Moines Steel Co.

CANTON, OHIO, 200 tons, stripper building for Timken Roller Bearing Co., to McClintic-Marshall Co.

WILMINGTON, N. C., 2100 tons, bridge, to Vincennes Bridge Co.

DETROIT, 250 tons, building for Finsterwald Furniture Co., to Massillon Bridge & Structural Co.

STATE OF MICHIGAN, 300 tons, three highway bridges, to Massillon Bridge & Structural Co.

Old Metals, Per Lb., New York

The buying prices represent what large dealers are paying for miscellaneous lots from the smaller accumulators and the selling prices are those charged consumers after the metal has been properly prepared for their use.

	Dealers' Buying Prices	Dealers' Selling Prices
Copper, heavy crucible	12.00c.	13.50c.
Copper, heavy and wire	11.75c.	12.875c.
Copper, light and bottoms	10.00c.	11.25c.
Brass, heavy	7.00c.	8.50c.
Brass, light	6.00c.	7.50c.
Heavy machine composition	9.50c.	10.625c.
No. 1 yellow brass turnings	7.75c.	9.00c.
No. 1 red brass or composition turnings	8.75c.	9.75c.
Lead, heavy	5.00c.	5.50c.
Lead, tea	4.00c.	4.50c.
Zinc	3.00c.	3.50c.
Sheet aluminum	12.50c.	14.50c.
Cast aluminum	12.50c.	14.00c.

CHICAGO, 260 tons, building for W. F. McLaughlin Co., to American Bridge Co.

CHICAGO & NORTH WESTERN RAILROAD, 6000 tons, bridges; 5400 tons, to American Bridge Co., and 600 tons, to Clinton Bridge Works, Clinton, Iowa.

CHICAGO, 1100 tons, building for Chicago Motor Club, to American Bridge Co.

CHICAGO, 4000 tons, building for Palmolive Peet Co., to American Bridge Co.; previously reported to unnamed bidder.

SAUKVILLE, WIS., 200 tons, State highway span over Milwaukee River, to Worden-Allen Co.

OGDEN, UTAH, 600 tons, train sheds, to Omaha Steel Works.

RENO, NEV., 200 tons, office building, to California Steel Co.

PORTLAND, ORE., 800 tons plates, three lightships for Government, to Albina Marine Engine Works.

GLENDALE, CAL., 650 tons, school buildings, to Llewellyn Iron Works.

Structural Projects Pending

Inquiries for fabricated steel work include the following:

FITCHBURG, MASS., 175 tons, theater.

LEOMINSTER, MASS., 150 tons, theater.

BOSTON, 200 tons, New York, New Haven & Hartford Railroad freight station.

BOSTON, 175 tons, theater on Hanover Street.

STATE OF NEW HAMPSHIRE, 500 tons, highway bridges.

NEW YORK, 17,000 tons, Reynolds office building at Lexington Avenue and Forty-second Street.

NEWARK, N. J., 1800 tons, bridge for Lehigh Valley Railroad.

NEW BRUNSWICK, N. J., 400 tons, arch centers for reinforced concrete bridge; bids in on general contract.

ALLENTOWN, PA., 280 tons, arch centers for reinforced concrete bridge; general contract to Seeds & Durham, Germantown, Pa.

WILMINGTON, DEL., 800 tons, highway bridge.

BALTIMORE, 400 tons, St. Mary's Seminary.

CHARLESTON, W. VA., 1700 tons, office building and bank.

WILMINGTON, N. C., 500 tons, electric station for Phoenix Utility Co.

BUFFALO, 750 tons, Buffalo Forum, ice skating rink; bids April 20.

CINCINNATI, 300 tons, St. Gregory's Seminary.

CLEVELAND, 1000 tons, Lake Shore Hotel.

PORTAGE, WIS., 350 tons, Wisconsin Street lift span over Government canal; bids about May 15, J. T. Henton, County highway commissioner.

CHICAGO, 250 tons, addition to Revell Building.

CHICAGO, 110 tons, power house for Chicago, Burlington & Quincy Railroad; American Bridge Co., low bidder.

CHICAGO, 3000 tons, 24-story apartment building.

CHICAGO, 1000 tons, office building at LaSalle and Lake Streets.

STATE OF ILLINOIS, 900 tons, highway bridges at Florence, Ingleside and Willow Springs.

NEW ORLEANS, 3100 tons, wharf sheds at Girod and Poydras Streets.

SAN DIEGO, CAL., 400 tons, seaplane hangar.

CRESCENT CITY, CAL., 600 tons, cantilever bridge.

HERMON, CAL., 900 tons, bridge.

OAKLAND, CAL., 350 tons, hangars for City Port Commission; Moore Drydock Co., low bidder.

LOS ANGELES, 150 tons for city work; McClintic-Marshall Co., low bidder.

Rolling mill machinery of the cluster type will be supplied by the E. W. Bliss Co., Brooklyn, to the Hirsch-Kupfer & Messingwerks, of Germany, in whose interest Messrs. Hirsch, Mata, Loewenstein and Seeger have been touring the United States, inspecting latest improvements in rolling mill equipment.

REINFORCING STEEL

New Projects Will Take 9300 Tons, With 5000 Tons in Illinois Sewer Job

WITH 5000 tons for a sewer project at Stickney, Ill., and 2000 tons for road work in the same State, about 9300 tons of reinforcing steel was added to pending work in the last week. Lettings amounted to 4300 tons, the largest of which was 1100 tons for road work in Illinois. Awards follow:

Cincinnati, 500 tons, Broadway Garage, to Pollak Steel Co.
Dayton, Ohio, 500 tons, Young Men's Christian Association building, to Pollak Steel Co.
State of Illinois, 1100 tons of rail steel bars for road work; 600 tons to Calumet Steel Co., 400 tons to Republic Iron & Steel Co., and 100 tons to Truscon Steel Co.
Chicago, 140 tons of rail steel bars, apartment building at 440 Barry Avenue, to Calumet Steel Co.
Chicago, 100 tons of rail steel bars, grain elevator, to Inland Steel Co.
Chicago, 200 tons of rail steel bars, office building at 30 West Washington Street, to Inland Steel Co.
Chicago, 100 tons of rail steel bars, apartment building at Deming and Geneva Streets, to Inland Steel Co.
Chicago, 190 tons, garage at Greenview and Greenwood Avenues, to unnamed bidder.
National City, Ill., 115 tons, additions to building at National Stock Yards, to Laclede Steel Co.
St. Louis, 250 tons, Mark Twain Hotel, to Laclede Steel Co.
Los Angeles, 663 tons, for city of Los Angeles, to Blue Diamond Co.
Riverside, Cal., 120 tons, Victoria Avenue bridge, to unnamed bidder.
San Francisco, 110 tons, Produce Building, to W. S. Wetenhall Co.
Seattle, Wash., 200 tons, Stimson Building, to unnamed interest.

Reinforcing Bars Pending

Inquiries for reinforcing steel bars include the following:

Dayton, Ohio, 300 tons, municipal sewage plant.
Stickney, Ill., 5000 tons, sewer project.
Springfield, Ill., 2000 tons, State road work.
Aurora, Ill., 350 tons, reservoir.
Evanston, Ill., tonnage not stated, apartment building; Hall, Radcliff & Lawrence, architects.
Evanston, tonnage being estimated, Young Men's Christian Association building.
Los Angeles, 5257 tons, Drainage Improvement District No. 23; Will F. Peck, low bidder on general contract.
San Francisco, 212 tons, Kezar stadium; bids opened.
Seattle, Wash., 1000 tons, warehouse for Peck & Hills Furniture Co.; bids being taken.
Seattle, 420 tons, warehouse for William Volker; bids being taken.

Steel Corporation's Unfilled Orders Declined in March

Unfilled orders on the books of the United States Steel Corporation declined moderately in March. The total on March 31 was 4,335,206 tons, a decrease of 62,983 tons from the 4,398,189 tons on Feb. 29. In February there was a gain of 122,242 tons, the fifth month in succession. A year ago in March the unfilled orders were 3,553,140 tons. The following table gives the unfilled tonnage by months, commencing with January, 1926:

	1928	1927	1926
Jan. 31.......	4,275,947	3,800,177	4,882,739
Feb. 28.......	4.398,189	3,597,119	4,616,822
Mar. 31.......	4,335,206	3,553,140	4,379,935
April 30.......	....	3,456,132	3,867,976
May 31.......	....	3,050,941	3,649,250
June 30.......	....	3,053,246	3,478,642
July 31.......	....	3,142,014	3,602,522
Aug. 31.......	....	3,196,037	3,542,335
Sept. 30.......	....	3,148,113	3,593,509
Oct. 31.......	....	3,341,040	3,683,661
Nov. 30.......	....	3,454,444	3,807,447
Dec. 31.......	....	3,972,874	3,960,969

The high record in unfilled orders was 12,183,093 tons at the close of April, 1917. The lowest was 2,674,757 tons on Dec. 31, 1910.

The Carnegie Steel Co. will add a 16-stand 10-in. electrically driven merchant mill to its McDonald, Ohio, group for rolling cotton ties and narrow strips. An identical mill is to be built by the Tennessee Coal, Iron & Railroad Co. at Fairfield, Ala.

RAILROAD EQUIPMENT

St. Paul Road Buys 4450 Freight Cars—Texas & Pacific Inquires for 20 Locomotives

PLACING of 4450 freight cars by the Chicago, Milwaukee, St. Paul & Pacific and of 600 steel underframes for refrigerator cars by the Pacific Fruit Express were the outstanding transactions of the railroad equipment market in the last week. The Texas & Pacific has inquired for 20 locomotives. Details of the week's business follow:

Chicago, Milwaukee, St. Paul & Pacific has placed orders for 4450 freight cars distributed as follows: 500 box cars with Pressed Steel Car Co.; 1250 box cars with Bettendorf Co.; 500 box cars with General American Car Co.; 250 box cars with Pacific Car & Foundry Co.; 500 hopper cars with Standard Steel Car Co.; 500 hopper cars with Pullman Car & Mfg. Corporation; 650 stock cars with Ryan Car Co., and 300 automobile cars with American Car & Foundry Co. With the 200 ore cars reported purchased last week, this road's original inquiry has been entirely acted upon.

Pacific Fruit Express has ordered 600 steel underframes for refrigerator cars from American Car & Foundry Co. to be used for building cars in its own shops.

Egyptian State Railways are inquiring for 320 low-side gondola cars of 10 tons' capacity.

Detroit, Toledo & Ironton will purchase two baggage mail and two passenger coaches.

Pennsylvania Railroad is considering reviving its inquiry for 300 passenger train refrigerator cars.

Atchison, Topeka & Santa Fe has ordered 15 locomotive tenders from Baldwin Locomotive Works.

Texas & Pacific has made inquiry for 15 2-10-4-type and five Mountain-type locomotives.

Dominion Coal Co. has ordered one Mogul-type and one Mikado-type locomotives from American Locomotive Co.

Akron, Canton & Youngstown has ordered two Mikado-type locomotives from Lima Locomotive Works, Inc.

San Francisco Iron and Steel Market

(*Concluded from page* 1047)

mosa Beach, Cal. Bids were opened on 127 tons of 6-in. class B for the improvement of Washington Street, Riverside, Cal. Los Angeles has opened bids on 234 tons of 24-in. class B pipe and Monrovia, Cal., will open bids on April 16 for 2764 tons of 4 to 16-in. class B and 20-in. class A pipe.

Standard Pipe.—H. G. Cult, Brighouse, B. C., took 510 tons of 4 and 6-in. seamless pipe for Brighouse, B. C. The Pacific Gas & Electric Co., San Francisco, placed 2600 tons of 8 to 36-in. standard pipe with an Eastern producer. Monrovia, Cal., will take bids on April 16 for 710 tons of 4 to 20-in. lapweld pipe dipped and wrapped. Bids have been opened on 125 tons of 2 to 8-in. pipe for Armona, Cal.

Rails.—The Seattle Municipal Railway is taking bids on 200 tons of 80 lb. rail. No other inquiries of importance are before the trade for figures at the moment.

Coke.—Demand for coke is spotty and few inquiries or sales of size are noted. Another shipment of English beehive and by-product coke is en route to the Coast and will arrive about May 6. This vessel has 4500 tons aboard and the bulk of the shipment will be distributed between Los Angeles and San Francisco foundries.

PERSONAL

C. M. EASTERLY

Charles M. Easterly, whose resignation as vice-president of the Inland Steel Co. of Wisconsin, Milwaukee, and district manager of the Inland company at that city, was mentioned in THE IRON AGE last week, will now devote his entire time to the Capital City Culvert Co., Madison, Wis., of which he is president and majority stockholder. He will remove his headquarters to Madison. Mr. Easterly was district sales manager for the Inland Steel Co. for 18 years and previously represented the Berger Mfg. Co., Canton, Ohio, and the Stark Rolling Mill Co., also of Canton, now divisions of the Central Alloy Steel Corporation.

—

O. W. Irwin has been appointed manager of the steel joist department of the Truscon Steel Co., Youngstown, succeeding John Bowditch, Jr., who has resigned to locate in Pittsburgh. Mr. Irwin has been in the sales department of the Truscon company for many years.

—

Ralph N. Sourbeck, recently sales engineer with the Clarkson Coal & Dock Co., Cleveland, has become associated with the Cleveland Duplex Machinery Co., Inc., Cleveland, and will be in charge of its surplus machinery department. In his new capacity he will purchase and liquidate industrial plants and supervise the rebuilding of machine tools.

—

Robert Weatherly, assistant sales manager of the Federal Abrasives Co., Birmingham, has been appointed sales manager of that company and other subsidiaries of the Federal Electrochemical Co., namely the Federal Phosphorus Co., the Federal Carbide Co. and the Southern Manganese Corporation. His headquarters will be at the Birmingham offices of these companies. S. D. Crenshaw, Jr., and H. P. Walmsley have been appointed assistant sales managers of the Federal Abrasives Co., and will maintain headquarters at Birmingham and Philadelphia, respectively.

—

Charles E. Ahl, formerly with the Vesuvius Crucible Co., now is associated with J. B. Booth & Co., Pittsburgh. This company represents Hiram Swank's Sons, Johnstown, Pa., refractories manufacturers, in the Pittsburgh district, and Mr. Ahl will devote his time to the sale of its products.

—

William C. Smith, manager of the Fulton, N. Y., plant of the McHenry-Millhouse Mfg. Co., has been elected a vice-president of the company and will continue in charge of the plant.

—

Henry Sears Hoyt, of A. Milne & Co., 745 Washington Street, New York, steel and iron merchants, sailed for Havana, Cuba, on April 6 and will visit his firm's distributers in that country.

—

F. P. Walsh has been appointed manager of the crane department, and R. H. Moore, manager of the foundry equipment department of the Whiting Corporation, Harvey, Ill.

—

Edwin B. Peet, who was associated with the E. W. Bliss Co., Brooklyn, several years ago, has returned to that company and will devote himself principally to the sale of can making machinery and allied products.

Virgil Jordan, chief economist of the National Industrial Conference Board, New York, will be the principal speaker at the monthly luncheon and business meeting of the Credit Association of the Building Trades of New York at the Hotel McAlpin in that city on Tuesday, April 24.

—

W. H. Graham is in charge of a district sales office which has been opened at 1 East Forty-second Street, New York, by the Graham Bolt & Nut Co., Pittsburgh. His territory will include metropolitan New York and New England.

—

M. L. Northrup, New England manager of the Warren Foundry & Pipe Co., Phillipsburg, N. J., is back at his office in Boston, after an extended rest in Florida following an operation.

—

A. H. McDougall, vice-president Whiting Corporation, Harvey, Ill., will speak at a meeting of the St. Louis District Foundrymen's Club at the Missouri Athletic Association on April 17, his subject being "Cupola Practice." H. R. Cutting, Carondelet Foundry Co., St. Louis, will lead a discussion of the work done recently at Pittsburgh toward the establishment of a research group on gray iron foundries.

—

Tom D. Taylor, metallurgist Bliss & Laughlin Steel Corporation, Harvey, Ill., addressed the monthly meeting of the Indianapolis chapter of American Society for Steel Treating, April 9, on the subject of "Cold Drawn Steels."

—

Joseph H. Jeffcott has recently become associated with the Vulcan Mold & Iron Co., Latrobe, Pa., in the sales and service department, taking the place of Thomas Windsor Evans, resigned. Mr. Jeffcott has been connected with the iron and steel industry for the past 20 years in both operating and sales capacities. His early experience was in the ingot mold foundry of the Bethlehem Steel Co., where he later was in charge of the Lower Works open-hearth department. He has also been connected with the Donner Steel Co., Buffalo, as open-hearth superintendent and more recently with the Jones & Laughlin Steel Corporation, Pittsburgh, at its Soho plant.

—

D. E. McLaughlin, formerly vice-president, was elected president of the Pacific Coast Steel Co., San Francisco, at the annual meeting of stockholders. He succeeds the late Judge E. M. Wilson. William Pigott was named chairman of the board of directors, E. S. Houdlette and T. S. Clignan were elected vice-presidents and William Pigott, Jr., was reelected secretary-treasurer.

—

C. B. S. Jackson, for the last six years superintendent of the Norton Iron Works, Ashland, Ky., has been appointed superintendent of the Texas Nail & Wire Mfg. Co., Galveston, Tex.

—

Harry Woodhead has been appointed general manager of the Cleveland plant of the Truscon Steel Co., Youngstown, Ohio. This was formerly the East Side plant of the Hydraulic Pressed Steel Co. and will be known as the Hydraulic Pressed Steel Division of the Truscon Steel Co. Mr. Woodhead had been with the Hydraulic company for several months and was previously connected with the Midland Steel Products Co., Cleveland, and the A. O. Smith Corporation, Milwaukee.

—

H. K. Ferguson, president H. K. Ferguson Co., Cleveland, has been elected president of the University Club of that city.

—

Dudley V. Walker, sales agent Vulcan Iron Works, New Britain, Conn., has been made general manager of the Malleable Iron Works, New Britain, succeeding Frank Miller.

—

Marcus Chase has resigned as manager of the Boston office of the Niles-Bement-Pond Co. He has been associated with the company for approximately 30 years.

M. S. Bradley, who has been with the company for 15 years, is acting manager. W. S. McCormick has resigned as manager of the Pittsburgh office of the Niles company, and P. C. McBeth is acting manager.

F. F. Harter has been appointed district sales manager for New York and eastern Pennsylvania of the Cyclops Steel Co., Titusville, Pa., and the Universal Steel Co., Bridgeville, Pa. His headquarters for the present will be at the office of the Cyclops company at Titusville.

O. W. Young, formerly in the western division sales office of the Hyatt Roller Bearing Co., Chicago, has been appointed chief engineer and will be located at the company's headquarters in Newark, N. J. He joined the Hyatt company in 1915 as sales engineer, serving in that capacity for several years. He then took charge of all engineering activities of the western division, and during the last two years was assistant manager in charge of sales to the tractor and agricultural equipment industry.

Philip Stremmel, who has been acting superintendent of the Granite City Steel Co., Granite City, Ill., has been made general superintendent.

George L. Meyer, Jr., for a number of years purchasing agent of the Stewart-Warner Speedometer Corporation, Chicago, has been put in charge of production and will retain supervision over purchases of the company.

Charles R. McGrail has been appointed metallurgist and chemist at the Sheffield Works of Fairbanks, Morse & Co., Three Rivers, Mich.

E. C. Smith, assistant general superintendent of the Central Alloy Steel Corporation, Massillon, Ohio, spoke before the Hartford, Conn., chapter of the American Society for Steel Treating on April 10, on the manufacture and application of high grade automotive alloy steels.

William S. McCormick, who resigned recently as Pittsburgh sales manager for the Niles Tools Works Co., Hamilton, Ohio, and the Pratt & Whitney Co., Hartford, Conn., is now Western sales representative for Leeds, Tozzer & Co., Inc., 75 West Street, New York.

H. W. Kent has resigned as president of the Todd Drydocks, Inc., Seattle, and will devote his time to private interests. He will continue as a director of the Todd company.

George T. Aitken has been appointed manager of industrial sales for the Peden Iron & Steel Co., Houston, Tex. He was formerly associated with Fairbanks, Morse & Co. at Indianapolis and previously had been sales manager of the Vonnegut Machinery Co., Indianapolis.

R. L. Rickwood, supervisor of design for the Cincinnati Bickford Tool Co., Cincinnati, has resigned to become mechanical superintendent of the Cincinnati Enquirer Building. He will be succeeded by Thomas Addison, formerly of the Cincinnati Planer Co.

H. C. White has been appointed works manager for the Western Harvester Co., Stockton, Cal. He had had charge of the plant when it was operated by the Holt Mfg. Co.

W. R. Bean, president Grindle Fuel Equipment Co., Harvey, Ill., will speak at the monthly meeting of the Pittsburgh Foundrymen's Association at the Fort Pitt Hotel, Pittsburgh, Monday evening, April 16. "Metallurgical Problems in the Malleable Iron Foundry" will be his subject.

J. W. Innes, recently superintendent of the Kelvinator Co. of Canada, Ltd., has been added to the Toronto sales staff of the Arthur Jackson Machine Tool Co., Toronto, and will cover the Hamilton and Niagara peninsula district in Ontario.

C. A. Wieselthier, purchasing agent for the St. Louis Gas & Coke Corporation, Granite City, Ill., has had his duties expanded to include the purchase of raw materials. Since 1921 raw materials purchases have been made in Chicago under the direction of F. R. Johnson.

President James A. Farrell of the United States Steel Corporation will make the closing address at the fifteenth National Foreign Trade Convention which will be held at Houston, Texas, on April 25, 26 and 27. His subject will be "Foreign Trade Progress." Another feature of the convention program will be an address by E. P. Thomas, president United States Steel Products Co., on "The Foreign Trade Outlook."

Robert Leroy Fatzinger, Carnegie Steel Co., Duquesne, Pa.; Charles B. Francis, Carnegie Steel Co., Pittsburgh; Frank Edward Goeckler, Midvale Co., Philadelphia, and George Thomas Motok, Carnegie Institute of Technology, Pittsburgh, will become members of the Iron and Steel Institute at the annual meeting in London, May 3.

OBITUARY

John Sommer, vice-president and a director and one of the founders of the Keystone Steel & Wire Co., Peoria, Ill., and president of the Mid-States Steel & Wire Co., Crawfordsville, Ind., died on April 7, aged 62 years. He was born at Morton, Ill., and spent his boyhood at that place and at Tremont, Ill. In 1889 he became associated with his father and brother in the manufacture of wire fence at Tremont. The business was removed to Peoria in 1895. In 1901 Mr. Sommer took up his residence at Tremonton, Utah, on account of ill health, where he remained until 1915. Since returning to Peoria he has been prominent in the management of the Keystone company and last year was active in the formation of the Mid-State Steel & Wire Co., organized by a merger of the Crawfordsville Wire & Nail Co., the Dwiggens Fence Co. and the Adrian Wire Fence Co. Two brothers, B. L. and W. H. Sommer are president, and vice-president and general superintendent, respectively, of the Keystone company.

Leroy Pardee Needham, district manager at Chicago for Wheelock, Lovejoy & Co., Inc., Cambridge, Mass., died on March 24 at the Wesley Hospital, Chicago, following an operation. He was born at Coatesville, Pa., in 1890 and was graduated in civil engineering from Pennsylvania State College in 1915. He became associated with Wheelock, Lovejoy & Co., at Cleveland in 1916 and was identified with the sales department of that branch until 1920 when he was made Chicago district manager. During the war he served as an inspector of steels in the Ordnance Department. He was a member of the American Society for Steel Treating.

Robert W. Freeland, works manager Hubbard Steel Foundry Co., East Chicago, Ind., died at Hammond, Ind., on April 5, of pneumonia. He was graduated from the Carnegie Institute of Technology in 1913 and immediately became associated with the American Steel Foundries, Chicago, as a special apprentice. In 1918 he became manager of the steel foundry of the Edgewater Steel Co., Verona, Pa., and in 1920 served as cost accountant of the Steel Founders' Society of America. He had been with the Hubbard company since 1921.

George E. Titcomb, vice-president McMyler Interstate Co., Bedford, Ohio, and for years prominently identified with the material handling equipment industry, died April 1. He was connected for a number of years with the Link-Belt Co., Chicago, and became chief engineer of that company. Later he became affiliated with the McMyler Interstate Co. as its Eastern sales manager in New York and in 1925 became its vice-president. He contributed to the successful development of bridge and gantry cranes, car dumpers and coal and ore handling equipment. He was a member of the American Society of Mechanical Engineers.

—

MATT BRODIE, for the last 10 years manager of the Asiatic business of the Sullivan Machinery Co., Chicago, with headquarters at Tokio, Japan, died on March 25. He was graduated from the Massachusetts Institute of Technology in 1902 and became associated with the Sullivan company as manager of its Salt Lake City, Utah, office. He was then assigned to foreign duty and for eight years was located in Australia where he organized and conducted the company's Sydney office. In 1916 he was placed in charge of the company's interests in Russia, having left that country after the revolution to take over the company's Asiatic sales.

Wrought Iron Research Association Formed

PITTSBURGH, April 10.—The Wrought Iron Research Association came into existence at a meeting of representatives of the leading manufacturers of wrought iron from various parts of the country at the Duquesne Club here last week. The principal aim of the organization is to gather and disseminate information about wrought iron. The members of the association are the American-Swedo Iron Co., Philadelphia; the Burden Iron Co., Troy, N. Y.; A. M. Byers Co., Pittsburgh; the Cohoes Rolling Mill Co., Cohoes, N. Y.; the Ewald Iron Co., Louisville, Ky.; the Glasgow Iron Co., Philadelphia; the Highland Iron & Steel Co., Chicago; Hughes & Patterson, Philadelphia; the Logan Iron & Steel Co., Philadelphia; the Lockhart Iron & Steel Co., Pittsburgh; the Penn Iron & Steel Co., Creighton, Pa.; the Pittsburgh Forge & Iron Co., Pittsburgh; the Reading Iron Co., Reading, Pa., and the Ulster Iron Works, Dover, N. J.

The executive committee consists of George O. Boomer, vice-president Ewald Iron Co.; Frank W. Hamilton, president Ulster Iron Works; J. M. Gillespie, vice-president Lockhart Iron & Steel Co.; L. M. Johnston, vice-president A. M. Byers Co.; Snowden Samuel, secretary American-Swedo Iron Co.; L. E. Thomas, president Reading Iron Co., and William C. Wolfe, manager of sales Highland Iron & Steel Co. L. M. Johnston was elected president, and Snowden Samuel, secretary-treasurer of the association. Headquarters will be in Pittsburgh.

Study of Distribution Costs Suggested for Simonds Essays

"How Can the Costs of Distribution Be Reduced?" was chosen by 64 out of 138 economists and business men as the best subject for the Simonds prize essay competition for 1928. "To stimulate economic thinking and to increase general economic intelligence," Alvan T. Simonds, president Simonds Saw & Steel Co., Fitchburg, Mass., is offering prizes of $1,000 and $500 respectively for the best two essays on an economic subject.

To select a subject for the essays Mr. Simonds submitted a list of six tentative topics to 210 leading economists and business men, asking them to indicate their preference or to suggest some other subject. Of 138 replies received thus far, nearly one-half chose the subject of distribution costs. The next highest number of votes, 26, was cast for the topic, "Is Advertising Costing the Consumer Too Much?" Seventeen indicated a preference for "Can the Purchasing Power of the Dollar Be Stabilized?" Sixteen votes were divided among the three remaining topics, and 15 replies suggested other subjects.

Standard Trade Customs in Steel Foundry Industry

As a guide in governing the operations of its membership, the Steel Founders' Society of America, 511 Magee Building, Pittsburgh, has issued a list of standard trade customs. These are 20 in number and cover both internal and external matters. They form a notable collection of trade data, the definite acceptance and use of which should be of great value to the industry. The list follows:

1.—When purchasers ask for quotations they should give the actual or estimated rough weights of the castings upon which quotations are to be based.

2.—Unless otherwise arranged, quotations should be accepted and pattern equipment furnished to the foundry by the purchaser within 30 days from the date of such quotations.

3.—Unless otherwise specified, castings are sold as unmachined castings, f.o.b. the foundry. Terms of sale are net cash 30 days from date of invoice. No cash discounts are allowed.

4.—Pattern equipment should be in proper condition and of a type suitable for the economical production of castings of the quality, quantity and delivery required.

5.—Before patterns are made, the purchaser should submit blue prints to the foundry that is to make the castings, to obtain suggestions concerning the best method for constructing the pattern equipment.

6.—When the purchaser furnishes skeleton patterns, coreboxes, sweeps or conjunction patterns which increase the cost of production of castings, an extra charge will be made.

7.—Patterns should be painted in accordance with the following standard practice:

> Surfaces to be left unfinished are to be painted black.
> Surfaces to be machined are to be painted red.
> Seats of and for loose pieces are to be red stripes on a yellow background.
> Core prints and seats for loose core prints are to be painted yellow.
> Stop-offs are to be indicated by diagonal black stripes on a yellow base.

8.—Patterns, coreboxes and loose pieces thereof shall be properly marked for identification.

9.—Alterations and repairs on pattern equipment shall be paid for by the customer.

10.—The foundry shall not be responsible for loss of, or damage to pattern equipment when caused by fire or other causes beyond its control.

11.—The foundry shall not be expected to provide storage for patterns for which no orders have been received during a period of two years.

12.—All transportation charges on pattern equipment to and from the foundry shall be paid by the customer.

13.—Unless requested in writing, changes in orders will not be accepted by the foundry.

14.—To be effective, cancellation of orders must be mutually agreed to by the foundry and the customer.

15.—After the original order is in production the customer shall reimburse the foundry for castings made or for molds or cores discarded by the foundry due to cancellation, changes in orders or alterations in pattern equipment.

16.—The foundry shall not be liable for damages due to failure to make delivery of castings when such delay is caused by fire, strikes, accidents or other and additional causes beyond the foundry's control.

17.—Claims for errors in weight or in number of castings received shall be made by the customer within 10 days after the receipt of the castings.

18.—The foundry shall not be responsible for machine work or other expense incurred on castings which are later rejected as defective.

19.—The foundry has the right to replace castings rejected by the customer as defective.

20.—The foundry shall not be liable for any special, indirect or consequential damages whatsoever, in connection with any castings it furnishes.

To Add Normalizing Furnaces

The Newton Steel Co., Newton Falls, Ohio, has ordered from the Rust Engineering Co., Pittsburgh, two additional Kathner-type roller bottom sheet normalizing furnaces, 155 ft. long. These will be the same in practically all regards as the two furnaces recently completed, with the exception that one will be 84 in. wide instead of 72 in., which is the width of the other three. The Kathner-type shafts and disks will be supplied by the Duraloy Co. In the Kathner design of shaft, the entire alloy hub and disk is protected from cooling effect, since the water-cooled shaft upon which it is mounted is completely insulated.

Machinery Markets and News of the Works

MACHINERY BUYING FAIR

April Starts Out Less Actively Than March But Outlook Is Good

Almost Total Absence of Railroad Buying—Automobile Parts Manufacturer Seeks About 30 Used Tools

SALES records for March among machine tool builders were quite generally larger than those of either of the two preceding months this year, so that it would not be surprising if April sales were slightly below last month's. However, some manufacturers expect that the total for the month, based on the present outlook, will not be far from 85 to 90 per cent of the March totals. In the first week of April a few manufacturers bettered their March record for the same number of days.

Automobile manufacturers have to a considerable extent satisfied their needs of new equipment for the high production rate at which they are now engaged, but an outstanding inquiry from this field is for 30 or more used tools wanted by a Michigan maker of automobile parts. The Dana Mfg. Co., Toledo, Ohio, continues to buy for the manufacture of shock absorbers for Ford automobiles.

Railroad buying is conspicuously small; in fact, there is an almost total absence of important business in this field. The list of the Union Pacific, on which the Chicago trade has submitted quotations, totals in value about $200,000. The Rock Island is expected to come into the market shortly. Meanwhile, no action has been taken on the pending inquiries of the Santa Fe.

New York

New York, April 10.

THE first week of April has brought no falling off in orders for machine tools as compared with the average weekly sales in March. Considerable business is pending and, with the general improvement that has come in several lines of manufacture in the past month, the outlook is promising that orders will result this month. Railroad demand, particularly for heavy tools, remains conspicuously dull, but the general inquiry for light and medium-size tools leaves little to be desired. Prices of shapers have been advanced about 10 per cent.

Among the week's sales were the following: A hob and cutter grinder to a manufacturer in Wisconsin; Pratt & Whitney No. 2 jig borer to a Cleveland company; also a No. 2 jig borer to a Michigan company and another to a tool and die company in Detroit; 13-ft. deep-hole drilling machine to a Detroit automobile company; No. 0 Sigourney drill to a company in California; 7 x 32-in. bench lathe to a Brooklyn manufacturer; duplex hand centering machine to a Reading, Pa., company three 8-in. rotary surface grinders to a gear manufacturer in New York State; 16 x 60-in. lathe to a California company; 27-in. x 12-ft. Time-Saver lathe to a Detroit automobile manufacturer; 42-in. rotary planer to a company in San Francisco.

Robert Gair Co., Graybar Building, New York, manufacturer of folding paper boxes, boxboard products, etc., is disposing of stock issue of $10,000,000, portion of proceeds to be used for expansion and improvements. Work is under way on addition to branch plant at Chicago to cost in excess of $250,000.

Best Die Casting & Stamping Corporation, 19 Thompson Street, New York, has leased space at 33 Grand Street for expansion.

Board of Estimate, Municipal Building, New York, has approved an appropriation of $500,000 for a municipal airport on Barren Island, including hangars, shops, oil storage and distributing plants, etc. Project will be in charge of Department of Plant and Structures.

S. Robert Schwartz & Brother, 546 Broadway, New York, manufacturer of electric lighting equipment and appliances, has leased two floors in twelve-story building at 160 Varick Street for expansion and will move to new location.

Seelig & Finkelstein, 44 Court Street, Brooklyn, architects, have plans for an automobile service, repair and garage building, 95 x 105 ft., at Coney Island Avenue and Avenue P, to cost close to $100,000 with equipment.

Quartermaster Supply Officer, Brooklyn, is asking bids until April 19 for grates and forced draft equipment for two 100 hp. boilers; also for two CO_2 indicating and recording meters for boiler units, circular 176.

Union School District, Elmont, N. Y., H. E. Foster, president, is considering installation of manual training equipment in new central high school at Floral Park, N. Y., to cost about $850,000. Knappe & Morris, 171 Madison Avenue, New York, are architects.

American Gas & Electric Co., 30 Church Street, New York, is disposing of a bond issue of $50,000,000, a portion of fund to be used for expansion and improvements, including acquisition of additional utilities. Company operates light and power plants in Pennsylvania, West Virginia, Tennessee, Indiana and other states.

Officials of Radio Corporation of America, Inc., Woolworth Building, New York, have organized R.C.A. Photophone, Inc., to manufacture synchronizing motion picture machines and devices, for "talking" motion pictures in homes. Gen. James G. Harbord, president of parent company, will be chairman of board of new organization; David Sarnoff will be president.

Van Alstyne Motor Corporation, 1871 Broadway, New York, representative for Hupmobile, has leased three floors and basement in new building at 239-49 West Sixty-sixth Street for main service and repair department, with parts and equipment divisions, etc.

Bayonne Steel Ceiling Co., 223 West Nineteenth Street, New York, will take bids at once for two-story plant at Long Island City, to cost approximately $75,000 with equipment. William Higginson, 101 Park Avenue, New York, is architect and engineer.

American Power & Light Co., a unit of Electric Bond & Share Co., 71 Broadway, New York, has purchased controlling interest in Montana Power Co., Butte, Mont., heretofore held by John D. Ryan, 25 Broadway, New York, for about $80,000,000. New owner will operate in conjunction with other properties in that district, including Washington Water Power Co., Spokane, Wash., lately secured. Extensions will be made in plants and transmission lines.

Portnow Lighting Fixture Co., New York, has leased building at 59 West Fourteenth Street for a new plant to manufacture electric lighting fixtures and devices.

Todd Shipyards Corporation, 25 Broadway, New York, will proceed with construction of new drydock with repair and shipbuilding facilities at Erie Basin, Brooklyn. It will be 715 ft. long and 113 ft. wide. Installation will include a main electrically-operated pumping plant with 600 hp. units, with hydraulically-operated sluice gates for drydock, etc. Entire project will cost about $2,000,000.

Bayonne Bolt & Nut Corporation, First Street and Trask Avenue, Bayonne, N. J., will rebuild portion of plant destroyed by fire April 5, with loss reported in excess of $200,000 including equipment.

Zucker Sons Co., 228 Broadway, Elizabeth, N. J., manufacturer of metal-polishing and plating materials, will remove its plant to 627 First Avenue, Roselle, N. J., where site was recently acquired. First unit is ready for occupancy and other units will be established later.

American Oil Co., American Building, Baltimore, is considering erection of new one-story oil storage and distributing plant at Bridgeton, N. J., to cost more than $50,000 with equipment. T. J. O'Connell is company engineer.

Board of Education, Roselle, N. J., is considering installation of manual training equipment in three-story and basement high school to cost $275,000. F. A. Elsasser, Falls Building, Union, N. J., is architect.

Ajax-Brand Lock Corporation, 25 Warren Street, New York, has been organized to manufacture locks and kindred products. Work is being done by contract at present, but company expects to establish its own plant during year.

Latham-Litho Printing Co., Woodside, N. Y., has filed plans for erection of a two-story, 115 x 186 ft. addition. Lockwood, Greene & Co., Inc., New York, is engineer.

George Swan & Co., Inc., 500 Kindland Road, Nutley, N. J., has been organized and is engaged in bending pipe and tubing and light manufacturing. It is in market for pipe and tubing and some small machinery. Company is building some special machines of its own design.

Plant of Bayonne Bolt Corporation, Bayonne, N. J., was almost completely destroyed by fire on April 5, loss amounting to from $350,000 to $400,000. Company proposes to rebuild as soon as insurance can be adjusted and financial negotiations completed. Offices are at 117 Liberty Street, New York.

New England

BOSTON, April 9.

FEW important New England industrial companies are buying or inquiring for machine tools. A Rhode Island plant has under consideration a $7,000 lathe; a Massachusetts shop is reported about to close on a similar tool; the Boston & Albany Railroad has inquiries out for a number of tools, but will probably buy one at a time; the Boston & Maine and New Haven railroads are expected to purchase several high-priced tools this year. The Maine Central is still negotiating on a large tool, and there are a few active inquiries from other users, but no indications are given as to the time of closing.

Current business is mostly the result of active solicitation by dealers. Buying involves the general line of standard equipment. The Boston Elevated Railway Co. is in the market for considerable wood-working machinery. New England machine tool builders, with few exceptions, are quite busy on orders booked in other sections of the country, largely from the automobile trade. There is quite a little buying of grab buckets, concrete mixers, steam shovels, road machinery and other equipment, including pneumatic tools, in New England.

Connecticut plants with orders from Ford Motor Co. are exceptionally busy. Moore Drop Forging Co., Springfield, Mass., also is rushed on such work and is operating day and night shifts.

Work has started on a three-story, 60 x 100 ft., addition for Franks Brothers, Chandler Street, Lawrence, Mass. Motors and miscellaneous equipment are required. Herman Petzold, 712 Bay State building, Lawrence, is architect.

Bids are in for a one-story, 65 x 68 ft. addition for Haskell Mfg. Co., Commerce Street, Pawtucket, R. I., requiring miscellaneous mechanical and electrical equipment. Warren B. Lewis, 10 Weybosset Street, Providence, is engineer.

Atlantic Precision Co., Malden, Mass., weight meters, has been reorganized as Atlantic Precision Instrument Co., with 2500 shares, of no par value. Robert F. Herrick, Jr., is president. Plans are in progress for enlarging manufacturing facilities.

Massachusetts Electric Co., 11 Margin Street, Lynn, Mass., has started general repairs made necessary by a recent fire.

Independent Lock Co., 78 Winter Street, Fitchburg, Mass., has started work on a two-story, 40 x 154 ft., addition.

Cleverdon, Varney & Pike, architects, 46 Cornhill, Boston, closed bids April 9 for alterations for plant of Elliott Addressing Machine Co., 143 Albany Street, Cambridge, Mass.

Svensson & Berggren Co., 127 West Brookline Street, Boston, printer, has plans for a four-story, 30 x 60 ft., office and light manufacturing plant. Motors and other equipment are required. Clifford Allbright, 308 Boylston Street, Boston, is architect.

G. E. Hoglund Co., Gardner, Mass., foundry, has reincorporated under name of Donlan Foundry Co., Inc. There will be no change in personnel.

Holyoke Water Power Co., Holyoke, Mass., has secured permission to proceed with hydroelectric power project on Connecticut River, near Holyoke, for a capacity of 40,000 hp., to cost in excess of $450,000 with transmission lines.

Atwater Mfg. Co., Plantsville, Conn., manufacturer of drop forgings, has awarded general contract to H. Wales Lines Co., Meriden, Conn., for a one-story addition to cost more than $20,000 with equipment.

Cambridge Gas Light Co., 354 Third Street, Cambridge, Mass., has plans for a one-story machine shop.

New England Power Association, Worcester, Mass., operating light and power properties in Massachusetts, New Hampshire, Vermont and Rhode Island, is disposing of a bond issue of $25,000,000, a portion of proceeds to be used for extensions and improvements. It is reported considering construction of a hydroelectric power plant on Conecticut River, vicinity of Barnet, Vt., with capacity of 50,000 hp., to cost more than $650,000 with equipment; extensions will be made in transmission lines in that district.

E. F. Sharples, New Haven, Conn., has acquired plant and property of Connecticut Valley Trap Rock Co., Inc., Hartford, Conn., at a public sale. New owner is said to be planning improvements.

American Chain Co., Inc., Bridgeport, Conn., has acquired the plant and business of Wright Mfg. Co., Lisbon, Ohio, manufacturer of high speed hoists, trolleys, etc., and will operate as a division. W. F. Wright will continue in charge of production; H. F. Wright will also continue to be identified with company.

Simplex Wire & Cable Co., 201 Devonshire Street, Boston, has filed plans for extensions and improvements in plant at Cambridge, to cost about $18,000. Stone & Webster, Inc., 49 Federal Street, is engineer and contractor.

Connecticut Electric Service Co., Hartford, Conn., operating light and power utilities, has work under way on hydroelectric power development on Rocky River, near New Milford, Conn., for capacity of 24,000 kw. Construction will also proceed on a transmission line from Montville to Meriden, Conn., about 40 miles.

St. Louis

ST. LOUIS, April 9.

BIDS have been asked on revised plans by Independent Plumbing & Heating Supply Co., 1119 Chestnut Street, St. Louis, for a two-story storage and distributing plant, 170 x 249 ft., with pipe cutting and fitting and other mechanical departments, to cost about $125,000 with equipment. D. R. Harrison, Ambassador Building, is architect.

American Car & Foundry Co., Syndicate Trust Building, St. Louis, contemplates an addition to plant on Dorcas Street to cost more than $200,000 with equipment. Headquarters are at 30 Church Street, New York.

Chickasha Cotton Oil Co., Chickasha, Okla., has arranged for a stock issue to total $4,750,000, a portion of proceeds to be used for expansion and improvements.

Midwest Oil Co., Third and Central Streets, Kansas City, Kan., contemplates a new oil storage and distributing plant, to cost more than $40,000 with equipment.

White River Power Co., Boyle Building, Little Rock, Ark., Charles Jacobson, head, has secured a permit for a hydroelectric power development on White River and its forks, vicinity of Cotter, Ark., with capacity of 165,000-hp. A transmission line will be built. Entire project will cost more than $1,500,000.

Gill & Jackson, Buder Building, St. Louis, architects, will proceed with erection of two-story and basement building, 100 x 108 ft., to be leased by B. F. Goodrich Co., Akron, Ohio, for a factory branch and distributing plant. It will cost about $100,000 with equipment.

Ira Varnell, head of Varnell Lumber Co., Hampton, Ark., plans construction of power house and system for local commercial service, to cost about $40,000 with equipment.

Industrial Gas Co., 801 Board of Trade Building, Kansas City, Mo., is planning for a natural gas plant and pipe lines in different parts of State. Company plans bond issue of $1,500,000, majority of proceeds to be used for project.

Baldwin Harvester Co., 432 South Wichita Street, Wichita, Kan., agricultural equipment, has plans for a one-story addition, 63 x 100 ft., portion of structure to be used for storage and distribution.

Jamieson & Spearl, Arcade Building, St. Louis, architects, have plans for a two-story automobile service, repair and garage building, to cost approximately $100,000 with equipment.

The Crane Market

THERE is but little new inquiry for electric overhead cranes, but the locomotive crane market is quite active. In addition to the cranes under inquiry by the Amtorg Trading Corporation and the list of seven 15-ton crawl tread locomotive cranes and six steam shovels from Dwight P. Robinson & Co., New York, for a contract at Buenos Aires, Argentina, there is a list of five 10-ton locomotive cranes, capable of 10 miles per hr. for the Boston & Maine Railroad.

Among recent purchases are:

Delaware, Lackawanna & Western Railroad, New York, 20-ton locomotive crane from the Browning Crane Co. and a 40-ton traveling gantry crane, reported purchased from the Whiting Corporation.

E. I. du Pont de Nemours & Co., Wilmington, Del., a 15-ton, 2-motor overhead crane reported purchased from the Niles Crane Corporation.

Nugent Sand Co., Muskegon, Mich., 25-ton steam-operated locomotive crane from the Orton Crane & Shovel Co.

Samuel Olson Co., Chicago, 3-ton, 3-motor, floor-operated crane from H. D. Conkey & Co.

St. Louis Contracting Co., St. Louis, 3-ton electric bridge crane from H. D. Conkey & Co.

J. S. Kirk & Co., Chicago, two 5-ton double-girder cranes from H. D. Conkey & Co.

International Harvester Co., Rockford, Ill., two 2-ton special underhung and two electric follow-up cranes from H. D. Conkey & Co.

Midwest Piping & Supply Co., 1452 South Second Street, St. Louis, manufacturer of pipe, pipe fittings, etc., has awarded general contract to James H. Bright Construction & Building Co., Arcade Building, for a one-story addition, 45 x 120 ft., to cost close to $50,000 with equipment. Klipstein & Rathman, Security Trust Building, are architects.

Paxton-Mitchell Co., 2614 Martha Street, Omaha, Neb., has filed plans for a one-story and basement foundry, 92 x 165 ft., for production of iron castings, to cost $50,000 with equipment.

Board of Education, Fullerton, Neb., is planning installation of manual training equipment in three-story and basement high and grade school to cost $150,000, for which bids are being asked on general contract until April 19. Meginnis & Schaumberg, Federal Trust Building, Lincoln, Neb., are architects.

A. R. Pannell Machinery Co., Inc., 33 East Grand Avenue, Oklahoma City, Okla., dealer in heavy machinery and steam, oil and electric power plant equipment, is adding a stock of mill supplies.

Cleveland

CLEVELAND, April 9.

WHILE machine tool business is fair, April is not starting out quite as well as March. A Michigan manufacturer of automobile parts is in the market for 30 or more high-grade used tools for work on wheels and brakes for Ford automobiles. The requirements include turret lathes, punch presses, drilling and grinding machines. The Dana Mfg. Co., Toledo, has purchased milling and other machines for manufacturing shock absorbers for Ford cars and still has some equipment to place. Locally, single tools are in fair demand. Turret lathes continue to move well in single unit orders. Railroad inquiry is confined to single machines.

Plans are being arranged by White Chevrolet Co., South Third Street, Zanesville, Ohio, local representative for Chevrolet automobile, for five-story service, repair and garage building, to cost about $100,000 with equipment.

City Council, Akron, Ohio, has approved bond issue of $900,000 for a municipal airport, providing for purchase of 500-acre site in vicinity of Fulton Field, and construction of hangars, repair shops, oil storage and distributing plant, etc., for which plans will soon be drawn.

G. Schaefer Wagon Co., 4180 Lorain Avenue, Cleveland, has awarded general contract to G. A. Rutherford Co., 2725 Prospect Avenue, for rebuilding four-story automobile body and wagon plant recently destroyed by fire, to cost close to $135,000 with equipment. W. S. Longee, Marshall Building, is architect.

Federal Radiator & Boiler Co., Zanesville, Ohio, is said to have plans for a one-story plant at Licking View, to replace portion of works recently destroyed by fire, with loss close to $90,000 including equipment.

Heller Brothers Co., 879 Mount Prospect Avenue, Newark, N. J., manufacturer of files, rasps, tools, etc., will build a one-story plant, totaling about 35,000 sq. ft. floor space, at Newcomerstown, Ohio, vicinity of works of Rex File and Vixon Tool companies, subsidiaries. It will cost more than $75,000 with equipment. A portion of machinery will be removed from Newark plant.

Hercules Motors Corporation, Halliwell Place, S. E., Canton, Ohio, manufacturer of gasoline and oil engines, etc., is said to be completing plans for rebuilding one-story unit recently destroyed by fire, to cost about $55,000 with equipment.

Wright Mfg. Co., Lisbon, Ohio, manufacturer of hoists and trolleys, has sold its business and trade name to American Chain Co., Inc., Bridgeport, Conn. No changes in policies or sales organization are anticipated.

Gulf States

BIRMINGHAM, April 9.

PLANS are being arranged by Texas Utilities Co., Plainview, Tex., for a new super-power steam-operated electric generating plant for service in Panhandle and eastern New Mexico districts, to cost in excess of $400,000 with transmission lines.

Pasotex Pipe Line Co., El Paso, Tex., operated by Pasotex Petroleum Co., same city, subsidiary of Standard Oil Co. of California, 225 Bush Street, San Francisco, plans installation of electrically-operated pumping plant at Wink, Tex., and three booster stations, with Diesel engine and auxiliaries, in connection with proposed pipe line from El Paso to Wink. Line will have capacity of 17,000 bbl. daily and will cost in excess of $2,500,000.

Texas Gulf Sulphur Co., 41 East Forty-second Street, New York, has taken over properties at Boling Dome, Tex., and will install equipment for sulphur mining, including transportation facilities.

Southern Ornamental Iron Works, 2425 South Harwood Street, Dallas, Tex., has awarded a general contract to Churchill-Humphrey Co., Burt Building, for new one and two-story plant, 100 x 310 ft., at Arlington, Tex., to cost more than $70,000 with equipment.

Black Donald Graphite Co., Florence, Ala., is considering rebuilding of portion of mill recently destroyed by fire with loss reported at close to $65,000 including equipment.

Gulf Power Co., Pensacola, Fla., has arranged for bond issue of $2,500,000, a portion of fund to be used for expansion and improvements, including new transmission lines.

Clarence W. King, Giddens-Lane Building, Shreveport, La., architect, will soon take bids on general contract for a two-story automobile service, repair and garage building, 115 x 150 ft., to cost about $90,000 with equipment.

Notros Hangar Corporation, 3609 McKinney Avenue, Houston, Tex., Harry E. Weaver, president, recently organized, will operate a plant for manufacture of steel aircraft hangars and kindred equipment.

June Machinery Co., Waco, Tex., D. June, head, has plans for a one-story foundry at 208 South First Street, to cost about $21,000 with equipment.

Crawford's Auto Shop, Inc., 2227 North First Avenue, Birmingham, has completed plans for a two-story repair, service and garage building, 140 x 150 ft., to cost more than $70,000 with equipment. William L. Welton, American Trust Building, is architect.

H. L. Luckett and associates have acquired Corpus Christi Foundry & Machine Co., Corpus Christi, Tex. An expansion and improvement program will be carried out. Company will be reorganized as Luckett Foundry & Machine Co.

Dixie Gas & Fuel Co., Houston, Tex., operating natural gas properties, is said to be planning a bond issue of $25,000,000, a portion of proceeds to be used for expansion and improvements, including pipe line construction.

Roxanna Petroleum Corporation, Shell Building, St. Louis, is reported planning construction of a new oil refinery in vicinity of Houston, Tex., to cost in excess of $250,000 with equipment. A right-of-way has been secured from McCamey, Tex., for a 10-in. welded steel pipe line to refinery site. Plans have been approved for oil storage and distributing plant at McCamey, to cost more than $175,000.

Graybar Electric Co., Graybar Building, New York, electrical equipment and supplies, has leased a two-story building, 50 x 175 ft., to be erected at 1521 North First Avenue, Birmingham, to cost $40,000, for a new storage and distributing plant. Local headquarters are at 1529 North First Avenue. Charles M. McCauley, Jackson Building, is architect.

Harvey M. Mansfield, 3032 Spruce Street, Tampa, Fla., is at the head of a project to construct and operate a mill in this vicinity for pulp and kraft paper manufacture. Inquiries are being made for equipment.

Humble Oil & Refining Co., Houston, Tex., is reported planning a new pipe line from Pierce Junction, Tex., terminus of present line, to a point near Sugarland, Tex., to cost close to $100,000.

St. Tammany Parish School Board, Covington, La., is said to be planning installation of manual training equipment in a two-story high school addition to cost $135,000, for which bids will be asked on general contract early in May. William T. Nolan, Canal Bank Building, New Orleans, is architect.

Momsen, Dunegan & Ryan, El Paso, Tex., hardware products, have plans for a four-story storage and distributing plant, to cost $125,000 with equipment.

Philadelphia

PHILADELPHIA, April 9.

PLANS are being considered by Reading Coal & Iron Co., Reading Terminal, Philadelphia, for complete electrification of anthracite coal-mining properties at Hazleton, Wilkes-Barre and vicinity, including installation of motors, hoists, controls, etc. Negotiations are under way for central station service from Pennsylvania Power & Light Co., Allentown, Pa., which will build lines to different properties.

U. S. M. C. Garages, Inc., 1401-7 Locust Street, Philadelphia, has engaged M. A. Bernhardt, 127 South Eighteenth Street, architect, to prepare plans for a three-story addition to service, repair and garage building at Broad and Pine Streets, to cost $110,000 with equipment.

Pennsylvania Railroad Co., Broad Street Station, Philadelphia, has awarded contract to Sinclair & Grigg, 1518 Walnut Street, for a new coal pier, 900 ft. long, at Greenwich Point, and will install mechanical conveying, hoisting and kindred equipment. William H. Cookman is company architect.

Philadelphia Rural Transit Co., subsidiary of Philadelphia Rapid Transit Co., 810 Dauphin Street, Philadelphia, has secured garage and adjoining structures of Commercial Truck Co., now in receivership, totaling 110,000 sq. ft. floor space, and will remodel and equip for new motor bus service, repair and garage building. A complete maintenance division will be installed.

Allegheny Wagon & Truck Co., Inc., Philadelphia, recently organized, will take over and expand company of same name at 1733-37 North Front Street, specializing in manufacture and repair of motor trucks, wagons, etc., and motor truck bodies.

Electric Coil Winding Co., 2101 Federal Street, Camden, N. J., has awarded general contract to Charles B. Coe, 120 West Irving Avenue, Merchantville, N. J., for a one-story addition, 49 x 59 ft., to cost about $18,000 with equipment.

Audubon Wire Cloth Co., Audubon, N. J., has awarded contract to J. D. Lawrence, Westville, N. J., for a two-story and basement addition, 55 x 100 ft., to cost about $30,000 with equipment.

Board of Education, South Fayette Township, Sturgeon, Pa., P. H. Walker, president, is considering installation of manual training equipment in high school near Bridgeville, Pa., to cost $200,000. Laurie Green & Co., Third and Forster Streets, Harrisburg, Pa., are architects.

Metropolitan Edison Co., Reading, Pa., has secured permission to take over and consolidate 11 electric light and power companies in Adams, Chester, Dauphin, Berks, Lehigh and Lebanon Counties, for total consideration of $2,401,192. Extensions and improvements will be carried out, including transmission line construction. Purchasing company recently disposed of bond issue of $23,000,000, portion of fund to be used for expansion.

Gordon Nagle, Pottsville, Pa., has organized a company to construct and operate a local mill for fabricating light structural steel. A site, 150 x 300 ft., has been secured, and plant will soon be built.

Lancaster Advertising Poster Co., Lancaster, Pa., has awarded general contract to W. B. Aierstruck, 34 East Chestnut Street, for a one and two-story sign and electric display manufacturing plant, 50 x 150 ft., to cost more than $20,000 with equipment. H. Y. Shaub, 20 North Queen Street, is architect.

In connection with new three-story engineering building at University of Delaware, Newark, Del., Board of Trustees has authorized installation of following departments, for which equipment will be arranged at early date: Foundry forge shop, machine shops, electrical laboratory, woodworking shop, highway and test laboratory, blue-printing department, gas and steel laboratory, and experiment rooms. Structure will cost about $200,000. Charles Z. Klauder, Franklin Bank Building, Philadelphia, is architect.

General Cement Corporation has been organized to take over and consolidate Pennsylvania-Dixie Cement Corporation, Nazareth, Pa., and North American Cement Corporation, Albany, N. Y. First-noted company is now operating seven mills with gross output of 10,000,000 bbl. per annum, and other organization is running three mills with rating of 4,500,000 bbl. per year. Pennsylvania-Dixie company has recently concluded negotiations for purchase of plant and business of Pyramid Portland Cement Co., Valley Junction, near Des Moines, Iowa, and latter interest will be included in merger. Consolidated company will carry out general expansion and improvement program. All mills are scheduled to be continued in service.

American Machinery Corporation, 1120 Vine Street, Philadelphia, has been organized to succeed American Machinery Co., Inc., and to manufacture products formerly made by that company, American Fruit Machinery Co. and American Paring Machine Co. It will not build a plant, but will continue assembling machines at present location.

Hazard Wire Rope Co., Wilkes-Barre, Pa., has been licensed by American Cable Co., Inc., Chicago, to manufacture Tru-Lay Preformed wire rope and Tru-Loc Processed fitting.

Pittsburgh

PITTSBURGH, April 9.

DULLNESS which set in about the middle of last month in machine-tool sales continues, but inquiry still is fairly active and the majority of the trade reports sales so far this year as making a favorable comparison with the same period in 1927. Homestead Valve Mfg. Co., which will move from Homestead, Pa., to Stoops Ferry, Pa., is a possible buyer of a few tools to supplement those to be moved from the old to the new plant.

Homestead Valve Mfg. Co., Homestead, Pa., has acquired and will occupy former plant of Sewickley Electric & Mfg. Co., Stoops Ferry, Pa. Sewickley company grew out of John W. Semple & Co., Sewickley, manufacturers of time fuses. Purchase includes plant containing 50,000 sq. ft. of floor space, and 108 acres.

Contract has been let by Pittsburgh Plate Glass Co., Frick Building, Pittsburgh, to C. W. & P. Construction Co., Akron, Ohio, for a two-story addition to plant at Barberton, Ohio, to cost about $50,000. J. F. Suppes, Akron Savings & Loan Building, Akron, is architect.

Cyclone Fence Co., Waukegan, Ill., manufacturer of iron and wire fencing, has secured property at 909 Behan Street, Pittsburgh, for a new factory branch and distributing plant. J. H. Laughlin will be branch manager.

J. & J. B. Milholland Co., 714 Fifth Avenue, Pittsburgh, manufacturer of engines, mine cages, etc., plans rebuilding portion of machine shop destroyed by fire April 4, with loss close to $35,000 including equipment.

Lawson Mfg. Co., Lexington Avenue and Thomas Boulevard, Pittsburgh, manufacturer of heaters and heating equipment, has awarded general contract to Donald Ranolla & Son, Cedarville Street, for a one-story addition, 50 x 275 ft., to cost about $50,000 with equipment. Bernard H. Prack, Martin Building, is architect and engineer.

Charleston-Dunbar Natural Gas Co., 1023 Quarrier Street, Charleston, W. Va., is considering an expansion and improvement program in pipe lines and properties to cost $100,000. John P. Chenoweth is representative.

Gellatly & Co., Inc., Oliver Building, Pittsburgh, manufacturer of mine equipment, has leased a factory on Grand Avenue, Neville Island district, for establishment of a new plant unit for increased output.

Charles G. Hanny and Walter H. Stifel, 1034 Murray Hill Avenue, Pittsburgh, have organized Charles G. Hanny & Co., with capital stock of $25,000, to establish and operate a plant for manufacture of light structural steel and ornamental iron products. A department for wire work will be provided.

Board of Education, Glassport, Pa., is considering installation of manual training equipment in three-story high school to cost about $180,000, for which bids are being asked on general contract. H. C. Clepper, Century Building, Pittsburgh, is architect.

Crystal Oil Works, Rouseville, near Oil City, Pa., are planning to rebuild portion of oil refinery destroyed by fire April 3, with loss close to $30,000 with equipment. Damaged section was used largely for wax and kindred production.

Detroit

DETROIT, April 9.

CONTRACT has been let by Chevrolet Motor Co., Flint, Mich., to H. G. Christman Co., Lansing, for a one-story plant unit at Bay City, Mich., to cost more than $400,000 with machinery. Wright & Nice, 4339 South Saginaw Street, Flint, are architects.

Board of Education, Muskegon, Mich., has approved plans for an addition to Hackley Manual Training School to cost in excess of $100,000. Frank F. Forster, Muskegon, is architect.

Detroit City Service Co., Lafayette Building, Detroit, will build a new two-story ice-manufacturing plant, to cost about $65,000 with equipment.

Arthur Corbeille, Ypsilanti, Mich., has plans for a one-story foundry for manufacture of iron castings, to cost about $22,000.

Board of Education, Battle Creek, Mich., is considering installation of manual training equipment in a new junior high school to cost close to $500,000. William B. Ittner, Board of Education Building, St. Louis, is architect.

Falcon Mfg. Co., Big Rapids, Mich., manufacturer of furniture, is planning to rebuild its No. 2 plant, recently partially destroyed by fire, with loss close to $50,000 with equipment.

White Co., East Seventy-ninth Street, Cleveland, manufacturer of motor trucks, is planning a one-story factory branch, service and repair station, 185 x 200 ft., at Detroit, to cost about $135,000 with equipment.

Motor Wheel Corporation, Lansing, has remodeled one of its plant units for production of wire wheels for automobiles, a new development for company, which heretofore has specialized in disk steel and wood wheels. It is proposed to increase wire wheel department later.

Electric Steel Castings Co., St. Joseph, Mich., recently organized, will operate a plant for production of small electric steel castings, weighing up to 45 and 50 lb. Operations will soon begin.

Mount Clemens Gas Co., Mount Clemens, Mich., is completing plans for an addition to its gas-generating plant, to cost close to $200,000 with equipment. It will also make extensions in lines to cost about $100,000. C. S. Holt is general manager.

King-Seeley Co., Ann Arbor, manufacturer of gasoline gages and kindred equipment, has awarded general contract to Townsend-Dailey Co., 213 West Michigan Avenue, Ypsilanti, Mich., for a five-story addition, 65 x 85 ft., to cost close to $100,000 with equipment.

Florin Mfg. Co., Carson City, Mich., has been organized to manufacture washing machines and furniture specialties and will erect factory immediately.

North-Moller Co., Jackson, Mich., has been awarded contract for an addition to plant of Sparks-Withington Co., Jackson, manufacturer of automobile horns and radio receiving sets. It will be two stories, 60 x 260 ft., with separate boiler house. Lockwood, Greene & Co., Inc., Cleveland, is engineer.

L. A. Young Industries, Detroit, has changed its name to L. A. Young Spring & Wire Corporation.

South Atlantic States

BALTIMORE, April 9.

RECENTLY organized Dixie Aircraft Corporation, care of I. L. Paisley, Frederick, Md., is said to be planning establishment of new plant in vicinity of Lynchburg, Va., for manufacture of all-metal monoplanes and parts. It is understood that motors will be secured from outside sources.

Common Council, Lexington, Va., is reported planning installation of municipal power plant, to cost upward of $25,000 with equipment.

Suburban Light & Power Co., Cambridge, Md., George W. Woolford, president, recently organized, has secured permission to construct power substations and transmission lines in portions of St. Mary's, Charles and Prince George's Counties, totaling 80 miles, to cost in excess of $125,000. Authority has been granted also for issuance of preferred stock to total $250,000 and 1000 shares common stock, no par value, proceeds to be used in part for expansion.

Bureau of Yards and Docks, Navy Department, Washington, is asking bids (closing date not specified) for refrigerating plant for Mare Island Navy Yard hospital, including motor-driven compressors, condensers, liquid receivers, expansion coils and accessories.

Superintendent, National Training School for Boys, Bladenburg Road, N. E., Washington, is asking bids until April 16 for material for complete 9-ft. high, chain link wire fence, No. 6 gage wire.

Blue Ridge Power Co., Manassas, Va., is planning installation of additional equipment at power plant, including water wheel, generator and accessories.

Board of City Commissioners, Kings Mountain, N. C., plans installation of pumping machinery and other power equipment in connection with extensions and improvements in municipal waterworks to cost $250,000. Carolina Engineering Co., Wilmington, N. C., is engineer.

Morocto Roofing Co., Rowlandsville, Md., manufacturer of roofing products, will rebuild portion of plant destroyed by fire April 5, with loss reported in excess of $350,000 including equipment.

Purchasing section, Bureau of Standards, Washington, is asking bids until April 27 for furnaces, pulverizers, burners and auxiliary equipment for new power plant.

Cocker Machine & Foundry Co., Gastonia, N. C., manufacturer of cotton mill machinery, castings, etc., plans construction of two one-story additions, 60 x 100 ft., and 40 x 60 ft. It is understood that standardized steel buildings will be selected.

Southeastern Power & Light Co., Birmingham, affiliated with Alabama Power Co., and other utilities, has purchased Edisto Public Service Co., Denmark, S. C., operating in 16 communities in that State. New owner plans expansion, including transmission line construction to connect with system in Georgia. Edisto company has work under way on a hydroelectric power project at Clarks Hill, on Savannah River, which will be completed by Southeastern company, to cost more than $5,000,000.

Common Council, Nashville, Ga., has sold municipal electric light and power plant to new interests, headed by Roger C. Bauman. Plans are under way for extensions and betterments, including installation of 350-hp. Diesel engine unit and other equipment. It is understood that Southeast Georgia Power Co. is interested in plant purchase.

Board of Education, Roanoke, Va., is considering installation of manual training equipment in three-story junior high school to cost about $150,000, for which superstructure will soon be started. H. M. Miller, Shenandoah Life Building, is architect; Charles S. Churchill, Liberty Trust Building, is consulting engineer.

Duke Power Co., Charlotte, N. C., has approved plans for first unit of new steam-operated electric power plant at River Bend on Catawba River, near Mount Holly, to be equipped for capacity of 150,000 hp. and to cost more than $2,000,000 with transmission lines. Station will be designed to use pulverized coal. Later plant will be enlarged with three other units for total rating of 600,000 hp., and ultimate cost of close to $10,000,000.

Buffalo

BUFFALO, April 9.

PROPERTY at 550 Abbott Road, Buffalo, has been leased by General Aircraft Corporation, recently organized, for a new plant for production of airplane parts and assembling. This plant will be temporary, it is said, pending selection of site for erection of new works. G. MacLean Gardner, formerly engineer for Fokker Aircraft Corporation, Hasbrouck Heights, N. J., will be general manager. It is reported that company is identified with General Motors Corporation, Detroit, and will become airplane production division of that organization. George H. Hannum, formerly president of Oakland Motor Car Co., Pontiac, Mich., is president of new company.

Morse Chain Co., Ithaca, N. Y., manufacturer of silent chain drives, etc., has disposed of a new bond issue of $2,000,000, a portion of proceeds to be used for general expansion.

American-La France & Foamite Industries, Inc., Elmira, N. Y., has been organized with capital stock of $100,000 by officials of American-La France Fire Engine Co., Elmira, manufacturer of motor-driven fire equipment, to take over and consolidate that company with other acquired interests in similar line of production, including Foamite-Childs Corporation, Utica, N. Y. An expansion program will be carried out.

Fairbanks Co., Glenwood Avenue, Binghamton, N. Y., and Broome and Lafayette Streets, New York, manufacturer of valves and other mechanical equipment, is reported to be arranging for a two-story plant unit, to cost about $125,000 with equipment, to replace its local works recently destroyed by fire.

Certain-Teed Products Corporation, 100 East Forty-second Street, New York, manufacturer of roofing products, gypsum specialties, etc., has concluded arrangements for purchase of Beaver Board Companies, Inc., Beaver Road, Buffalo, manufacturer of wallboard products, and will operate as a division. Increased production is planned. Purchasing company has arranged for bond issue of $13,500,000, and common stock issue of 93,000 shares, no par value. George M. Brown is president of Certain-Teed company.

Afga-Ansco Mfg. Co., 23 Charles Street, Binghamton, N. Y., manufacturer of cameras, tripods and other photographic equipment, formed by recent merger of Ansco Photo Products, Inc., Afga Products, Inc., and Afga Raw Film Co., is planning an early call for bids on general contract for a two and three-story addition, to cost in excess of $500,000 with equipment. Otto S. Schlick, 136 Liberty Street, New York, is engineer.

Garlock Packing Co., Palmyra, N. Y., will erect power plant to replace old unit at its factory. Two 550-hp. boilers will take place of eight boilers now in use and two turbo generators will provide electric current. Sigmund Firestone, Rochester, N. Y., will supervise building.

Buffalo Foundry & Machine Co., Buffalo, has acquired entire assets of Chemical & Vacuum Machinery Co., local, and will supplement Buflocak and Buflokast lines of dryers and evaporators with several new types. Included will be spray film feed applicable to both vacuum and atmospheric drum dryers, new design of vacuum rotary dryer and other modifications of present types.

William Summerhays Sons Corporation, Rochester, N. Y., has moved its offices to warehouse at 614 Clinton Avenue South.

Chicago

Chicago, April 9.

In machine tool sales, March was not only the best month so far this year, but is also ahead of the corresponding period in 1927 and, with several dealers, the best month since 1920. This record has been made in the almost total absence of railroad buying. The Santa Fe list is dormant, but it is reported that the Rock Island will soon come into the market for machine tools. The Union Pacific list shows equipment worth $200,000 and subsidiary lines of that railroad are still to be heard from.

A forging plant in Chicago has taken a 30 x 30-in. x 8-ft. planer and an Illinois watch maker has purchased two 12-in. x 5-ft. lathes and a 14-in. x 6-ft. lathe. Tractor plants are active buyers.

General Electric Co., Milwaukee, is asking for prices on following list:

Two power hack saws.
One 28-in. shaper.
One No. 2 universal miller.
One 36-in. x 16-ft. lathe.
One 18-in. x 12-ft. lathe.
One 2-ft. radial drill.
One 3-ft. radial drill.
One 24-in. drill.
One floor grinder.
Several wood-working machines.

Wyckoff Drawn Steel Co., 2300 South Kedzie Avenue, Chicago, will build a warehouse, 50 x 150 ft., to cost $10,000. W. M. Wood, 208 South LaSalle Street, is architect.

Contract has been let by Glabman Brothers, Inc., 832 Maxwell Street, Chicago, manufacturer of furniture, to H. M. Lipman, 5079 West Monroe Street, for a new four-story and basement plant, 50 x 100 ft., to cost close to $150,000 including equipment. Dubin & Eisenberg, 14 West Washington Street, are architects.

Bassick Mfg. Co., 2638 North Crawford Avenue, Chicago, manufacturer of lubricating equipment and devices, subsidiary of Stewart-Warner Speedometer Corporation, 1828 Diversey Parkway, is planning an addition to increase capacity about 25 per cent, to cost $300,000 with machinery.

Greenleaf-Glenwood Garage Corporation, 924 Ainslie Avenue, Chicago, Samuel Wanig, head, has plans for a four-story service, repair and garage building to cost in excess of $200,000 with equipment. Rissman & Hirschfield, 228 North LaSalle Street, are architects.

Olson Mfg. Co., Albert Lea, Minn., manufacturer of farm equipment, is having plans completed for a one-story and basement addition, to cost close to $30,000 with equipment. Toltz, King & Day, Inc., Builders' Exchange, St. Paul, Minn., is architect.

Minnesota Power & Light Co., Duluth, Minn., is disposing of bond issue of $14,000,000, a portion of fund to be used for expansion and improvements, including transmission line construction.

Great Northern Railway Co., Railroad Building, St. Paul, Minn., has plans under way for a new engine house, with machine shop and other repair facilities, 90 x 250 ft., at Grand Forks, N. D., to cost in excess of $90,000 with equipment. T. D. McMahon is company architect.

Reiter Co., Elgin, Ill., manufacturer of water softeners and kindred equipment is reported planning a two-story addition to cost more than $40,000.

United States Engineer, Peoria, Ill., is asking bids until April 19, for one force pump, circular 24.

Southern Colorado Power Co., Fourth and Main Streets, Pueblo, Colo., is planning an expansion program, including transmission line construction, to cost close to $250,000. A new power line will be built from Penrose to Beaver Park.

Holly Sugar Corporation, Colorado Springs, Colo., operating beet sugar mills, has arranged for bond issue of $6,500,000, a portion of proceeds to be used for expansion and improvements. Plans are in progress for betterments in refinery at Torrington, Wyo., including installation of additional machinery, to cost $200,000.

Jefferson Ice Co., 1515 Bickerdike Avenue, Chicago, has plans for a one-story ice-manufacturing plant, to cost more than $45,000 with equipment. G. L. Lehl, 3810 Broadway, is engineer.

Allied Industrial Products Co., 120 North May Street, Chicago, manufacturer of grinding wheels, buffing equipment, etc., has awarded general contract to Freevoll & Smedberg, 5950 West Erie Street, for a three-story and basement plant unit, 40 x 105 ft., to cost close to $80,000 with equipment. Meyer & Cook, Tower Court, are architects.

M. A. Erickson, operating Rugby Light & Power Co., Rugby, N. D., plans extensions and improvements in steam-operated electric power house at Westhope, N. D., including installation of engines and other equipment.

National Wire Cloth & Iron Works, Inc., St. Paul, Minn., has been formed to manufacture wire cloth and do ornamental iron and wire work. Company has own plant and equipment and has been in operation since March 15.

Cincinnati

Cincinnati, April 9.

Reports from local machine-tool builders show considerable irregularity in sales. In the first week of April some manufacturers have bettered their March record, while others have suffered a decline. However, the consensus of opinion is that bookings this month will be from 85 to 90 per cent of those in March. Decreased buying by automobile makers is expected to account in large part for the anticipated inability to attain last month's volume of business during April. The McClintic-Marshall Co. of California, San Francisco, has purchased a 42-in. rotary planer, and Charles E. Larson & Co., Chicago, have bought a 1500-lb. single frame steam hammer.

Plans are being drawn by Star Foundry Co., Covington, Ky., manufacturer of gray iron castings, for a one-story addition, 60 x 62 ft., to cost about $25,000 with equipment. Howard McClorey, 211 East Fourth Street, Cincinnati, is architect.

Ferro Concrete Co., Third and Elm Street, Cincinnati, has taken contract for erection of nine-story automobile service, repair and garage building, 100 x 200 ft., to cost in excess of $850,000, with equipment.

Miami Development Co., Dayton, Ohio, O. E. Howland, Dayton Power & Light Co., treasurer, has acquired property on Eaker Street as site for a multi-story cold storage and refrigerating plant, to cost upward of $150,000 with equipment.

Air Corps, Material Division, Wright Field, Dayton, Ohio, is asking bids until April 17 for 46,000 copper asbestos annular gaskets, 125,000 machine nuts, 500,000 brass grommets and 5000 Woodruff keys, circular 290; on April 23 for 1000 Liberty engine exhaust valves, circular 294, and on April 27 for one heavy-duty portable refueling unit, circular 293.

Post Sign Co., 514 Watauga Avenue, Knoxville, Tenn., Edward L. Hicks, head, plans erection of one-story sign and display manufacturing plant to cost about $18,000 with equipment.

Board of Education, Nashville, Tenn., is considering installation of manual training equipment in two-story junior high school for which general contract has just been let to Foster & Creighton Co., Bennie-Dillon Building, to cost $160,000.

Cincinnati Gas & Electric Co., Cincinnati, is arranging for bond issue of $35,000,000, a portion of proceeds to be used for extensions and betterments, including transmission line construction.

Standard Sanitary Mfg. Co., Bessemer Building, Pittsburgh, will soon take bids for a two-story and basement factory branch and distributing plant, 100 x 100 ft., at Nashville, Tenn., to cost about $85,000 with equipment.

City Machine Tool Co., Third and June Streets, N. W., Dayton, Ohio, has awarded general contract for one-story addition to J. C. Gohn, Dayton.

Department of Public Service, Knoxville, Tenn., W. W. Mynatt, director, has received low bid on general contract from Emory Construction Co., Empire Building, for a one-story municipal service, repair and garage building, 50 x 300 ft., with capacity of 60 cars, to cost approximately $100,000 with equipment. A traveling crane will be installed. L. M. Dow, Brownlow Building, is architect.

Farnsworth-Evans Co., Cotton Exchange Building, Memphis, Tenn., plans construction of one-story unit, 269 x 1325 ft., to cotton compress plant in Holleywood district, to cost $350,000 with machinery. George Mahan, Jr., American Bank Building, is associate architect.

Webster Mfg. Co., Chicago, maker of elevating, conveying and power transmitting machinery, is moving its Cincinnati office from 1914 Union Central Building to 503 Chamber of Commerce Building. L. A. Scheck is in charge.

Indiana

INDIANAPOLIS, April 9.

A NEW company, Eaglesfield-Link Co., with capital stock of $40,000, has been formed by R. D. Eaglesfield, Brazil, and associates, to establish and operate a plant for manufacture of a patented molding machine, recently invented by Mr. Eaglesfield. Dick Link, Brazil, is also interested in organization.

Truck Engineering Co., East Pontiac Street, Fort Wayne, manufacturer of motor truck equipment, has awarded general contract to Buesching, Hagerman & Co., 402 East Superior Street, for a one-story, sawtooth roof type addition, 60 x 100 ft., to cost more than $60,000 with equipment. Guy Mahurin, Standard Building, is architect.

Montgomery Ward & Co., Chicago Avenue, Chicago, operating a mail-order business, will soon take bids for a one and three-story and basement storage and distributing plant at Evansville, 160 x 310 ft., and 180 x 190 ft., to cost approximately $300,000 with equipment. A. E. Neucks, Old National Bank Building, Evansville, is architect.

Martin-Parry Corporation, 1100 West Henry Street, Indianapolis, manufacturer of commercial automobile bodies, is reported planning a one-story addition to cost more than $30,000 with equipment. Headquarters are at York, Pa.

City Council, Fort Wayne, is said to have approved plans for extensions and improvements in municipal electric light and power plant, to cost in excess of $200,000 with equipment. Froehleich & Emery Engineering Co., Second National Bank Building, Toledo, Ohio, is engineer, in charge.

Automotive Syndicate, Ltd., Indianapolis, recently organized, has leased a portion of former local plant of National Automobile Co., and will establish a factory for manufacture of patented steam-propelled buses, with capacity of about 40 passengers. A complete experimental plant will be installed for initial service. W. J. Parrish and D. McCall White head organization, last noted will be engineer for company. H. W. Alden, chairman of board, Timken-Detroit Axle Co., 200 Clark Avenue, Detroit, is said to be interested in new organization.

E. F. Miller, Farmers' Trust Building, Anderson, architect, will take bids at once on general contract for a two-story and basement automobile service, repair and garage building, 85 x 125 ft., at Logansport, to cost approximately $95,000 with equipment.

Milwaukee

MILWAUKEE, April 9.

ACTIVITY in the machine-tool market is well sustained by orders for one or two machines from diversified sources. A moderate aggregate is the result, and it enables tool builders to keep production at the previously established rate, which is higher than at this period last year. Replacement business predominates and there is a relatively good demand for milling machines with special tooling. Prospects are for improvement in industrial construction.

Board of Regents, University of Wisconsin, Madison, Wis., has instructed Arthur Peabody, State architect, to proceed with plans for a new mechanical engineering building costing $577,000. It will be first unit of a new group for College of Engineering. Other units will be built for electrical engineering, mining engineering, chemical engineering and material testing laboratory departments. Work on first unit is expected to start by June 1. M. E. McCaffrey is secretary of board. An appropriation of $88,500 for new boiler equipment for central heating plant has also been authorized. Specifications will be issued shortly.

Common Council, Waukesha, Wis., is about to call for bids for construction of a complete sewage disposal plant to cost $200,000, designed by Alvord, Burdick & Howson, consulting engineers, 8 South Dearborn Street, Chicago. T. C. Martin is city clerk.

Walter Gerlinger, 403 Sixty-sixth Street, Wauwatosa, suburb of Milwaukee, formerly of Gerlinger Electric Steel Casting Co., has incorporated as Walter Gerlinger, Inc., to deal in foundry supplies, including molding, core and sand blast sands, fire clay, fuel oil, etc.

Milwaukee Printing Co., 377 Florida Street, manufacturer of cartons, food and candy wrappers and advertising material, is starting work on a six-story addition, 86 x 132 ft., to cost $200,000 with equipment, motors, etc. A complete lithographing plant is being added. Architects are Tharinger & Bruecker, 774 Third Street, local.

Village of Randolph, Wis., has approved proposed expenditure of $58,000 for rebuilding and enlarging municipal electric light and power plant. New boilers, two new generators and an addition are contemplated. L. E. Williams is city clerk.

Parker Pen Co., Janesville, Wis., manufacturer of fountain pens and pencils, is starting construction work on a two-story addition costing about $35,000.

Allen-Bradley Co., 494 Reed Street, manufacturer of electric control devices, has let general contract to Henry Danischefsky, 1484 Humboldt Avenne, local, for erecting a furnace house and substation, 44 x 140 ft., one and two stories.

Hartland Engine & Machine Co., Hartland, Wis., has been organized with $50,000 capital stock to operate a machine shop and build and repair internal combustion engines. Principals are Alfred Hilton, Grove E. Palmer and J. H. Overbough. Details of company's plans have not been completed.

Pacific Coast

SAN FRANCISCO, April 4.

CONTRACT has been let by Emsco Press Forge Co., 5701 South Boyle Avenue, Vernon, Los Angeles, to Union Iron Works, local, for a one-story plant unit to cost about $20,000 with equipment.

Douglas Co., 2435 Wilshire Boulevard, Los Angeles, manufacturer of airplanes and parts, has plans for a one and two-story plant at Santa Monica, 240 x 375 ft., to cost $90,000, with equipment. L. B. Norman, 1323 Georgia Avenue, Santa Monica, is architect.

Merritt Concrete Products Co., San Jose, Cal., manufacturer of concrete pipe, etc., will build a new plant at Oakland, Cal., to cost about $50,000 with equipment. H. A. Weigand is engineer.

Crawford & Daherty, 934 East Seventeenth Street, Portland, manufacturers of iron castings, have awarded general contract to Parker & Banfield, East Seventeenth Street, for a one-story foundry to cost close to $21,000 with equipment.

S. Karpen & Brothers, 925 West Irvington Avenue, Los Angeles, manufacturers of furniture, with headquarters at 626 West Twenty-second Street, Chicago, has filed plans for a four-story plant at Huntington Park, to cost $160,000 with equipment.

Ford Motor Co., Detroit, has taken title to a tract near Port Richmond, vicinity of San Francisco, and is said to be contemplating construction of one-story assembling plant, to cost in excess of $400,000 with equipment.

California Consumers Co., Los Angeles, recently organized to take over and operate Los Angeles Ice & Cold Storage Co.; Pasadena Ice Co., Pasadena, Cal., and other properties in southern California, has arranged for bond issue of $3,750,000, a portion of fund to be used for acquisition of companies noted, and for expansion and betterments. A. E. Fitkin & Co., Inc., 165 Broadway, New York, operating public utility properties, is identified with new organization.

Southwestern Gas & Fuel Co., Banning, Cal., recently acquired by Pacific Lighting Corporation, San Francisco, is planning extensions and improvements to cost about $50,000.

Gate Ice Co., Mesa, Ariz., is planning early erection of one-story ice-manufacturing plant, to cost about $55,000 with equipment.

Board of Education, Hillsboro, Ore., is considering installation of manual training equipment in new union high school to cost close to $200,000. Marion Stokes, Chamber of Commerce Building, Portland, is architect.

Ryan Aeronautical Corporation, 412 Union Building, San Diego, Cal., is arranging for manufacture in United States of Siemens-Halske radial air-cooled airplane engines, formerly made only in Germany, and sold in this country as Ryan-Siemens engines. Company contemplates erection of plant for initial production of 1000 engines annually.

Offices and warehouse of Lally Co., San Francisco, pipe distributer, have been moved from 1123 Harrison Street to 1261 Howard Street.

Union Machinery & Supply Co., Seattle, has opened a branch at Portland with temporary headquarters at 68½ Fourth Street under management of Fred W. Rodolf. It will act as distributer for Massillon shovels and other construction equipment.

City of Elma, Wash., will purchase a new steel tank of 500,000 gal. capacity for water supply and an auxiliary Diesel pumping engine.

Canada

TORONTO, April 9.

SLOWING up of machine-tool sales was noted the past week, but this was probably due more to the approaching Easter holidays than to users dropping out of the market. The automotive industry is not buying as extensively as it was a couple of months ago, but sales of single tools for garages and repair plants continue at a high level. Business closed during March, in all lines, was the best month so far this year.

Ingersoll Machine Co., Ingersoll, Ont., is building an addition and will shortly be ready for installation of equipment.

General Metal Devices, Ltd., Oakville, Ont., recently organized with capital stock of $200,000, is completing arrangements for erection of a manufacturing plant covering an area of 18,000 sq. ft. Thomas Strachan is president of company; Edward Bamber, vice-president; Edward Stansbury and Albert McMurray, members of board.

Otto Higel Co., Ltd., King and Bathurst Streets, Toronto, is planning to build a factory at St. Hyacinthe, Que., to cost about $100,000, for manufacture of pianos, gramophone, piano actions, mechanisms, etc.

Bids are being received by B. Swartz, architect, 336 Dundas Street West, Toronto, for erection of a factory, to cost $20,000, for Queen City Furniture Co., 51 Vine Street. It will be two stories, 30 x 90 ft., steel and brick construction.

Barnes Top & Trimming Co., 137 Adelaide Street West, Toronto, will build a one-story factory, construction to be started about May 1.

W. Hughes, 216 Simcoe Street, has general contract for erection of one-story addition, 60 x 70 ft., to plant of White & Thomas, sheet metal products manufacturer, 210 Simcoe Street, Toronto.

Toms Contracting Co., Ltd., 245 St. Clair Avenue East, Toronto, has been awarded contract for an addition to local plant under construction for Dominion Boxboards, Ltd., to be one story and basement, 65 x 139 ft. J. L. Carey, 208 North Laramie Avenue, Chicago, is engineer.

R. Truax Son & Co., Walkerton, Ont., manufacturers of sash and doors, etc., will start work immediately on erection of a new two-story factory, 80 x 80 ft.

Wells & Gray, Ltd., Confederation Life Building, Toronto, has contract for construction of a new plant for Reid & Brown Structural Steel & Iron Works, Ltd., 63 Esplanade East, Toronto.

Western Canada

Canadian Forest Products Co., Ltd., Victoria, B. C., and Chicago, is having plans prepared for erection of a hydroelectric power plant on Nimkish River, British Columbia, to provide power for a pulp and paper mill on which construction will be started later.

Terminal Sheet Metal Works, 1043 Pender Street West, Vancouver, B. C., has awarded contract to B. Davidson, 1012 Broughton Street, for erection of a one-story plant, 71 x 120 ft.

Foreign

CONSTRUCTION of a tin smelting plant is contemplated by N. V. Hollandsche Metallurgische Bedrivjen, Arnhem, Netherlands, recently organized to cost more than $1,000,000 with machinery.

Municipal Council, Moscow, Russia, has appointed a special commission to develop plans and purchase equipment for an automobile manufacturing plant for light cars. Initial works will have capacity of 10,000 cars per annum. A fund of $20,000,000 is being arranged for entire project. Majority of machinery will be purchased in United States.

Standard Oil Co., 26 Broadway, New York, plans rebuilding portion of its refinery, and storage and distributing works at Regla, Cuba, destroyed by fire April 5, with loss reported in excess of $350,000 including equipment.

Mexico Northern Power Co., LaBoquilla, State of Chihuahua, Mexico, has secured permission to build an addition to its local hydroelectric generating plant. Project will include construction of an irrigation system in this district, with electrically-operated pumping stations. A fund of $1,500,000 has been arranged for expansion.

Ulen & Co., Inc., 120 Broadway, New York, subsidiary of American International Corporation, same address, has a contract from Government of Persia for construction of a railroad from Caspian Sea to Persian Gulf. It is estimated to cost $80,000,000, with station structures, shops, rolling stock, etc., and will require about six years for completion. J. G. White Engineering Corporation, 43 Exchange Place, New York, will be associated with enterprise.

Motor-Columbus Corporation for Electrical Enterprises, Zurich, Switzerland, operating electric power properties, is organizing a subsidiary to be known as Swiss-American Electric Co., with headquarters at Zurich. New company is arranging for financing and will dispose of a security issue in United States. It will secure an interest in Italo-Argentine Electric Co., Buenos Aires, Argentina, as well as other South American light and power properties, including Bahia Blanca Electric Co., operating in Argentina, and Compania Americana de Luz. An expansion program will be carried out for power plant construction and new transmission lines. New company will have total assets approximating $26,000,000 in properties.

Department of Public Works, Angora, Turkey, has approved plans for a new hydroelectric power plant with capacity of 100,000 hp., output to be used for Government nitrogen works.

New Trade Publications

Gas vs. Acetylene for Cutting. — International Acetylene Association, 30 East Forty-second Street, New York. Pamphlet of 24 pages, containing two addresses on this subject before a recent association meeting, one giving results of a precise laboratory study, the other citing experience at several shops where both systems of cutting have been in use.

Electric Switches and Containers.—Allen-Bradley Co., Milwaukee. A number of bulletins and price sheets covering a variety of starting and stopping switches and other like equipment for electric power use. Information and illustrations are in considerable detail.

Fuel Feed for Gas Producers.—Wellman-Seaver-Morgan Co., Cleveland. Bulletin 90 describes and illustrates a new type of fuel feed for mechanical gas producers. Passing of the fuel from the overhead bin to the producer is controlled by two bells which are lowered and raised alternately.

Centrifugal Pumps.—Aldrich Pump Co., Allentown, Pa. Data bulletin 70 of 16 pages illustrates and describes in considerable detail single-stage, double-suction centrifugal pumps rated from 20 to 14,000 gal. a minute. Speeds vary from 690 to 1750 r.p.m. Tables of particulars give clearances and other items in the design.

Mass Manufacture of Lathes

Production Control System, Routing and Mechanical Handling, and Special-Purpose Equipment Reduce Costs at Moderate-Sized Plant

BY BURNHAM FINNEY*

THAT methods of mass production successfully used by automobile makers and by other large industrial manufacturers can be adapted to the needs of the machine tool builder in achieving lower operating costs is indicated by the experience of the Monarch Machine Tool Co., Sidney, Ohio, manufacturer of engine lathes. To enumerate the ways and means by which this company has planned its activities along the lines of quantity output, however, would be telling only part of the story of how production economies and greater shop efficiency have been brought about, because the system for controlling production,

*Resident editor of THE IRON AGE at Cincinnati.

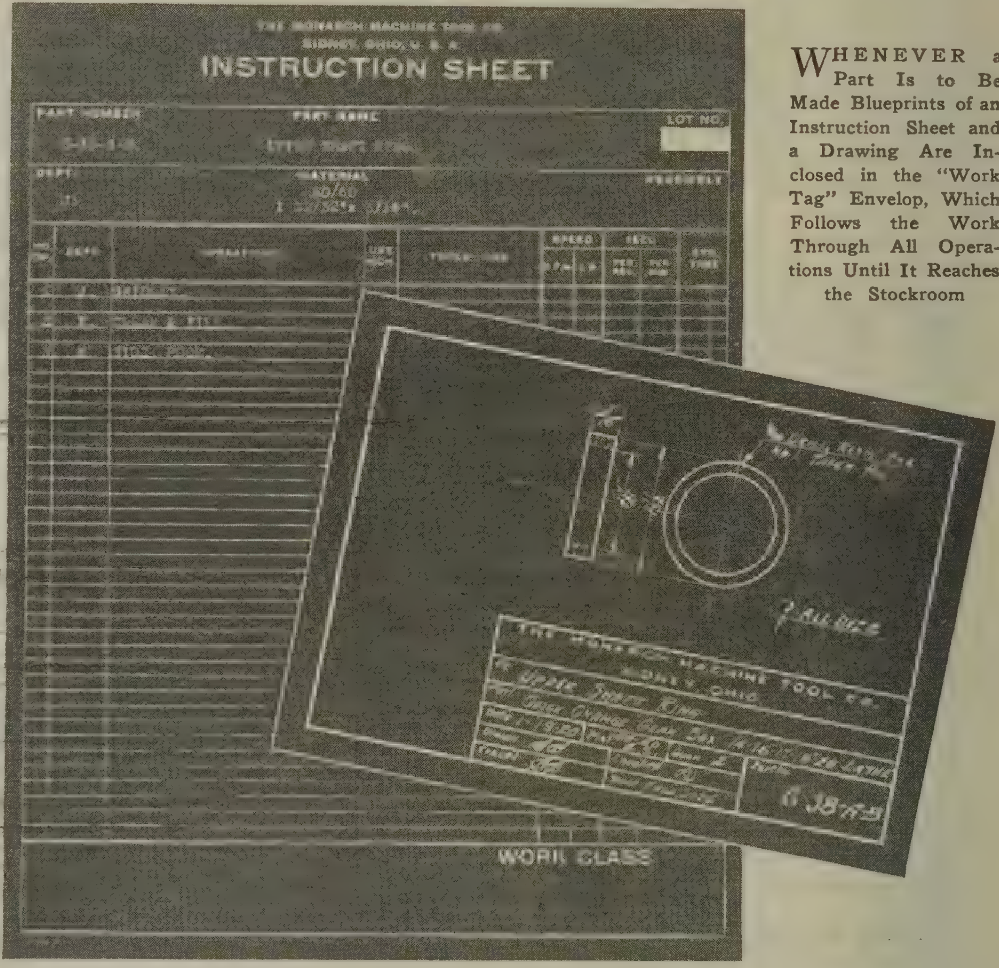
the manner in which inventories are determined and the process for handling materials are factors in the final calculation of results.

While the layout of the company's plant is not ideal so far as straight-line production is concerned, routing of work has been so arranged that no backtracking is necessary. The stockroom for finished parts might well be called the division line separating the machine shop and the sub-assembly departments from the final assembly department. Parts for Monarch engine lathes are made up in quantities, according to orders issued by the production department. For example, a number of gears are put through the shop at one time, with the result that the expense of changing set-ups is reduced to a low point.

Raw Material Needs Estimated on Basis of Pending Business

To have enough raw material on hand to meet requirements without accumulating a surplus is a problem which has been met successfully. Instead of basing its needs upon the amount of business done in the previous year or upon other data which might lead to erroneous conclusions, the sales department reports to the management the number of outstanding proposals which have been made by Monarch dealers. This is possible, because each dealer is obliged to send to the company a copy of each inquiry he receives and also a copy of his quotations to prospective buyers. The management knows from past experience that orders are likely to come from a certain percentage of the total inquiries. When this figure is arrived at, it is added to the number of orders on which work is being done, so that an intelligent conception is gained of the quantity of material which must be purchased.

Whenever an order is received by the company, a factory order form is filled out, copies going to the bookkeeper, the order department, the production department, the stock department, the cost department and the shipping department. Copies are also sent to the dealer and the customer.



THE MONARCH MACHINE TOOL CO.
SIDNEY, OHIO, U. S. A.
INSTRUCTION SHEET
LOT NO.
WORK CLASS

WHENEVER a Part Is to Be Made Blueprints of an Instruction Sheet and a Drawing Are Inclosed in the "Work Tag" Envelop, Which Follows the Work Through All Operations Until It Reaches the Stockroom

"Work Tag" Follows Parts Through All Operations

When the production department receives the order, it ascertains from its files whether the necessary parts to fill the order are in stock. If not, it prepares an instruction sheet containing the name of the part desired, the list of operations through which the part must go and the name of the department to which the part is sent for the first machining work. Attached to the instruction sheet is a blue print of the part. If an upper shaft ring for a quick change gear is needed, for example, the instruction sheet shows that the first operation is in Department J on a Gridley automatic, the second operation is cleaning and filing in Department W, from which the casting goes to the stockroom, known as Department X.

When the instruction sheet and the drawing are sent out from the production department they are inclosed in an envelope called a "work tag." On the exterior of the envelop is information concerning the name of the part, its number, the amount desired, the size, the date issued, the date wanted, the department in which the work starts, the date received in the stockroom and other pertinent data. The "work tag" follows the parts through their various operations until they reach the stockroom. Upon arrival at that point, the tag is returned to the production department, where it is filed.

"Move Card" Authorizes Transfer of Material to Next Department

When parts are ready to be sent from one department to another, the foreman fills out a red "move card" authorizing the transfer of the material to the next department listed on the instruction sheet. The "move card" is given to the shifter handling the material, who turns it over to the foreman of the department to which the parts are in process of delivery.

In case the assembly of certain parts is ordered, the production department makes out a work tag and sends it to the stockroom for finished parts. There it is placed with the parts which are to be assembled in the sub-assembly department and accompanies them through the assembling operations and back to the finished stockroom. As the work tag goes from one operation to the next, workmen put in it small time cards stating the amount of time spent on that particular job. After the work tag returns to the stockroom, it is dispatched to the production department, where it is filed. From the time cards contained in the work tag envelop the production department can quickly determine the labor cost in assembling any part.

Each operator in the machine shop is furnished with cards on which he registers the time spent on every job. The cards in each department are collected daily and are sent to the production department, which thereby has an accurate record of the work done by every employee.

Record Kept of Cost of All Sub-Assemblies

The production department keeps a record of the cost of all sub-assemblies, an assembly cost card being provided for that purpose. On one side of the card is a list of the operations through which the work has passed, the time spent by the workmen and the rate they received, from which is computed the labor cost, the burden and the burden cost. At the right side of the card is a summary of the costs of material, labor and burden, the total cost and the cost of each sub-assembled part. On the back of the card is detailed the cost of all materials going into sub-assemblies.

Through the comparatively simple record system just described the production department is able to control operations throughout the plant and to have detailed information regarding costs, the amount of finished parts and sub-assemblies on hand and the volume of work in process in the shop. Whenever the time expended on a specific operation is wanted, the department has in its files the time cards of the men who have worked on the job. If a time study is to be made of an operation performed on a new machine or by

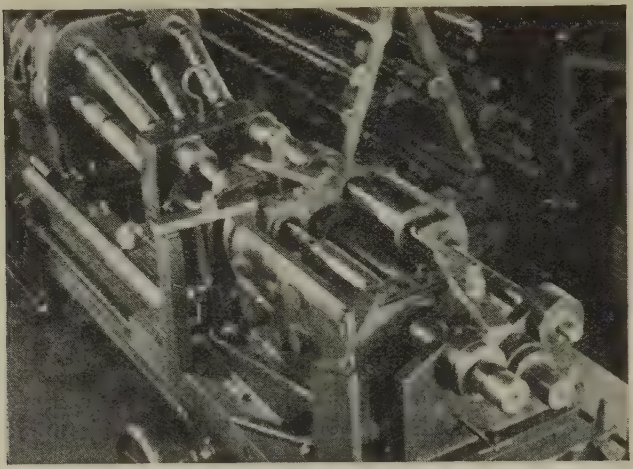
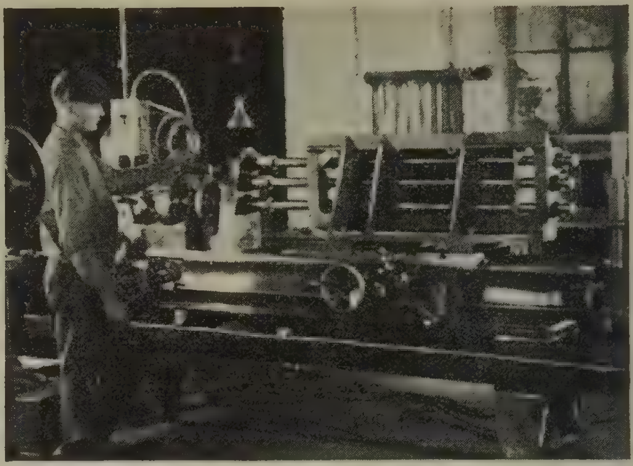
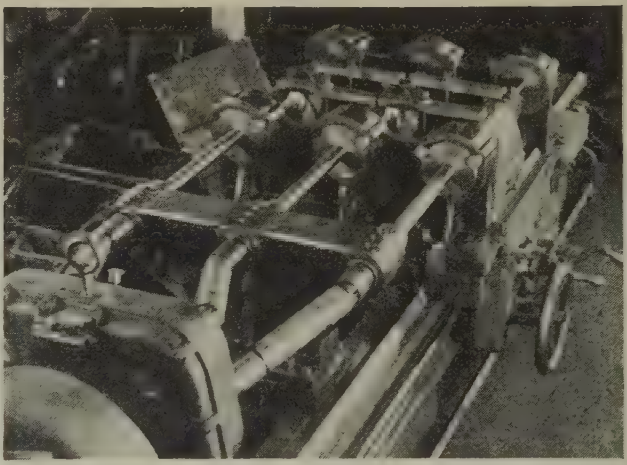
THE Cost of All Sub-Assemblies Is Recorded on an Assembly Cost Card, Which Is Filed by the Production Department. On the back of the card is detailed the cost of all materials going into sub-assemblies



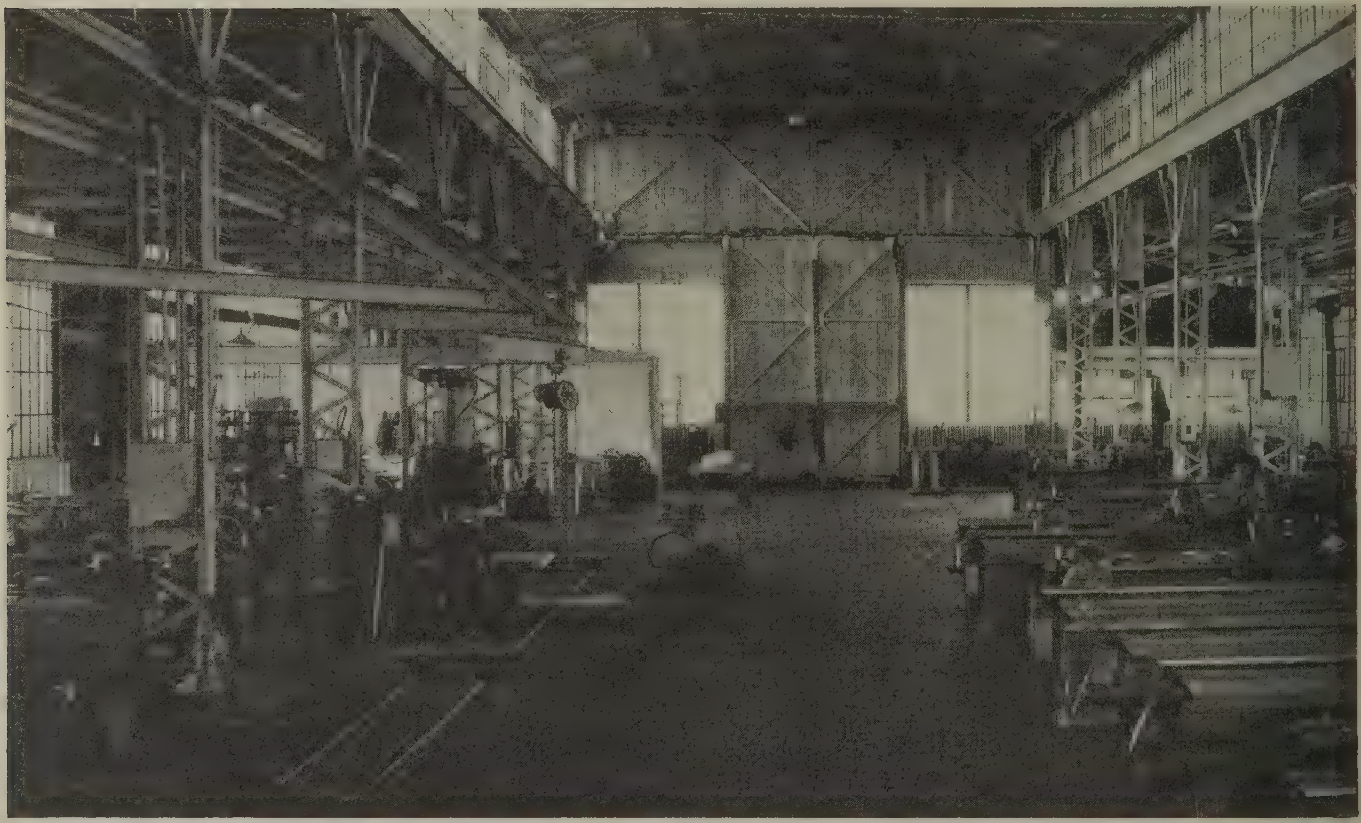




MULTIPLE Boring Is a Feature of the Machine Shop. At upper left, boring seven holes in a headstock at one time on a special boring machine. At upper right, simultaneous boring of 11 holes in a quick-change gear box in the time it takes to bore the largest hole. In upper center, boring three tailstocks at one time

MICROMETER Collars and Other Graduated and Numbered Parts Are Made with Roll Dies on Special Machines (in Lower Center)

Drilling Holes in Lathe Beds Is the Only Machining Operation in the Final Assembly Department (Below). The work is done on a radial drill, shown in the left background. Flat cars, 3 ft. square, on narrow-gage tracks are used to support the ends of a lathe bed when it is put into position for drilling



some other new method, it can be done without disturbing the normal routine of the shop.

Supervisory Committee and Conferences with Foremen Are Features of Management

Formerly it was the custom of the company to have two general superintendents in charge of the plant, but this arrangement resulted in an overlapping of duties which militated against attaining the greatest efficiency. The management, therefore, divided the responsibility by having one of the superintendents take charge of the machining division and the other the assembling division. To consider the formulation of new shop policies and to pass upon all matters of major importance relating to production there is a general supervisory committee consisting of the general manager, assistant general manager, chief engineer and the two superintendents.

Once a week each superintendent has a conference with each foreman under his supervision. In an intimate and informal way the two discuss the work of the men in the department and any other matters pertaining to operating efficiency. This plan puts squarely on the shoulders of the individual foreman his responsibility to the management. It also gives him a voice in discussing and deciding issues affecting his department and encourages him in developing initiative.

Monorail and Lift Trucks Facilitate Handling of Materials

Ample provision has been made in the plant for the mechanical handling of materials. From the receiving shed adjacent to the machine shop a monorail conveyor extends through the shop to the final assembly department. It is used principally to transport lathe beds, and is slightly inclined so that a workman pushing material suspended from it by a chain has an easy task.

For transporting small castings within and between various departments Stuebing-Cowan hand-lift trucks are utilized. Practically all castings, whether light or heavy, are kept on trucks which are stationed alongside the machine operators.

In the sub-assembly department a Louden overhead monorail system parallels the assembly lines, providing adequate means for moving materials. Serving the long bay occupied by the final assembly department is an electric overhead crane operated by rope controls from the floor. The runway of the crane extends over a railroad siding just outside the west end of the building and over the truck loading platform, which occupies a small space at the east end. Two workmen, with the aid of the crane, crate and load all of the lathes shipped by the company.

For drilling holes in the lathe beds, the only machining operation in the final assembly department, material is handled in an unusual manner. Small flat cars, about 3 ft. square, have been placed on a short narrow-gage track extending under and about 10 ft. on both sides of the drill. Whenever a lathe bed is put into position for drilling, each of the two ends rests on one of the cars, with the middle part of the lathe ready for the drilling operation.

To save time for workmen, the tool room, situated near the center of the shop, has windows on all four sides. Each workman has 10 metal checks. Whenever he applies for a tool, he deposits one of these checks, which is put on the rack from which the tool has been taken. Incidentally, the two men in charge of the tool room not only hand out small tools and jigs to the workmen, but also do all of the graduating on the graduating machines and do considerable tool and cutter grinding.

While parts are produced in quantities, care is exercised to make sure that the volume manufactured at any one time will not clog the stock room and will not require an inventory out of proportion to the normal amount of business obtained by the sales department. In fact, the number of parts put through on a shop order depends largely on what is the most economical set-up run for each part on each separate operation. Many parts for small-size lathes are run through in lots of 200, while some of the larger parts are put through in lots of only 25 or 50.

AMPLE Provision for Mechanical Handling of Materials Has Been Made in the Sub-Assembly Department. An overhead monorail system is suspended lengthwise of the assembly lines. Hand-lift platforms, which are transported within and between departments by lift trucks, are also used. One is shown in the foreground

Semi-steel lathe beds are rough-planed and rough-milled and are stored for a period of two months for air-seasoning. Over 1500 are being seasoned at all times. After the seasoning process, the beds are finish-planed. All castings are ground, chipped, cleaned and painted by an air-brush system before machining.

Quantity Machining Yields Economies

Among the factors which have been responsible in large part for reducing costs is the time saved by various machining operations. Lathe carriages are milled in a fraction of the time formerly required by planing, large lots being machined at each set-up. Quantity production of clutches is attained on a clutch milling machine which indexes automatically and is equipped with power rapid traverse between cuts.

Multiple tooling is achieved to a high degree in boring processes. Eleven holes are bored in a quick-change gearbox in the time that is necessary to bore the largest hole, while seven holes are bored in a headstock at one time on a special boring machine.

Lead screws, rough-chased and seasoned, are finish-chased on lathes fitted with precision screws. Micrometer collars and all other graduated and numbered parts are made with roll dies on special machines, and helical gears are cut by the hobbing process with ground hobs, roughing and finishing cuts being taken. High-carbon alloy steel gears used in Monarch lathes are given the same heat treatment as automobile transmission gears, are tested for hardness and are cleaned by sand blasting.

The final assembly department is divided into three units. The first of these is a small unit in which small junior lathes are assembled, the second is utilized for standard-pattern lathes ranging in size from 14 to 20 in., while heavy duty lathes, varying in size from 20 to 30 in., are assembled in the third. In addition, a special unit is maintained in which lathes intended for single-purpose work are assembled. Each unit is manned by a trained crew of specialists. Every assembling and alining operation is inspected, with 0.001 in. allowed as the limit of error. Experience has shown, however, that the average error is less than half of that amount.

From the assembly department the finished lathe passes to the final painting room where the last coat of lacquer enamel is sprayed on. The company is prepared to furnish lathes in any color which fits into the shop color scheme of its customers.

Each of the factors enumerated has contributed its share to the reduction of manufacturing costs and to increased efficiency of production. Considered as a whole, they have made possible the application to this moderate-sized plant of the methods usually associated with companies annually turning out thousands of units instead of 1000, the average number of engine lathes manufactured annually by the Monarch Machine Tool Co.

Overcoming the Tendency of Enameled Cast Iron Ware to Blister

Blisters on enameled cast iron ware may be traced either to faulty enamels and process of application or to the castings themselves is the conclusion reached by the metallurgical and ceramic divisions of the United States Bureau of Standards. Recently the bureau has been studying the latter type of blisters. Differences in the blistering tendencies of different sets of castings were clearly brought out by an enameling test which included a variety of firing treatments. Using this test it was found that not only do different irons have different blistering tendencies, but successive heats of the same iron may have different blistering tendencies. The main source of blisters from the irons used in this work was overcome by the removal of a thin surface layer of the castings, through either mechanical or chemical means.

Metal Traffic Through Sault Ste. Marie Canal

Figures of the 1927 commerce passing through the canal of Sault Ste. Marie have been issued by the Corps of Engineers of the United States Army. The total amount of east-bound iron ore is given as 49,963,131 net tons, all of which went through the United States canal. Pig iron shipped eastward through the canals aggregated 78,772 tons, of which 57,900 tons came through the American canal and 20,872 tons through the Canadian canal. Copper to the amount of 67,422 tons came eastward, of which 63,963 tons passed through the American canal.

West-bound iron ore aggregated 134,937 tons, more than 99 per cent of which went through the American canal. Manufactured iron and steel to the extent of 115,502 tons went westward through the canals, of which 82,240 tons traversed the American canal.

High-Pressure Steam Plant Described

Melvin D. Engle of the Edison Electric Illuminating Co. of Boston was the speaker on April 3 before a meeting of the Providence Engineering Society, Providence, R. I. He told of the first commercial use of 1200-lb. steam pressure anywhere in the world. His description was of the Edgar station of the Edison company, which contains, among other things, the largest single-barrel, single-flow, 1800 r.p.m., turbo-generator unit designed for 350 lb. pressure; the largest 1200-lb. pressure turbo-generator; the largest boiler feed pumps, as measured in power required; and the largest underfeed stokers of any plant in the world.

The speaker traced the great improvements of the past two decades in the design and operation of central station equipment. During this period cast iron has been replaced by steel in turbine shells; brass or bronze by steel, monel metal and stainless iron in turbine blades; heat-proof insulating material has been developed, and countless changes have been made in details and in methods of manufacture. Coal consumption has been cut virtually in half, and the use of equipment of large capacity has tended to hold down the capital charge per unit of installed capacity.

Improvement in Welding Electrodes

The Fusion Welding Corporation, which operates as the welding equipment and supply division of Chicago Steel & Wire Co., 103rd Street and Torrence Avenue, Chicago, has completed an engineering and research laboratory. Included are well equipped workrooms supplied with various forms of alternating and direct current for welding, as well as oxy-acetylene cutting and welding equipment, and apparatus for testing of welds. There is also a photographic darkroom equipped with the latest type of metallographic microscope. The laboratory has also been used for instructing select groups of engineers studying some special phases of welding. It is planned to establish full working exhibits, not only at the engineering laboratory in Chicago, but also at the company's offices in New York, Cleveland, Kansas City, Mo., and San Francisco.

Development work recently completed by the engineering department has produced two new mild steel welding electrodes, known as "blue streak" and "yellow jacket." "Blue streak" is a full flux coated electrode and is said to melt more rapidly than the fastest flowing bare wire and, at the same time, having excellent stability. It is especially suited to the welding of the medium and lighter gage plates and sheets. "Yellow jacket" is a surfaced electrode, and is designed to give extreme penetration when used with high current on heavy material. In the laboratory ½-in. mild steel plates have been successfully welded without beveling the edges at a rate of over 20 ft. per hr.

Mechanization of coal mines will be discussed at the April meeting of the Ohio section of the American Institute of Mining and Metallurgical Engineers, to be held in Columbus, April 21. Technical papers will be presented during afternoon sessions at the chapel of Ohio State University. Among the speakers will be J. W. Wilson, Link-Belt Co., Chicago, who will discuss modern coal cleaning methods. The Jeffrey Mfg. Co., Columbus, will present moving pictures of loading and conveying machinery. Registration will be at the plant of the International Derrick & Equipment Co.

Steels Made Under New Conditions

Results of German Tests with a High-Frequency Induction Furnace—Carbonless, Carbon and Alloy Steels Show Unusual Properties—Future Possibilities*

WORK in connection with a high-frequency furnace installation at the Kaiser Wilhelm Institute for Iron Research, Düsseldorf, Germany, during the winter of 1925-26 led to the conclusion that very strong circulation of the metal bath, a fundamental characteristic of the ironless induction furnace, would lead to new working conditions for the basic chemical reactions in producing steel.

The following are the results of a systematic investigation of the capabilities of the high-frequency furnace for producing steel, which demonstrate the improvement that this new type of furnace offers for making alloy steels.

Refining Accelerated in a High-Frequency Furnace

Acceleration of the speed of refining, due to the active bath movement, was observed in several experiments. A steel bath, under a normal refining slag, was brought from 0.14 per cent carbon to 0.03 per cent in 2 min. In another case, a low-carbon stainless steel was produced by adding ferrochrome of 4.8 per cent carbon and 64.9 per cent chromium to a carbon-free bath. Directly after the chrome addition, the melt contained 1.04 per cent carbon and 14.5 per cent chromium. After a refining period of 96 min., the carbon was reduced to 0.16 per cent and the chromium to 13.42 per cent.

A strong bath movement also presents some undesirable factors when melting solid material, due to a "settlement" that forms on the bottom of the furnace, which is constantly turned over with the continually renewed surface taking up oxygen from the furnace atmosphere. For this reason, it is preferable to use fluid charges when using an ironless induction furnace for steel work.

The effect of deoxidation in the strongly circulated bath was investigated by additions of manganese, silicon and aluminum in over-refined heats. The weight of the experimental heats was 40 kg. The additions of metallic manganese, silicon and aluminum were made after the heat was refined to 0.01 to 0.03 per cent carbon, under a lime-fluorspar slag or sand slag. The decrease of the various constituents was determined by continuous sampling, and is shown in Figs. 4 to 9.

In the basic-lined furnace, the silicon and aluminum content fell very quickly, while the manganese fell more slowly. On the other hand, in the acid furnace, the manganese and aluminum decreased rapidly, while the reduction in silicon was somewhat slower. It should be especially noted that the content was reduced to 0.01 per cent and less without the addition of any refining matter. We can conclude from the reduction curves that, as a result of the energetic bath movement, a very rapid reaction is obtained between oxygen combined with the iron and the deoxidizing constituents, and, at the same time, the resulting deoxidized products very rapidly and completely leave the bath and go into the slag—with proper slag procedure.

The following described experimental heats were made in a basic furnace lined with magnesite. After melting the charge, two phosphorus slags and finally one sulphur slag were built up.

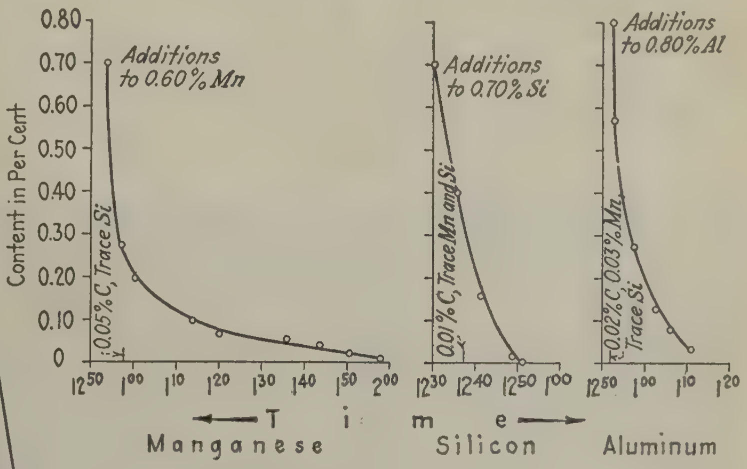
Carbonless Steel Made in High-Frequency Furnace

A direct proof for the conclusions, made from the above washing-out experiments, is given by heats Nos. 69, 71 and 103 in Table I.

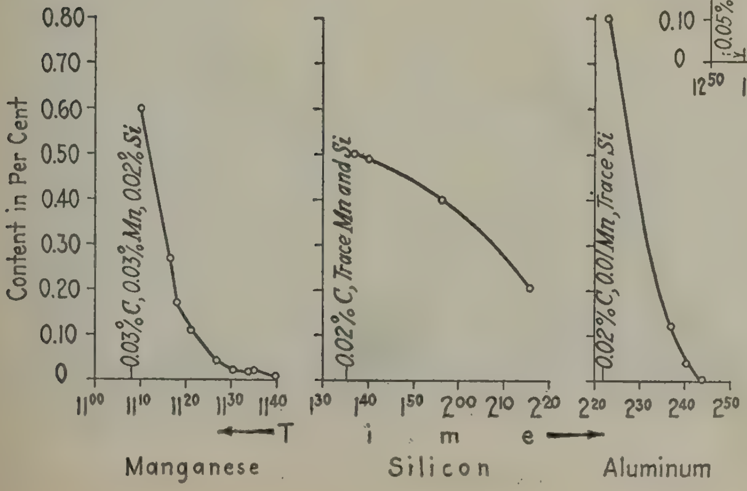
These are completely free of hot-shortness, although they contain only a very small amount of manganese and silicon with the very low-carbon content of 0.01 per cent. The heats Nos. 69, 71 and 103 were poured directly after the washing-out process without adding any further deoxidizing matter, in order to prove that this treatment would make them free of hot-shortness.

---

*Abstract of a paper by Franz Wever and Heinz Neuhauss in the *Proceedings* of the Kaiser Wilhelm Institute for Iron Research, Düsseldorf, Germany, Vol. VIII, No. 11. Prepared by William Adams, one of the engineers of the Ajax Metal Co., Philadelphia.



Figs. 4, 5 and 6 (Right).—Manganese, Silicon and Aluminum Separations in a Basic Furnace. Silicon and aluminum content fell rapidly



Figs. 7, 8 and 9 (Left).—Manganese, Silicon and Aluminum Separations in an Acid Furnace. Manganese and aluminum percentage decreased rapidly

Bars from these heats, bent at a dull red heat, were eminently satisfactory.

A billet from heat No. 103 was rolled into bars measuring 18 x 4.5 mm. Some of this was also rolled into sheet. Samples of this sheet, in 50 and 100 mm. widths, were cold rolled, 9 to 11 passes, with a speed of 30 meters per minute without heat treatment between the passes, and brought down to 0.2 mm. (90 per cent reduction in area).

Table I—Analysis of Carbonless Steels
(In Per Cent)

No. of Heats	C	Mn	Si	P	S	Cu	Al	Cr
69	0.01	0.17	0.15	0.015	0.033	0.10	0.01	....
71	0.01	0.13	0.15	0.014	0.017	0.09	0.02	....
103	0.01	0.14	0.22	0.010	0.010	0.05	...	....

105	0.01	0.52	0.23	0.010	0.012	...	...	12.22
102	0.16	0.43	0.09	0.008	0.049	...	...	13.42
106	0.15	0.44	0.17	0.010	0.020	...	...	13.20

A non-rusting chrome iron (rustless iron), containing very little carbon was also produced (Heat No. 99, Table I). This material was tested at the firm of Sack, Düsseldorf-Rath, after being forged from a 90-mm. square section to a 58-mm. round section. It was turned to 55 mm. diameter and then made into a tube in one operation. The tube, which measured 65 x 3.5 mm., did not show the smallest defect, inside or outside.

In order to verify these good results, heat No. 105, Table I, of the same analysis, was forged and rolled into a tube, 89 x 3½ mm., in two operations, by an automatic machine. The tube was perfectly smooth inside and outside and free from defects, although it had cooled to below 700 deg. at the last operation. After these excellent results from the carbon-free ferrochrome ingot No. 105, the heat No. 106, Table I, containing 0.15 per cent carbon, 13.2 per cent chromium and 0.44 per cent manganese, was given a rolling test. As previously described, this metal had been alloyed with hard ferrochrome and refined from 1.04 per cent carbon to its final content. The ingot, after being forged from a 90-mm. square section to an 88-mm. round section and turned to 75 mm., was readily rolled into a tube, 76 x 3 mm., in four operations on an automatic machine.

Carbon Steels Made in High-Frequency Furnace

Strong circulation in the ironless induction furnace has still greater advantages for producing higher carbon steels, because in this case the bath may be cleansed of any oxygen with carbon, to form carbon monoxide gas. The method of procedure is as follows: After removing the phosphor slag, pieces of carbon are laid on the bath, and, at the same time, a lime-fluorspar-carbon slag covers the bath surface. The bath movement then continually brings new metal particles in contact with the carbon so that any oxide in the bath is quickly and completely reduced. At the beginning of this process the bath boils considerably, but becomes very calm with increasing deoxidation. The following is a complete charging process:

Charging Process for Heat No. 97

Metal charge—40 kg. tube and sheet scrap, and Krupp soft iron.
8.15 o'clock—Power connected; meter reading 9418 kwhr.
9.55 o'clock—Charge melted; meter reading 9481 kwhr., lime and fluorspar charged.
10.10 o'clock—100 gm. hammer-scales.
10.15 o'clock—First phosphor slag removed; lime and fluorspar charged.
10.25 o'clock—100 gm. hammer-scales.
10.35 o'clock—Second phosphor slag completely removed.
10.36 o'clock—Sulphur slag charged.
(One part charcoal, by weight)
(One part fluorspar, by weight)
(Four parts lime, by weight)
10.40 o'clock—175 gm. carbon electrode material added; bath is turbulent.
10.56 o'clock—First test: 0.37 per cent C, 0.18 per cent Mn. Bath is less turbulent and hot; 153 gm. carbon electrode material added.
11.06 o'clock—Second test: 0.95 per cent C. Bath is very quiet; 70 gm. carbon electrode material added.
11.18 o'clock—Third test: 1.05 per cent C.
11.30 o'clock—60 gm. carbon electrode material added.
11.43 o'clock—58 gm. ferromanganese inserted. (75 per cent Mn., 6 per cent C).
11.46 o'clock—Charge poured in ladle; 7 gm. Al and 40 gm. FeSi (93 per cent Si) added.
Final analysis: 1.32 per cent C, 0.25 per cent Mn, 0.12 per cent Si, 0.013 P, 0.011 per cent S.

18	880	53.96	5.97	9.97	47.99	1060	136.5	Partly overheated	653	66.7

Due to the tendency of the bath movement to pull the slag to the side walls, it was necessary to work with a comparatively thick slag covering. The temperature conditions in the small experimental furnace were also unfavorable for maintaining a white slag. In order that the results may be valued correctly, it should be borne in mind that in these experiments the bath was always over-refined after being melted down. As the heats No. 70 and No. 72 show, the over-refined metal may be brought back completely by deoxidation using a layer of carbon under a thick lime-fluorspar-carbon slag. In spite of the small manganese content (0.05 to 0.06 per cent), both heats were free of all hot-shortness. The carbon in the two heats was 1.14 and 0.84 per cent respectively, silicon, 0.23 and 0.19 per cent; phosphorus, 0.011 and 0.006 per cent, and sulphur, 0.005 and 0.007 per cent.

In order to arrive at some numerical expression for comparing the quality of the carbon steels melted with clay crucible, graphite crucible and electric steels, the Maurer repeating hardness test was used. A series of carbon steels of similar analyses were melted as outlined by the work of Maurer and Haufe (E. Maurer and W. Haufe, *Stahl und Eisen,* Vol. 44, 1926).

The test pieces measured 20 mm. square and 85 mm. long. They were notched in the middle of one side, the notch being 1.5 mm. wide and 3 mm. deep and perpendicular to the long axis. They were then hardened in brine to the first hardening level of 780 deg. C.

In order to test the sensitiveness of the steel against overheating, experiments were made with pieces hardened at temperatures between 760 and 950 deg. C. As a whole, the steels in Table III showed very little sensitiveness to overheating. In all pieces fractured, the fine grain lies inside of the hardened outer layer.

Tests on a Hard Alloy Steel

As an example for a hard alloy steel, a chrome ball bearing steel of the following analysis was melted:

(Heat No. 75) 1.18 per cent C., 0.46 Mn., 0.09 per cent Si., 1.45 per cent Cr., 0.02 per cent P, 0.012 S., 0.072 per cent O_2.

This was made into a tube, 55½ x 39 mm. Table IV shows the bending strength, fracture examination and hardness at various hardenings. The metallographic examination also showed a material free of all objections.

Similar Results Expected in Large Furnaces

The foregoing results of melting experiments up to the present time lead to the conclusion that the ironless induction furnace will play an important part in any further development of the electric alloy steels. These results are not to be attributed to a special working procedure attainable only in the laboratory, because we believe the main reason for the high excellence of the high-frequency steel is due to the fundamental improvement in the physical and chemical conditions brought about by the bath circulation.

These metallurgical fundamentals will remain the same in larger furnaces. Therefore, it is believed possible to transfer the results into large operations. The difficulty encountered when working with small furnaces due to the unfavorable relation of the working opening to the total top surface will be greatly improved with larger units.

Condenser Units with Self-Cleaning Surfaces

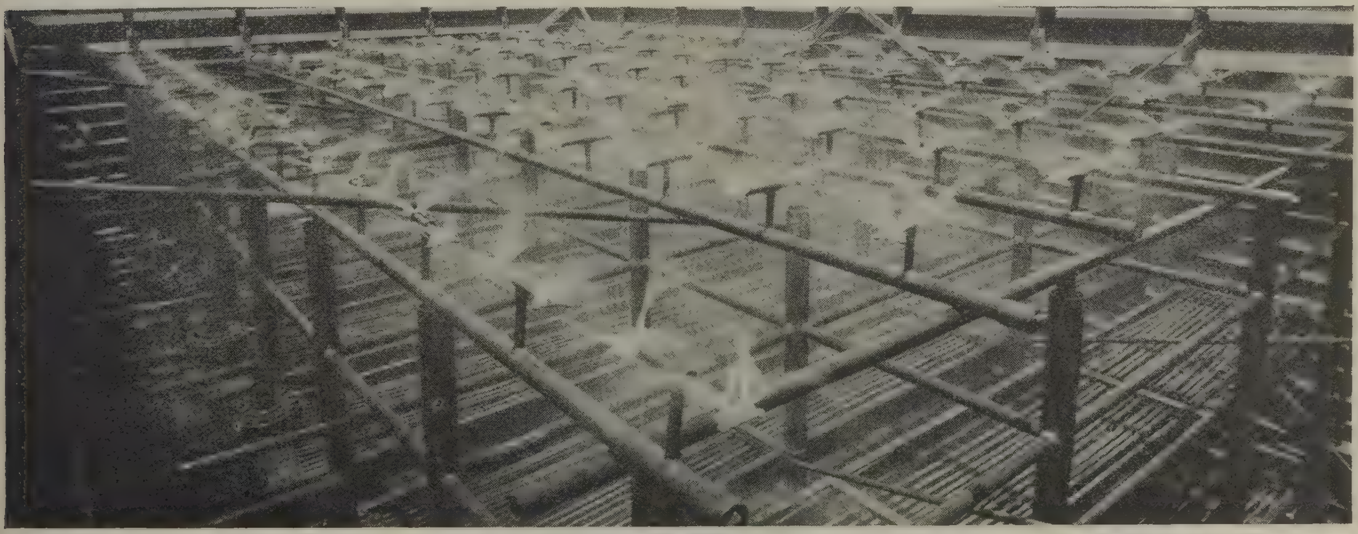
The Griscom-Russell Co., New York, has developed a new surface condenser or cooler unit, known as the G-R Bentube section. Essentially, each section consists of two cast iron headers fixed rigidly at proper distances apart by angle irons or other structural members. Between these headers are a series of admiralty metal tubes, somewhat too long for the intervening space. Each tube therefore possesses initially a slight bow, deviating from a straight line.

In operation the hot gas or liquid to be cooled enters the unit by one header, thence through the tubes to the other header, and from there to other Bentube units in series, or is returned to the main circulating system. Hot liquids inside the tubes cause them to expand in length, and increase the sidewise bow or curve. This change in curve with changing temperature is said to be sufficient to flake off any scale collecting on the outside of the tubes from the evaporation of the cooling water, which may therefore be quite hard or dirty.

Commercial Stocks of Industrial Coal Becoming Smaller

Estimates of the National Association of Purchasing Agents place the supply of coal in various industries at 26 days for steel mills, 36 days for by-product coke plants, 37 days for railroads, 51 days for electric and gas utility plants and 37 days for other industries. The total is given at 47,388,000 tons on March 1, compared with 50,595,000 tons Feb. 1. There has been a steady reduction since Oct. 1, when the total was 60,154,000 tons. Industrial consumption during February was placed at 36,301,000 tons, a drop of more than 3 per cent from the January total of 37,678,000 tons.

With only one more week of the coal year yet to hear from, estimates of the total production of the year ended March 31 include 480,000,000 tons of bituminous coal, compared with 600,000,000 tons a year ago. The figures are based on the latest reports from the United States Bureau of Mines. In anthracite, the coal year will show an output of about 78,700,000 tons, compared with nearly 92,000,000 tons last year.



Cooling Bed for Oil Vapors, Built of "Bentube" Sections

Chrome-Molybdenum Steel

SUCCESSFUL spanning of the Atlantic from East to West by the German-Irish flyers focuses attention on the importance of alloy steels in airplane construction. The steel described in this article made up the framework of the famous Lindbergh plane and of other planes which have made epoch-making flights in the last year.

BY J. B. JOHNSON*

THE survival of any alloy steel in the keen competition of commercial application depends upon the superior properties which the steel may have for performing any particular service. This is particularly true when it is used in aircraft construction. Aeronautical engineers are forced to conserve weight by the very nature of the conditions under which the airplane operates. Such conservation can be effected by using steels with a high strength-weight ratio and by designing members to utilize the material most economically. The former is obtained with heat-treated alloy steels and the latter by using shapes with a large moment of inertia, connected together by simple joints. A large moment of inertia is obtained by using hollow or built-up sections of thin material.

The most popular form of structural member is a seamless tube. Tubing of either circular or square cross-section can be readily adapted to the truss or bridge type of construction, which is almost universally used in modern aircraft. A carbon steel tube was used in the original airplanes and is still extensively used on the small commercial airplanes. With the increase in size of the airplane and the higher factors of safety demanded by the increase in horsepower of the engines, an alloy steel tubing is more economical of weight and more uniform in quality.

Three and one-half per cent nickel and nickel-chromium steels were utilized when the use of alloy tubing was confined to straight axles with a comparatively low ratio of diameter to wall thickness. These axles were heated during fabrication to develop a tensile strength of 200,000 lb. per sq. in., with a minimum elongation of 5 per cent, and were entirely satisfactory for the purpose.

With the more extended use of alloy steel tubing in the structure, however, it was found desirable to develop other alloys which could be more economically manufactured in very thin gages and large diameters, that is, with a large ratio of diameter to wall thickness, and which could be welded without a great reduction in tensile strength. Steel containing chromium and vanadium as the alloying elements could not be cold-drawn to the ratio desired without excessive waste, but the substitution of molybdenum for vanadium overcame this difficulty. Chrome-molybdenum steel is being used in the automotive industry for axles, torque tubes and other highly stressed parts, and its adaptation to aircraft use was a logical development.

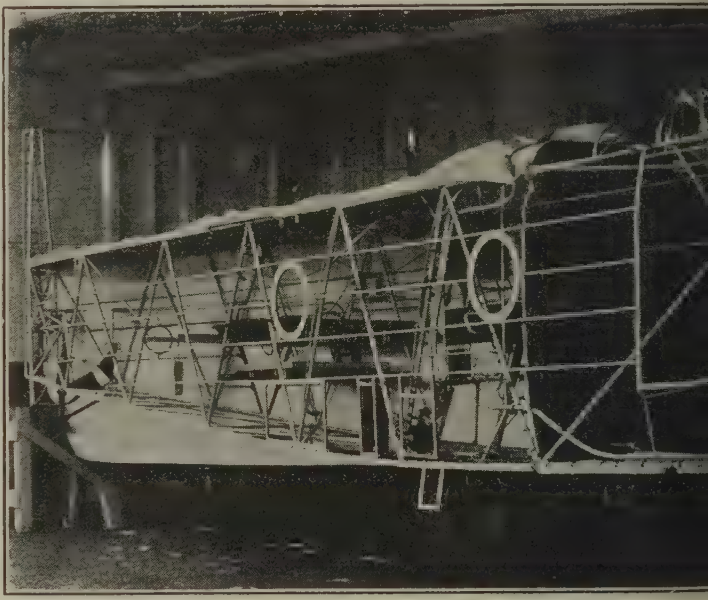


Fig. 1—Typical Assembly of Welded Truss

Chrome-molybdenum tubing is manufactured to any outside diameter and wall thickness which can be economically used in aircraft construction. The range of sizes is as extensive as for low-carbon tubing. The smallest size ordinarily used is ¼ in. in outside diameter by 0.028 in. in wall thickness. As the diameter increases, the ratio of diameter to wall thickness increases, and tubes over 2 in. in diameter with a wall thickness of 0.035 in. are commonly employed. The following analysis is called for in United States Army specifications and is used almost exclusively:

	Per Cent		Per Cent
Carbon	0.25-0.35	Chromium	0.80-1.10
Manganese	0.40-0.60	Molybdenum	0.15-0.25

This material has excellent weldability and has air-hardening properties in thin sections which are very desirable, since the tensile strength of a section close to the weld is not seriously affected.

Several tests have been reported by different investigators indicating that a tensile strength of 95,000

---

*Chief of material branch War Department Air Corps, Dayton, Ohio.

in Airplane Construction

lb. per sq. in. can be obtained in this material after cooling from the welding heat. The following results obtained on plain butt welds were given in a recent paper prepared for the American Welding Society[*]:

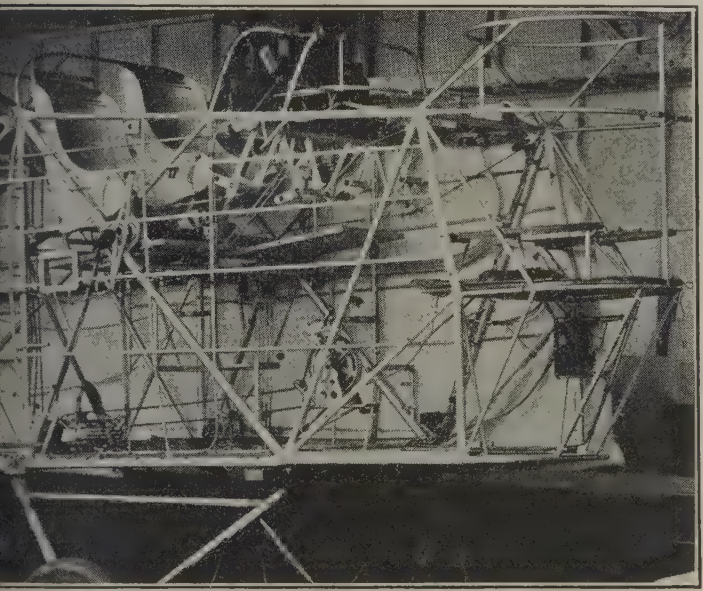
Chemical Composition:	Per Cent		Per Cent
Carbon	0.28-0.35	Chromium	0.90-1.00
Manganese	0.30-0.60	Molybdenum	0.15-0.25

Physical Properties:	Unwelded	Welded
Tensile strength, lb. per sq. in.	98,000	96,000
Yield point, lb. per sq. in.	75,000	72,000
Elongation in 2 in. per cent	12	7

The above results of the tensile test are the average of several obtained on specimens in the range of chemical composition indicated and varying in size from ¾ to 1¼ in. in outside diameter and 0.028 to 0.093 in. in wall thickness.

A unit stress of 80,000 lb. per sq. in. for the section close to the weld is commonly used in design in order to take care of any imperfections in the weld.

The chrome-molybdenum analysis gives excellent response to heat treatment. The normalized steel, which is material air-cooled from about 1625 deg. Fahr., has an ultimate tensile strength and elongation equivalent to that obtained by quenching in oil and tempering at 1200 deg. Fahr., but has a lower yield point. This air-hardening is a valuable asset in aircraft construction. The welded structures used for the body and control surfaces are impractical to heat treat by quenching on account of the size of the assemblies and the slenderness of the individual parts, which cause warping and twisting. By using a normalized or quenched and drawn steel with a tensile strength of 95,000 lb. per sq. in., it is possible to weld up these assemblies and retain this strength, due to the air-hardening properties of the chrome-molybdenum analysis.



Fuselage Structure of the Modern Airplane

This steel, in common with other structural alloy steels, will give a wide variation in tensile properties, dependent upon the tempering temperature after quenching. Aircraft parts that are quenched must be handled carefully to prevent damage, on account of the thin sections and the fairly sharp changes of section due to welded seams. Oil quenching is generally preferred to water quenching. Fig. 3 is a curve which has been extensively used by aircraft manufacturers as the basis of heat treatment of chrome-molybdenum steel.

One of the most important applications for tubing is in the fuselage structure. An excellent example of this type of construction is shown by the fuselage structure (Fig. 1), which represents a typical assembly of welded trusses. All of the tubes in this assembly are chrome-molybdenum steel, heat treated at the mill by normalizing or quenching to develop a minimum tensile strength of 95,000 lb. per sq. in., a yield point of 60,000 lb. per sq. in., and an elongation of 12 per cent. Fuselages of chrome-molybdenum tubing are built for the small airplane weighing 1500 lb. and the larger ones weighing 18,000 lb.

A type of joint commonly used is shown in Fig. 2. This is an excellent tension or compression joint, and a minimum strength of 95,000 lb. per sq. in. on the projected area of the tube is practically always attained by welders of only average ability. Welding can be performed by means of the oxy-acetylene flame or electric arc. Welding wire of low or medium-carbon steel gives excellent results.

Closely allied with the use of thin tubes for structural members is the use of sheet steel fittings fastening together various main and sub-assemblies. During the course of fabrication, sheet steel fittings are subjected to severe bending operations and are practically always welded or brazed. Material that will fabricate the best when subjected to these operations is the logical material for sheet metal fittings. The different types of alloy steels have been thoroughly tested to determine which give the best results. H. C. Knerr, in THE IRON AGE of Sept. 8, 1921, gave the results of a number of tests on 3.5 per cent nickel, nickel-chromium and chrome-vanadium sheet steel, and concluded that the chrome-vanadium was the best type. This was also the conclusion of other investigators, and chrome-

A Racing Plane with Chrome-Molybdenum Steel Fuselage Is Reproduced in Upper Left-Hand Corner of Opposite Page. The plane at the right is a transport airplane with fuselage and landing gear of the same steel

---

[*] "Welding the Aircraft Structure," presented at fall meeting of the A. W. S. at Detroit, Sept. 20, 1927.

vanadium has been used quite extensively during the past few years.

Recent investigations of chrome-molybdenum sheet steel have indicated that this is even superior to the chrome-vanadium. It is more easily welded, and bending operations can be performed with greater ease. It is more plastic and does not tend to spring back when released from the jig. Normalized material can be bent 180 deg. over a radius equal to the thickness of the sheet without cracking. Annealing the material or quenching and tempering at 1200 to 1300 deg. Fahr. increases the workability and permits 180-deg. bends over a radius equal to one-half the thickness up to ⅜ in. in thickness. It has the added advantage that sheets and tubes, welded or brazed together, can be heat treated as a unit and corresponding physical properties will be developed in all parts of the assembly.

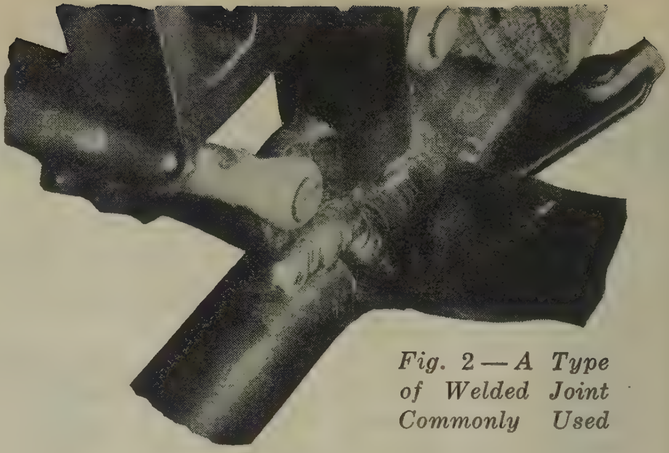


Fig. 2 — A Type of Welded Joint Commonly Used

Such an assembly is shown in Fig. 4. This is a fitting built up of chrome-molybdenum tubing and chrome-molybdenum sheets of identical analysis, heat treated after welding by quenching from 1625 deg. Fahr. in oil and tempering at 1000 deg. Fahr. to develop a minimum tensile strength of 125,000 lb. per sq. in. The tensile properties of the sheets and tubes are practically identical for the same heat treatment except for the elongation. Since the elongation is a function of the test specimen, the thinner sheets will not give so high a value as the heavier sheets for the same tempering temperature. This is indicated by the curve shown in Fig. 5. When the tests are made on a tube using the full cross-section for the test specimen, the results are higher than with the standard sheet metal test specimen. The sheet metal specimen used in obtaining the results shown in the curves is similar to the new specimen of the American Society for Testing Materials, with a gage length of 4 in. and a width of ½ in.

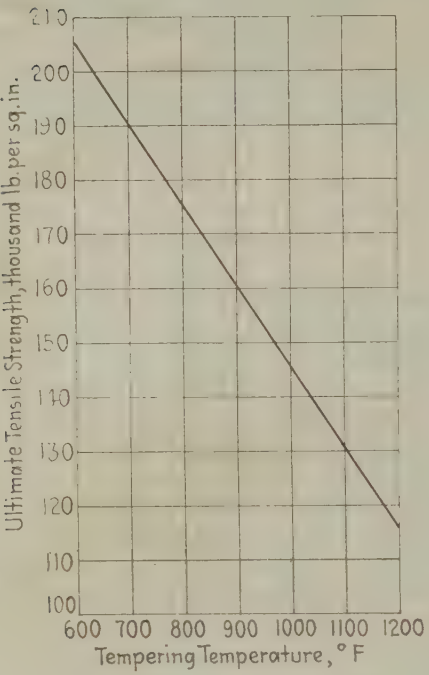

Fig. 3 (Left).—Curve Extensively Used by Aircraft Manufacturers as the Basis of Heat Treatment of Chrome-Molybdenum Steel Sheet and Tubing. Heat treatment: Heat to 1600 to 1625 deg. Fahr., quench in oil and reheat as indicated. The normalized steel has a tensile strength of about 95,000 lb. per sq. in. Chemical analysis: Carbon, 0.25 to 0.35; manganese, 0.40 to 0.60; chromium, 0.80 to 1.10; molybdenum, 0.15 to 0.25

Conception of Safety Work Broadens

Questions of General Health of Employee Becoming Dominant —Mechanical Safeguards Only a Stop-Gap

BY C. B. AUEL*

WHEN accident prevention first began to receive systematic attention by industry, about 20 years ago, it was assumed naturally that it was almost wholly a problem of guarding tools and equipment. It was recognized that this would in some instances be a difficult thing to do. But it was further felt that, if this guarding could be successfully accomplished, the problem would be solved for all time.

After the lapse of a number of years, during which the guarding of tools and equipment had gone forward to a considerable extent, it was found that accidents continued. It began to be apparent that accidents happened on occasion at places other than the point of operation, where most accidents had, in the absence of statistics, been assumed to have happened. Many accidents occurred quite remote from the vicinity of tools or equipment.

And so today the guarding of tools and equipment, though important, may be set down as only one of a number of major safety precautions. The problem of accident prevention, instead of being comparatively simple, as at first believed, is commencing to be recognized as most complex. Some of the other major items involved in the work of accident prevention are:

- Minimum labor turnover
- Good health, involving physical examination, both on employment and at subsequent periods
- Contentment; absence of dissatisfaction and worry
- Cleanliness, plant and personal, and neatness
- Good lighting
- English language
- Carefulness

A safety program can hardly be mapped out with any degree of completeness without taking all of these, and even some others, into consideration. But their relative importance may shift in different industries, or may shift in practically all industries alike, depending on varying factors.

Some years ago the speaker placed "minimum labor turnover" as the greatest safety device that could be installed in any plant. But, with the growing tendency to interpret compensation laws more and more liberally and to make them more nearly all inclusive, as well as to increase the compensation paid, the item of health assumes larger and larger proportions. In time, if the tendency is continued, health will become the greatest phase of the accident prevention problem.

Good Health a Prime Requisite

From 50 to almost 80 per cent of children in school have physical defects. They are either excessively above or below weight, or have defective teeth or eyesight, or adenoids or seriously enlarged tonsils, etc. Nearly all of these defects lend themselves to correction if taken in time.

No one of intelligence would think of continuing a machine in operation for long after it was found to need repairs, and such repairs would be promptly made. But our most valuable machines of all, our young folks, we either do not inspect or else inspect in a haphazard manner. And we largely fail to make repairs, but are inclined to hope they may with time outgrow the need of repairs.

Physicians employed by the industries were originally used largely to administer "first-aid" to employees who became sick, as well as to take care of any who might meet with accident. This work was undertaken principally for humanitarian reasons. Naturally, however, it in turn led to occasional physical examination of employees. In due course, it came to be recognized that there were economic advantages in physical examination and that it could profitably be extended to applicants for employment, and be made to apply to all employees at periodic intervals.

Physical Examination Beneficial

Regardless of the causes which brought about physical examination, it is here to stay and to be developed and extended beyond the industries. Its effect will be greatly beneficial, and more and more far-reaching, with the passing of the years.

The industries want to see every worker who applies for a job obtain the one best suited to him. Where physical examination shows an individual lacking in certain respects, industry will, in the main, still endeavor to place him. Our company will hire a worker with defective eyesight, or continue one in our employ, if he will procure corrective glasses. In a case of defective teeth or of a hernia we may engage him if he will, within a specified time, have the defect corrected.

Investigation by us many years ago, as to the causes of accident, developed the supposed fact that about 25 per cent were due to carelessness. In seeking a remedy for this we found that carelessness was in many cases produced by something else—that it might be itself an effect and not a cause. Possible causes of carelessness include largely worry and ill health.

Good Vision a Corollary of Proper Lighting

Many accidents have been traced to poor eyesight, a corollary of ill health. Admitting this, it is but a step further to say that many accidents have been due to poor lighting, in producing the equivalent of poor vision. Some years ago the Travelers' Iusurance Co. prepared a chart of 95,000 accidents. This showed an increase in the short, dark days of winter and a decrease in the long, light days of summer. This has been confirmed by other investigators.

Illuminating engineers have in the past been much to blame for not impressing upon factory managers the value of good lighting and its comparative cheapness. Reference to early tables of lighting intensities for various kinds of work will generally show that, while they recommended anywhere from 10 to 20 foot-candles for drafting rooms, yet from 5 to 10 foot-candles were deemed liberal for manufacturing.

They seemed to overlook entirely the fact that many times the worker and the inspector had to make measurements as close as 0.001 in., reading the fine lines of verniers and micrometers. And they must obtain the figures from soiled, crumpled and more or less illegible blue prints.

We have found cases of defective eyesight—one in particular, with 40 per cent vision in one eye and 50 per cent in the other—yet the employee did not even know there was anything the matter. Much of this can be traced to the diseases of childhood.

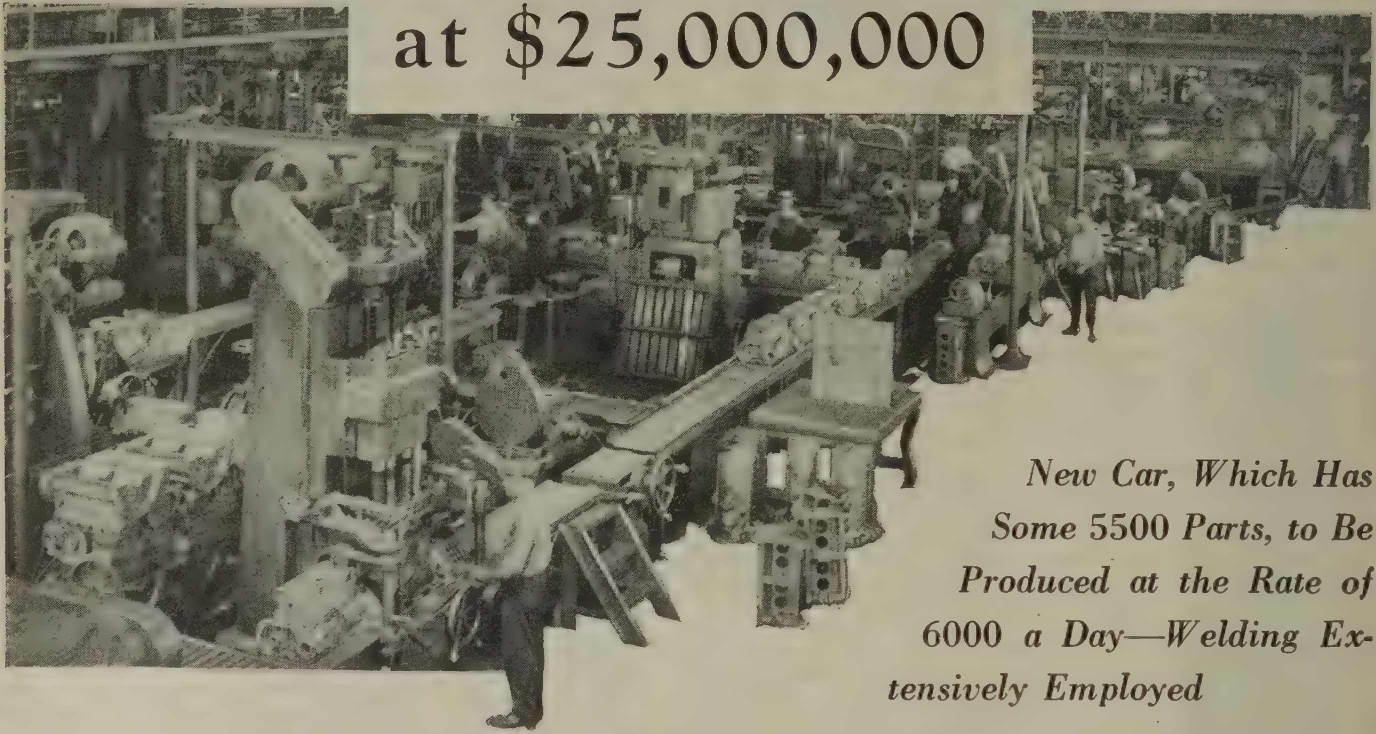
Ford Shop Changes Estimated at $25,000,000



New Car, Which Has Some 5500 Parts, to Be Produced at the Rate of 6000 a Day—Welding Extensively Employed

BY FAY LEONE FAUROTE*

TO those production men interested in the fabrication of metals, especially steel, the new Model A Ford furnishes a striking example of what can be done by electric welding, forging, upsetting, mass machining, extruding and grinding.

The car, which contains some 5500 parts; several hundred more than its predecessor, is now being made at the rate of 2000 a day and it is expected that this production will be increased to 4000 per day by June 1 and reach 5000 a day by July 1 of this year. A 6000 car per day rate is planned. When it is calculated that this production will demand the daily delivery to the process line of some 33,000,000 components it will be seen that the plants at Highland Park and Fordson, as well as several of the smaller Ford factories and branches outside of Detroit, will be a busy place this year.

It is estimated by Ford engineers that in the 19 previous years devoted to the manufacture of the Model T car (1908-1927) some $4,868,000,000 had been expended for materials and a total of $1,970,414,972 had been paid out in wages and salaries. During this period Ford production was the greatest in the industry. In 1921, at the height of his quantity manufacture of the Model T, the Ford company was making 56 per cent of all the cars produced in this country. Incidentally, one-eighth of the factory equipment is still engaged in making Model T parts so that the 10,000,000 cars which Ford statisticians estimate are still in use may be serviced. During the change-over period last year orders amounting to $10,000,000 per month were filled.

The fifteenth million Model T came off the assembly line on May 26, 1927, and production of the Model A began in the fall of the same year. The first Model A engine was completed on Oct. 20, 1927, and the car first publicly shown on Dec. 2, 1927. Production progressed slowly, however, due to the complete shop overhaul necessary and the fact that the quality of the new car demanded a slower pace at first in order that the inspection requirements might be carefully learned. Not only the parts but many of the machines and processes were entirely new and no one knew just what could be expected of the various production groups.

Then there were the usual "kinks" to be ironed out; not all the welders worked satisfactorily and many small alterations had to be made in machines and the sequence of operations. The six tool rooms at Fordson have been kept busy with new machine work, alterations of standard machines, conversions of others; in a word, the Ford shop over-haul was a Herculean task and cost a fortune.

Half of Machine Tool Equipment Rebuilt

Early figures placed the cost of the shop changes at $15,000,000 but it is safe now to estimate that the final cost will exceed $25,000,000. Fifty per cent of the machine tools had to be rebuilt. Gear-generating machines to the number of 166 were completely rebuilt at a cost of $3,000 each. This was made necessary by the production of the two gears in the Ford Model A rear axle. Some $4,000,000 more was spent for new machine tools; about $4,500,000 more went into the remodeling and altering of the tools on hand; 4500 new machine tools costing in the neighborhood of $4,000,000 were added for special Model A work; and new dies and fixtures, including a set for forming the new steel bodies, cost $5,000,000 more. For spinning the rear axle housing $120,000 went for spinning machines. Another $1,000,000 went for punch presses and other mechanical equipment of this nature. For making the new steel wheels which are assembled at Hamilton, Ohio, plant, machine alterations and new materials for this process cost another $600,000. Three hundred welding machines, many of them entirely rebuilt in Ford shops for the special Ford welding operations, were provided at costs ranging from $700 to $9,000 each. Milling machines of continuous drum type were purchased. For example, three of these units, Ingersolls, are used for machining the cylinder heads, each machine takes 16 blocks at a time, eight on each side. The production is 250 cylinder blocks every eight hours.

---

*Mechanical engineer, New York, and co-author of "Ford Methods and the Ford Shops," published in 1915.

Less Than 1000 Machine Tools Scrapped in 20 Years

The machine tool register shows that there are some 53,000 machine tools in service in the Ford industries today. Less than 1000 actually have been scrapped during the last 20 years which speaks well for Ford adaptability. Nothing is thrown away if it can be utilized and even when it is discarded it is not wasted. Even scrap is melted and used again. Paper is remade, tool handles made into smaller sizes. Even water, oil, gas, oily waste, in fact almost everything, is made to yield its utmost in usefulness and profit. And the shops are kept spotlessly clean.

There are at present about 100,000 men employed in the Ford shops in and around Detroit; of these 8000 are skilled tool makers. This payroll may be increased to 125,000 when production has reached 6000 cars per day.

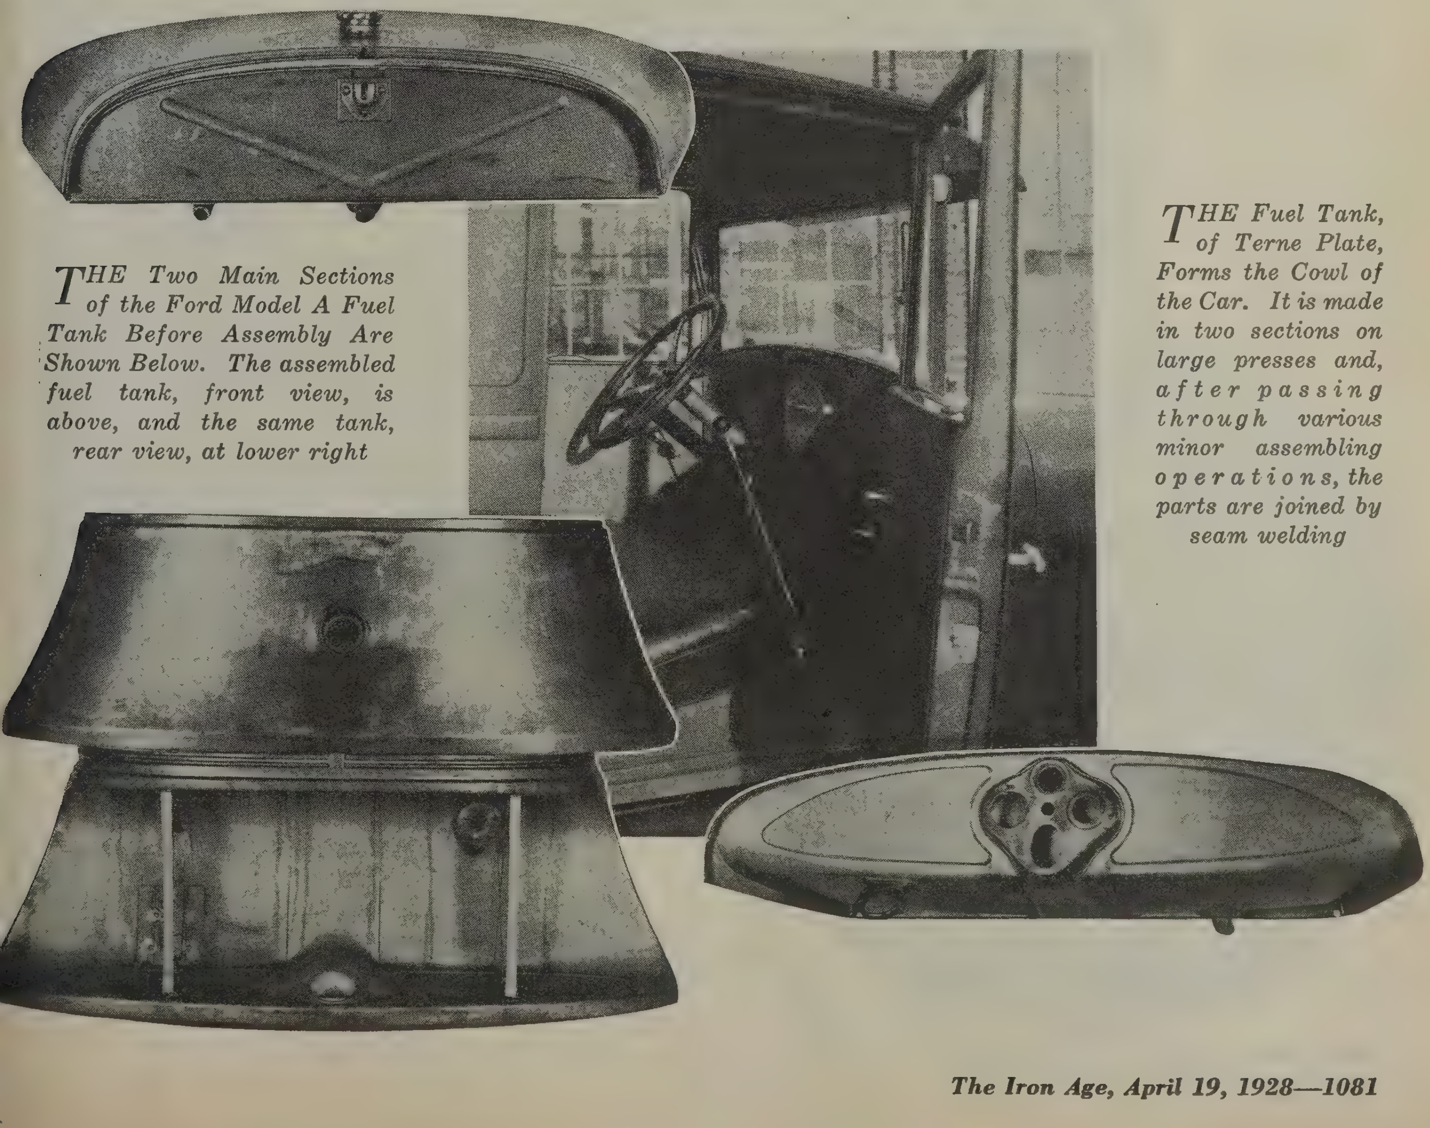
While Fordson, as the River Rouge plant is now called, is the center of greatest production activity, there is still going on at Highland Park a variety of processes and the manufacture of the steering gear, radiators, valves, ball and roller bearings, ignition equipment, rubber parts, wire, leather, some drop forgings, some of the glass manufacture, Fordensite, lead, storage batteries, textiles and some standard small parts. The lamps are coming from the Flat Rock plant. The main process lines and final assembly line are at Fordson, where is also the new Ford administration building, recently opened.

Unusual Number of Parts Electrically Welded

An examination of the main components of the new Ford car reveals extensive use of electric welding. In fact it may be said that this new Ford is a triumph for welding, forging and stamping processes; an almost all-steel car with an unusual number of all-steel *integral* parts, so built up. Thus, the rear axle housing, the fuel tank, the fan, the muffler, the steel-spoked wheels, the steering gear housing, the differential ring gear, the starter shaft, the crankcase or engine pan, the oil pump gear, spare tire carrier, battery support, generator pulley, brake shafts, windshield frame and other small parts owe much of their strength, light weight, uniformity and speed of fabrication to the Ford system of electric welding. The actual machines used and the manner in which these parts are made will be described in a later article of this series.

It has always been characteristic of Ford practice to make everything as fool-proof as possible. The car because of its world-wide use must be simple in construction and capable of being of service everywhere; so it has been carefully designed with that fact in mind. If it is possible to make several parts into *one* unit, Ford engineers have tried to do it. For example, the rear axle gear is butt-welded on to the shaft; it cannot come off. There are no keys or splines to become loose and drop out. So Ford parts have been assembled wherever possible "for good and all." This makes for reliability and permanence. Incidentally it will cut the service charges materially. Furthermore, Ford parts made in this way are lower priced. Punch presses, upsetting machines, bulldozers, electric furnaces—both for forging and heat treatment—the very wide use of welders, hot-metal spinning machines, two, three and four-way drilling machines, drum type continuous milling machines, special testing machines, scales, automatic inspection devices of all kinds, conveyors, slides, roller platforms and tables, moving chains, hoists, cranes of 5, 10 and 25-ton capacity, some 92 miles of interior plant railroad, scores of special Ford machines; these facilities make Ford production unique and allow it to proceed at a rate not dreamed of a few years ago.

One is always amazed when visiting Ford shops for the first time to see how closely all the machines are grouped and how little room seemingly is left for aisles and for the men to work in. After watching the



THE Two Main Sections of the Ford Model A Fuel Tank Before Assembly Are Shown Below. The assembled fuel tank, front view, is above, and the same tank, rear view, at lower right

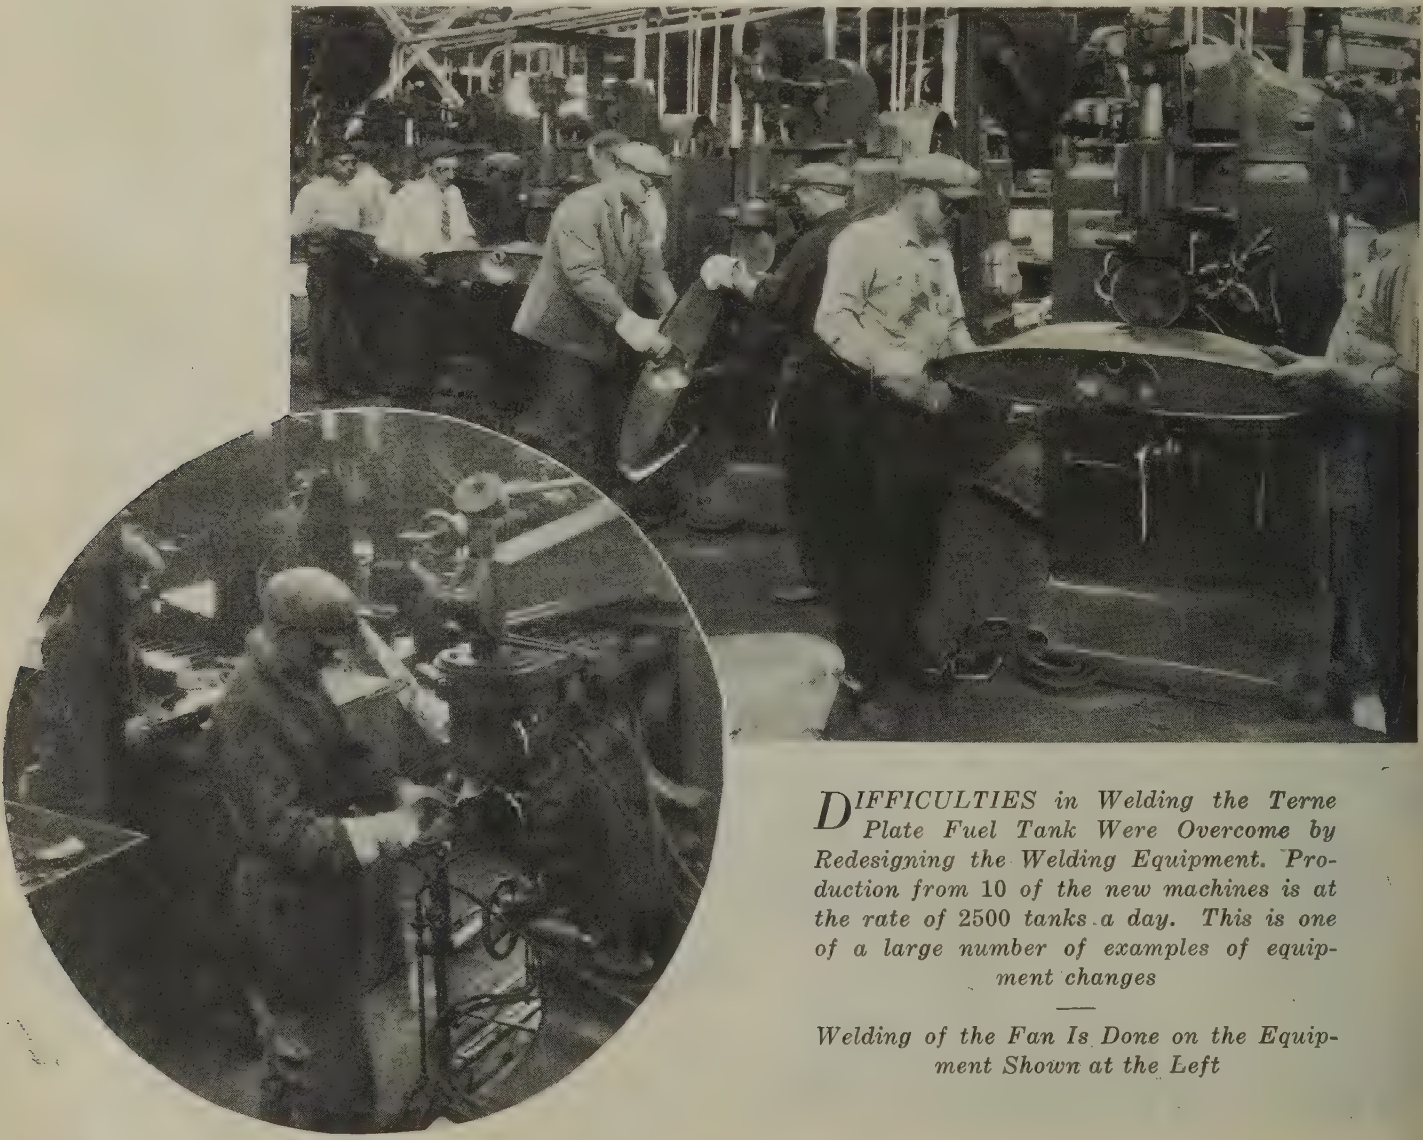
THE Fuel Tank, of Terne Plate, Forms the Cowl of the Car. It is made in two sections on large presses and, after passing through various minor assembling operations, the parts are joined by seam welding operations, however, it soon becomes evident that such close grouping makes for efficiency and speed of production. Where such conveyor systems are used the work is never left on the floor beside the machine but is at once thrown or hooked on to the conveyor. New parts come to the workman in the same way and a slight holdup at any point along the line soon makes itself manifest. So the production planning is simplified by adjusting the conveyor speeds so that just enough time is given to do a good job, no more and no less. In arranging the machinery for manufacture of the new car the usual Ford practice has been followed. Furnaces stand next to hammers, annealing ovens are directly in the process line. Everything needed to perform a series of operations is there. There is no trucking of material from stock room to machine and back, no storage of material until needed, no traversing the shop for tools and fixtures. Each machine is scheduled to do a certain thing at a given rate of production and each man is skilled and able to do his special job with his machine, tools, fixtures or jig without being compelled to move from his place for anything. Ford planning is complete and accurately dispatched to prevent shortages or overstocks at any point. The process lines in turn must be able to feed the main assembly at a specified rate of speed. Here again accurately-laid out operation and assembly sheets dictate a procession of parts which is quite unvarying.

Of course this smooth-running mechanical system has not been evolved over night. It is the result of years of Ford planning. Ford process lines are usually started in an experimental way and gradually speeded up as the men become accustomed to the work. Many of the best suggestions come from the men on the job. They see ways that operations may be eliminated or combined. The way is tried and if it is successful the process is changed. Thus the work goes on. So the process line and many of the smaller methods of assembly of the new car are not yet in "finished form"; in fact, it is never too late to change processes in the Ford industries if a new way is better or faster. All things are in a state of flux and every man in the Ford factory knows that what is best today may be discarded tomorrow when a better method or material is discovered. The tools, too, are forever being changed. So are the processes. The method of producing the piston pin by extrusion is a case in point. It is producing a better pin, the steel is gaining strength by the process. Ford tool designers attempt anything that will promise better quality or faster production.

Welding Equipment Redesigned

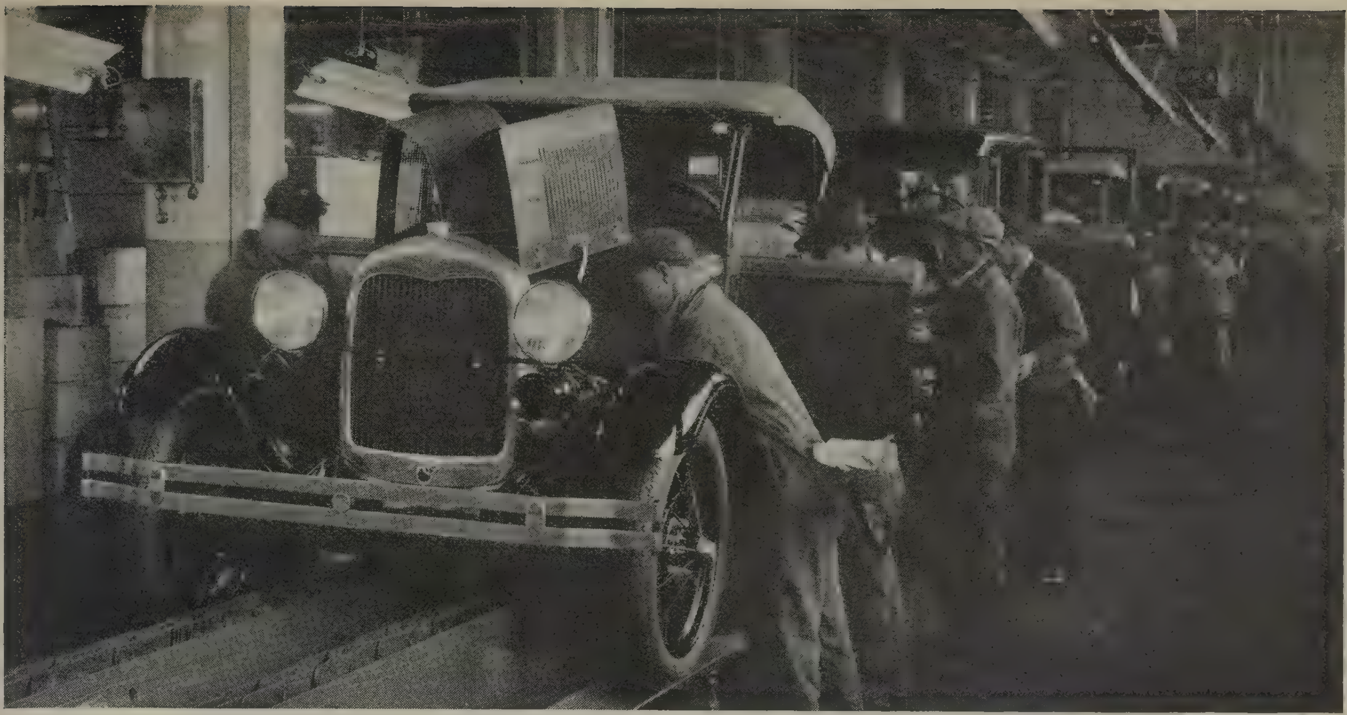
The complete redesigning and rebuilding of the electric welders used for welding the fuel tank saved the day for the production department when serious trouble in getting production in this department threatened. The tank, made of terne plate, forms the cowl of the car and is made of two main sections seam-welded to form an air-tight tank. The parts are formed on giant presses and after passing through various minor assembly operations are finally brought to the welders for junction.

When the actual work was started, however, the inspectors discovered that the welders were not doing a satisfactory job. The joints were not tight and the welders were skipping. Terne plate is, of course, difficult metal to weld; it is apt to burn in spots and in others not heat up evenly, one resulting in faulty metal and the other in no weld. Things looked serious for a time, until the Ford production engineers began to do some investigation work on their own account. They



DIFFICULTIES in Welding the Terne Plate Fuel Tank Were Overcome by Redesigning the Welding Equipment. Production from 10 of the new machines is at the rate of 2500 tanks a day. This is one of a large number of examples of equipment changes

Welding of the Fan Is Done on the Equipment Shown at the Left



End of the Final Assembly Line at Fordson. Conveyor speeds are adjusted so that just enough time is given for the particular operation

found that the standard welder bought for the work could not be made to do the job. So they decided to redesign and rebuild it. This they did. Now ten of these new Ford special welders are turning out 2500 fuel tanks per day.

This is what had to be done to make these welding machines work satisfactorily on the fuel tank job: The transformer was enlarged, the copper welding disk arms were shortened, Ford type electrodes, which are said to give superior current efficiency, were installed, the bearing in which the welding spindle was mounted was altered and mercury introduced, the shaft nickel-plated and baked, and a Ford type of interruptor cutting the current 360 times per minute as a minimum, thus preventing the burning of the stock under ordinary circumstances, was put in place of what was claimed to be a less efficient standard unit used for that purpose. This is just one example of hundreds of changes and alterations which have been made in machines, special and standard, so that they may function satisfactorily in the Ford shops.

The development of electric furnaces and their adaptation to Ford purposes is another story in itself.

Machine tools, special heads, unusual, made for just one purpose, special tools, jigs, fixtures, dies; there are hundreds of unique things to be found in the Ford shops. Each is assisting in advancing Ford production and incidentally contributing not a little to the universal advancement of the art of metal working—and the welfare of mankind.

Hacksaw Simplified Practice Recommendation Adopted

WASHINGTON, April 17.—Representing a reduction of approximately 75 per cent in variety a simplified practice recommendation for standard tungsten and carbon hacksaw blades was adopted at a general conference at the Department of Commerce under the auspices of the Division of Simplified Practice. The conference, held April 12, set July 1 as the date at which the recommendation shall become effective for new production and Jan. 1, 1929, as the date for clearing current stocks.

The recommendation follows:

Hand Hacksaw Blades, All Hard; Also Flexible Hacksaw Blades

Length (Inches)	Width (Inches)	Thickness (Inches)	Number of Teeth per Inch
8	7/16	0.025	18, 24, 32
10	½	0.025	14, 18, 24, 32
12	½	0.025	14, 18, 24, 32
12	9/16	0.025	14, 18, 24
Power Hack Saw Blades, All Hard			
12	⅝	0.032	14, 18
12	¾	0.032	14, 18
12	¾	0.049	10, 14
12	1	0.049	10, 14
14	¾	0.049	10, 14
14	1	0.049	10, 14
14	1	0.065	8, 10
17	1	0.049	10, 14
17	1	0.065	8, 10
18	1¼	0.065	8, 10
20	1¼	0.065	8, 10
24	1½	0.065	6, 10

The conference appointed the following standard committee: W. P. Jeffery, managing director Hack Saw Manufacturers Association, to represent the manufacturers; L. C. Puchta, National Supply and Machinery Distributers' Association, to represent the distributers; and F. S. Walters, American Society of Mechanical Engineers and the Westinghouse Electric & Mfg. Co., F. C. Nichols, Navy Department, and a representative to be appointed by the American Railway Association, to represent the organized users. The committee will make periodic re-surveys to determine the degree of adherence and to recommend revisions if conditions warrant.

Trumbull Steel Co. Broke Production Record in March

In March the Trumbull Steel Co. established new production and shipping records at its plant at Warren, Ohio. Last month the company shipped 55,720 tons of finished material and in a single day moved 4000 tons, requiring 126 railroad freight cars. Production was at the annual rate of 668,000 tons of finished materials. Previous to 1926, the company's high monthly shipment record was 41,000 tons. Production records were set up in March by the open-hearth department, blooming mill, hot strip mills, tin mills and cold rolled department. In March, 1928, Trumbull produced 21,941 tons more steel than in March, 1925, with an increase of only 100 in its working force in the steel plant. Steel tonnage per capita throughout the entire plant last month exceeded output per man in March, 1925, by 56½ per cent.

Trumbull is installing new wide cold strip mills of the latest design, which will be in operation in two months and will enable the company to produce highly finished wide strip steel for use in automobile bodies.

Bethlehem's New Pipe Mills

Sparrows Point Plant Turns Out Wide Range of Butt and Lap-Weld Product—Materials Move Minimum Distances

BY GEORGE A. RICHARDSON*

IN expanding the Maryland plant of Bethlehem Steel Co. to cover the widest possible range of products, the latest construction is the modern plant to manufacture butt and lap-welded pipe. Ground was broken for the new units over a year ago and the first of the butt mills came into operation last fall. At present two butt mills and two lap mills, with all auxiliary equipment, are in full operation. All sizes of pipe from ⅛ in. up to 16 in. in outside diameter, inclusive, can be made.

Sparrows Point is advantageously located on tidewater, with docking facilities for the largest ocean-going vessels. Raw materials can be economically brought in and finished product shipped to all parts of the world. In addition to water shipping facilities, three railroads are available for shipments to interior points.

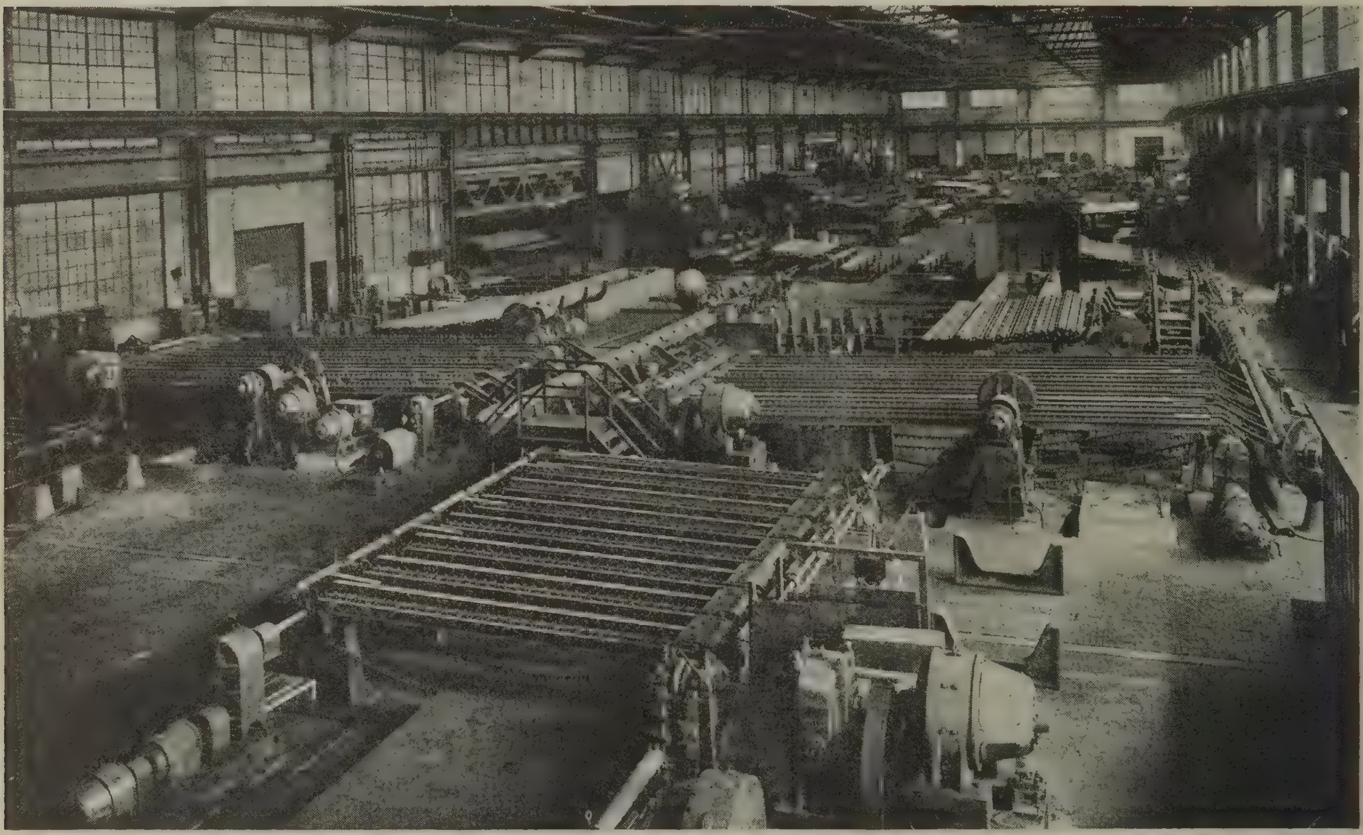
At Sparrows Point the same trains of mills which supply the skelp not only care for the requirements of the pipe mills, but also supply sheet bars for the tinplate and sheet mills, blooms for the rail mill, slabs for the plate mill and billets for the wire mill. The continuous mills where skelp is rolled are in separate units, housed in brick and steel-frame buildings. There is a billet-receiving crane-yard, skelp-loading crane-yard and a mill building 600 ft. long. In this building are housed the reheating furnaces, rolling mill, shears and other necessary machinery and equipment required to finish this product.

Adjacent to the skelp mill building are other continuous mills for rolling billets, sheet bar, wide skelp, etc. All of these are supplied from the blooming mill sections, which adjoin the entrance ends of the continuous mills. The new blooming and continuous mills are housed in a brick and steel-frame building about 1225 ft. long, which, together with the skelp mill building, makes a total length of 1825 ft. In the blooming mill section are the soaking pits, gas producers, 200-ton ingot strippers, etc., which are located at one end and form an integral part of the main units.

After soaking, the ingots are rolled in the blooming mills and thence through two sets of continuous mills, where the blooms are rolled down into the required sizes of skelp. The finished skelp is then transferred by rail to the pipe mills, a short distance away.

Four new pipe mills are housed in a structural-steel and brick building made up of seven units or bays. Five of these units parallel each other, running the long way of the building. These house respectively No. 1 and No. 2 butt mills, pipe galvanizing shop and machine shop, coupling department and No. 1 and No. 2 lap mills. Running at right angles to these units, and extending the entire width covered by all of the above buildings, are two buildings across the ends. That at one end is for skelp storage and at the opposite end for storage and shippings of finished products. A separate gas producer building is located adjacent to the pipe mill buildings.

This pipe mill layout is in a newly developed section



GENERAL View of No. 1 and No. 2 Butt Mills, Looking East Toward Warehouse. In immediate foreground are sizing rolls and the short cooling rack. The finishing department is beyond the two "shields"

FLAT Skelp Charger in Operation at No. 1 Lap Mill. This furnace heats the steel only for scarfing and bending. Skelp is delivered to the charger by crane

of the plant, reached from the main part by a bridge across Humphrey's Creek, which does triple duty as a railroad, trucking and foot bridge. The first unit in this new section was the wire mill. The new pipe mills, located close by, are supplied with compressed air, water, fuel oil and steam by a power plant designed to take care of the requirements of both plants.

Operation of the gas producer unit is practically automatic. One floorman runs the entire floor, on which the seven gas producers are located. Coal is brought to the building by rail and dumped into track hoppers. From these it is lifted to the top of a tower by automatic skip hoists and dumped into two large storage bins. Two rotary crushers are provided for crushing the coal to the proper size for the producers.

Over each producer is an individual bin. A distributing crane, on which is carried a scale hopper, serves these bins, each load being weighed by the craneman, who is also weighmaster. In this way a fuel record is maintained showing consumption each day, week or month, or as required. The producers are hopper-fed.

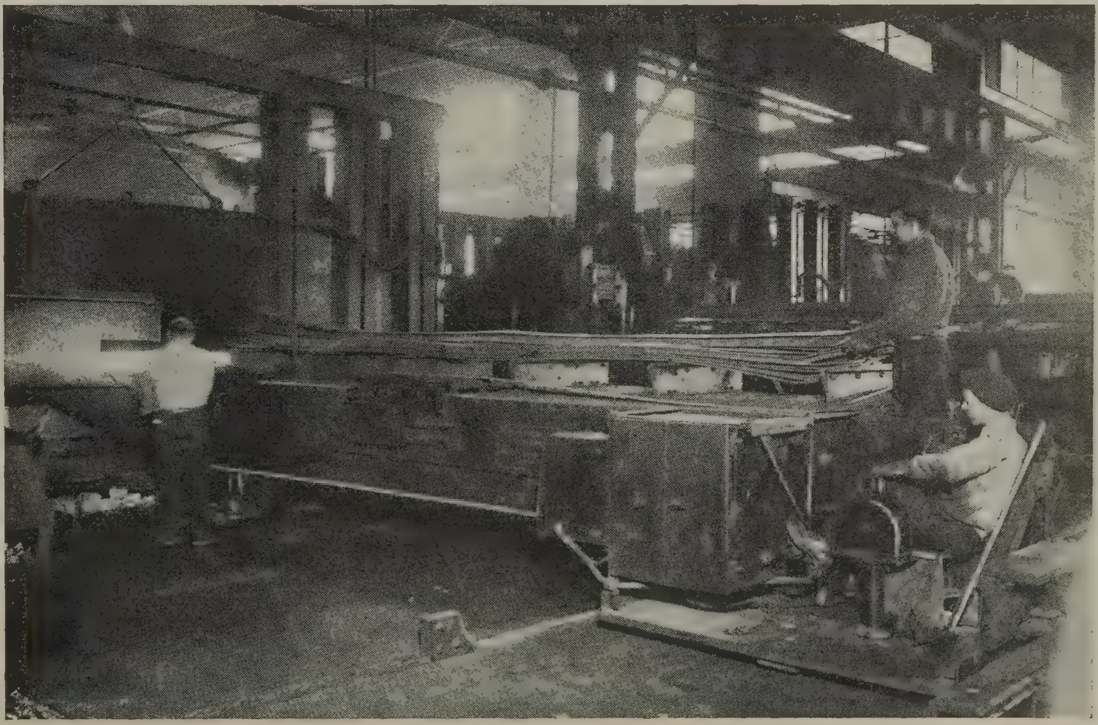
Each producer will gasify about 3500 lb. of coal an hour. A standard-gage ash-car track underneath, on ground level and connected to yard tracks, makes it possible to drop ashes and flue dust directly into the car without rehandling.

Gas leaves the producer at a temperature of 1200 to 1400 deg. Fahr., and passes to the heating furnaces through steel brick-lined overhead flues. Dust catchers, adjacent to each gas producer outlet and approximately every 50 ft. in these flues, make it possible to deliver clean producer gas to the furnaces.

Skelp is stored in a bay which extends across the entire front of the pipe mill buildings, as mentioned above. There is storage capacity of 50,000 to 60,000 tons of skelp—more than ample for the requirements of both butt and lap mills. Skelp is brought here from the skelp mills by rail. Two 10-ton cranes are used for unloading, storing and transferring skelp directly to the shears at charging end of furnaces.

From the time skelp enters the skelp storage, the flow of material is in one general direction until it leaves the mills or warehouse as pipe. By extending the chargers and clipping and bending shears into the skelp storage, it has been made possible to utilize the storage cranes for transferring material direct from storage to the racks in front of these machines.

In the north bay are No. 1 and No. 2 butt-welding mills, with their auxiliary equipment. These two mills



Magnetic Charger of No. 2 Butt Mill Delivering Skelp into a Furnace 9 Ft. Wide. The charger can traverse the width of the furnace and takes its load from the clipping and bending shears are exact duplicates and were designed to manufacture all sizes of butt-welded pipe from ⅛ in. to 3 in. in diameter.

Skelp from the storage is transferred by crane to the clipping and bending shears. Here the ends are clipped and bent so that the piece will more easily enter the welding bells. From here it passes through the heating furnaces, welding, sizing, straightening, testing, threading, oiling, bundling, etc., emerging at the warehouse and shipping end as finished pipe.

Skelp heating furnaces having hearths 9 ft. wide are used. Into these skelp is charged by magnetic chargers, which travel not only over the entire width of the furnaces, but can be moved up to the clipping and bending shears for direct loading.

Steel Moves from Skelp Storage, at Left, in a Straight Line Across the Plant to the Warehouse and Shipping Platforms at Right

After being brought to welding temperature, the skelp is pulled out of the furnace, one piece at a time, and drawn through bells which are set by hand in a bell block or holder which is fixed on the end of the drawbench nearest the furnace. The tongs, caught by attachments located at intervals on the drawbench chain, pull the skelp through a bell of suitable size. The skelp is bent and welded in one operation, forming a pipe which is slightly oversize.

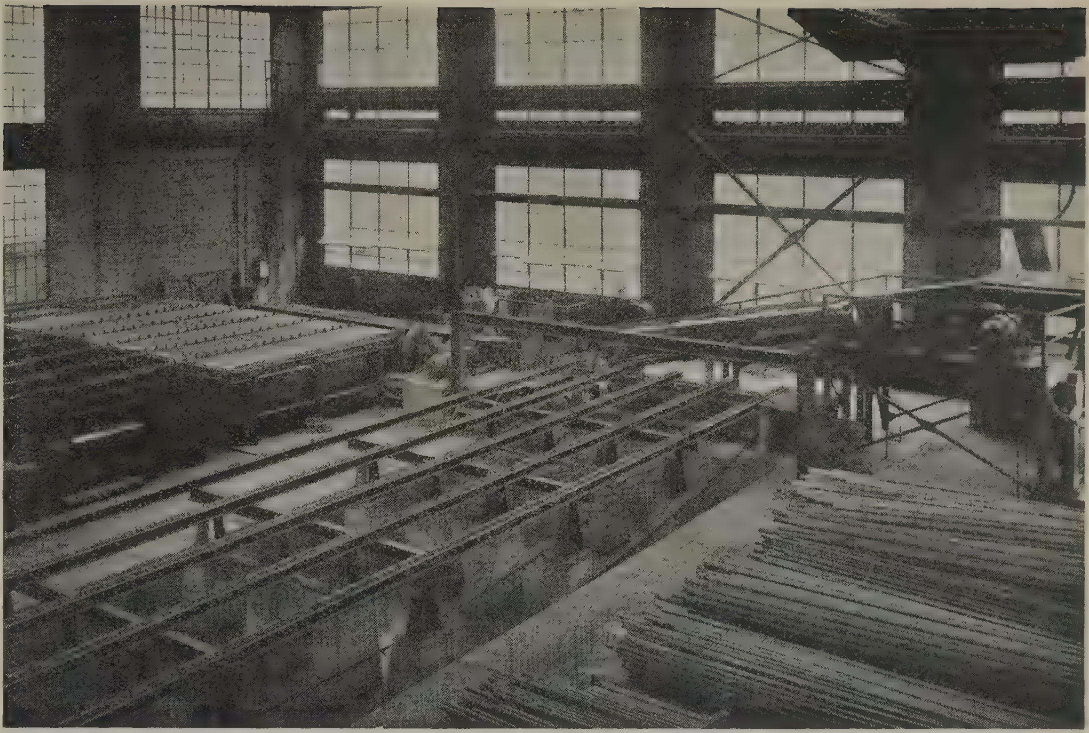
When the tongs are removed the pipe passes to the size-roll trough and through guides to the first sizing rolls; thence out on to a short cooling rack. The second sizing rolls reduce the pipe to the outside diameter required by standard specifications. From these the pipe passes on to a final cooling rack, on which it moves between two high-speed saws which cut off the end far enough back to remove defective welds. These saws are staggered, one end of the pipe being cut off at a time. After sawing, a reaming and facing machine puts the ends in good condition, ready for straightening, testing and threading operations.

From the cooling rack the pipe passes through automatic straightening machines of a type believed to be the most satisfactory yet developed. These remove all kinks or bends in the pipe and straighten it to meet requirements of the trade. At the same time, the outside surface is made smooth and practically all of the remaining scale is removed. The pipe, as turned out, is as nearly straight and "scale-free" as it is possible to produce.

Thorough inspection is given to each piece at the cooling racks and after every step in the finishing department. Surface defects, split ends, imperfect welding, lack of straightness, are among the causes for rejection by the inspector.

All pipe after straightening is subjected to hydraulic test. Two testing machines are provided for each of the butt mills and can handle any of the sizes made. These machines are of the quick-acting type, and are connected with a direct accumulator line at 750 lb. pressure. Four intensifiers give an added range of test pressures above and below 750 lb. as required for larger pipe and special pipe for ammonia plants, hydraulic work, etc. All defects in welds become apparent in the hydraulic test and pipe having such defects is scrapped.

After the hydraulic test, the pipe is ready for threading. Two large-size automatic six-spindle threading



GALVANIZING Department, Showing Drying Plate, Galvanizing Tank, Inclined Drawbench and Cooling Rack. The inclined bench permits excess spelter inside the pipe to drain back

machines handle all sizes of pipe from ⅛ in. to 2 in. in diameter. Pipe from 2½ in. to 3 in. in diameter is threaded on mill-type threading machines provided with an air grip. There are two machines to a threading bench, one at each end. The pipe is easily moved back and forth between the two machines on rollers set in the top of the threading bench, one end of the pipe being threaded at a time. From the threaders the pipe goes to the inspection table for final inspection.

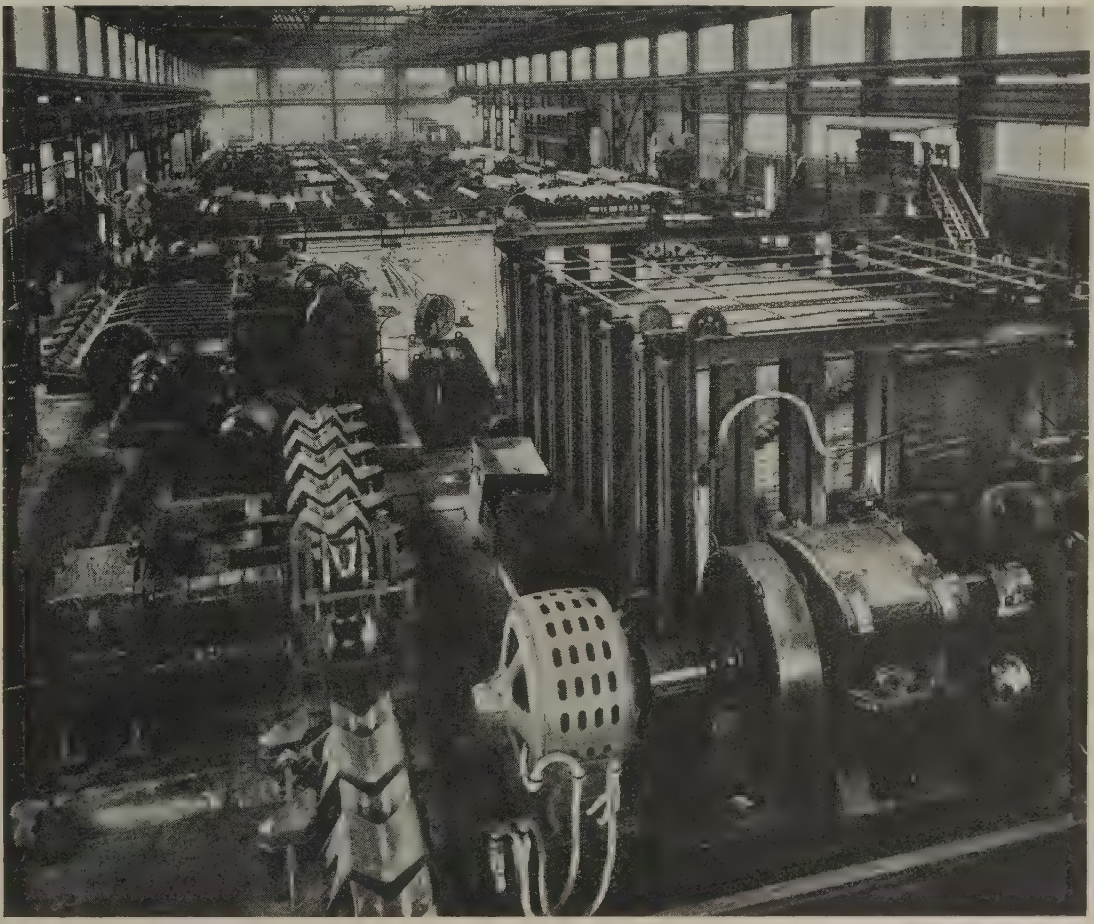
Pipe that passes the final examination goes to the coupling screwing-on machine, where each length is fitted with a coupling, and thence to the oiling machines. These are of the spray type and are readily adjustable so that the thickness of the protective coating can be varied to suit the requirements. The coating is applied to all black pipe and dries quickly and hard, thus to prevent rusting either in transit or in stock.

After the protective coating has been applied the pipe goes to the measuring table, where each length is measured and where sizes from ⅛ in. to 1½ in., inclusive, are bundled. In the case of bundled pipe, the total number of feet and inches is marked on a metal tag attached to the bundle. Pipe 2 in. and larger is not bundled, the length in feet and inches being stenciled on each piece.

Pipe from the measuring and bundling benches may be loaded directly into cars or sent to the warehouse. Small electric cars operated by third-rail contact are used to transfer material from the measuring and bundling benches direct to the warehouse.

Ample warehouse facilities are provided by a warehouse which extends across the delivery end of the five pipe mill building bays. This is served by two cranes and has capacity for storing about 25,000 tons of butt and lap-welded pipe.

Proper storing of the pipe is a factor in insuring the delivery of the product in good condition to the customer. The practice here is to place planks between



NO. 2 Lap Mill, Looking East Toward Warehouse, with Welding Furnace at Right. From the control platform, just off the extreme left of cut, one man controls all hot-mill operations. This mill makes pipe from 6 in. to 16 in. in diameter

layers of pipe. This keeps the pipe straight and eliminates the possibility of damage that is apt to occur in piling large lifts.

The galvanizing department occupies a part of the second building bay, which opens into the side of the butt-weld mill division. The equipment includes two sulphuric tubs, a rinsing tub, a muriatic acid tub, a drawing rack, waste-gas heated drying plates and a galvanizing pot, together with an inclined draw bench, cooling rack, etc.

Procedure up to and including the galvanizing operation represents standard practice. Pipe to be galvanized is deposited on a receiving rack which extends into the butt weld mill building and is served by the crane in this building. The pipe is delivered from the receiving rack into the sulphuric acid pickling tubs on top of large bronze sprocket chains hung in the various tubs. At given intervals these chains, which are operated by motor-driven sprockets, roll the pipe around in the bath. This insures thorough pickling and cleansing.

Each piece of pipe after galvanizing is wiped by being drawn through steel wipers, which insures a smooth finish and results in a satisfactory spangle. The drawbench, of the angle type, in inclined, to permit excess molten spelter to drain back from the interior of the galvanized pipe into the galvanizing pot. As the pipe is drawn up the incline to the top of the draw bench, each piece is applied against the nozzle of a compressed air line. The air blows the interior clean and gets rid of any excess spelter. From the draw bench the pipe goes to the cooling rack, where it is allowed to cool slowly, while it is being conveyed to the delivery end.

Galvanized pipe is not being dipped in water at the Maryland plant. The elimination of the water dip is one of those small refinements which aids in giving a better spangle finish and appearance. After cooling, the pipe is inspected, both inside and outside, and then goes to the threading machines. The subsequent handling of the galvanized pipe is the same as that of black pipe, except that there is no oiling of the surface.

Only a part of the second bay is occupied by the galvanizing department. Nearest the skelp storage a blacksmith shop is located in this bay. Then comes a completely equipped machine shop for taking care of all requirements of the pipe mills, and then the galvanizing shop. The aim was to locate the machine and blacksmith shops as centrally as possible.

Two building bays are given over to the lap mills. The No. 1 lap mill is capable of turning out all sizes of lap-welded pipe from 2 in. in diameter up to 8 in., inclusive. The No. 2 mill manufactures pipe from 6 in. to 16 in., inclusive. These two mills are practically the same, except for differences in size of equipment.

After being weighed, skelp from storage is handled by a crane directly on to a flat skelp loading rack. From there it is delivered on to a flat skelp-charger, which moves electrically across the face of the heating furnace. The furnace in this case is used only for heating the skelp for scarfing and bending.

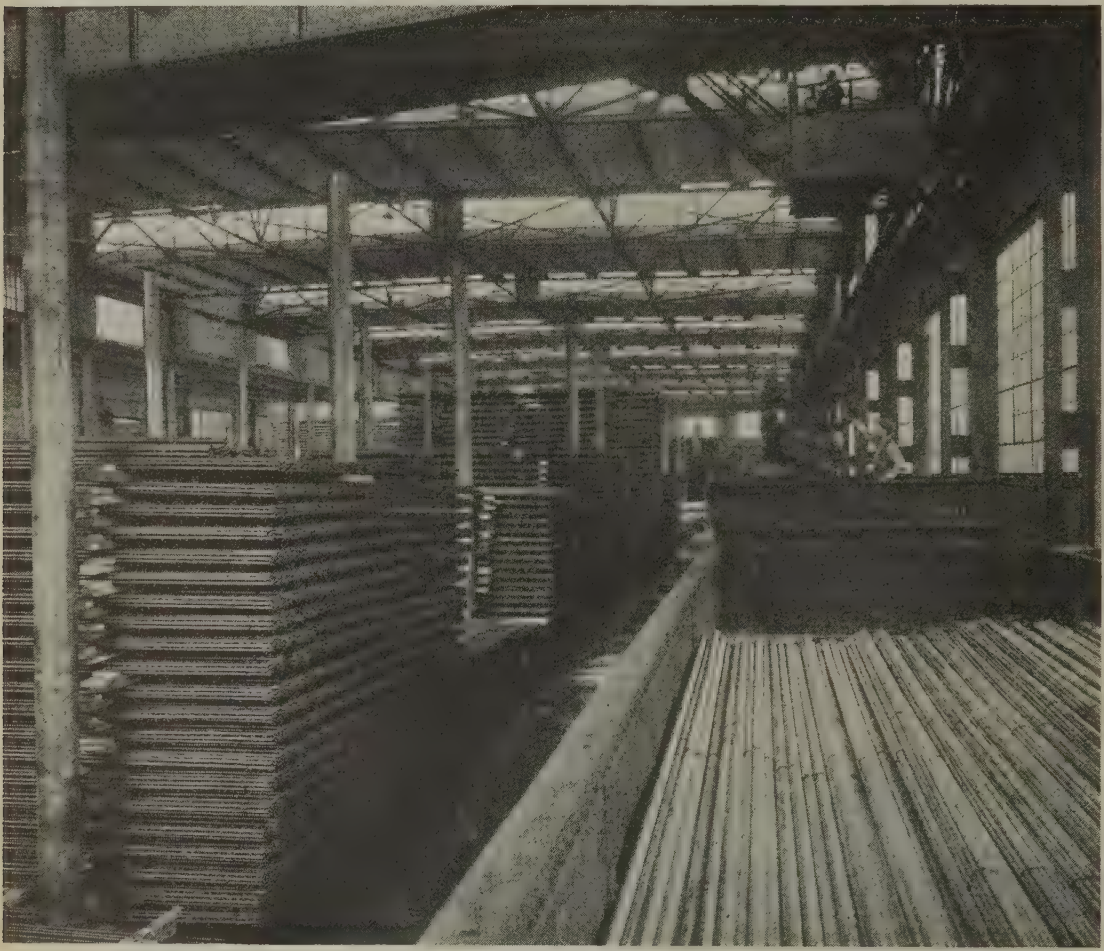
Skelp is pushed out from the furnace into electrically driven scarfing rolls so mounted that they can be moved across the face of the discharge side of the furnace from one side to the other. On leaving the scarfing rolls the skelp passes to the scarfing table and is pulled across by chain conveyors to the draw bench. From here, in turn, it is drawn through the bending dies and is bent into shape for welding.

Skids are used to transfer the bent skelp to the traveling bent-skelp chargers, which charge the heating zones of the welding furnaces of the two-gutter type. There are two welding positions, the skelp being moved from the heating zones to the gutters, which are located symmetrically on either side of the center line of the furnace.

Welding of the skelp is done by welding rolls driven by a 400-hp. electric motor. They can travel back and forth opposite the two welding troughs. The bars are controlled by a double bar puller.

Two sizing and two cross-roll straightening operations follow. Immediately after welding, the pipe passes through the first sizing rolls and then through cross rolls, which straighten it. From that point it passes the short cooling rack, which is operated at variable speed. This makes it possible to control the temperature of pipe entering the second sizing rolls, as at the butt mills. It then passes into the second sizing rolls and thence through the second cross rolls.

As with the butt-welded pipe, the temperature is reduced between the first and second sizing so that the second sizing operation is, to all practical intents and



WAREHOUSE. Note method of piling pipe for stock, with boards between lifts. This building is served by two overhead cranes and has storage capacity for about 25,000 tons of pipe purposes, done black hot, thus insuring correct size and round pipe. A cooling rack leading from the second cross rolls allows the pipe to cool down to normal temperature as it is being inspected. It is then weighed and conveyed to the cold pipe straighteners.

These are the only mills in the country where the cold straightening machines are in a direct line with the cooling racks, sizing rolls, etc. All pipe passes through the cold straighteners without any break in handling, from the time it leaves the furnace until it is delivered to the finishing department.

Pipe, after being straightened, goes to cutting-off machines. There are two pairs of these, of the mill type, using double tools. The crop ends are cut off, ends of pipe faced, reamed, chamfered and rounded up, thus insuring true and round ends for the threaders.

The threading machines, of conventional mill type, with a lead-screw to insure correct pitch, are used solely for threading. This is a decided advantage, as this practice saves wear and tear, ordinarily occasioned by using the threading machines for chamfering, etc. The machines thus are more like precision tools than is usually the case.

One unique feature of the lap weld mills is the use of driven roller conveyors for handling the pipe from operation to operation throughout the entire mill.

Each piece of pipe is inspected for surface defects, blisters, laminations, etc. The thread size is measured and checked for taper and pitch. After this inspection the pipe goes to the coupling screwing-on machine and thence to the hydraulic tester. Each piece of lap-welded pipe is tested with the coupling on it. After this hydraulic test comes another general checking inspection before delivery to the warehouse and shipping building.

Each piece of pipe is weighed separately and must weigh within allowed standard tolerances. The weight per foot, total weight and length are stenciled on each piece.

Oiling machines similar to those used at the butt mills oil the pipe as it is traveling through on a roller conveyor.

One striking feature in the lap weld mills is the control system. Every piece of equipment in the hot mill end is controlled by one man, located on an elevated platform behind which is the big control panel. A similar arrangement is in use in the finishing department.

Moves for Conference on Warehouse Distribution

Hardware Jobbers and Mill Supply Houses Asked to Join with Manufacturers in Applying Methods of Handling Bolts and Nuts to Wide Range of Commodities

THE plan evolved by the bolt, nut and rivet industry for the economical distribution of its products has worked out so well that its sponsors, under the leadership of Charles J. Graham, president of the Bolt, Nut and Rivet Manufacturers Association, Pittsburgh, believe that it can be applied to other products that are distributed either partly or entirely through hardware jobbing and mill supply channels. Accordingly, a national conference to discuss sales and distribution plans has been proposed in a pamphlet issued from Mr. Graham's office, and, if enough sentiment favorable to it is created, Mr. Graham will call such a meeting.

The basic principle of the distribution plan successfully applied by the bolt, nut and rivet manufacturers is the elimination of the manufacturer as the leading competitor of the distributer. With the province of the merchant or jobber clearly defined and freed from incursions by the manufacturer, it has been found that a degree of market stabilization has developed that was entirely lacking when manufacturers would take orders of a size that properly belong to, and could be more economically handled by, jobbers.

Asks Industries to Appoint Representatives to Confer with Jobbers' Chairmen

Mr. Graham says in the pamphlet: "The necessity for stabilization in all of our leading lines is more apparent today than ever before, and is a problem that is being studied not only by industrial executives, but by the Government itself.

"Stabilization to a point of producing reasonable profits in all lines is the essential requirement, if we are to maintain and perpetuate present labor conditions, both from the standpoint of employment and wages paid.

"The necessity for the continuance of present labor conditions and, if possible, an improvement in them, is now a well recognized fact, and is the very foundation of our present and future prosperity.

"The plan followed by the bolt, nut and rivet industry is applicable to all competitive lines and, should it be adopted by the leading industries, would create a condition in selling and distribution never before attained, and would become an automatic stabilizer of market conditions.

"It would be the largest factor in cost reduction of anything heretofore attempted, and would affect particularly the great overburden of American business, overhead expense, creating a saving in all departments from the point where actual manufacturing stops.

"In the development of this plan, the greatest organization ever put together in the distributing industry has been created, and is ready to function in all lines that are interested.

"A committee is now in existence in practically every important jobbing center in the country, consisting of a prominent jobbing executive as chairman and in its membership covering the outlying territory.

"The chairmen of these committees will all be invited to attend, and a majority of them have already signified their intention of doing so, should the meeting be called. Some jobbers not represented on the committees will also be invited, as well as the officers of all national jobbing and mill supply associations.

"To make the meeting thoroughly representative, and limit the number in attendance, it is suggested that each industry appoint five executives to represent the industry as a whole. This will be a very simple matter where industries have trade associations or other types of organization. Where such organizations do not exist it will be necessary for the appointments to be made by correspondence, or for one of the leading companies to call a meeting of its particular industry for the appointment of such a committee.

Products Covered by Distribution Plan

"By combining the suggestions of the 34 jobbers' chairmen, the following industries are being approached, to determine their attitude regarding such a meeting, and should the reaction be favorable, invitations will be extended to five executives representing each industry, appointed as heretofore suggested: Ammunition; bars, shapes and plates; builders' hardware; chain; chain hoists; cold-rolled steel, including shafting; composition roofing; conduit; copper and brass

(*Concluded on page* 1132)

Small Cloudburst Superhardening Machine

A method of superhardening by "cloudburst" was described by Edward G. Herbert in THE IRON AGE of Feb. 2, page 332. Mr. Herbert now sends a photograph of a laboratory machine designed to treat case-hardened disks up to 1¼ in. in diameter.

Intermittent Device for Superhardening Small Surfaces by Impact With a Cloud of Steel Balls

About 20,000 steel shot are placed in a cup-shaped hopper, which is elevated to a point near the top of a vertical shaft, so the slots there observed are immersed in the shot. The latter start passing through the slots, falling down the hollow shaft and striking the work beneath. A disk to be treated has been previously placed on top of a perforated piston, entrance being effected through the side door in a box-like stand. The piston is slid up the vertical shaft until the distance from slots to piston is correct, as indicated by a counterpoise and meter stick at the rear.

As explained in the previous article, the height is set so that the falling balls work-harden the surface without indenting it. It takes about half a minute for the balls to drain from the hopper; they are then collected in the pan at the bottom, reloaded into the cup-shaped hopper, and re-elevated. Meanwhile the disk being treated is sunk gradually, so the hardening can be progressive.

A disk tested in the machine possesses a highly reflecting surface with faint markings suggesting very fine ripples on a turbulent liquid. A soft spot will be covered with small pits, close together, like a badly corroded surface after cleaning off the rust.

Special Railroad Car for Transporting Long Beams

To avoid expensive blocking in shipping long steel beams that must be carried on two cars, the Carnegie Steel Co. has had a dozen gondola cars built measuring 65 ft. inside. This is about 25 ft. longer than standard for large cars of this type. Since stock lengths of 60 to 65 ft. are common for fabricating shops, it is estimated that the 65-ft. car will handle at least 80 per cent of the long lengths of steel now being ordered.

While the cars have been used mainly in shipping steel locally from one works to another of the Carnegie company, or to nearby fabricators, one of the cars was shipped some time ago to the Boston warehouse of the company and its behavior was carefully observed with regard to negotiation of curves and clearances.

As built, the car has a marked capacity of 140,000 lb. The tare weight averages about 67,000 lb. The car measures 68 ft. 9 in. over striking plates, 7 ft. 9 in. in width inside, 8 ft. 6 in. wide overall, while the trucks are 55 ft. 10 in. center to center. The height of sides is 3 ft. The trucks are of the standard four-wheel type, the same as would be used for a shorter car of the same capacity.

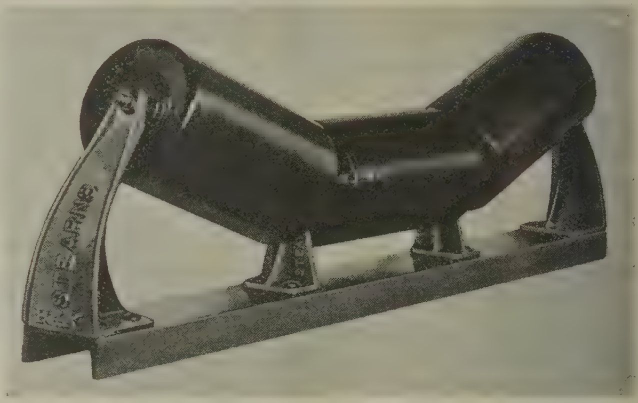
While the cars were built to negotiate curves of 200-ft. radius they have in fact been successfully operated over curves with a radius as low as 175 ft. The cost of the 65-ft. car is estimated at only slightly more than one-half that of two ordinary gondola cars. Maintenance and deterioration on one such long car will be considerably less than on two of the mill-type cars now used for taking double loads. The track space occupied by the long car is 30 per cent less than that of the double load. This will result in shortening trains of given tonnage and will increase yard capacity accordingly.

A principal factor in getting out the long cars was the desire to lessen the damage to goods in transport. There will be considerable elimination of dunnage, resulting in less dead weight to be hauled per ton of revenue traffic moved. Train resistance will be reduced, particularly around curves. General safety is much enhanced by the innovation.

Malleable Iron Brackets for Belt Conveyor Carrier

A new belt conveyor carrier has been put out by the Stearns Conveyor Co., Cleveland (subsidiary of Chain Belt Co., Milwaukee), for mounting pressed steel and chilled rim cast iron idler units. The supporting brackets are made of certified malleable iron. By redistribution of the metal, a much stronger bracket has been worked out than is possible in gray iron, with no considerable increase in the total amount of metal used.

The spacing between idlers is reduced to 5/16 in. on this new carrier. With this close spacing, there is little chance of the belt "creasing" and being worn accordingly. The new type of bracket has made it possible to secure this close spacing, and at the same time keep the idlers safely mounted and quickly and completely interchangeable. Any idler can be removed from the carrier without disturbing any of the others.



Close Spacing and Ease of Replacement Feature This New Idler for Belt Conveyors

Five sizes—18, 20, 24, 30 and 36 in.—are offered, with either Rex-Stearns pressed steel or chilled rim cast iron idlers. Both have one-piece pulley shell construction, Timken bearings, long-time lubrication and a positive grease seal, which serves the double purpose of keeping dust out of the idler and grease within it. The new idler is interchangeable with previous Stearns units.

Light-Weight Combination Cutting and Welding Torch

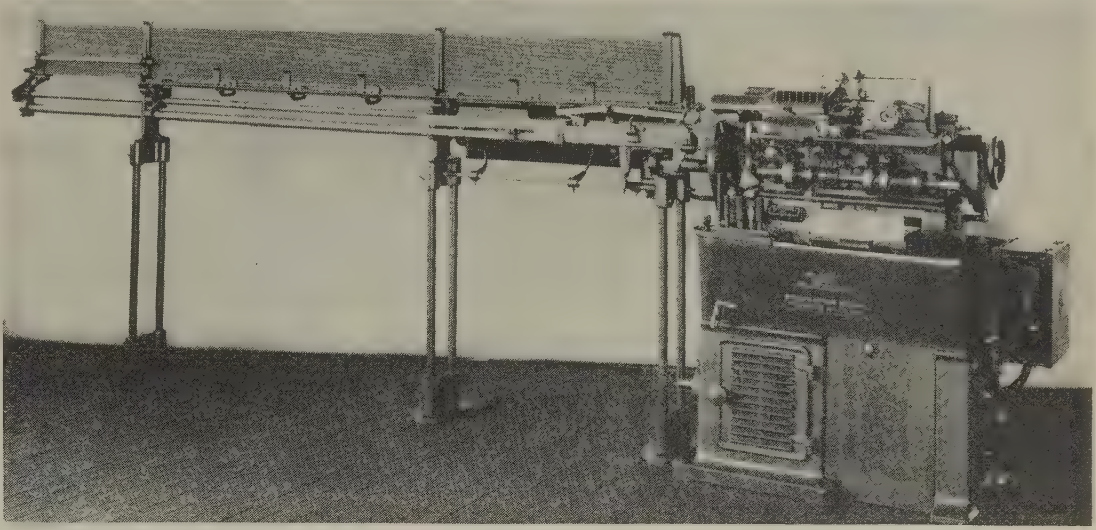
A new combination cutting and welding torch which weighs only 40 oz., and which may be used either for welding or cutting operations merely by interchanging the tips, has been added to the line of the Alexander Milburn Co., Baltimore.

This torch, designated as the type RI, incorporates the features of the company's model NI torch, which is also a two-purpose unit. Features include the use of two gas tubes, made of stainless steel, instead of three tubes, and the high-pressure cutting oxygen thumb button which remains in the open or closed position without sustained pressure from the thumb. The torch head and valves are of bronze forgings of high tensile strength. The tool is well balanced and its light weight is emphasized as adapting it for continuous operations.

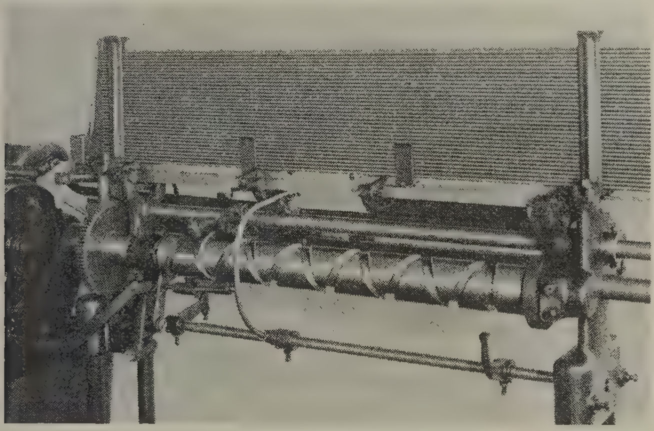
AUTOMATIC ROD MAGAZINE

Device for B&S Screw Machines Eliminates Time Lost in Waiting for Replenishment of Stock

An external stock feeding mechanism, known as the automatic rod magazine, has been made available by the Brown & Sharpe Mfg. Co., Providence, for use on its automatic screw machines in the No. 00 size, including the regular and high-speed units and the screw threading machines.



A New Rod Is Fed Automatically to the Machine as the Preceding Rod Is Used Up, Operation of the Magazine Being Actuated by the Screw Machine. The mechanism of the magazine is controlled by the barrel cam, below, which is mounted at the rear. When set in motion, the cam trips the magazine and drops a new rod into feeding position. A pusher then feeds the rod forward



This mechanism, designed to hold several rods, is located at the left end of the machine, as shown in the accompanying illustration, and is intended for use in place of the usual stock stands. The device is arranged so that a new rod is fed automatically into the working position as the preceding length of stock is exhausted. In addition to marked reduction of non-productive time, due to idleness of machines awaiting replenishment of stock, use of the device is emphasized as leaving the operator free to devote his entire time to the operation of the machine and the requirements of the work, as well as permitting one operator to attend to a greater number of machines.

The automatic rod mechanism is of simple design and is operated by the machine with which it is used. The mechanism is connected with the feeding arrangement of the machine in such a manner that when the end of the bar on which the machine is working passes a certain point, a ratchet is engaged which feeds a stop forward. This stop comes in contact with the starting lever of the machine at the instant the last piece is cut off, stopping the machine and at the same time engaging a clutch which delivers power to the rod magazine.

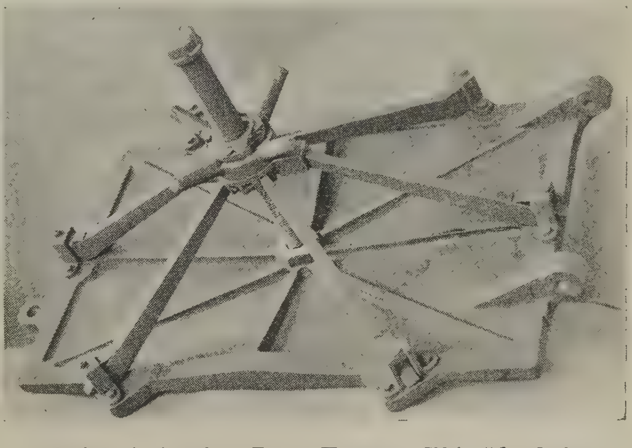
When the clutch of the magazine is engaged, a long barrel cam on the rear of the device is caused to rotate. The first movement of this cam trips the mechanism of the magazine and drops a rod into the feeding position. Continued rotation of the cam advances a pusher at the end of the mechanism, which comes in contact with the rod and feeds it forward through the feeding finger and chuck to the desired position. As the follower of the cam comes to the end of its travel the starting lever of the machine is thrown into engagement and the machine is set in operation. The follower then returns to its starting position and the clutch of the rod magazine is thrown out of engagement. Operation of the mechanism is correctly timed with relation to the automatic functioning of the machine.

The simplicity of the mechanism and its automatic operation permit unskilled labor to be used in loading the magazine, which can be filled at any time. There is no need for the machine to be stopped except when the tools need sharpening or attention to the work is required. The device is particularly advantageous for use in connection with the high-speed machines where the rapid rate of production requires more frequent replenishment of the stock. Patents, foreign and domestic, are pending.

Unusual Clamping Mechanism

A new type of manhole cover, designed by the United Filters Corporation, Hazleton, Pa., has an exceptional locking device. As illustrated, this is operated by screwing down on the capstan. The dogs are thus forced in under suitable clamps on the equipment to which the cover is attached. The result is said to be especially effective. The screw can be operated either by hand or by power control. It is patented.

One place in which this type of cover is being used is at the Calumet-Hecla mines. Here the ammonia stills must be opened frequently for removal of precipitated copper oxide. The ease of operation of this device fits it particularly for such conditions.



Quick-Adjusting Dogs Feature This Manhole Cover and Its Operation

---

The Hopkins-Benedict Co., dealer in railroad supplies, has moved its Chicago office from 549 West Washington Street to 1529 Railway Exchange Building.

Business Analysis and Forecast

BY DR. LEWIS H. HANEY

DIRECTOR, NEW YORK UNIVERSITY BUREAU OF BUSINESS RESEARCH

Current Statistical Data, Considered Independently of Trade Opinion, Indicate That:

Steel ingot output (adjusted) was lower in March and may taper off from recent high levels.

Unfilled orders showed a small decrease in March but remain higher than for two years past; they are "rounding off" for a decline.

Pig iron production was slightly above normal by a smaller margin than ingot output; early price recovery is not expected.

Finished steel prices, still too low for a proper relation with their raw materials, show little signs of advancing to a better position.

CORRECT statistical treatment of the available figures places the facts concerning the steel situation in March as follows:

"Adjusted" Production Figures Show Decline

IN the first place, the average daily production of steel ingots increased only 3.2 per cent, although the usual seasonal gain is a little over 4 per cent. If we eliminate the usual seasonal increase, therefore, and allow for a slight factor of normal growth, we find a small net decrease in March production. This means that the output of steel ingots failed to show a normal gain. Our adjusted index for the month is 105.1 per cent of normal, and compares with 106.1 in February, 105.5 in January and 106.9 a year ago. In short, each of the three months in the first quarter of 1928 showed about the same annual rate of production and each was about 5 per cent above normal. Compared with a year ago, January showed a gain, February was about the same, while March was lower. The trend in the first quarter was about sidewise, with a very slight downturn in the last month.

In the second place, the unfilled orders of the Steel Corporation decreased 62,900 tons in March. Some decline in March is a usual and normal occurrence, the most common condition being a drop of about 1½ per cent from February. The decline last month was, if anything, a trifle less than normal. Our adjusted index of unfilled orders becomes 96.1 per cent of the average of the last five years, against 95.9 per cent in February, and 78.8 per cent in March, 1927. This is the highest index since March, 1926.

The most notable fact about the unfilled orders curve, however, is the way in which it has rounded off, during the last three months each increase in the adjusted index being less than in the preceding one. Usually such a development indicates that production and shipments are gaining on new orders.

Very close similarity may be seen between the recent situation and that which existed from February through June, 1923. This appears both as to unfilled orders and the production of steel ingots. From April through July, 1923, the production curve was practically level and from February to May the unfilled orders curve tapered off as it has been doing of late. Then came a recession. In recent years it has been usual to find that a flattening out or a decline in the adjusted curve of ingot production has been followed or attended by a declining trend in the unfilled orders. One point suggested by our analysis is that the failure of unfilled orders to increase in March, while production declined slightly (as adjusted), may be taken to indicate that new orders fell off.

Of course, the analogy between the 1923 period and the present is by no means perfect: Forward buying of steel is small; prices are lower. While it seems that the chart indicates some decline within a month or two, there is now apparent no basis for any such recession as came in August, 1923.

In the third place, the average price of finished steel has held fairly steady, in spite of the above-normal production and the apparent decline in demand as indicated by the tapering of unfilled orders. THE IRON AGE composite of finished steel prices averaged 2.361c. in March, against 2.360c. in February and 2.367c. a year ago. The March average is 93.5 per cent of the average of the last five years. At present writing a further slight increase appears, the composite standing at 2.362c. But the price level has been practically unchanged, and this action is analogous to the trend of prices between April and July, 1923. Unfilled orders are much lower than in the earlier period, but there has been heavy buying for current requirements. There

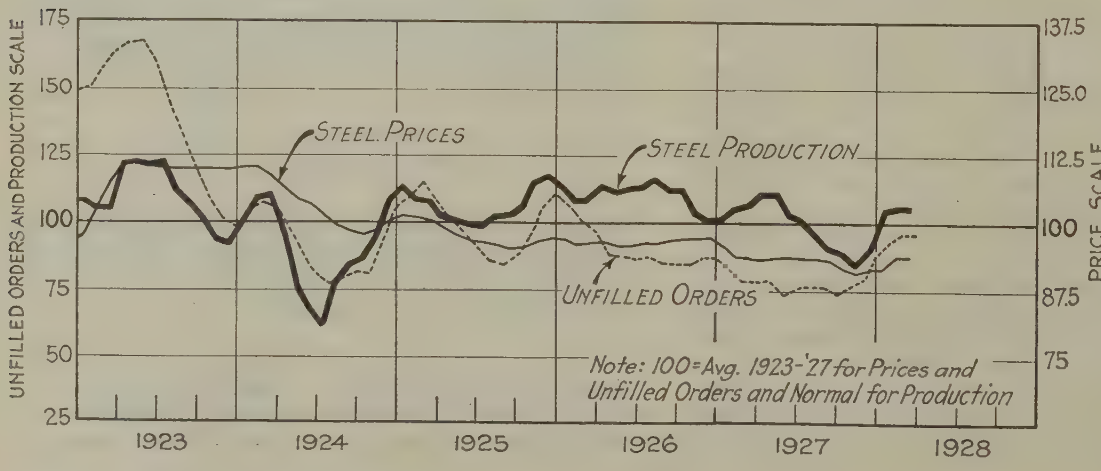


Fig. 1—Steel Production Increased by Less Than the Seasonal Amount. Prices have held fairly steady. Unfilled orders are rounding off, after substantial gains

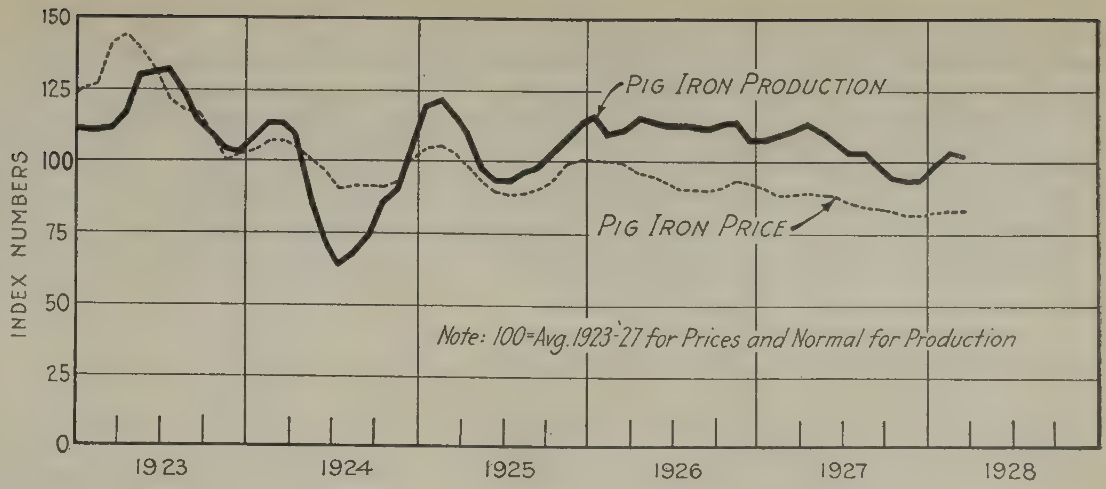

Note: 100=Avg. 1923-27 for Prices and Normal for Production

Firmness in Pig Iron Prices Appears Logical with Pig Iron Output in March Only 2 Per Cent Above Normal (with All Adjustments Made)

seems to be no reason to expect much change in the average price of the chief items of finished steel during the next month or two as the somewhat larger volume of unfilled orders should help to maintain the market.

Little Change Indicated in Pig Iron Prices

PIG iron production figures, when subjected to careful statistical analysis, indicate a more considerable decline in March than was shown by the steel figures. Usually the pig iron output is about 5 per cent larger in March than in February. Last month there was actually an increase of only about 3.2 per cent. Accordingly, our adjusted index declined, being only 102 per cent of normal in comparison with 104.2 per cent in February and 111.8 per cent a year ago.

Pig iron production in March was 2 per cent above normal, while steel production was 5 per cent above. The ratio of the steel output to the pig iron output is a little above normal, which usually means greater strength in the pig iron market. Usually, too, this condition indicates a fairly sound general business situation. Incidentally, we find here a considerable difference between the situation in the middle of 1923 and the present, for in the earlier year the pig iron output was decidedly excessive in comparison with steel-making requirements.

As to pig iron prices, THE IRON AGE composite averaged $17.72 in March, which compares with $17.73 in February and with $19.04 a year ago. Pig iron prices were only 82.8 per cent of the average of the last five years, which is relatively much lower than the average of finished steel prices. At present writing pig iron prices average $17.67, or somewhat lower than the average for March.

Thus the markets for pig iron are rather weak, in spite of the relatively large volume of steel production. Analogy offers little assistance in this case. Perhaps the most similar situation is found in May, 1927, when pig iron prices were sagging; but the comparison is imperfect in that now the production of pig iron is considerably lower and the same may be said of prices. In May, 1927, too, the price of bituminous coal was on the decline, and was actually lower than in March, 1927, the *Coal Age* composite price having been $1.87 in the earlier period, against $1.92 last month. In view of the relatively small volume of pig iron production and the low price of fuel, it does not seem probable that the price will decline in the near future. Firmness would seem more logical. Not much change in either direction, however, is indicated.

Prices Less "Out of Joint" Than They Were

GENERAL price relations in the iron and steel industry seem quite uncertain. Basic materials such as coke, steel scrap and pig iron are at or near bottom levels and are "about right" in their relationship to one another. Heavy melting steel scrap might go lower, judged by precedent, and the temporary strength in some markets of late appears to be due chiefly to local shortages of some grades of old material. Billets also appear to be fairly low and likely to be maintained at present levels, though it would be logical to find some weakness in sheet bars.

Such items of finished steel as bars, nails and sheets are relatively low in comparison with the foregoing materials. Of the three items, nails are comparatively high and show a spread over billets and raw material which is nearly normal. The spread between bars and nails is fully normal. But bars are fairly low, though they have been much cheaper at certain periods in the

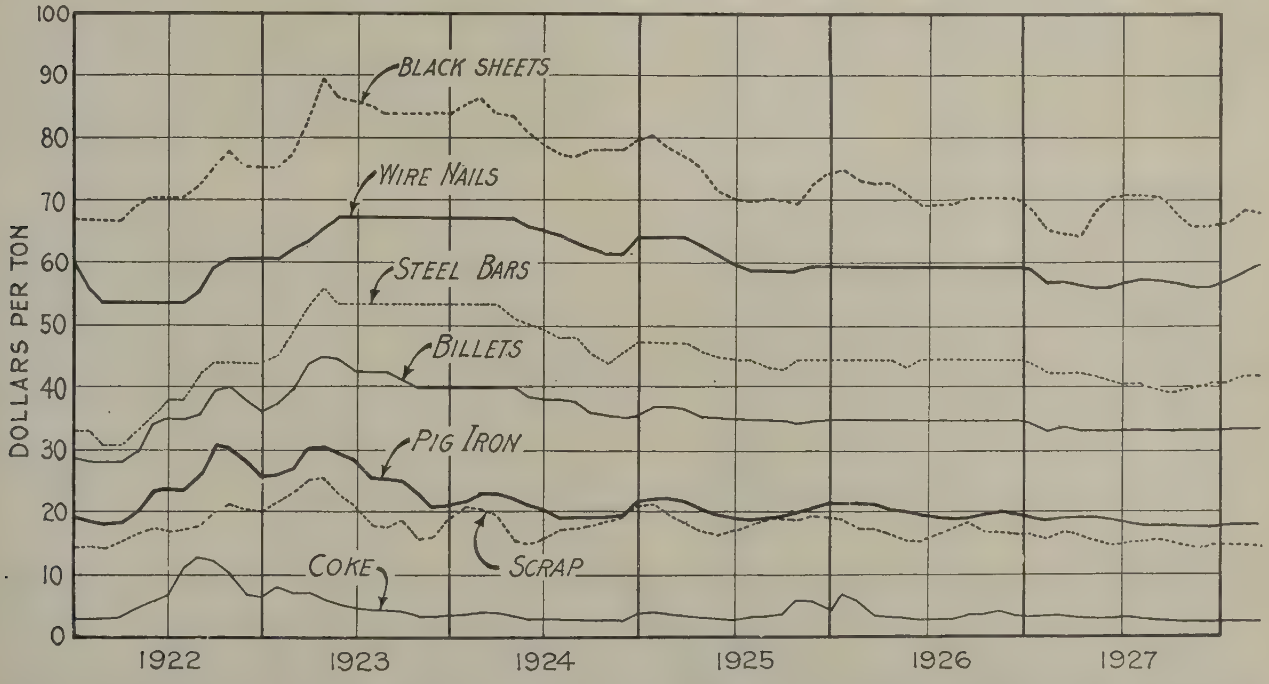

Fig. 3—Finished Steel Prices (in Particular, Sheets, Nails and Bars) Are Relatively Low, Compared with Semi-Finished and Raw Materials. Sheets have had their regular spring decline. Sustained improvement is not indicated

past. Sheets are very low, but may go still lower. Rarely indeed does the monthly average of sheet prices decline a little, as it did last month, without falling further. There has been a spring decline in sheet prices in each of the last five years. It seems difficult to escape the conclusion that the production of sheets must be somewhat excessive at present, in view of the weakness in this product while automobile production is gaining.

Concessions in the price of plates are reported, and the accuracy of such reports may be accepted, inasmuch as orders for railroad equipment are so backward.

On the whole, demand for steel appears to have slackened some last month, reflecting the indicated decline in our composite demand line (page 1018, April 12). The slackening of building activity cannot but affect the demand for steel unfavorably. At the same time, production is considerably above normal and probably a little above the usual relationship with the average activity of the chief consuming industries, though not much. The whole situation, therefore, does not seem to indicate the possibility of any considerable or sustained advance in steel prices.

MARCH SHEET SALES LARGE

Month's Total of Nearly 400,000 Tons by Independents Best Showing with One Exception Since September, 1926

March sales of independent sheet steel manufacturers reporting to the National Association of Sheet and Tin Plate Manufacturers were 399,441 net tons and, excepting last December, when they amounted to more than 530,000 tons, they were the largest in any month since September, 1926. March sales were more than 133,000 tons greater than those of the month before and exceeded those for January by approximately 97,000 tons. Shipments were approximately 40,000 tons less than the sales, but there was no such increase in the unfilled orders. This item at the end of March was 675,196 tons, or about 8000 tons more than at the end of February.

In view of the fact that production last month is stated to have been 103 per cent of capacity, it appears that potential capacity ratings are too low. Production for several months is known to have been six or eight points in excess of the rate of mechanical operation. The reckoning of capacities appears to hang a little more heavily upon mechanical performance than upon what has been done in actual practice.

Figures for March with comparisons follow:

	March	February	January
Total No. of mills	721	718	720
Capacity for month	492,150	461,750	486,550
Per cent reporting	72.3	72.6	72.6
Sales	399,441	266,210	302,921
Production	366,127	330,565	316,541
Shipments	359,532	298,420	274,126
Unfilled orders	675,196	667,054	694,197
Unshipped orders	110,702	......	110,945
Unsold stocks	53,144	......	59,508
Percentages to Capacity			
Sales	112.4	79.5	85.7
Production	103.0	98.7	89.6
Shipments	101.1	89.1	77.6
Unfilled orders	189.9	199.2	196.5
Unshipped orders	31.1	......	31.4
Unsold stocks	15.0	......	16.8

Industrial Activity as Measured by Electric Power Consumption

Industrial activity in March, based upon electric energy consumption by about 3000 manufacturing plants, is estimated by *Electrical World* at 118.2, compared with 100 in the basic period 1923-1925. This shows a reduction from the 127.7 in February, but a gain over the 116.8 of March, 1927. The average for the first quarter is given as 121.4, compared with 116.3 for the first quarter of 1927. Reductions in March, compared with February, are reported in rolling mills and steel plants and in metal-working plants, these two constituting the metal industries group. Reductions are shown also in leather, textiles, lumber, automobiles, stone, clay and glass, paper and pulp, rubber, chemicals, foods and shipbuilding. Compared with a year ago, however, all of these groups, except shipbuilding, textiles and rolling mills and steel plants, showed gains.

British Iron and Steel Output in March Largest This Year

LONDON, ENGLAND, April 16 (*By Cable*).—Pig Iron output in March was 592,600 gross tons while that of steel was 793,300 tons, castings included. Both are the largest this year.

A comparison of the March production with February and January and with the monthly rate for previous years is shown in the following table in gross tons:

	Pig Iron, Tons	Steel Ingots and Castings, Tons
1913—Average monthly	855,000	638,600
1920—Average monthly	669,500	755,600
1922—Average monthly	408,500	490,100
1923—Average monthly	620,000	706,800
1924—Average monthly	609,900	685,100
1925—Average monthly	519,700	616,400
1926—Average monthly	203,500	296,700
1927—Average monthly	607,800	758,200
1928—January	560,600	626,200
1928—February	550,800	764,400
1928—March	592,600	793,300

Metal Statistics for 1928

The twenty-first annual edition of "Metal Statistics, 1928" has just been issued by the American Metal Market Co., 11 Cliff Street, New York. Various new tables have been added to the general assortment of statistical information on ferrous and non-ferrous metals that features previous issues of this handbook. One new table entitled "The Distribution of Steel in 1927" is adapted from the compilation in THE IRON AGE, Jan. 5, 1928, and gives the percentage of each class of steel passing into respective consuming lines. Including advertisements and indexes there are 552 pages.

Sales of Mechanical Stokers

Mechanical stokers to the number of 123, with a total rating of 43,425 hp., were sold in March, against 85 of 43,643 hp. in February, according to reports received by the Department of Commerce from 12 establishments. Of those sold in March, 31 of 5078 hp. were installed under fire-tube boilers and 92 of 38,347 hp. under water-tube boilers.

Except for February, the March rating was the highest reported since last August. It compares with 49,694 hp. in March, 1927.

Schedule of the next instalments of the ***Business Analysis and Forecast,*** *by Dr. Lewis H. Haney, Director New York University Bureau of Business Research, follows:* ***April 26***—*General Business Outlook;* ***May 17***—*Activity in Steel Consuming Industries;* ***May 24***—*Position of Iron and Steel Producers.*

Continental Export Trade Smaller

British Hematite Competes in France—Swedish Miners' Strike Nearing End—About 200,000 Metal Workers Out in Germany

(*By Cable*)

LONDON, ENGLAND, April 16.

THE Cleveland pig iron market is still quiet and forward buying is restricted, but makers of foundry grades are fairly well booked with orders and are not pressing for sales.

Considerable competition between British and French pig iron is reported in French coastal districts. British makers are considering the possibility of increased sales to Europe in the near future, if labor troubles develop there.

There is improved export demand for hematite iron, but domestic buying is still slow, with makers maintaining a fairly firm attitude despite large stocks. Foreign ore prices are firm, although new business is small, most mines being well sold ahead. It is believed that the Swedish iron miners' strike is nearing termination.

Demand for finished steel is unsatisfactory, particularly for export, which is stagnant and there are no signs of an early revival. Purchasing of Continental material in this country is slow, but prices are steadier as a result of less insistent German offers and the well-booked condition of French plants.

Tin plate is firm as a result of good business and a more hopeful outlook. It is quite possible that makers may raise the minimum selling price to 18s. 3d. ($4.45), f.o.b. works port, at the Swansea, Wales, meeting, April 17. Meanwhile mills are well booked and contracts are reported to have been made for delivery to the end of the year.

Galvanized sheet prices are steady. Black sheets are quiet with some Japanese buying.

Central European wire rod mills are still outside the International Wire Rod Cartel, but have agreed to maintain prices at the cartel level. The reported desire of French mills to withdraw from the International Steel Cartel is strongly denied.

The Pont-a-Mousson works in France has secured an order for 2500 tons of cast iron pipe for Vienna, Austria. In Luxemburg the Acieries Reunies de Burbach-Eich-Dudelange has blown out a furnace at Esch for modernization.

The German labor situation is unsatisfactory. About 200,000 metal workers are now striking or locked out in Saxony.

FRENCH EXPORT PRICES WEAK

Trade Limited but Stocks in Foreign Markets Believed Low—Domestic Market Good

PARIS, FRANCE, April 6.—The export situation is rather confused, with buyers seeking lower prices and mills, on the strength of orders on their books, trying to maintain the present level. While there was a slight recession of prices at the end of March, bars and beams were the principal products affected and this was the result of German competition, which also appeared to a less extent on light-gage sheets. Export business is rather limited, but it is believed that there is a considerable volume of unsatisfied requirements in world markets, so that further recession in prices is not generally expected by producers.

Domestic business continues good, despite the slackening in export trade, and prices are firm. While the present satisfactory situation is attributed partly to the formation of a selling syndicate for semi-finished material and beams, replenishment of greatly depleted stocks has also been a factor.

Pig Iron.—Despite low British quotations the export market is still firm. Phosphoric foundry iron is being quoted at £3 4s. per ton ($15.59), f.o.b. Antwerp, for purchases of about 2500 tons. Prices on basic iron are somewhat depressed and range from £2 16s. to £2 17s. ($13.64 to $14.15) per ton, f.o.b. Antwerp. At a meeting, March 29, the Entente of French-Belgian-Luxemburg Pig Iron Producers agreed to maintain the present price level and fixed 16,000 tons as the total to be offered for May delivery to domestic users. Export prices quoted on foundry grade are: For Great Britain and overseas countries, £3 15s. 6d. ($18.39) per

British and Continental European prices per gross ton, except where otherwise stated, f.o.b. makers' works, with American equivalent figured at $4.87 per £ as follows:

Durham coke, del'd.	£0 17s.	to £0 18s.	$4.15	to $4.39

(a) Nominal.

ton; for Holland, £3 7s. ($16.32) per ton, f.o.b. Dutch frontier; for Italy, £2 19s. 6d. ($14.50), f.o.b. Thionville; for Switzerland, 79.25 Swiss francs ($15.67) per ton, delivered Basle. On large tonnages concessions are made from these prices. Negotiations are being continued for a revival of the association of hematite iron producers, which expired March 31, and a decision is expected soon. Meanwhile price concessions have begun to appear, and the recent increase in freight rates has not always been added to delivered prices.

Semi-Finished Material.—The shortage of semi-finished steel has disappeared, but prices continue fairly firm at £4 2s. to £4 6s. ($19.97 to $20.94) per ton, f.o.b. Antwerp, for blooms and £4 9s. to £4 12s. ($21.68 to $22.40) per ton for billets. Sheet bars range from £4 13s. to £4 13s. 6d. ($22.65 to $22.77) per ton.

Finished Material.—The irregularity of quotations that was in evidence a few weeks ago has been eliminated, but concessions for export business are beginning to appear. In the domestic market open-hearth steel prices have been advanced from 755 fr. ($29.75) per ton to 830 fr. ($32.70) per ton for small rolled products and from 730 fr. ($28.76) to 805 fr. ($31.72) per ton for large rolled products. Steel bars have settled to about £5 4s. per ton (1.14c. per lb.), and normal specification beams are quoted at £4 13s. to £4 14s. per ton (1.02c. to 1.03c. per lb.). The European Rail Makers' Association at its recent meeting decided to maintain rails at £6 7s. 6d. ($31.05) per ton.

Japan Using German and Domestic Electrical Sheets

NEW YORK, April 17.—In the past, Japanese consumers of electrical steel sheets have obtained most of their requirements from the United States or Great Britain. Recently, however, these consumers report that German electrical steel sheets have been improving in quality, and the Shibaura Engineering Co. has just purchased a substantial tonnage of Bismarck motor sheets from the Thyssen mill of the Vereinigte Stahlwerke, Düsseldorf, Germany, at about $98 per ton, c.i.f. Yokohama. This reported improvement in the quality of German electrical sheets recalls similar improvement in the quality of German light-gage black sheets, reported about two years ago. Since then, Japanese consumers have been fairly steady consumers of the German product, which, however, is produced in only a small tonnage.

Another factor that may tend to reduce Japanese purchases of electrical steel sheets in the United States and Great Britain is the growing importance of the Imperial Steel Works in Japan. Since beginning the production of electrical steel sheets, the Government works has had its product tried by various engineering works in Japan, and the opinion of these consumers seems to be that the product has been so improved as to place it in competition with foreign material. The only defect in the steel reported by the users is its irregularity in thickness, but with this defect eliminated, they state, it would rate as a first class product in the international market. The Government works is still working to improve its product, and, according to recent reports from Japan, successful production of high-grade electrical steel sheets is expected in the near future.

The annual capacity of the Government works in electrical steel sheets is estimated at 3000 to 4000 tons, while the annual consumption of such sheets by Japanese consumers is placed at 10,000 tons or more.

Large Shipments of Electric Industrial Trucks in March

March shipments of electric industrial trucks and tractors are reported by the Department of Commerce at 131 units, compared with 119 (revised figure) in February and 112 in January. Except for June and February of last year, the March total is the greatest since October, 1926. Of the total 16 were for export, while 18 tractors and 97 of other types were on domestic order.

URGES FRENCH USE OF STEEL

Per Capita Consumption in France Lags Behind That of Other Producing Countries

Increased domestic consumption of metallurgical products made in France was urged in a speech made recently by Maurice Fould, director of the Forges & Acieries de Pompey, at the Union des Industries Metallurgiques et Minières, Paris, before an audience of prominent representatives of the siderurgical, fabricating and consuming industries. Increased consumption of steel in France was declared to be one of the most urgent problems of the French metallurgical industry, says a report received by the iron and steel division, Department of Commerce, Washington, from the office of the American trade commissioner in Paris.

Steel consumption in France, according to M. Fould, increased from 4,293,000 metric tons in 1913 to 6,086,000 tons in 1926, a gain of 40 per cent. During the same period, owing to the acquisition of the large Lorraine plants and to the construction of new equipment in war-damaged plants, production increased from 4,687,000 tons to 8,386,000 tons, an increase of 80 per cent, or twice as much as the gain of consumption.

M. Fould compared this consumption with that of other nations to show "where the remedy lies." The following figures were given as showing the classification in 1926 of the principal steel-producing countries according to the annual steel consumption per capita (in parenthesis the consumption before the war, pig iron included, stated in kilograms, each kilogram being 2.2 lb.): United States, 411 kg. (372); Belgium and Luxemburg, 313 kg. (190); Germany, 155 kg. (261); Great Britain (in 1925), 152 kg. (236); France, 149 kg. (151).

The annual excess of production over consumption per capita, said M. Fould, is as follows: Belgium and Luxemburg, 383 kg.; France, 66 kg.; Germany, 42 kg.; United States, 15 kg.; Great Britain, 13 kg.

In 1927, the report says, France was obliged to export 52 per cent of its steel production. As a result of the war France has become one of the large metallurgical countries and to remain such, it was pointed out, it is necessary to develop its interior consumption. If not, it was explained, it cannot hope that exportation will permit it to find steady outlets for more than one-half of its production.

M. Fould indicated means employed by the United States and in Germany to increase consumption of steel and especially emphasized the organization and action of the Propaganda Abteilung recently formed by the Stahlwerksverband at Düsseldorf. He asked the interested industries and trades to organize a propaganda office in France and called attention to the importance of capital which should be placed at the disposal of the organization. M. Richemond, president of the Union des Industries Metallurgiques et Minières, made a proposal, which was accepted, to constitute an intersyndical committee to study the best means to carry out the policy urged by M. Fould.

Germany Replacing Minette With Swedish Iron Ore

WASHINGTON, April 14.—In addition to the iron mines in the Sieg, Lahn and Dill districts, which annually supply German blast furnaces with some 7,000,000 metric tons of 50 per cent iron content, Germany also draws extensively on the deposits in Sweden, Lorraine and Newfoundland, and less extensively on those of northern France, Norway, Spain and North Africa, says a report received by the iron and steel division, Department of Commerce, from Thomas Butts, trade commissioner at Berlin.

The marked dependence of Germany on foreign ores, it is stated, becomes more apparent when it is understood that the pig iron produced from the domestic ores during 1927 constituted only a little more than a quarter of the total production. Prior to the war Germany drew heavily on the ore deposits of Lorraine and Luxemburg, taking from the former about 21,200,000 tons and from the latter about 7,400,000 tons annually, or more than enough to provide the ore for more than one half of the 10,000,000 tons of pig iron then being produced. Since the war, and especially during the past few years, Swedish ores have largely taken the place of those formerly secured in Lorraine, and in 1927 approximately 15,000,000 tons, with an iron content of nearly 65 per cent, was obtained from that source. It is probable that this figure will not be equalled in 1928, as the German ore reserves during 1927 were depleted, but have been since reconstituted.

If the present rate of pig iron production in Germany is maintained throughout 1928, it is calculated that about 1,000,000 tons of Swedish ore will be imported monthly, a volume sufficient to supply nearly three-fifths of the needs of the German industry. Minette ore from Lorraine, with an iron content of about 35 per cent, is being imported into Germany at the rate of approximately 2,500,000 to 3,000,000 tons annually, while Newfoundland is the source of an additional 1,000,000 tons annually.

Germany Recovers Old Place in Machine Tool Industry

Exports Last Year Exceeded Those of United States—More Than Half of Imports Came From This Country—Russia Best Export Customer

THE rapid recovery of the German metal-working machinery industry is the subject of a bulletin by Theodore Pilger, American trade commissioner, Berlin, just issued by the Bureau of Foreign and Domestic Commerce, Washington. Conditions since the war, according to the report, have tended to stimulate the industry in Germany, with the result that the Germans have 865 factories with 65,000 workers, contrasted with 378 plants in the United States with 36,000 employees. Moreover, Germany now claims 46 per cent of the world's trade in metal-working and other closely related types of machinery, compared with America's 36 per cent. An increase in German metal-working machinery exports from 34,000 metric tons valued at $12,700,000 in 1924 to 63,000 metric tons valued at $27,700,000 in 1927 shows the rapidity with which foreign outlets are being developed.

Germany Passes United States in Exports

Although the total value of metal-working machinery manufactured in the United States in 1927 was nearly three times the value of the German product, $175,592,488 compared with $68,000,000, the German export value was $27,700,000, compared with $25,400,000 in the case of the United States. In other words, German manufacturers exported from 33 to 40 per cent of their product while in the United States exports were only 12½ per cent of total production. A further comparison of the industry in the two countries is shown in the accompanying table, which has been derived from census returns.

German Industry Seriously Over-Capacitated

Germany's census of 1921 showed 501 factories engaged in making metal-working machinery, with 50,000 employees. By 1925 there were 865 factories, employing 65,000 persons, an increase of 73 per cent in number of factories and 30 per cent in number of employees. As Mr. Pilger points out, "the machinery industry has organization, friendly government assistance, factories, workmen, engineers and raw materials enough to make tremendous inroads into the world's machine tool markets. The great needs in the German machine tool line now are sales organization, salesmanship and markets.

"There are from 90 to 100 German manufacturers of lathes of all kinds. This number of factories is sufficient to pour out an enormous overproduction. The same thing is true in almost every other type of machine tool, and these factories compete so vigorously that there is no profit for anyone except the buyer. Price is the outstanding factor in sales argument."

German Imports from the United States

As was the case before the war, the United States continues to furnish Germany with more than half its total imports of metal-working machinery. These imports were valued at 3,765,000 gold marks in 1926 and amounted to 58.8 per cent of Germany's total imports of this kind of machinery. Switzerland, Great Britain and Austria followed in the order named, supplying 9 per cent, 6.8 per cent and 5.6 per cent respectively.

The most striking development in Germany's exports of metal-working machinery in 1927 was the establishment of credit guaranties to Russia which resulted in that country's taking 30.6 per cent of Germany's total exports last year. In the previous year Russia took only 4.6 per cent of the total, but in 1913 Russia was a large buyer, taking 18.8 per cent. In 1927 Great Britain was second in the list of Germany's customers, taking 7.8 per cent of total metal-working machinery exports. Italy, the Netherlands, Switzerland, Czechoslovakia, the United States and France followed in the order named.

German and United States Metal-Working Industries Compared

Item	Germany	United States
Number of factories	865	378
Salaried employees, proprietors and firm members	65,107	36,825
Number of horsepower	75,113	147,418
Horsepower per employee	1.15	4.4
Employees per plant	75	95
Value of product[1]	$68,000,000	$175,592,488
Value of product per workman[1]	$1,000	$4,770
Value exported:		
1913	$19,500,000	$16,097,000
1925[2]	$18,400,000	$22,036,800
1927[2]	$27,700,000	$25,400,000
Export ratio, 1925 (per cent)	33–40	12½

[1] Estimated for 1927.

[2] German export statistics for 1925 exclude "reparations in kind," while for 1927 these payments are included and accounted for 6.4 per cent of the total.

Czechoslovakian Steel Output Estimated at 1,500,000 Tons

WASHINGTON, April 14.—While Czechoslovakia is the only country among important steel producing nations that does not officially publish figures showing its total production, it has been indicated that the total output in 1927 was about 1,500,000 tons of steel ingots, says a report to the Department of Commerce from Prague. This is calculated from the fact that the Czechoslovak industry last year exceeded its quota of 1,429,000 metric tons in the Continental Steel Entente by about 70,000 tons. This figure also seems to be substantiated by the consumption of coke.

British Consider Marking Imported Bearings

WASHINGTON, April 14.—Applications have been received by the British Board of Trade for regulations requiring a mark of origin on ball and roller bearings and their parts, and on copper tubes and pumps (other than semi-rotary wing pumps) and their parts, according to the Board of Trade *Journal*, says a statement issued by the Department of Commerce. The same authority also says that applications have been received by the board to exempt specified cabinet furniture of metal from the order requiring a mark of origin, provided it is sold in a container indicating the origin by printing in a conspicuous manner.

MERCHANT MARINE URGED

Hearings Show American Ships Carry Less Than One-Third of Our Foreign Trade

WASHINGTON, April 17.—The vital importance of a first-class American merchant marine to the industries and people of this country perhaps was never better shown than during the recent hearings held before the House Committee on Merchant Marine and Fisheries. While great volumes of evidence have been presented on this perennial subject during the past three score years or more, that presented recently is held by those who have followed the subject to have been especially impressive. Legislation has been attempted ever since the Civil War to build up an American merchant marine and either has failed of passage or, if passed, has proved ineffective. One of the outstanding difficulties has been the general indifference to the subject, even by some who should be the most greatly concerned, including large industries that would be called upon to supply materials and would be benefited as exporters in American bottoms.

There now seems, however, to be greatly increased interest in the subject, and it was exhibited at the hearing before the House committee. The result has been the reporting out of a shipping bill which, significantly enough, has been unanimously approved by the committee.

As drawn, the measure carries features of the Jones bill passed by the Senate, but authorizes the sale of Government lines by a vote of five members of the Shipping Board instead of seven, as provided in the Senate bill.

Large Construction Loan Fund Proposed

Recognizing the necessity of Government aid to private shipping, the House measure increases the proportion that may be loaned for the construction of new ships from two-thirds to three-fourths of the construction costs, and reduces the rate of interest to the rate paid by the Government itself. The construction loan fund is increased from $125,000,000 to $250,000,000, making available a substantial sum of cheap money to shipbuilders. The bill also extends the term and increases the rates of mail pay, which will range from $1.50 to $12 per mile, depending upon speed and tonnage. The Postmaster-General is authorized to allow additional compensation for air mail from ship to shore and from shore to ship. This provision, it is believed, would insure the building and operation of six American four-day liners to ply between American and British and French ports, as proposed by the American Brown-Boveri Electric Corporation, New York. The ships, designed as airplane carriers, would be by far the fastest on the ocean, having a continuous speed of 33 knots per hour and a maximum of 35 knots per hour, about 9 knots faster than the present fastest liner.

Another important feature of the bill is a provision creating an insurance fund which the Shipping Board would use to insure any interest the Government may have in any vessel, through liens on loans, or otherwise. This feature has been pointed to as freeing American shipping from the necessity of turning to foreign marine insurance, heretofore a heavy handicap against the building of a privately-owned American fleet. Necessarily also the importance of a merchant marine as an arm of the national defense was taken into consideration.

Statistics were presented showing the millions of American money now paid out to foreign interests for passenger, freight and mail service. At the same time the utter depression of American shipyards and the vast loss to American industries which would supply the materials for ships, together with the loss suffered in the export trade by having to turn to the superior and faster foreign ships, were pointed out to the committee.

Edward C. Plummer, vice-chairman of the Shipping Board, pointed out that at the present time more than 5760 ships, of 26,000,000 gross tons, are employed in transporting the foreign commerce of the United States, and less than one-third of these ships are American vessels.

"The peculiar significance of that fact is this," said Mr. Plummer, "that, while our foreign competitors are continually blaming the United States for the overtonnaged condition of the world, it is to be noticed that during the very period they have been complaining of this overtonnage, they have been building and, of course, building the most modern and economical vessels that can be produced."

Many Industries Involved in Shipbuilding

Illustrated by many exhibits, a statement was presented to the committee by H. G. Smith, vice-president of the Bethlehem Shipbuilding Corporation and also vice-president of the National Council of American Shipbuilders, showing the condition of the shipbuilding industry in the United States and what it means to the country. One of the exhibits showed that 146 industries, covering every State in the Union, are involved in the building of a ship. The materials coming from these States, with the value of each, were cited and covered a wide range, including steel, machinery, cotton, lumber, textiles, petroleum, ore, paints, glassware, flax, linseed, etc.

It was pointed out that shipyards of the United States are virtually idle and that trained staffs have almost disappeared. It would require 10 years, Mr. Smith said, to build up the required staff of engineers, draftsmen, scientific men and mechanics, but like others he expressed confidence that this could be done and a first class privately-owned American merchant marine be established with the proper Government aid, despite higher costs of labor and other handicaps in this country.

Special Test of Imported Steel May Be Required

NEW YORK, April 17.—The use of imported structural steel in buildings erected in Greater New York is receiving serious consideration by the superintendents of buildings in the various boroughs. As a result of recent conferences it is understood that the city may require physical tests and chemical analyses of structural steel imported from European mills. Under this plan, a decision would be made, on the basis of material tested, as to whether the mill from which the steel originated was furnishing material of proper specifications. It is understood that May 21 has been tentatively set as the date before which such tests should be made by the importers, and the Columbia University testing laboratories are mentioned as the agency for carrying out such tests.

In the case of imported reinforcing bars, the Treasury Department, Washington, has announced its intention to appeal the recent decision of Justice I. F. Fischer, reported in THE IRON AGE, April 12, by which reinforcing bars would be dutiable at 20c. instead of 30c. per 100 lb. A brief has not yet been filed by the Government, so it is not yet known on what grounds the appeal is being made.

While New York importers of steel have submitted bids on several projects requiring substantial tonnages of bars, principally bridge construction, in most cases contracts are expected to go to American mills. Continental steel prices have declined slightly from the peak reached a few weeks ago, so that plain steel bars are quoted today at 1.73c. to 1.75c. per lb., base, duty paid, and shapes range from 1.63c. to 1.65c. per lb., base, duty paid, New York.

J. B. Booth & Co., 216 East Robinson Street, Pittsburgh, doing a warehouse business in iron and steel products, have added cold finished steel bars and shafting to their list of stock items. The product of the Columbia Steel & Shafting Co., Pittsburgh, is to be carried. Bars, plates, shapes, hoops, bands and welding wire are its other lines.

Foundrymen Announce Program

Many Subjects to Be Discussed at Sixteen Sessions at Convention in Philadelphia, May 14 to 18

THE program committee of the American Foundrymen's Association has prepared the following schedule of technical sessions for the thirty-second convention, to be held in Philadelphia, May 14 to 18:

MONDAY, MAY 14

Registration and committee meetings.

TUESDAY, MAY 15

9.30 a. m.—General Opening Meeting and Business Session; Chairman—President S. W. Utley.

11 a. m.—Non-ferrous Metals.

"Science in the Foundry," by E. F. Hess, Ohio Injector Co., Wadsworth, Ohio.

"Furnace Refractories for Brass Foundries," by H. M. St. John, Detroit Lubricator Co., Detroit.

"Risers, Their Need and Methods of Feeding," by R. R. Clarke, General Electric Co., Erie, Pa.

"The Effect of Melting and Pouring Conditions Upon the Quality of No. 12 Aluminum Alloy," by T. W. Bossert, Aluminum Co. of America, New Kensington, Pa.

11 a. m.—Steel Founding.

"Economies in Oxy-Acetylene Cutting for Riser Removing," by G. O. Carter, Linde Air Products Co., New York.

"Variables in Steel Foundry Practice," by F. A. Melmoth, Thomas Firth & Sons, Ltd., Sheffield, England. Annual exchange paper to be presented on behalf of the Institute of British Foundrymen.

"Interdependence of Operating and Sales Departments in the Success of a Foundry," by K. V. Wheeler, Lebanon Steel Foundry, Lebanon, Pa.

"Reducing New Sand Consumption in a Steel Foundry," by H. A. Mason, Gould Coupler Co., Depew, N. Y.

11 a. m.—Cast Iron Founding—Cupola Developments.

"Theory of Cupola Operation in Relation to Practice," by R. B. Schaal, Roberts & Manders Stove Co., Hatboro, Pa.

"Automatic Blast Gate Control for Cupola Melting," by H. V. Crawford, General Electric Co., Schenectady, N. Y.

"Refractories for the Cupola," by C. E. Bales, Ironton Fire Brick Co., Ironton, Ohio.

2.30 p. m.—Foundry Costs.

Report of committee on foundry costs.

"The Schedule Fallacy," by J. J. Ewens, George H. Smith Steel Casting Co., Milwaukee.

"Necessity for Creating a Castings Consciousness," by A. F. Jensen, Hanna Engineering Co., Chicago. Presented on behalf of the Foundry Equipment Manufacturers' Association.

WEDNESDAY, MAY 16

10 a. m.—Steel Metallurgy.

"General Characteristics of Alloy Steel Castings," by J. W. Frank, Chicago Steel Foundry Co., Chicago.

"Manganese Steel," by H. P. Evans and A. F. Burtt, Pettibone-Mulliken Co., Chicago.

"A Modern Plant for the Heat Treatment of Miscellaneous Steel Castings," by A. W. Lorenz, Bucyrus-Erie Co., Milwaukee.

"Research Laboratory of the American Steel Foundries," by W. C. Hamilton, American Steel Foundries, Indiana Harbor, Ind.

Report of committee on steel castings.

Report of committee on heat treatment of ferrous castings.

Report of A.F.A. representative on joint committee on investigation of the effects of phosphorus and sulphur in steel.

10 a. m.—Cast Iron

"Influences of Carbon and Silicon Variations in Cast Iron," by D. G. Anderson and G. R. Bessmer, Western Electric Co., Chicago.

"Some Recent Developments in Cupola Metal," by J. D. Miller, Cresson-Morris Co., Philadelphia.

"Temperature Measurements of Molten Cast Iron," by H. T. Wensel and W. F. Roeser, Bureau of Standards, Washington.

"Test Bar for Testing the Chill of Cast Iron with Medium and High Silicon Contents," by M. Dudouet, Ecole Superieure de Fonderie, Paris, France. Annual exchange paper of the French Foundry Technical Association.

"Heat Losses from a 75-Ton Hot Metal Car," by W. F. Roeser, Bureau of Standards, Washington.

10 a. m.—Malleable Iron.

"Reducing Scrap in the Malleable Foundry," by R. A. Greene, Ohio Brass Co., Mansfield, Ohio.

"Effects of Various Elements on Malleable Cast Iron," by L. E. Gilmore, Crane Co., Chicago.

"The Need for Research in the Foundry," by E. E. Griest, Chicago Railway Equipment Co., Chicago.

"Oxidation Phenomena During the Annealing of Malleable Cast Iron," by H. A. Schwartz, National Malleable & Steel Casting Co., Cleveland.

"An Incentive Bonus Plan for Molders Based on Scrap Control," by R. J. Teetor, Cadillac Malleable Iron Co., Cadillac, Mich.

12.30 p. m.—Round Table Discussion on Brass Founding.

2.30 p. m.—Foundry Management.

"Basic Principles of Management in the Foundry," by J. D. Towne, Dayton, Ohio.

"Stabilizing Labor and Cutting Costs," by A. D. Lynch, Ohio Brass Co., Mansfield, Ohio.

"What Does the Buyer Expect for His Money?" by J. A. Marks, Packard Motor Car Co., Detroit.

"A Contribution to the Training of Labor and the Personnel of a Foundry," by A. Soupart, director of Musee Professional de l'Etat et des Ecoles Techniques de Morlanwetz, Belgium. Annual exchange paper of the Belgian Technical Foundry Association.

2.30 p. m.—Foundry Coke.

Round table discussion of the present status of coke specifications.

"Presentation of Review of Status of Coke Specifications," by W. A. Selvig, United States Bureau of Mines, Pittsburgh.

THURSDAY, MAY 17

10 a. m.—Apprentice Training.

"The American Boy in the Foundry," by F. J. McGrail, Sheffield Works, Fairbanks, Morse Co., Three Rivers, Mich.

Reports of apprentice training in various foundry centers. Reviewed by F. A. Lorenz, American Steel Foundries, Indiana Harbor, Ind., and L. V. Park, Park & Williams, Inc., Philadelphia.

Discussion of apprentice training.

10 a. m.—Cast Iron.

"Theory or Practice in the Gray Iron Foundry," by John Shaw, Southsea, England.

"On Research Problems of the Gray Iron Foundry," by J. W. Bolton, Lunkenheimer Co., Cincinnati.

Report of committee on gray iron.

12.30 p. m.—Malleable Iron Round Table Discussion.

Following a luncheon gathering, an informal discussion of shop problems of the malleable foundry will take place.

2.30 p. m.—Sand Control.

"Surface Conditions of Castings as Affected by Core Sand Mixtures," by H. L. Campbell, University of Michigan, Ann Arbor, Mich.

"Testing Molding Sands for Durability," by M. A. Blakey, International Harvester Co., Milwaukee.

"Sand Conservation and Control in a Gray Iron Jobbing Shop," by T. F. Kiley, Brown & Sharpe Mfg. Co., Providence, R. I.

"Sand Control in a Light Casting Shop," by W. G. Reichert, Singer Mfg. Co., Elizabethport, N. J.

"A Compression Test of High Precision—The Colloid Nature of Natural Bond—The Effect of Heating on the Bond," by G. G. Brown, Ann Arbor, Mich., and C. C. DeWitt, Michigan College of Mines and Technology, Houghton, Mich.

Report of committees.

FRIDAY, MAY 18

10 a. m.—Materials Handling.

"Materials Handling and Its Relationship to Building Plans," by E. F. Scott, Austin Co., Cleveland.

"Determining Returns from Materials Handling Equipment," by J. J. Hartley, Link-Belt Co., Chicago.

"What Materials Handling Equipment Can Do for the Jobbing Foundry," by W. B. Marshall, Chain Belt Co., Milwaukee.

"Unloading Foundry Materials," by R. T. Turner, Shepard Electric Crane & Hoist Co., Montour Falls, N. Y.

"How to Determine When Materials Handling Equipment Should Be Installed," by H. J. Dorus and C. S. Schroeder, Yale & Towne Mfg. Co., Stamford, Conn.

Course in Cupola Operation

AN innovation this year is a course on cupola operation. The schedule of the sessions is as follows:

Monday, May 14, 4 p. m.
Period 1—Principles Underlying Cupola Melting Process. Leader, Dr. Richard Moldenke.
Tuesday, May 15, 4 p. m.
Period 2—Cupola Construction Details. Leader, E. J. Lowry.
Wednesday, May 16, 4 p. m.
Period 3—Cupola Charging Practice. Leader, David McLain.
Thursday, May 17, 4 p. m.
Period 4—Cupola Improvements. Leader, H. W. Dietert.

European Exchange Papers

EXCHANGE papers are to be presented by representatives of three European associations with which the A. F. A. has exchange arrangements. F. A. Melmoth, manager of the steel foundry of Thomas Firth & Sons, Sheffield, England, will present the exchange paper of the Institute of British Foundrymen. His paper will be on variables in steel foundry practice.

M. Dudouet, of the Foundry High School of Paris, will present the exchange paper of the Association Technique de Fonderie, which is the technical foundry association of France. This paper will deal with test bars for determining the chill of cast irons with high and medium silicon contents.

A. Soupart, director of Musee Professional de l'Etat et des Ecoles Techniques de Morlanwetz, will present the exchange paper for the Belgian Technical Foundry Association. This paper will be a contribution to the training of labor and the personnel of a foundry.

Refractories Institute to Discuss Specifications

A feature of the annual meeting of the American Refractories Institute to be held at the Greenbrier, White Sulphur Springs, W. Va., May 8, will be the discussion of a selected list of specifications used by consumers in the purchase of refractories. An effort is being made to have a well-balanced attendance of consuming and producing interests. It is planned to discuss in detail the various phases of specifications and in a non-technical way to indicate their merits and faults.

A practical specification is one which ranges between the requirements for an ideal refractory and one which can be manufactured at a reasonable profit. It is believed that the discussion will be of considerable value to consumers in formulating more practical requirements and to manufacturers in obtaining ideas of the consumers as well as in learning more of the requirements of refractories in various furnace operations. This meeting is open to everyone interested in such specifications.

"Screening of Fire Clays" and "The Cause of Bulging in Hand-Made Shapes" are the topics of two of the papers to be presented.

Miss Dorothy A. Texter, 2202 Oliver Building, Pittsburgh, is secretary of the institute.

Gear Manufacturers Meet at Rochester

In addition to progress reports and recommendations of the association's several standardization committees, a number of addresses have been arranged for the twelfth annual meeting of the American Gear Manufacturers Association, which will be held at the Seneca Hotel, Rochester, N. Y., April 19, 20 and 21. Luncheon and an inspection visit to the Gleason Works is also to be a feature.

"Gear Lubrication" will be discussed by G. A. Round, assistant chief engineer Vacuum Oil Co., and "Non-Metallic Materials—The Part They Will Play in the Future of the Gear Industry," by T. C. Roantree, Westinghouse Electric & Mfg. Co. "Nitration of Steel," by W. H. Phillips, Molybdenum Corporation of America. "Contact of Standard Worm Gears," by J. C. O'Brien, Pittsburgh Gear & Machine Co.; and "The Value of Research to the Present Day Manufacturer," by C. E. Skinner, assistant director of engineering, Westinghouse Electric & Mfg. Co., are among other addresses planned.

Dr. Dexter S. Kimball, dean of the College of Engineering, Cornell University, will speak at the informal banquet, to be held on the evening of April 20. E. J. Frost, president Frost Gear & Machine Co., will be the toastmaster and musical features will be furnished by talent from the Gleason Works.

American Gray Iron Institute to Meet in Philadelphia May 18

The American Gray Iron Institute, which was organized at a conference held in Pittsburgh, March 13, will hold a meeting in Philadelphia, Friday, May 18. This date, the last day of the American Foundrymen's Association's convention and exhibition, was chosen to avoid conflict with other activities and to permit the largest possible attendance of gray iron foundrymen.

The organization committee chosen at Pittsburgh held a meeting in Cleveland Tuesday, April 10, and set up a tentative plan of procedure for action at the Philadelphia meeting. The principles enunciated by the resolution adopted at Pittsburgh have been clarified and enlarged to include the purposes for which the American Gray Iron Institute was founded. These principles, which will be submitted to general discussion at Philadelphia, were published in THE IRON AGE March 15, p. 777.

The organization committee appointed at Pittsburgh includes the following gray iron foundrymen:

Walter L. Seelbach, chairman, Forest City-Walworth Run Foundries Co., Cleveland; A. E. Hageboeck, vice-chairman, Frank Foundries Corporation, Moline, Ill.; J. H. Bruce, Bowler Foundry Co., Cleveland; J. L. Carter, Barlow Foundry Co., Newark, N. J.; H. S. Chafee, Builders' Iron Foundry, Providence, R. I.; A. E. Clarke, Des Plaines Foundry Co., Des Plaines, Ill.; J. D. Coltman, Bullard Machine Tool Co., Bridgeport, Conn.; Horace R. Culling, Carondelet Foundry Co., St. Louis; Fred Erb, Erb-Joyce Foundry Co., Detroit; W. J. Grede, Liberty Foundry Co., Milwaukee; John Hartman, Atlas Foundry & Machinery Co., Tacoma, Wash.; B. H. Johnson, Cresson-Morris Co., Philadelphia; Angus Macdonald, Snead & Co., Jersey City, N. J.; Don McDaniel, Hamilton Foundry & Machine Co., Hamilton, Ohio; Edward B. Sherwin, Chicago Hardware Foundry Co., North Chicago, Ill.

Of this number, 13 attended the meeting of the committee in Cleveland, April 10.

The meeting in Philadelphia on May 18 will be held in the convention hall of Philadelphia Commercial Museum and will be called to order by B. H. Johnson, temporary chairman, who presided at the Pittsburgh conference. A speaker of national prominence, familiar with the problems of group action upon commercial and industrial problems, has been engaged for this occasion.

American Welding Society Announces Annual Program

American Welding Society will hold its annual meeting in the Engineering Societies Building, 33 West Thirty-ninth Street, New York, on April 25, 26 and 27. Wednesday, April 25, will be given over to meetings of the standing committees on pressure vessels, structural steel and nomenclature.

On April 26, the morning session will discuss papers on "Welding of Corrosion-Resisting Alloys" by W. B. Miller of the Union Carbide & Carbon Research Laboratories and "Building Up Rail Ends by Electric Arc" by H. E. McKee, Electric Rail Weld Service Corporation. In the afternoon the matters of qualification of welders, inspection and supervision will be considered from many angles by a group of speakers. In the evening the annual dinner will be held.

Friday morning, April 27, M. L. Eckman, welding supervisor Ford Motor Co., Detroit, will describe "Welding the Ford Car." In the afternoon the American Bureau of Welding (the research group of the society) will hold its annual meeting.

Organize for World Engineering Congress at Tokio

For the world engineering congress to be held next year in Tokio, an American committee was formally organized in New York, March 22, and officers elected as follows:

Honorary chairman, Herbert Hoover; chairman, Elmer A. Sperry, New York; vice-chairman and chairman of the executive committee, John W. Lieb, New York; vice-chairman, C. E. Grunsky (Pacific Coast), San Francisco; C. E. Kettering (Middle West), Detroit; executive secretary, Maurice Holland; executive committee, Gano Dunn, George W. Fuller, Maurice Holland, Frank B. Jewett, John W. Lieb, John H. McGraw, Calvin Rice and W. E. Wickenden, New York; Donald C. Jackson, Cambridge, Mass.; O. C. Merrell, Washington; Charles F. Scott, New Haven, and Elmer A. Sperry, Brooklyn.

Employee Representation Is Gaining Rapidly Over Trade Unionism

That employee representation, as expressed in works councils and company unions, is rapidly assuming the activities of trade unionism in most of the large mass production manufacturing industries was emphasized by William M. Leiserson, professor of economics, Antioch College, Yellow Springs, Ohio, in an address before the Academy of Political Science at the Hotel Astor, New York, on April 11. Professor Leiserson went on to say that this evolution in labor relations is not coming about because company unions are necessarily better prepared or situated to handle the interests of the laborer, but because they have taken the initiative and have succeeded in accomplishing smoothly and satisfactorily what trade unions have not seemed able to do without friction and poor management.

The speaker explained further that industrial executives had not hesitated to seek out men scientifically trained in personnel relations to conduct their activities in employee representation work, while trade unions had failed in many cases to recognize the need for broadminded leadership. Until the unions realize the need for this sort of leadership, he pointed out, they will continue to fight a losing battle with the young but energetic competitor, employee representation.

"Industrial leaders, however," Professor Leiserson said, "are erring seriously if they believe that in creating company unions they have built up a passive and docile instrument for the handling of labor disputes. Employee representation does not deprive the workers of the right to strike, but on the other hand it does offer a more satisfactory means of arbitration than has been possible in the past with the majority of trade unions."

Features of Mechanical Engineers' Spring Meeting at Pittsburgh

The program of the spring meeting of the American Society of Mechanical Engineers, to be held at Pittsburgh, May 14 to 17, inclusive, includes the following papers:

Manufacture of Seamless Tubes, R. C. Stiefel and George A. Pugh, Aetna Standard Engineering Co., Ellwood City, Pa.

Some Common Delusions Concerning Depreciation, Ernest F. DuBrul, general manager National Machine Tool Builders Association, Cincinnati.

Ball Bearing Machine Tool Spindles, Thomas Barish.

A Material Handling and Transport Organization, C. A. Fike.

High-Pressure Steam Boilers, George A. Orrok, consulting engineer, New York.

The Flow of Heat Through Furnace Hearths, J. D. Keller.

Use of Pulverized Coal in Basic Open Hearth Furnaces, E. L. Herndon.

Combination Firing of Blast-Furnace Gas and Pulverized Coal, F. G. Cutler, chief Bureau of Steam Engineering, Tennessee Coal, Iron & Railroad Co., Ensley, Ala.

Locomotive and Freight Car Utilization, C. B. Peck.

Mechanical Properties of Aluminum Casting Alloys at Elevated Temperatures, R. L. Templin, C. Braglio and K. Marsh.

A Study of Tin-Base Bearing Metals, Part I. O. W. Ellis and G. B. Karelitz, Westinghouse Electric & Mfg. Co., East Pittsburgh, Pa.

Training Minor Executives in a Rapidly Growing Organization, A. J. Beatty.

COMING MEETINGS

April

American Gear Manufacturers Association. April 19 to 21. Twelfth annual meeting, Hotel Seneca, Rochester, N. Y. T. W. Owen, 3608 Euclid Avenue, Cleveland, secretary.

American Society of Mechanical Engineers. April 23, 24. Meeting of materials handling division, Benjamin Franklin Hotel, Philadelphia. Calvin W. Rice, 29 West Thirty-ninth Street, New York, secretary.

National Metal Trades Association. April 25, 26. Annual convention, Hotel Astor, New York. J. E. Nyhan, Peoples Gas Building, Chicago, secretary.

National Foreign Trade Council. April 25 to 27. Fifteenth annual convention, Rice Hotel, Houston, Tex. O. K. Davis, India House, New York, secretary.

American Welding Society. April 25 to 27. Annual meeting, Engineering Societies Building, New York. Miss M. M. Kelly, 33 West Thirty-ninth Street, New York, secretary.

American Management Association. April 26, 27. Fourth financial executives' conference, Hotel Pennsylvania, New York. W. J. Donald, 20 Vesey Street, New York, managing director.

American Electrochemical Society. April 26 to 28. Spring meeting, Stratfield Hotel, Bridgeport, Conn. Colin G. Fink, Columbia University, New York, secretary.

May

Iron and Steel Institute. May 3 and 4. Annual meeting, House of Institution of Civil Engineers, London, England. George C. Lloyd, 28 Victoria Street, London, S. W. 1, England, secretary.

American Refractories Institute. May 8 and 9. Annual meeting, White Sulphur Springs, W. Va. Dorothy A. Texter, 2202 Oliver Building, Pittsburgh, secretary.

American Society of Mechanical Engineers. May 14 to 17. Spring meeting, William Penn Hotel, Pittsburgh. Calvin W. Rice, 29 West Thirty-ninth Street, New York, secretary.

American Foundrymen's Association. May 14 to 18. Annual meeting and exhibition, Commercial Museum, Philadelphia. C. E. Hoyt, 140 South Dearborn Street, Chicago, secretary.

Joint Machinery and Supply Convention. Joint meeting of Southern Supply and Machinery Dealers' Association, National Supply and Machinery Distributers' Association and American Supply and Machinery Manufacturers' Association. May 15 to 17. Nashville, Tenn. Alvin M. Smith, Smith Courteney Co., Richmond, Va., George Fernley, 505 Arch Street, Philadelphia, and F. D. Mitchell, 1819 Broadway, New York, secretaries.

American Steel and Heavy Hardware Association. May 22 to 24. Nineteenth annual convention, Copley-Plaza Hotel, Boston. Benjamin R. Sackett, 503 Arch Street, Philadelphia, secretary.

American Iron and Steel Institute. May 25. Annual meeting, Hotel Commodore, New York. E. A. S. Clarke, 75 West Street, New York, secretary.

Recent Experiments on the Cause of Hardness in Steel

Doctor Jeffries Believes Hardness of Martensite Is Due to Extremely Fine Grain of Iron Crystals and Critical Dispersion of Carbide Particles Therein

AT a meeting of the New York chapter of the American Society for Steel Treating, Dr. Zay Jeffries, consulting engineer Aluminum Co. of America, described recent researches into the nature of martensite, and their application to the riddle of "Why does steel harden?"

When he and his associate, R. S. Archer, some years ago proposed the "slip interference" theory of hardening, some difficulty was experienced in explaining the great hardness of martensite in freshly quenched high-carbon steels. The general theory seemed to demand an aggregate of very fine crystals with random orientations, within which are dispersed many particles of a second harder substance acting as keys to prevent one portion of the individual crystalline grain from sliding past another (normal plastic deformation). However, everyone knew that martensite under the microscope showed a relatively coarse structure of needle-like, interlocking crystals.

Martensite Has Many Visual Aspects

Since then it has become more acceptable to describe martensite in terms of the general conditions existing within the steel rather than as a particular microscopic appearance. In other words, martensite is thought of as the early stages in the series of changes which transform austenite (the solid solution of carbon in gamma iron) to pearlite (a mixture of visible ferrite and cementite crystals). Since there are at least three methods of transformation, there are three possibilities as to the structure of martensite. Furthermore, since it is generally accepted that the iron in martensite is in the alpha or body-centered modification, it should be fruitful to study the condition of the ferrite in the three varieties by the X-ray method.

A large single crystal of austenite which formed in an iron runner and transformed slowly into lamellar pearlite showed no relation between the orientation of the mother crystal and the ferrite flakes. Another large crystal of austenitic manganese steel was annealed to harden it and produce martensite; again the ferrite crystals had random orientation. A high-carbon steel, having coarse-grained austenite by a long high anneal, was quenched so the transformation occurred at about 200 deg. C. into the usual acicular martensite. In the latter the X-ray pattern indicated that the ferrite might be controlled to an extent by the cleavage planes in the austenite. In the light of these studies, and those of Young in England on meteoric iron, Jeffries concludes that the ferrite in martensite is at random orientations, or at most parallel in only one crystalline plane so the third axial direction can be almost anything. This random orientation is a condition which makes for great slip interference, and therefore hardens the metal.

Martensite a Complex Aggregate of Fine Crystals

F. F. Lucas has secured micrographs of martensite needles which demonstrate that these have a very fine complex structure.

Doctor Jeffries next inquired how much of the hardening of martensite is due to the fine grain of the random ferrite crystals present, and what proportion is due to the presence of carbon.

A nickel-iron (19:81) alloy with 0.006 per cent carbon was prepared having a coarse grain. Its Rockwell hardness was diamond cone 18—i.e., soft. After remelting to 0.012 per cent carbon, and cooling to 200 deg. C. in the furnace the grain was refined enormously, and the hardness was C36. This increase of 18 points is ascribed to grain refinement during transformation. (This same experiment, in Doctor Jeffries' opinion, disposes of the theory that hardness of quenched carbon steel is due to internal strains set up by the expansion taking place when gamma iron transforms to alpha iron. The nickel-iron alloy expanded during the transformation, and at a low temperature where the metal would be cold-worked thereby, but the total increase in hardness is only 18 Rockwell units.) When the same alloy has 0.05 per cent carbon and is cooled from 500 deg. C., it has a cloudy microstructure and hardness of C45. It is obvious that the principal cause of hardness here is grain refinement, and a very little carbon is sufficient for this purpose.

In plain steels carbon must not only lower the transformation (which is done by the nickel in the above experiment) and obstruct grain growth in the transformed material (which is done by no more than 0.012 per cent carbon in the nickel-iron alloy), but must also harden the alloy by its own presence. In the first stage of the transformation, carbon probably exists in solid solution in the ferrite; later it forms growing crystals of cementite.

Iron-Carbon Solid Solution Not Very Hard

To evaluate the hardness which may be expected from a solid solution of carbon in ferrite, the speaker referred to Sykes' iron-molybdenum alloys. Pure ferrite has a Brinell hardness of 70; ferrite is saturated with 6 per cent molybdenum and its hardness is then 130. A super-saturated solid solution containing 22 per cent molybdenum is 215 hard, and the same, when heated 50 hr. at 600 deg. C., enabling a hard compound to precipitate, has a hardness of 530. Evidently, the added hardness due to the hard compound, properly dispersed, is much greater than that due to the atomic dispersion of the compound's constituents in solid solution.

In summary, Doctor Jeffries said that these tests, made in alloys where the individual effect is unmasked by other factors, indicated that the hardness of martensite is due to the following factors:

a. Random orientation of ferrite grains
b. Extremely small size of ferrite grain
c. Intrinsic hardness of carbon-iron solid solution
d. Added hardness due to carbide precipitate.

While he is as yet unable to give definite or even relative values to the four hardening factors, one would gather that item c. is least effective, and items b. and d. are most.

Age-Hardening of Quenched Steel

As a general check on the assumption that freshly formed martensite is a supersaturated solid solution of carbon in alpha iron, from which carbon is being precipitated in the form of cementite crystals, Doctor Jeffries remarked that this view of the nature of martensite placed it in the same category with more than 20 alloy systems, all of which show age-hardening effects and follow general laws of age hardening, and all of which are due to the break-down of a solid solution with the formation of a second substance within the alloy. W. P. Sykes is now studying quenched high-carbon steels and finds that they also show these age-hardening phenomena.

For instance, 1.23 per cent carbon steel quenched in iced alkali solution, has a hardness of C 64.9. After immersion in liquid oxygen this increased to C 66.2, with an increase in volume, indicating that the added hardness is due to the transformation of residual austenite. Either of these samples, when held at room temperature, increase in hardness with time; for instance, the oxygen-quenched sample in 5 hr. measures C 67.1; in 100 hr., C 68.3; in 800 hr., C 69.8. However, these increases in hardness are accompanied by a *contraction* in volume, showing that the added hardness is from a different cause than transformation of remaining traces of austenite. Study of hardness tests taken after aging at different temperatures shows them to possess the same mutual relationships as do similar data for duralumin, for instance, and indicate an essential similarity in action between martensite and the other age-hardening alloys. This agrees entirely with the requirements of the slip interference theory of hardening—namely, that the size of precipitated carbide in martensite may be too small on fresh quenching to give maximum hardness. This critical size and maximum hardness may, however, be attained after aging for the right time at the right temperature. Longer aging at that temperature causes a slight softening, as theory demands.

Lower Freight Rate on Tin Plate from San Francisco to Sacramento Denied

WASHINGTON, April 17.—In a decision made public last week, the Interstate Commerce Commission held that the proposal of the Western Pacific and other railroads to reduce from 18.5c. to 9c. per 100 lb. the rate on tin plate, in carloads, from San Francisco and other San Francisco Bay points to Sacramento, Cal., shipped by water from the Atlantic seaboard, is not justified. The schedules were ordered canceled. Protests against the proposed reduction were made by water carriers and others, while the United States Steel Products Co. supported the rail lines.

The report said that tin plate moves from the Atlantic seaboard by water through the Panama Canal to San Francisco, where it is transshipped to Sacramento, and that practically all of it is made into containers and exported by the Sacramento plant of the American Can Co. The plant, it was stated, will use about 250,000 net tons annually, of which a small portion moves all-rail from such manufacturing points as Gary, Ind., and Pittsburgh. The rate of the Sacramento Navigation Co. from San Francisco to Sacramento is 10.5c. per 100 lb. There is also a switching charge of 34c. per net ton at Sacramento, of which the boat line absorbs 15c., making a through charge of $2.29 per net ton to the plant of the American Can Co. According to the decision, the United States Steel Products Co. had said it was not satisfied with the water service, and that the business would be taken from the boat line and its own barge service established if the lower rail rate were not established.

Steel Co. of Canada Profits Off Slightly Last Year

Profits of the Steel Co. of Canada, Ltd., Hamilton, Ont., for the year ended Dec. 31, 1927, amounted to $11.64 a share on combined common and preferred stock, as compared with $12.38 in 1926, and $10.10 in 1925. Manufacturing profits for 1927 amounted to $3,166,280, compared with $3,247,606 in 1926 and after adding investment income and deducting depreciation, sinking fund requirement, bond interest, etc., the amount available for dividends was $2,095,373, as against $2,229,211 in the previous year.

Heavier Trackwork Production

March production of trackwork for T-rails of 60 lb. a yard and heavier is reported at 15,058 net tons by the American Iron and Steel Institute. This shows a considerable gain over the immediately preceding months and is the largest total since last May. It compares, however, with 19,216 tons in March, 1927, and with 19,756 tons in March, 1926.

Total production for the first quarter is given at 35,761 tons. This compares with 45,863 tons in the first quarter of last year and 51,161 tons in the first quarter of 1926. The current figure is the smallest for any quarter in more than two years, with the exception of the last quarter of 1927.

Steel Shippers and Users in Chicago District Object to Rise in L. C. L. Rates

WASHINGTON, April 17.—Manufacturers, dealers and consumers of iron and steel products in Illinois, Iowa and Wisconsin have filed a petition with the Interstate Commerce Commission asking for reconsideration and modification of its decision justifying the railroads in cancelling existing commodity rates on iron and steel products in less-than-carloads, and placing them on a full classification basis in Illinois Freight Association, Western Trunk Line and Central Freight Association territories.

The petition declares that the findings of the commission are not based upon the evidence in that the railroads made no effort to justify the proposed increases. Instead, it is contended, witnesses for the railroads upon cross-examination specifically stated that their testimony in justification of the proposed cancellation of commodity rates for less-than-carloads generally did not apply to the rates on iron and steel and for this reason, it is pointed out, the protestants did not introduce evidence in support of the present adjustment of rates.

Cement Production Undergoing Seasonal Expansion

Production of Portland cement in March is reported by the United States Bureau of Mines at 10,223,000 bbl. This represents a seasonal gain over the 8,797,000 bbl. of February. The output, however, is more than 10 per cent below that of last March, which was 11,450,000 bbl.

Shipments in March were 10,135,000 bbl., compared with 11,100,000 bbl. a year ago. Stocks at the end of March were 27,436,000 bbl., a slight gain over a month earlier and the heaviest in more than a year. This increase again is seasonal, as the stocks last year at the end of March were heavier than at any other time during the year. Shipments normally exceed production in each month from April to October inclusive.

Pittsburgh Steel Co. Completes Financing for Plant Betterments

Stockholders of the Pittsburgh Steel Co., Pittsburgh, last week approved a bond issue of $16,000,000, of which $11,000,000 has been issued and the remainder has been reserved in the treasury for later issuance in connection with the building of a by-product coke plant. From the proceeds of the bonds sold, $2,000,000 has been appropriated for plant improvements, which include general electrification of the Monessen plant, involving a new boiler plant to operate at 400 lb. per sq. in. steam pressure with 200 deg. superheat; partial electrification of mill drives at that plant, and changes in the automatic mills at the Allenport, Pa., works to make possible the rolling of hot finished tubes to 40 ft. lengths, as against 24 ft., the present maximum length. Additional heating furnace capacity also will be installed at this works. The remaining $9,000,000 will be used to refund existing indebtedness.

This Issue in Brief

Outstanding quotations provide machinery builder with a yardstick for measuring raw material needs. He knows from experience about what proportion of quotations will be converted into orders, and is thus able to estimate closely his requirements.—Page 1068.

Shop policies are decided by supervisory committee. All important matters relating to production in machinery-building plant are passed on by board consisting of the general manager and his assistant, chief engineer and two superintendents.—Page 1071.

Eliminates time lost in replenishing screw machine stock by means of automatic rod magazine. A new rod is fed automatically into working position as the preceding length of stock is exhausted.—Page 1091.

What of iron and steel prices? Though finished steel prices are still too low for a proper relation with their raw materials, they show little indications of advancing to a better position, says Dr. Haney. Signs point to little change in pig iron prices. Pages 1092 and 1093.

"Standard" manufacturing procedure is unknown in Ford plant. All things are in a state of flux. Improvements are continually being made, and some of the best suggestions come from the men on the job. Discovery of a better method or material means its adoption.—Page 1082.

Improves appearance of galvanized pipe by eliminating water dip. A better spangle finish is thus obtained in the new Bethlehem pipe plant. Lap weld mills have driven roller conveyors throughout for handling the pipe from operation to operation.—Page 1088.

Air-hardening properties of chrome-molybdenum steel tubing and sheets make them preferred materials for airplane construction. Heat-treating by quenching is impracticable because of the size of the welded structures.—Page 1077.

Though minimum labor turnover is the greatest safety factor in any plant, health is increasingly important, says Westinghouse executive. Advocates regular physical examination of workers as a means of cutting the accident rate.—Page 1079.

Time lost in getting tools is cut by four-sided tool room in center of shop. Each worker has ten metal tool checks. He leaves a check when he takes a tool, and the check is placed on the rack from which the tool has been removed.—Page 1071.

Steels having unusual properties are produced by active bath movement in high-frequency induction furnace. A steel bath, under a normal refining slag, was brought from 0.14 per cent carbon to 0.03 per cent in 2 min. Another steel, with the very low-carbon content of 0.01 per cent, was found to be completely free of hot-shortness, although it contained only a very small amount of manganese and silicon.—Page 1073.

Illuminate your plant adequately if you want to keep down the accident rate. Investigation reveals that poor lighting and a poor safety record go hand in hand.—Page 1079.

In 20 years Ford has scrapped less than 2 per cent of his machine tools. He now has 53,000 in service, having scrapped less than 1000.—Page 1081.

Hardness of quenched carbon steel is not because of internal strains set up by expansion taking place when gamma iron transforms to alpha iron, Dr. Jeffries declares. Cites experiment as evidence of the untenability of theory.—Page 1102.

Drills lathe beds without removing them from conveying cars. Lathe manufacturer cuts production cost by mounting a lathe bed on two flat cars and drilling while on the cars.—Page 1071.

Ford believes in grouping machines closely. Though seemingly little room is left for aisles and for the movement of workmen, it is apparent that close grouping makes for efficiency and speed of production. —Page 1082.

Make the public steel-minded. The steel industry has suffered from lack of publicity. Markets have been lost to other products which have been aggressively promoted. Discovery and development of new markets in most cases has been left almost entirely to consumers. — Page 1106.

You don't have to produce in great quantities to profit by adoption of quantity production methods, machine tool builder proves. Though lathe manufacturer's annual output is only 1000 units, he has secured important economies by availing himself of the shortcuts the giant plants use.—Page 1067.

Simple record system enables production department to control operations throughout plant, providing detailed information regarding costs, volume of work in process, and quantity of parts on hand. Assembly cost card is the "heart" of system in use in machine shop. — Page 1069.

More Publicity for Steel

THIRTEEN years ago, at the two 1915 meetings of the American Iron and Steel Institute, men both within and without the industry spoke of the value to be gained from a well executed campaign informing the American public about steel. But in the commotion and distraction of sending munitions and machinery (and later men) to warring Europe, the project never got under way, despite the ease with which it then might have been financed.

At the spring meeting in that year Edward M. Hagar, formerly head of the Steel Corporation's cement subsidiary and at that time president of the Hagar Cement Co., told of the handsome return his industry had received from its continuing publicity. Among other things he said that the steel men could spend $12,000,000 annually on promotional work before they would exceed the pro-rata expenditure of the cement men. Then he added significantly: "We manufacturers of cement have found by experience that we get back with interest all the money we spend in the educational campaign."

At the fall meeting of the institute in the same year George H. Jones, vice-president Inland Steel Co., returned to the subject. He made disparaging comparisons between his own industry on the one hand and the lumbermen, pineapple growers, and the manufacturers of composition roofing, as well as of tooth paste and chewing gum. He indicated several lines of approach whereby the great American consuming public could be encouraged to make greater use of steel, particularly sheets, shapes and wire products. Finally, at the banquet Ralph H. Sweetser, then president of Thomas Iron Co., gave the discussion a very practical turn by telling how in a well directed advertising campaign his company had been able to get a premium for so prosaic a thing as a certain brand of pig iron made in the Lehigh Valley.

In 1915, when Mr. Hagar made his proposal that the American Iron and Steel Institute and the cement manufacturers cooperate in a campaign of publicity to promote their common interests, the steel industry was just emerging from one of the periodic famines. It was indulging in much talk about better selling methods and better promotion work. But the intervening years have rolled along and the situation is still in many respects what it was then. Many salesmen are still executing contracts rather than marketing steel. Most producers are letting their customers find out the new uses for steel and the comparative value of iron or substitutes for specific purposes.

For examples: Automobile body makers have discovered the adaptability of sheet steel, not only for body covering, but for the stiffening structure underneath. Furniture builders have developed the commercial and artistic possibilities of steel desks, beds, chairs and tables. The petroleum and chemical industries found that a costly but durable steel barrel is cheaper than the perishable wooden ones. And only a fortnight ago THE IRON AGE told of a new company which plans to apply mass production methods to the manufacture of sanitary fixtures from sheet steel, its potential market representing the use of 300,000 tons a year of enameled and stainless steel sheets.

Only such developments as these coming from without have enabled the sheet steel makers to absorb the punishment administered by promoters of copper and substitute products, who have had a field day at the expense of galvanized metal.

Certain sections of the steel industry have attempted recently to place their products in a favorable light in the public prints. But the statement holds true that the industry generally—and its various units large and small—is the loser because for 13 years it has postponed the use of well-considered publicity; such publicity as on the one hand would reach the ordinary citizen and tell him about steel and on the other hand would show the manufacturing consumer of steel why he would do well to use more of it.

Mr. Hagar's and Mr. Jones's preachments of 13 years ago may well be revived and acted upon. Whether undertaken through the American Iron and Steel Institute or in their individual capacities, no more compelling or remunerative work lies before the steel producers of the country than that of making the American public steel minded. To that end our best wish for the industry is that it will not long delay making itself publicity minded.

Rubber Also Came Down

THE downfall of rubber, or rather the collapse of the British plan for restricting production in order to enhance the price of the commodity, excellently illustrates the futility of cartels; and likewise the absence of popular danger from concentrated production. Here was a cartel, practically speaking, that was not merely sanctioned by a government but was inspired and regulated by it. For a while it worked satisfactorily, but it stimulated outside production which eventually broke its back. This simple story is the whole.

A great corporation controlling 50 per cent or more of an output can never be greedy or exacting, for if it were it would invite new competition that would defeat its purpose. Nor can a 100 per cent cartel go any further; for it would contain its own seeds of dissolution, which would spring up in irresistible temptation to its own members. This has been written in the industrial history of the world ever since the Secretan syndicate in copper of 40 years ago, and no doubt we might go further back.

The only octopus that can have its own way is one that has a monopoly of an indispensable natural resource or a generic patent or something of those sorts; and even such will not have their own arbitrary way, even if they could, inasmuch as their intelligence teaches them that broad business at low price is better than strangulation by exorbitance.

Steel and Other Activity

THAT divergent views are entertained on the state of general trade at the present time compared with that of a year ago is not strange when one sees what contrasting showings the quantitative statistics make. With important or supposedly important indexes we have these divergences: that in three weeks debits to individual accounts at banks have run 12 per cent higher than a year previous, while with a similar three-week comparison, and counting out coal which has had a decline for reasons of its own, freight car loadings are off 1.5 per cent; also that while portland cement shipments in March were 9 per cent under those of the preceding March, steel production is now running above that of one year ago. If this month's rate proves to be the same as that of last month there is a gain of 5 per cent over last April.

There have been no price changes such as would help to explain money transfers materially exceeding those of a year ago, when apparently the physical volume of trade is running substantially the same. As to steel, it may be noted that prices are enough lower than those of a year ago to make it doubtful whether the money transfer for steel has been running altogether as large as that of a year ago despite the excess in tonnage.

In all the general appraisals of the state of trade, allowance needs to be made for the human element. Repeatedly in the past few years it has been observable that actual results in any given period, when finally measured by volume or by profits, have often made a better showing than would be expected from the things men were saying during the period. It seems to have become quite a habit to be conservative or ultra conservative in appraising trade conditions, in contrast with the habit before the war, when it was usual to disseminate sunshine talk and speak of "confidence" as the main support of trade.

Also, we shall have in the next few months a great deal of talk about trade based on political considerations, and in consequence the business man wishing to mind his own affairs will have to be more circumspect than ever.

Low Accident Rate in Larger Plants

INCREASING accident rates definitely follow increasing hours of work, according to figures gathered by the United States Bureau of Mines. Analyzing the accident rates in coke oven plants, it is found that, where beehive ovens have daily schedules of eight hours per worker, the injuries for each million man-hours in 1926 were 42. This rate was increased to 68 for those plants having 9-hour shifts.

Similar figures for by-product ovens on 8-hour shifts showed 23 accidents in 1926 for each million man-hours. For 12-hour shifts the accident rate went up to 31. In both cases corresponding figures for 1925 showed proportionately greater accidents where the longer day was worked.

Decreasing accident rates seem to go also with the larger plants. Thus, in 1926 there were 260 accidents for each thousand 300-day workers in plants having less than 50 employees. This figure was more than cut in half in plants with 50 up to 200 employees, where the rate was 115. Plants having 200 or more employees cut this latter rate in half again, showing an average of only 49 accidents for each thousand 300-day employees.

Apparently the large plants, with greater facilities for coping with accident conditions, have benefited markedly from the use of safety engineers and the education of their workmen by the activities of these specialists.

Improved Fuel Utilization

PRODUCTION of coal has increased little in recent years while results obtained from fuel have increased greatly, the increase being due partly to large increased production of petroleum and natural gas and partly to improved methods of utilizing fuels. Notions vary widely as to the relative importance of these two influences, but computations can be made giving some definite intimations. Thus, comparing 1916, a year of great activity, with 1927, a year of reasonably full activity, it is found that there was an increase of 25 per cent in the heat units involved in the three fuels as produced. There was an increase of less than 2 per cent in coal production in the same eleven years, while petroleum production tripled and natural gas production doubled approximately. Gas production has not been reported for 1927, but a safe estimate may be made.

Production in the two years has been as follows, bituminous and anthracite coal being in net tons, petroleum in barrels of 42 gallons and natural gas in thousands of cubic feet:

	1916	1927
Bituminous coal	502,519,682	519,762,000
Anthracite	87,578,493	80,650,000
Petroleum	300,767,158	903,800,000
Natural gas	753,170,253	1,400,000,000

Factors developed some time ago by the Bureau of Mines as to average heat involved are, in British thermal units, 13,100 per pound of bituminous coal, 13,600 per pound of anthracite, 6,000,000 per barrel of petroleum and 1075 per cubic foot of natural gas. Accordingly, the total heat units involved in 1916 production of fuels was approximately 18,140 trillion, this rising 25 per cent to 22,750 trillion for 1927. Bituminous coal gained 480, anthracite lost 180, petroleum gained 3620 and natural gas gained 690. Thus the great bulk of the increase in heat units in 11 years was furnished by petroleum. The service rendered by all fuels has greatly increased, as is now well understood, by reasons of various improvements in utilization.

The division of heat units in 1927 was approximately as follows:

	Per Cent
Bituminous coal	59.9
Anthracite	9.7
Petroleum	23.8
Natural gas	6.6

Probably in the long run petroleum may be regarded as temporarily high, but natural gas promises to increase, in view of the large gains since 1922 and the several large pipe line projects now under consideration, apparently with no doubt that the gas itself will be available.

World Steel Output Trends Upward

A SCRUTINY of steel production of ten countries in January shows that nine exceeded the average monthly rate of 1927. In only one, Great Britain, was there a decrease. The percentage changes in order, beginning with the country having the largest increase, were as follows:

Russia	+14.3
Canada	+11.4
United States	+10.3
France	+ 8.9
Germany	+ 8.0
Saar	+ 6.8
Luxemburg	+ 3.6
Belgium	+ 2.0
Poland	+ 0.7
Great Britain	—17.4

In the ten countries the net increase was 6.5 per cent, from 7,506,000 tons per month in 1927 to 7,994,000 tons in January. Outside the United States and Great Britain the increase was 7.8 per cent.

The United States has shown such a uniform seasonal swing in recent years that none of the early months of the year can be regarded as strictly typical of the year, March in particular being likely to be the high month. That is not the case with other countries. Last year March was the high month in Great Britain, the Saar and Poland alone. April was the high month in Canada, August in Germany and Belgium, and October in France and Luxemburg. Russia showed a steady increase during the year, with December the high month; while Italy, not included in the foregoing comparison, had January as the high month, with a steady decrease thereafter.

LAKE ORE PRICES NAMED

Schedule for 1928 Same as for Last Year—Established by Large Sale to Ford

CLEVELAND, April 17.—Lake Superior iron ore prices that prevailed last year were established for 1928 by round lot sales made by leading ore firms April 16 to the Ford Motor Co. The Ford inquiry was for 445,000 tons and it is understood that approximately that amount was purchased. The bulk, if not all, of the Ford business went to two producers. On the same day a steel interest made an open market purchase of 100,000 tons, and today several additional open market sales were made. Last year's prices had been quoted on these inquiries several days ago, but the placing of the business was held up awaiting other sales to establish prices.

The Lake shipping season will start about May 1, and it is expected that the 1928 ore movement will be about the same as last year. However, several steel companies have under consideration schedules calling for more ore than they took in 1927.

It had been the belief of the ore trade for some time that the 1927 prices would prevail this year. These prices were established in 1925 and there has been no change since that time, so that this will be the fourth year without a change in the price schedule. The reaffirmed prices for base grades of ore having 51.50 per cent iron, delivered lower Lake ports are per gross ton: Mesabi non-Bessemer, $4.25; Old Range non-Bessemer, $4.40; Mesabi Bessemer, $4.40; Old Range Bessemer, $4.55, and high phosphorus, $4.15.

For several years ore producers have complained that ore prices were too low to yield a fair return to the mining companies and during at least one year many of the mines made no profit. This year there was virtually no talk of getting higher prices. However, the producers were able to reestablish the old prices in spite of a sharp decline in pig iron prices. When ore prices were named last year basic pig iron was quoted at $19, Valley furnace, or $2 a ton higher than at present, and No. 2 foundry iron was $18.50, or $1.25 a ton above the present price. When the present ore prices were first named in 1925 both basic and foundry pig iron were quoted at $20.50, Valley furnace.

Passing upon a complaint of the Sinclair Wyoming Oil Co., the Interstate Commerce Commission in a recent decision ordered the carload rate on steel tank material from the Chicago district to Casper, Carey, Welch and Clayton, Wyo., reduced to 90c. from $1 per 100-lb., with an 80,000-lb. minimum. The rate of $1.24 from Pittsburgh was held to be reasonable. Reparation was awarded on the basis between the rates and higher rates which were assessed.

STEEL CORPORATION CHANGES

Lamont Elected to Directorate and Two New Vice-Presidents Appointed

Thomas W. Lamont, a partner in J. P. Morgan & Co., was elected a director of the United States Steel Corporation, to fill the vacancy on the board caused by the death of Elbert H. Gary, at the annual meeting of stockholders held at Hoboken, N. J., on April 16. George F. Baker, Eugene J. Buffington, James A. Farrell and J. Pierpont Morgan were reelected directors. Myron C. Taylor, recently elected chairman of the finance committee, presided at the meeting in the absence of J. P. Morgan, now chairman of the board, and President James A. Farrell and General Counsel Nathan L. Miller sat with him.

Changes in the corporation's by-laws were approved by the stockholders providing that the chairman of the board and the chairman of the finance committee shall not be executive officers but that the executive officers shall be under their control and that the president shall be the chief executive officer of the corporation. Another change in by-laws was voted increasing the membership of the finance committee from eight to nine. It was also decided that future meetings of stockholders shall be held at the executive offices, 71 Broadway, New York, rather than at the corporate offices at Hoboken.

New Vice-Presidents Will Have Charge of Operations and Marketing

The Board of Directors of the United States Steel Corporation April 17 elected Thomas W. Lamont as an alternate member of the finance committee.

The board also appointed, effective June 1, two additional vice-presidents: I. Lamont Hughes, who now is a vice-president of the Carnegie Steel Co., and E. P. Thomas, who now is president of the United States Steel Products Co. Mr. Hughes and Mr. Thomas, under the direction of President Farrell, will have supervision over the operations of the subsidiary companies in the following capacities: Mr. Hughes in respect to manufacturing operations of subsidiaries engaged in the production of iron and steel, and Mr. Thomas in respect to the marketing of iron and steel products of the subsidiaries.

The board also ratified the appointment of two additional assistants to the president, W. A. Forbes and Harold L. Hughes.

RATES ON MILEAGE BASIS

Examiner for Interstate Commerce Commission Recommends Change in L. C. L. Charges in Eastern Territory

WASHINGTON, April 17.—Shipments of iron and steel products in less-than-carload lots will be greatly affected by changes in rates proposed if the report to the Interstate Commerce Commission by Examiner Howard Hosmer if the so-called Eastern class rate investigation is sustained. The Hosmer report recommends a distance or mileage scale of rates in substantially the same manner as that recently put into effect in the South. Iron and steel carload rates were not involved in the Eastern class rate investigation, but are being considered in a separate investigation involving all of Official Classification territory.

Iron and steel products in less than carloads are generally rated fourth class, although from Pittsburgh and Johnstown, Pa., to certain points in Pennsylvania, New York and West Virginia there are less-than-carload commodity rates. Youngstown manufacturers, who have no such commodity rates, have objected to this difference in treatment.

The first class rates proposed by Examiner Hosmer are about 73 per cent of those prescribed for the South. Between points in northwestern Illinois, Zone C in Michigan, Zone B in New England, certain branch lines of the New York Central in New York and certain branch lines in Virginia, West Virginia and Kentucky and other points in Official Classification territory, rates approximately 10 per cent higher than the basic level are proposed. To and from certain lines of the Chesapeake & Ohio and Norfolk & Western a still higher basis is proposed. Within Zone A in New England the proposed basis is 5 per cent higher, and within Zone B 15 per cent higher, than the basic level. No specific basis is proposed for short lines. Reasonable groupings, according to the report, would be authorized. The report recommends that standard rail-Lake rates to and from Chicago be made 85 per cent of the all-rail rates and rail-Lakes-rail rates by way of Chicago 90 per cent of the all-rail rates, but recommends no other findings as to water-rail rates.

It is suggested that the number of classes be increased from eight to 23, evidently, it is said, with the idea that many articles now moving on commodity rates will ultimately move on class rates. According to a statement issued by Wilbur LaRoe, Jr., counsel for the Associated Industries of New York State and the Port of New York Authority, iron and steel producers along the Niagara frontier will be given the benefit of their relatively short distances to New England, "which will help them materially in their competition with Pittsburgh."

Bookings of Fabricated Structural Steel Continue High

WASHINGTON, April 17.—Orders for fabricated structural steel in March totaled 202,251 tons, or 69 per cent of the monthly capacity of the 193 reporting firms, with combined capacity of 292,160 tons, according to reports received by the Department of Commerce. This compares with February bookings of 212,068 tons, or 71 per cent of capacity of the 210 reporting firms, with aggregate capacity of 299,420 tons. Computed total bookings in March and February were 258,750 tons and 266,250 tons respectively. Shipments in March were computed at 236,250 tons, or 63 per cent of capacity, and were identical with those of February.

For the first quarter ended March 31 computed bookings were 735,000 tons, and represented 65 per cent of capacity, against 671,250 tons during the corresponding period of last year, when they represented 60 per cent of capacity. Shipments during the first quarter of the current year were computed at 682,500 tons, or 61 per cent of capacity, compared with 618,750 tons, or 55 per cent capacity, for the first quarter of 1927.

Greatly Increased Production of Steel Barrels in March

March production of steel barrels as reported by the Department of Commerce at 636,855, compared with 518,944 in February and 475,906 in January. The number manufactured in March is the greatest in more than two years. Shipments were even heavier, at 644,521—again the largest in more than two years. Stocks at the end of the month were 51,269.

Unfilled orders March 31 called for a total of 1,343,583 barrels, of which 304,043 were scheduled for delivery within 30 days. The higher rate of manufacture and shipments cut into the unfilled order volume, which declined about 75,000 during the month. The total is now lower than at the end of either February or January, but otherwise is the highest since July 31, 1927.

Iron and Steel Markets

Further Gain in Output at Chicago

Steel Production in Western District Now Over 95 Per Cent of Capacity—Operations Holding in Other Centers but with Backlogs Declining—Increased Weakness in Sheets

A SUSTAINED rate of steel production, following a record quarter, is a market feature, but more impressive still is a further increase in operations at Chicago. With specifications for finished steel running ahead of shipments, deliveries from Chicago mills are extending and ingot output has passed 95 per cent of capacity, with the blowing in of another steel works blast furnace an early possibility.

The average rate of plant operations in the remainder of the country is not that high, but it is holding its own. Reduced output in some finished products is largely offset by heavier production of others. However, in contrast with the situation at Chicago, shipments are heavier than bookings, and mill backlogs are being reduced. The decline in new business, of course, is not surprising at this juncture, since consumers and jobbers freely covered their requirements prior to the last price advances.

Whether the present pause in demand is merely temporary or presages a downturn in mill operations will depend on the flow of steel into consuming channels. Automobile output, although large, is no longer gaining. Makers of motor car parts have reduced their purchases of cold-finished bars, producers of which are now taking less hot-rolled steel. On the other hand, the Ford Motor Co. is steadily increasing its operations and is placing proportionately larger steel orders. Some mills serving the motor car industry are fully booked in automobile body sheets and hot-rolled strip steel until late in May.

Agricultural implement plants, which have been taking considerable steel, especially from Chicago mills, are planning a reduction in output as spring demand for their products tapers.

Railroad purchases of rails have been largely completed, but good mill operations are assured for the next six or eight weeks and a secondary buying movement of fair proportions is expected in May or June. Railroad orders for rolling stock are disappointingly small.

Construction activity is still unabated. Awards of structural steel for the week exceeded 35,000 tons, and lettings of concrete bars were particularly high, totaling nearly 17,000 tons. Better specifications for standard-weight pipe, doubtless stimulated by the recent price advance, have resulted in heavier production, notably in the Youngstown district.

Tin plate specifications for June shipment are large, reflecting a heavier stocking of cans by packers, and tin mills are maintaining operations at 90 per cent of capacity.

Mill prices, as a whole, still await a real test. Sheets, however, have shown further weakness, although price concessions are reported mainly in the Central West. On blue annealed sheets 2c., Pittsburgh, a cut of $2 a ton, has become a commoner quotation, while black sheets have been sold at 2.75c., Pittsburgh, or $3 a ton below the last advance. Metal furniture sheets, weaker in sympathy with black sheets, have been sold at a reduction of $2 a ton.

Sheet bookings, possibly because of the flexibility of prices, are holding up surprisingly well, although March sales by independent mills, at 399,441 net tons, were the largest, excepting last December, for any month since September, 1926.

Makers of wire nails are finding it difficult to book second quarter business at $2.65 per keg, Pittsburgh or Cleveland, and some of them continue to accept specifications on first quarter contracts carrying a price 10c. per keg lower.

The 35,000 tons of structural steel awarded during the week included 6000 tons for a bridge approach at St. Louis, 5000 tons for subways in New York and 4400 tons for a New York hotel. About 40,000 tons was added to work under negotiation, the largest project a bridge in South Carolina calling for 12,000 tons.

Orders for fabricated steel in March are computed at 258,750 tons, compared with 266,250 tons in February. Computed bookings for the first quarter were 735,000 tons, representing 65 per cent of capacity, as against 671,250 tons, or 60 per cent of capacity, in the corresponding period last year.

The Southern Pacific Railroad has doubled its recent inquiry for 500 flat cars and 50 gondolas. The Chicago, Rock Island & Pacific is in the market for 500 box car underframes, and the St. Louis-San Francisco is inquiring for 250 car bodies. Several railroads are soon to buy a total of about 100 passenger cars.

A cargo of Lake Erie pig iron will arrive at Chicago about May 1, and some of it has been sold at prices 50c. or 75c. below the prevailing quotations by Chicago furnaces. In other centers pig iron prices are fairly steady. A steel foundry company has a quotation on basic pig iron equivalent to $16 at Valley furnace, but makers of iron in the Valley are said not to have quoted on the business because of disadvantageous freight rates. The St. Louis market is fairly active, with sales of 11,000 tons, of which 5000 tons was to a radiator company.

Lake Superior iron ore prices of 1927 were reestablished for this year by sales of 445,000 tons to the Ford Motor Co.

Both of THE IRON AGE composite prices remain at last week's levels, that for pig iron at $17.67 a gross ton and that for finished steel at 2.362c. a lb. Finished steel is close to its position of one year ago, but pig iron is down more than $1.50 a ton.

*The average switching charge for delivery to foundries in the Chicago district is 61c. per ton.

On export business there are frequent variations from the above prices. Also, in domestic business, there is at times a range of prices on various products, as shown in our market reports on other pages.

Pittsburgh

Steel Production Is Holding to March Rate But New Business Is Lighter

PITTSBURGH, April 17.—Steel ingot production still is holding up to the March rate in this and nearby districts, but a distinct decrease in the amount of new business creates the fear that the peak has been reached, unless the lull is merely the result of the fact that consumers are liquidating extremely heavy takings of the latter part of March and the fore part of this month. Sheet sales appear to be holding up well, which is partly explained by the fact that prices are easy on most finishes, and June specifications for tin plate are heavy, but in other finished products the report is uniformly that new business is lighter than it has been.

The question now is as to the maintenance of consumption. The best demand for steel recently has been from the motor car builders, but the shipment of steel for use in automobiles being from four to six weeks in advance of actual fabrication, the production for that use is probably at its peak now. There is such keen competition among low-priced cars, the quality of which has been improved to such an extent as to bring them into competition with the medium-priced cars, that makers of the latter have been forced to make plans for the new season earlier than usual. The between-series period usually means that car builders will take only such raw material as they have on order to avoid building too many of the old cars to compete with the new ones.

There is no tangible evidence yet of improvement in the oil industry, which means so much to pipe manufacturers. Railroad rolling stock business is far from active in this area. Building construction still promises well, but the agricultural implement industry rarely operates as fully in the summer, its selling season, as in other times of the year.

Steel ingot production is still running at 80 to 85 per cent of capacity. The Carnegie Steel Co. has put on a blast furnace at its Clairton, Pa., works.

In the primary materials, interest still centers in heavy melting steel scrap, which continues to move up under dealer buying. There is no life to the pig iron market and the coal market is very dull.

Pig Iron.—The Pittsburgh-Valley pig iron market is purely retail in character. Large melters appear covered against their requirements for the next 30 to 60 days, and buying is entirely from the consumers who seldom buy ahead of their nearby requirements. Carload lot sales are the rule and these are not especially numerous, since the jobbing foundries in this area are operating at a low rate, while the steel foundries feel the lack of railroad buying and the sanitary ware and radiator companies are not as busy as they sometimes have been at this time of the year. The American Steel Foundries is reported to be in the market for 5000 tons of basic iron for its Alliance, Ohio, works and is said to have a quotation that figures back to about $16, Valley furnace, but evidence is lacking that any Valley furnaces have had the inquiry or have quoted. It is believed that an Ohio furnace having a freight rate of 50c. a ton to Alliance has merely given away its freight rate advantage to have produced the quotation named. Valley furnaces still call the market $17, furnace. At that price the demand is limited, however, to the immediate Valley district, since basic iron cannot be sold in the Pittsburgh district at a price that figures back to more than $16 at Valley furnaces because of offerings by Pittsburgh district steel companies. Recent prices on other grades of Valley iron also are holding.

Prices per gross ton, f.o.b. Valley furnace:

Basic	$17.00
Bessemer	17.50
Gray forge	16.75
No. 2 foundry	17.25
No. 3 foundry	16.75
Malleable	17.25
Low phosphorus, copper free	27.00

Freight rate to the Pittsburgh or Cleveland district, $1.76.

Ferroalloys.—Specifications against contracts for ferromanganese, ferrosilicon and spiegeleisen continue in good volume, but there is little new business.

Semi-Finished Steel.—Billets, slabs and sheet bars are moving well, in keeping with a fairly high rate of engagement of non-integrated tin plate, sheet and strip mill capacity. There is little or no open market activity in these forms, since leading consuming companies, as for some time past, are drawing against contracts or agreements that are flexible as to duration. Only occasional sales of wire rods are being made at the present mill schedule, because there were few users who did not take full advantage of the lower prices available late last year and in January. While second quarter contracts have been signed at the full price, mills generally are waiting for specifications.

Bars, Plates and Shapes.—Fresh demand for bars suffers from the fact that consumers and jobbers took out or ordered tonnages freely last month to escape the advance in prices, and shipments of most of the mills now are exceeding orders. There are fair-sized new orders for plates for river barges, and in structural lettings local shops lately have been doing rather well, the week's awards including 3500 tons for the extension of the strip mill building of the American Rolling Mill Co., Butler, Pa. There is no evidence that mills are doing less than 1.85c., base Pittsburgh, on these products, while the small lot price is 1.90c.

Rails and Track Supplies.—Railroads are specifying steadily for rails and track fastenings. New business does not amount to much. There is only a moderate call for light-section rails.

Wire Products.—Uncertainty still exists as to nail prices, because jobbers, as a result of heavy takings in the first quarter, have not found it necessary to buy many and thus provide a test of the price to which makers went Jan. 26, last. Difficulty has been encountered by some mills in getting signatures to second quarter contracts at $2.65, base, per keg, because others have continued to accept specifications on first quarter contracts priced 10c. per keg lower. Specifications for wire products in general have been lighter in the past week than in the week before, reflecting the fact that buyers have exhausted first quarter contracts and are well enough stocked to wait a while before ordering against higher priced commitments.

Tubular Goods.—Standard-weight pipe is making a good showing in point of shipments and mill operations, but there is still a lack of activity in oil country goods. Projected line pipe orders of size are slow in reaching the mills. Mechanical tubing, for which the automotive industry is an important outlet, stands out in an otherwise quiet tubing market.

Cold-Finished Steel Bars and Shafting.—Demands for screw stock bars are steady, but generally are for small lots. Detroit advices suggest that motor car production has reached the spring peak, and with several makers planning new models for earlier presentation than usual, parts makers are ordering in close accord with requirements. There are no intimations of less than 2.20c., base Pittsburgh.

Hot-Rolled Flats.—Makers have no complaint as to the volume of business, but are not satisfied with the prices they are getting; on large tonnage orders competition has been sharp, and the full quotations of 1.90c., 2.10c. and 2.20c., according to width, have been obtained only on small lot business.

Cold-Rolled Strips.—Large lot consumers still are drawing against old orders carrying 2.75c., base Pittsburgh, for lots of three tons or more, and such tonnage as is moving at higher prices is in small lots, which, while numerous, account for a relatively small part of the total.

Sheets.—Mill operations are holding at the recent rate, but seemingly business is sustained by willingness on the part of most makers to meet buyers' ideas on prices. In this immediate area—not a large sheet consuming territory—black sheets are holding well to the full quotation, but elsewhere concessions of $1 to $3 a ton are reported, 2.75c., base, being fairly common in Detroit and in some parts of the South. Metal furniture sheets have been sold on a black sheet base of 2.75c. Galvanized sheets are generally 3.65c., with higher prices more of an asking than a sales basis. Blue annealed sheets are well held. Automobile body sheets are 4c., base, and most makers have written down to that price business taken at higher figures.

Tin Plate.—Business reports still are favorable, and mill operations maintain the high rate attained a few weeks ago of 90 per cent or more of capacity. Specifications for June shipment are very heavy. Regardless of the outcome of the crops, packers are reflecting in their releases a desire to have an ample stock of tin plate for the opening of summer.

Bolts, Nuts and Rivets.—Orders have been light since the opening of the month, but this is looked upon as a natural sequence to the fact that buyers were liberal in their specifications toward the close of last month, notably for rivets, which went to higher prices on April 1.

Coke and Coal.—The market still is in the doldrums. A call for a strike issued by irregular union leaders for April 16 has failed to bring out miners employed in open shop operations. The possibility of business stimulation through demands for coal from the Lakes is at least temporarily suspended by the injunction recently granted by the Federal Court at Richmond

Mill Prices of Finished Iron and Steel Products

Iron and Steel Bars

Soft Steel

	Base Per Lb.
F.o.b. Pittsburgh mill	1.85c. to 1.90c.
F.o.b. Chicago	2.00c.
Del'd Philadelphia	2.17c. to 2.22c.
Del'd New York	2.19c. to 2.24c.
Del'd Cleveland	2.04c. to 2.09c.
F.o.b. Cleveland	1.85c.
F.o.b. Lackawanna	1.95c.
F.o.b. Birmingham	2.05c. to 2.15c.
C.i.f. Pacific ports	2.35c.
F.o.b. San Francisco mills	2.35c. to 2.40c.

Billet Steel Reinforcing

F.o.b. Pittsburgh mills	1.90c. to 2.00c.
F.o.b. Birmingham	2.05c. to 2.15c.

Rail Steel

F.o.b. mills east of Chicago district	1.75c.
F.o.b. Chicago Heights mill	1.85c.

Iron

Common iron, f.o.b. Chicago	2.00c.
Refined iron, f.o.b. P'gh mills	2.75c.
Common iron, del'd Philadelphia	2.12c.
Common iron, del'd New York	2.14c.

Tank Plates

	Base Per Lb.
F.o.b. Pittsburgh mills	1.85c. to 1.90c.
F.o.b. Chicago	2.00c.
F.o.b. Birmingham	2.05c. to 2.15c.
Del'd Cleveland	2.04c. to 2.09c.
Del'd Philadelphia	2.10c. to 2.15c.
F.o.b. Coatesville	2.00c. to 2.05c.
F.o.b. Sparrows Point	2.00c.
F.o.b. Lackawanna	1.95c.
Del'd New York	2.17½c. to 2.22½c.
C.i.f. Pacific ports	2.30c.

Structural Shapes

	Base Per Lb.
F.o.b. Pittsburgh mills	1.85c. to 1.90c.
F.o.b. Chicago	2.00c.
F.o.b. Birmingham	2.05c. to 2.15c.
F.o.b. Lackawanna	1.95c.
F.o.b. Bethlehem	2.00c.
Del'd Cleveland	2.04c. to 2.09c.
Del'd Philadelphia	2.12c. to 2.18c.
Del'd New York	2.14½c. to 2.19½c.
C.i.f. Pacific ports	2.35c.

Hot-Rolled Flats (Hoops, Bands and Strips)

	Base Per Lb.
Narrower than 3 in., P'gh	2.20c. to 2.40c.
Wider than 3 in. to 6 in., P'gh	2.10c. to 2.20c.
6 in. and wider, P'gh	*1.90c. to 2.00c.
Narrower than 3 in., Chicago	2.40c. to 2.50c.
From 3 to 6 in., Chicago	2.20c. to 2.30c.
6 in. and wider, Chicago	2.00c. to 2.10c.

---

*Mills follow plate or sheet prices according to gage on wider than 12 in.

Cold-Finished Steel

	Base Per Lb.
Bars, f.o.b. Pittsburgh mills	2.20c.
Bars, f.o.b. Chicago	2.20c.
Bars, Cleveland	2.25c.
Shafting, ground, f.o.b. mill	*2.45c. to 2.90c.
Strips, under 12 in., 1 up to 3 tons, P'gh	3.00c. to 3.15c.
Strips, under 12 in., 1 up to 3 tons, Cleveland	3.00c. to 3.15c.
Strips, under 12 in., 1 up to 3 tons, del'd Chicago	3.30c. to 3.45c.
Strips, under 12 in., 1 up to 3 tons, Worcester	3.15c. to 3.30c.

*According to size.

Wire Products

(To jobbers in car lots, f.o.b. Pittsburgh and Cleveland)

	Base Per Keg
Wire nails	$2.65
Galvanized nails	4.65
Galvanized staples	3.35
Polished staples	3.10
Cement coated nails	2.65

	Base Per 100 *Lb.*
Bright plain wire, No. 9 gage	$2.50
Annealed fence wire	2.65
Spring wire	3.50
Galv'd wire, No. 9	3.10
Barbed wire, galv'd	3.35
Barbed wire, painted	3.10

Chicago district mill and delivered Chicago prices are $1 per ton above the foregoing. Birmingham mill prices $3 a ton higher; Worcester, Mass., (wire) mill $3 a ton higher on production of that plant; Duluth, Minn., mill $2 a ton higher; Anderson, Ind., $1 higher.

Woven Wire Fence

	Base to Retailers Per Net Ton
F.o.b. Pittsburgh	$65.00
F.o.b. Cleveland	65.00
F.o.b. Anderson, Ind.	66.00
F.o.b. Chicago district mills	67.00
F.o.b. Duluth	68.00
F.o.b. Birmingham	68.00

Sheets

Blue Annealed

	Base Per Lb.
Nos. 9 and 10, f.o.b. P'gh—wider than 40 in.	2.20c.
Nos. 9 and 10, f.o.b. P'gh—40 in. and narrower	2.10c.
Nos. 9 and 10, f.o.b. Chicago dist. mill,	2.20c. to 2.30c.
Nos. 9 and 10, del'd Cleveland	2.19c.
Nos. 9 and 10, del'd Philadelphia	2.32c. to 2.52c.
Nos. 9 and 10, f.o.b. Birmingham	2.25c. to 2.30c.

Box Annealed, One Pass Cold Rolled

No. 24, f.o.b. Pittsburgh	2.75c. to 2.90c.
No. 24, f.o.b. Chicago dist. mill	3.00c.
No. 24, del'd Cleveland	2.94c. to 2.99c.
No. 24, del'd Philadelphia	3.12c. to 3.22c.
No. 24, f.o.b. Birmingham	3.05c.

Metal Furniture Sheets

No. 24, f.o.b. Pittsburgh, A grade	3.90c. to 4.00c.
No. 24, f.o.b. Pittsburgh, B grade	3.70c. to 3.80c.

Galvanized

No. 24, f.o.b. Pittsburgh	3.65c. to 3.75c.
No. 24, f.o.b. Chicago dist. mill	3.85c.
No. 24, del'd Cleveland	3.74c. to 3.84c.
No. 24, del'd Philadelphia	3.97c. to 4.07c.
No. 24, f.o.b. Birmingham	3.90c.

Tin Mill Black Plate

No. 28, f.o.b. Pittsburgh	2.90c. to 3.00c.
No. 28, f.o.b. Chicago dist. mill	3.10c.

Automobile Body Sheets

No. 20, f.o.b. Pittsburgh	4.00c.

Long Ternes

No. 24, 8-lb. coating, f.o.b. mill primes	4.10c.

Tin Plate

	Per Base Box
Standard cokes, f.o.b. P'gh district mills	$5.25
Standard cokes, f.o.b. Gary	5.35

Terne Plate

(*F.o.b. Morgantown or Pittsburgh*)

(Per package, 20 x 28 in.)

8-lb. coating I.C.	$11.20	25-lb. coating I.C.	$16.70
15-lb. coating I.C.	14.00	30-lb. coating I.C.	17.75
20-lb. coating I.C.	15.30	40-lb. coating I.C.	19.85

Alloy Steel Bars

(F.o.b. maker's mill.)

S.A.E. Series Numbers		*Per* 100 *Lb.*
2000	(½% Nickel)	$2.90
2100	(1½% Nickel)	3.20
2300	(3½% Nickel)	4.15
2500	(5% Nickel)	4.90
3100	Nickel Chromium	3.20
3200	Nickel Chromium	3.65
3300	Nickel Chromium	6.45
3400	Nickel Chromium	5.85
4100	Chromium Molybdenum (0.15 to 0.25 Molybdenum)	3.15
4100	Chromium Molybdenum (0.25 to 0.40 Molybdenum)	3.35
4600	Nickel Molybdenum (0.20 to 0.30 Molybdenum, 1.25 to 1.75 Nickel)	3.70
5100	Chromium Steel (0.60 to 0.90 Chrome)	3.00
5100	Chromium Steel (0.80 to 1.10 Chrome)	3.10
5100	Chromium Spring Steel	2.85
6100	Chromium Vanadium Bars	3.85
6100	Chromium Vanadium Spring Steel	3.60
9250	Silicon Manganese Spring Steel	2.90
Chrome Nickel Vanadium		4.15
Carbon Vanadium		3.60

Above prices are for hot-rolled steel bars, forging quality. The ordinary differential for cold-drawn bars is 1c. per lb. higher. For billets 4 x 4 to 10 x 10 in., the price for a gross ton is the net price for bars of the same analysis. For billets under 4 x 4 in. down to and including 2½ in. squares, the price is $5 a gross ton above the 4 x 4 billet price.

Slabs with sectional area of 16 in. or over carry the billet price; slabs with sectional area of 12 in. to 16 in. carry a $5 extra above the billet price and slabs with a sectional area under 12 in. carry the bar price.

Band sizes are 40c. per 100 lb. higher.

Rails

	Per Gross Ton
Standard, f.o.b. mill	$43.00
Light (from billets), f.o.b. mill	36.00
Light (from rail steel), f.o.b. mill	34.00
Light (from billets), f.o.b. Ch'go mill	36.00

Track Equipment

	Base Per 100 *Lb.*
Spikes, 9/16 in. and larger	$2.80
Spikes, ½ in. and smaller	2.80
Spikes, boat and barge	3.00
Tie plates, steel	2.15
Angle bars	2.75
Track bolts, to steam railroads	$3.80 to 4.90
Track bolts, to jobbers, all sizes, per 100 count	70 per cent off list

Welded Pipe

Base Discounts, f.o.b. Pittsburgh District and Lorain, Ohio, Mills

Butt Weld

Steel			*Iron*		
Inches	Black	Galv.	Inches	Black	Galv.
⅛	45	19½	¼ to ⅜	+11	+39
¼ to ⅜	51	25½	½	22	2
½	56	42½	¾	28	11
¾	60	48½	1 to 1½	30	13
1 to 3	62	50½			

Lap Weld

2	55	43½	2	23	1
2½ to 6	59	47½	2½	26	11
7 and 8	56	43½	3 to 6	28	18
9 and 10	54	41½	7 to 12	26	11
11 and 12	53	40½			

Butt Weld, extra strong, plain ends

⅛	41	24½	¼ to ⅜	+19	+54
¼ to ⅜	47	30½	½	21	17
½	53	42½	¾	28	12
¾	58	47⅛	1 to 1½	30	14
1 to 1½	60	49½			
2 to 3	61	50½			

Lap Weld, extra strong, plain ends

2	53	42½	2	23	9
2½ to 4	57	46½	2½ to 4	29	15
4½ to 6	56	45½	4½ to 6	28	14
7 to 8	52	39½	7 to 8	21	15
9 and 10	45	32½	9 to 12	16	2
11 and 12	44	31½			

On carloads the above discounts on steel pipe are increased on black by one point, with supplementary discount of 5%, and on galvanized by 1½ points, with supplementary discount of 5%. On iron pipe, both black and galvanized, the above discounts are increased to jobbers by one point with supplementary discounts of 5 and 2½%.

Note.—Chicago district mills have a base two points less than the above discounts. Chicago delivered base is 2½ points less. Freight is figured from Pittsburgh, Lorain, Ohio, and Chicago district mills, the billing being from the point producing the lowest price to destination.

Boiler Tubes

Base Discounts, f.o.b. Pittsburgh

Lap Welded Steel		*Charcoal Iron*	
2 to 2¼ in.	27	1½ in.	+18
2½ to 2¾ in.	37	1¾ to 1⅞ in.	+ 8
3 in.	40	2 to 2¼ in.	— 2
3¼ to 3¾ in.	42½	2½ to 3 in.	— 7
4 to 13 in.	46	3¼ to 4½ in.	— 9

Beyond the above discounts, 7 fives extra are given on lap welded steel tubes and 2 tens to 2 tens and 1 five on charcoal iron tubes.

Standard Commercial Seamless Boiler Tubes

Cold Drawn

1 in.	60	3 in.	45
1¼ to 1½ in.	52	3¼ to 3½ in.	47
1¾ in.	36	4 in.	50
2 to 2¼ in.	31	4½, 5 and 6 in.	45
2½ to 2¾ in.	39		

Hot Rolled

2 and 2¼ in.	37	3¼ and 3½ in.	53
2½ and 2¾ in.	45	4 in.	56
3 in.	51	4½, 5 and 6 in.	51

Less carloads, 4 points less. Add $8 per net ton for more than four gages heavier than standard. No extra for lengths up to and including 24 ft. Sizes smaller than 1 in. and lighter than standard gage to be held at mechanical tubes list and discount. Intermediate sizes and gages not listed take price of next larger outside diameter and heavier gage.

Seamless Mechanical Tubing

	Per Cent Off List
Carbon, 0.10% to 0.30%, base	55
Carbon, 0.30% to 0.40%, base	50

Plus differentials for lengths over 18 ft. and for commercial exact lengths. Warehouse discounts on small lots are less than the above.

restraining the Interstate Commerce Commission from interfering with the plan of Southern roads to make a reduction of 20c. a ton on coal moving to the Lakes from Southern mines. There is almost no market for spot furnace coke from the blast furnaces, and the demand for other uses is limited. It is a buyers' market in that grade. Producers are also finding it hard to market spot foundry coke at quite as good prices as recently.

Old Material.—The scramble of dealers to cover short sales continues in heavy melting steel, and that grade has had a further advance within the week. Pressure of consumers for shipments against old orders has extended to the Youngstown district, where dealers have paid $16.08 to $16.15, delivered, for railroad steel, while as much as $16.50 has been paid by dealers for delivery at Steubenville, Ohio. The higher price also has been done on a sale to a Pittsburgh district mill that will take nothing but No. 1 railroad steel or its equivalent in industrial scrap. The competition of Youngstown dealers has forced local dealers to go as high as $15.75 for ordinary steel, but such material has been offered to the mills at $15.50. Heavy melting steel is quotable from $15.50 to $16.50, compared with $15.50 to $16 a week ago. Other grades are at the prices of a week ago and are not showing much activity.

Prices per gross ton delivered consumers' yards in Pittsburgh and points taking the Pittsburgh district freight rate:

Basic Open-Hearth Furnace Grades:		
Heavy melting steel	$15.50 to	$16.50
Scrap rails	15.00 to	15.50
Compressed sheet steel	15.00 to	15.50
Bundled sheets, sides and ends	14.00 to	14.50
Cast iron carwheels	14.50 to	15.00
Sheet bar crops, ordinary	15.50 to	16.00
Heavy breakable cast	13.00 to	13.50
No. 2 railroad wrought	15.50 to	16.00
Heavy steel axle turnings	13.00 to	13.50
Machine shop turnings		10.50
Acid Open-Hearth Furnace Grades:		
Railroad knuckles and couplers	16.50 to	17.00
Railroad coil and leaf springs	16.50 to	17.00
Rolled steel wheels	16.50 to	17.00
Low phosphorus billet and bloom ends	18.50 to	19.00
Low phosphorus, mill plate	17.50 to	18.00
Low phosphorus, light grade	16.50 to	17.00
Low phosphorus sheet bar crops	17.50 to	18.00
Heavy steel axle turnings	13.00 to	13.50
Electric Furnace Grades:		
Low phosphorus punchings	16.50 to	17.00
Heavy steel axle turnings	13.00 to	13.50
Blast Furnace Grades:		
Short shoveling steel turnings	11.00 to	11.25
Short mixed borings and turnings	11.00 to	11.25
Cast iron borings	11.00 to	11.25
No. 2 busheling	10.50 to	11.00
Rolling Mill Grades:		
Steel car axles	18.00 to	19.00
No. 1 railroad wrought	11.00 to	11.50
Sheet bar crops	17.00 to	17.50
Cupola Grades:		
No. 1 cast	14.50 to	15.00
Rails 3 ft. and under	15.50 to	16.00
Malleable Grades:		
Railroad	15.50 to	16.00
Industrial	15.00 to	15.50
Agricultural	14.50 to	15.00

Wire, black soft annealed, base per 100 lb.	$3.00 to 3.10
Wire, galvanized soft, base per 100 lb.	3.00 to 3.10
Common wire nails, per keg	3.00
Cement coated nails, per keg	3.05

Building Construction Volume Continues High

Construction contracts to the amount of $592,567,000 were awarded in March in the 37 States east of the Rocky Mountains, according to F. W. Dodge Corporation. This was the largest figure for any month since last June. It was, however, 5 per cent under the record of March, 1927. The total brings the aggregate for the first quarter to $1,485,067,000. This is 6 per cent above the first quarter of last year and is the highest first quarter on record.

Residential buildings accounted for 46 per cent of the total, with $275,192,000. Public works and utilities took $110,339,000; commercial buildings, $73,075,000; educational projects, $33,881,000.

In the Central West, including the area from eastern Indiana and southern Michigan to western Nebraska and Oklahoma, the March total was the highest for that month ever recorded. It amounted to $175,585,000. The Pittsburgh district, also, including western Pennsylvania, West Virginia, Ohio and Kentucky, showed a large gain in March, the total having been $76,499,000. Other districts reported March totals above February, but they were under the figures for March, 1927.

Wholesale Prices Slightly Lower

Commodity prices in March are reported by the United States Bureau of Labor Statistics at 96, compared with an average of 100 as the base in 1926. This shows a drop from 96.4 in February, but an increase over the 94.5 registered in March, 1927. Nearly all of the major groups participated in the decline, the only exceptions being building materials, which remain the same at 91, and metals and metal products, which increased from 98.3 in February to 98.4 in March.

Metals have been relatively stable for a long period, having registered 98.2 a year ago. In their component parts, however, there has been considerable change. Thus, the iron and steel group has declined from 97.4 a year ago to 95.2 in March. Non-ferrous metals have declined from 95.1 to 90.4 in the same period. Agricultural implements dropped from 99.4 to 98.8, and miscellaneous metal products from 99.5 to 97.9. Meantime, automobiles have advanced from 99.8 to 104.3, this advance more than compensating for the decline in the other items.

Trends in Industry

Employment in March showed a gain of nearly 3 per cent over February, according to the monthly labor barometer of the National Metal Trades Association. The improvement has been steady since a low point was reached in December. The March figure was about ½ per cent below that of a year ago.

—

Construction volume in March is charted by the Associated General Contractors of America at a little higher level than in any recent preceding March. Using 100 as the 1913 base, March is given an index of 136, against 135 a year ago and 119 in 1926. The curves in 1926 and 1927 were similar, but with the latter higher in almost every month; 1928 has been ahead of the other two years, except in January.

—

Total imports of industrial machinery into Chile in 1926 were valued at 120,490,244 pesos, of which 87,530,131 pesos represented the value of shipments from the United States, according to a report received by the Industrial Machinery Division, Department of Commerce, from Assistant Commercial Attaché Robert G. Glover, Santiago.

—

On March 1 American shipyards were building, or had under contract to build, for private shipowners, 283 steel vessels of 179,502 gross tons, compared with 261 steel vessels of 184,945 tons on Feb. 1, according to the bureau of navigation, Department of Commerce.

Semi-Finished Steel, Raw Materials, Bolts and Rivets

Mill Prices of Semi-Finished Steel

F.o.b. Pittsburgh or Youngstown

Billets and Blooms

	Per Gross Ton
Rerolling, 4-in. and over	$33.00
Rerolling, under 4-in. to and including 1¾-in.	$33.50 to 34.00
Forging, ordinary	38.00 to 39.00
Forging, guaranteed	43.00 to 44.00

Sheet Bars

	Per Gross Ton
Open-hearth or Bessemer	$34.00

Slabs

	Per Gross Ton
8 in. x 2 in. and larger	$33.00
Smaller than 8 in. x 2 in.	34.00

	Per Cent Off List
Milled cap screws	80, 10 and 10
Milled standard set screws, case hardened,	80 and 10
Milled headless set screws, cut thread	80
Upset hex. head cap screws, U.S.S. thread,	85 and 5
Upset hex. cap screws, S.A.E. thread	85 and 5
Upset set screws	80, 10 and 10
Milled studs	70 and 5

Chicago

Steel Specifications Exceed Shipments—Automobile Demands Heavy

CHICAGO, April 17.—A feature of this market is that the demand for plates, shapes and bars is well balanced and producers are enjoying the most favorable rolling schedules in a year. Specifications for finished steel exceed shipments, thus delaying deliveries and bringing to the fore the probability that another steel mill blast furnace may be lighted at an early date. Ingot output for the district now stands well above 95 per cent.

Railroad inquiries include 96 passenger cars for three roads, 250 car bodies for a Southwestern road and 500 freight car underframes for the Rock Island. Steel tonnage taken by automobile manufacturers was large in March, but several automobile plants did not swing into heavy production until that month was well along, and at the current rate of specifying steel consumption by that industry in April gives promise of exceeding that of March. The agricultural implement trade is finding a steady use for rolling mill products, but with the spring demand for farm machinery rapidly nearing an end it is not improbable that production schedules will be revised downward by the end of this month.

An encouraging note in the business situation here is that employment in metalworking industries is gaining. March figures now available show an increase of 5 per cent in the number of workers in iron and steel plants.

Pig Iron.—With 95 per cent of second quarter iron sold, buyers in this market are turning their attention to their needs in third quarter. Sales are smaller than a week ago, but a number of large inquiries are taking shape. Local producers are holding to $18.50 a ton and a strong effort is being made to maintain full differentials. A disturbing influence, however, is the fact that a cargo of Lake Erie iron will arrive here about May 1. Some of this has been sold at the full Chicago market prices, but the bulk of it carries prices from 50c. to 75c. a ton lower. Prices for silvery iron are weak and shading is not uncommon.

Prices per gross ton at Chicago:

Northern No. 2 foundry, sil. 1.75 to 2.25	$18.50
N'th'n No. 1 fdy., sil. 2.25 to 2.75	19.00
Malleable, not over 2.25 sil.	18.50
High phosphorus	18.50
Lake Superior charcoal, averaging sil. 1.50	27.04
Southern No. 2 fdy. (all rail)	22.01
Southern No. 2 (barge and rail)	21.18
Low phos., sil. 1 to 2 per cent, copper free	$28.50 to 29.00
Silvery, sil. 8 per cent	29.79
Bessemer ferrosilicon, 14 to 15 per cent	46.79

Prices are delivered consumers' yards except on Northern foundry, high phosphorus and malleable, which are f.o.b. local furnace, not including an average switching charge of 61c. per gross ton.

Ferroalloys.—Specifications for ferrosilicon are heavy, as steel mills continue to produce close to capacity. Small lots of ferromanganese are being taken at $100, seaboard. Spiegeleisen is quiet, and prices quoted are $31 to $32, Hazard, Pa., for the 19 to 21 per cent grade.

Prices delivered Chicago: 80 per cent ferromanganese, $107.56; 50 per cent ferrosilicon, $83.50 to $87.50; spiegeleisen, 19 to 21 per cent, $38.76 to $39.76.

Bolts, Nuts and Rivets.—Specifications are steady but the outlook is not encouraging for the reason that farm implement manufacturers are planning an early reduction in output in accordance with a smaller sales volume, as the spring demand for machinery of this kind tapers. Fully 95 per cent of bolt, nut and rivet contracts submitted to buyers have been signed.

Coke.—Shipments of by-product foundry coke are steady and prices are firm.

Plates.—Interest is revived in several gas pipe lines that had previously come to the attention of the trade. It is reported that financial matters have been arranged for a pipe line from the Southwest fields to Kansas City, Mo. The project that was to extend to Omaha, Neb., is still alive. Two lots of 1000 tons each of tankage materials have been purchased. Fresh inquiry from the oil fields is lacking, but it has been the experience that new business for oil companies develops rapidly and does not often stay long on the pending list. Car shops are apparently holding in check some of the work that is now on their books; this is shown by the tardiness with which specifications are being entered at mills for steel that will be needed for several recent car orders. Railroad equipment orders for the week include 50 caboose car underframes for the Northern Pacific. Among fresh inquiries are 500 flat and 50 gondola cars for the Southern Pacific, these being in addition to a similar request for prices issued several weeks ago; also 50 passenger cars for two Eastern railroads with terminals at Chicago and 250 car bodies for the St. Louis-San Francisco. Chicago district plate mills are well engaged and prices in and near Chicago are steady at 2c.

Mill prices on plates per lb.: 2.00c., base Chicago.

Structural Material.—The outlook in the structural field is encouraging. For a few weeks fresh inquiry dropped considerably behind the present rate of shop operations as the result of a scramble to award tonnages ahead of recent advances in steel prices. The effects of this move appear to be wearing off, and once more fabricators are busily engaged in estimating a large number and a wide variety of projects. Notable among fresh inquiry is a highway bridge, requiring 2100 tons, at St. Joseph, Mo., and 1700 tons for a bridge for the Baltimore & Ohio Railroad in Chicago. Outstanding among awards is 3100 tons for wharf sheds at New Orleans and 1400 tons for a steel mill building at Kansas City, Mo. Although shops in this district are well engaged, there is still an urge to cut prices, possibly because of the uncertainty of the volume of business which may be expected in the future and not because of a lack of orders on books or of tonnage that may be reasonably expected to come to fabricators over the next five or six weeks. Prices for structural material are steady at 2c. in practically all parts of this territory, except along the eastern border, where 1.95c., Chicago, is being done occasionally to meet competition from mines east of here.

Mill prices on plain material per lb.: 2.00c., base, Chicago.

Bars.—Specifications for mild steel bars continue to run ahead of shipments, and delivery dates have extended to well beyond four weeks and in some sizes to six weeks. Meanwhile, new buying, which is usually for 6 to 12 weeks' requirements, is fully equal to production. A feature of the market for this commodity is that the demand is widespread and orders on mill books are more diversified as to classification of consumers than at any recent time. Builders of road machinery are unusually busy and forgers are taking large quantities of soft steel bars. Prices on this grade are steady at 2c., Chicago. Alloy bar mills in this district are fully engaged, and in this commodity as in soft steel bars there is an ever widening circle of users. Prices at the new base and differentials are steady. Chicago mills are quoting 2c. on iron bars. No improvement in demand is noted. Backlogs in hard steel bars are slowly expanding. Specifications are in excess of production and deliveries are gradually extending, now being about two weeks on certain sizes. Mill output is being diverted to the general manufacturing trade, as stocks of fence post material and hard steel reinforcing bars are ample to meet immediate demands. Prices are steady at 1.85c., Chicago Heights.

Mill prices per lb.: Soft steel bars, 2.00c. base, Chicago; common bar iron, 2.00c., base, Chicago; rail steel bars, 1.85c., base, Chicago Heights mill.

Wire Products.—Muddy roads are still a market factor in several of the States west of the Mississippi River. This situation, however, is partly offset by a larger volume of business from the Northwest and a steady flow of orders from the South and the Central States east of the Mississippi Valley. Mill orders for nails are more numerous, which is not only a reflection of greater consumer demand, but also an indication that stocks in the hands of distributers are being reduced. New buying is at close range and approximately equal to shipments, which represent 70 per cent of wire mill capacity. The reduction in producers' stocks has been checked, and a portion of output is being used to round out and in some instances to expand stocks at mills. Specifications from the manufacturing trade are steady. Prices for wire and wire products are given on page 1113.

Rails and Track Supplies.—New business in standard-section rails is quiet. This is of little concern to local producers for the reason that mill schedules are well arranged for the next six to eight weeks. Furthermore, the secondary tonnage that already has been added to books has come earlier than usual and producers are expecting a fair buying movement in May and June. Several carloads of light rails have been purchased. Miscellaneous orders for track accessories total over 14,000 tons, and inquiry is for not less than 5000 tons. Operations in all track supply departments are steady and output is running a trifle ahead of the rate a year ago.

Prices f.o.b. mill, per gross ton: Standard-section open-hearth and Bessemer rails, $43; light rails, rolled from billets, $36. *Per lb.:* Standard railroad spikes, 2.80c.; track bolts with square nuts, 3.80c.; steel tie plates, 2.25c.; angle bars, 2.75c.

Sheets.—Producers of this commodity are still working under the handicap of small orders and badly unbalanced books that do not afford schedules more than a week in advance. The Milwaukee hot mills were down most of last week, but have been producing since the first of this week. Output ranges from 70 to 75 per cent, which is a drop of 5 to 10 points in the last 10 days. The jobbing trade is quiet. Users of light gages are showing little interest in the market. Prices in and near Chicago are steady, but concessions are more common in nearly all outlying territory.

Base prices per lb., delivered from mill in Chicago: No. 24 black, 3.05c.; No. 24 galvanized, 3.90c.; No. 10 blue annealed, 2.25c. to 2.35c. Delivered prices at other Western points are equal to the freight from Gary plus the mill prices, which are 5c. per 100 lb. lower than the Chicago delivered prices.

Cast Iron Pipe.—This market in and near Chicago is quiet. To the east and at Milwaukee several sizable public lettings are soon to be made. Detroit opens bids April 20 on 6000 tons of 36-in., 1000 tons of 30-in. and 5000 tons of 24-in. class C pipe. Royal Oak, Mich., will buy 500 tons of 6 and 8-in. pipe on April 23, and St. Clair Shores, Mich., will open bids May 1 on 19 miles of 6 and 8-in. pipe. Milwaukee will receive tenders on 2800 tons of 24 and 48-in. plain pipe and 180 tons of lugged pipe. Chicago is in need of 200 tons of special fittings in sizes from 16 to 54-in. Prices are steady at $29 to $31, Birmingham, for diameters 6-in. and larger.

Prices per net ton, delivered Chicago: Water pipe, 6-in. and over, $36.20 to $39.20; 4-in., $40.20 to $43.20; Class A and gas pipe, $4 extra.

Reinforcing Bars.—Rail steel bar tonnages hold the center of interest in this market. Awards of Illinois State roadwork, all of which take this commodity, are numerous. Mills selling rail steel reinforcing bars direct are obtaining 1.85c. to 1.90c. on the ordinary run of work and 1.95c. on steel for bridges and culverts. The contract for the Chicago Daily News Building, calling for 1000 tons, is still open, but may be closed at any time. The Stickney, Ill., sewer project, 5000 tons, is active. Notable among fresh inquiries is 400 tons for a building for the Nu-Art Engraving Co., Chicago. Chicago warehouse prices for new billet reinforcing bars show some variation, with the minumum at 2.20c. a lb. Recent awards and new projects are shown on page 1128.

Warehouse Prices, f.o.b. Chicago

	Base per Lb.
Plates and structural shapes	3.10c.
Soft steel bars	3.00c.
Reinforcing bars, billet steel	2.20c. to 2.55c.
Cold-finished steel bars and shafting—	
Rounds and hexagons	3.60c.
Flats and squares	4.10c.
Bands	3.65c.
Hoops	4.15c.
Black sheets (No. 24)	3.95c.
Galvanized sheets (No. 24)	4.80c.
Blue annealed sheets (No. 10)	3.50c.
Spikes, standard railroad	3.55c.
Track bolts	4.55c.
Rivets, structural	3.60c.
Rivets, boiler	3.60c.
	Per Cent Off List
Machine bolts	60
Carriage bolts	60
Coach or lag screws	60
Hot-pressed nuts, squares, tapped or blank	60
Hot-pressed nuts, hexagons, tapped or blank	60
No. 8 black annealed wire, per 100 lb.	$3.20
Common wire nails, base per keg	3.00
Cement coated nails, base per keg	2.90

Old Material.—Whatever strength exists in this market is largely because of tightening of inspections and difficulty in getting scrap to meet the requirements of certain large users. Consumer purchases are small in the aggregate, but when sales are made it develops that prices are more stable than a week ago. Shipments against old contracts for heavy melting steel are large. New buying in this grade is of moderate size and confined to deliveries that are to be made to Gary mills. Stocks in the hands of buyers have been accumulating and, except in low phosphorus grades, there is little urge for melters to take the offerings of sellers. A check on the inflow of country scrap is following numerous rejections of material coming from rural districts. The Rock Island will sell 7200 tons of scrap material.

Prices delivered consumers' yards, Chicago:

Per Gross Ton	
Basic Open-Hearth Grades:	
Heavy melting steel	$12.50 to $13.00
Shoveling steel	12.50 to 13.00
Frogs, switches and guards, cut apart, and miscellaneous rails	13.00 to 13.50
Hydraulic compressed sheets	11.00 to 11.50
Drop forge flashings	9.50 to 10.00
Forged, cast and rolled steel carwheels	14.75 to 15.25
Railroad tires, charging box size	16.00 to 16.50
Railroad leaf springs, cut apart	16.00 to 16.50
Acid Open-Hearth Grades:	
Steel couplers and knuckles	14.00 to 14.50
Coil springs	16.25 to 16.75
Electric Furnace Grades:	
Axle turnings	12.75 to 13.25
Low phosphorus punchings	14.00 to 14.50
Low phosphorus plate, 12 in. and under	13.75 to 14.25
Blast Furnace Grades:	
Axle turnings	10.00 to 10.50
Cast iron borings	9.25 to 9.75
Short shoveling turnings	9.25 to 9.75
Machine shop turnings	7.00 to 7.50
Rolling Mill Grades:	
Iron rails	14.00 to 14.50
Rerolling rails	13.75 to 14.25
Cupola Grades:	
Steel rails less than 3 ft.	15.00 to 15.50
Angle bars, steel	13.75 to 14.25
Cast iron carwheels	13.50 to 14.00
Malleable Grades:	
Railroad	12.75 to 13.25
Agricultural	12.00 to 12.50
Miscellaneous:	
*Relaying rails, 56 to 60 lb.	23.00 to 25.00
*Relaying rails, 65 lb. and heavier	26.00 to 31.00
Per Net Ton	
Rolling Mill Grades:	
Iron angles and splice bars	13.75 to 14.25
Iron arch bars and transoms	18.75 to 19.25
Iron car axles	21.50 to 22.00
Steel car axles	15.75 to 16.25
No. 1 railroad wrought	11.50 to 12.00
No. 2 railroad wrought	11.25 to 11.75
No. 1 busheling	10.00 to 10.50
No. 2 busheling	5.75 to 6.25
Locomotive tires, smooth	12.50 to 13.00
Pipes and flues	8.00 to 8.50
Cupola Grades:	
No. 1 machinery cast	14.00 to 14.50
No. 1 railroad cast	12.50 to 13.00
No. 1 agricultural cast	12.50 to 13.00
Stove plate	11.25 to 11.75
Grate bars	11.00 to 11.50
Brake shoes	11.00 to 11.50

*Relaying rails, including angle bars to match, are quoted f.o.b. dealers' yards.

The New York office of the Standard Seamless Tube Co., Pittsburgh, has been consolidated with that of Spang Chalfant & Co., Inc., at 51 East Forty-second Street.

The Marks-Fiske-Zeiger Co., 126 South Artillery Avenue, Detroit, dealer in iron and steel products, has changed its name to the Federal Steel Corporation.

Philadelphia

Steel Shipments Fair—Pig Iron Continues Quiet but Firm

PHILADELPHIA, April 16.—Except for a fair volume of shipments on contracts, business is decidedly limited both in steel and pig iron. Consumers are evidently operating sufficiently well to use the tonnage for which they have contracted, but require little or nothing in addition. On the small lots of new steel business in the market, 1.90c., Pittsburgh, on bars and 2.05c., Coatesville, on plates are being obtained, while shapes bring 2.05c., Bethlehem, only on the smaller purchases, usually less than carload lots.

Blue annealed, black and galvanized sheet prices continue unsettled. There is apparently a range of about $2 a ton in quotations on these finishes.

Competition for fabricated steel projects is keen, but only a small tonnage of new business is reported in the market. The New York Central Railroad has awarded 10 steel barges to two builders and the Pennsylvania Railroad has 10 barges, floats and a tugboat hull still pending. About 300 tons of steel piling for a bridge at Allentown, Pa., went to the Bethlehem Steel Co.

Pig Iron.—Sales of pig iron consist mainly of carload lots to foundries. Eastern Pennsylvania furnaces are maintaining $20, base, on foundry grades. The Panama Canal Commission, Washington, is about to close on 100 tons of No. 2 plain. Eastern Pennsylvania producers of low phosphorus iron have sold a few carloads to western Pennsylvania consumers. Small tonnages of Indian and Dutch iron continue to appear on the market at about $20.25 per ton, duty paid.

Prices per gross ton at Philadelphia:

East. Pa. No. 2 plain, 1.75 to 2.25 sil.		$20.76
East. Pa. No. 2X, 2.25 to 2.75 sil.		21.26
East. Pa. No. IX		21.76
Basic (delivered eastern Pa.)	$19.50 to	20.00
Gray forge	19.75 to	20.25
Malleable	21.00 to	21.50
Standard low phos. (f.o.b. New York State furnace)	23.00 to	24.00
Copper bearing low phos. (f.o.b. furnace)	23.50 to	24.00
Virginia No. 2 plain, 1.75 to 2.25 sil.	24.54 to	25.04
Virginia No. 2X, 2.25 to 2.75 sil.	25.04 to	25.54

Prices, except as specified otherwise, are delivered Philadelphia. Freight rates: 76c. to $1.64 from eastern Pennsylvania furnaces; $4.54 from Virginia furnaces.

Billets.—Prices are unchanged at $33 per ton, Pittsburgh, for rerolling billets and $38 per ton, Pittsburgh, for forging quality.

Bars.—There is a moderate demand for bars, but purchases are confined to small lots and specifications against contracts. On small tonnages of new business, 1.90c. per lb., Pittsburgh, or 2.22c., delivered Philadelphia, is obtained, while deliveries on contracts are at 1.85c., Pittsburgh, or 2.17c., Philadelphia.

Warehouse Prices, f.o.b. Philadelphia

	Base per Lb.
Plates, ¼-in. and heavier	2.50c. to 2.60c.
Plates, $\frac{3}{16}$-in.	2.80c. to 3.00c.
Structural shapes	2.40c. to 2.60c.
Soft steel bars, small shapes and iron bars (except bands)	2.50c.
Round-edge iron	3.50c.
Round-edge steel, iron finished 1½ x 1½ in.	3.50c.
Round-edge steel, planished	4.30c.
Reinforcing steel bars, square, twisted and deformed	2.50c. to 3.00c.
Cold-finished steel, rounds and hexagons	3.35c.
Cold-finished steel, squares and flats	3.85c.
Steel hoops	3.60c.
Steel bands, No. 12 gage to $\frac{3}{16}$-in., inclusive	3.35c.
Spring steel	5.00c.
*Black sheets (No. 24)	4.00c.
†Galvanized sheets (No. 24)	4.75c.
Blue annealed sheets (No. 10)	3.15c.
Diamond pattern floor plates—	
¼-in.	5.30c.
$\frac{3}{16}$-in.	5.50c.
Rails	3.20c.
Swedish iron bars	6.60c.

---

*For 50 bundles or more; 10 to 49 bundles, 4.25c. base; 1 to 9 bundles, 4.50c. base.

†For 50 bundles or more; 10 to 49 bundles, 5.10c. base; 1 to 9 bundles, 5.45c. base.

Shapes.—Local structural steel projects consist chiefly of tonnages that have been pending for several weeks. Barges, floats and a tugboat hull for the Pennsylvania Railroad have not yet been awarded to a builder. Ten New York Central Railroad barges, which are to be constructed of 12-in. channels, about 300 tons or more to each barge, are to be built by the Dravo Contracting Co., Pittsburgh, and the Atlantic-Ellis Channel System, Inc., New York. On current small lot purchases of shapes, 2.05c., Bethlehem, 2.025c., Pottsville, or 2.17c. to 2.18c., delivered Philadelphia, are quoted. Deliveries on second quarter contracts are being made at 2c., Bethlehem, or 2.13c., Philadelphia, and there are still a few tonnages that have been carried over from the first quarter at $1 a ton less.

Plates.—Specifications against contracts at 2c., Coatesville, or 2.10c., delivered Philadelphia, are coming in freely, but new purchasing is limited. On new business, however, 2.05c., Coatesville, or 2.15c., delivered Philadelphia, seems to be generally maintained.

Sheets.—Eastern Pennsylvania mills have not generally followed the action of an Ohio mill in revising blue annealed sheets to 2c., base Pittsburgh, and black to 2.75c., Pittsburgh. While there is weakness in the market, 2.10c., base, is being quoted here on small tonnages of blue annealed sheets, so that prices are represented by a range of 2c. to 2.10c. per lb. Galvanized sheets are 3.65c. to 3.75c. per lb., Pittsburgh, while black sheets seem to be rather generally quoted at 2.75c. to 2.85c., Pittsburgh.

Warehouse Business.—Efforts to establish a quantity differential on black and galvanized sheets, reported a week ago, were not completely successful and local jobbers have adopted a substitute plan whereby three different base prices for sheets, depending upon the quantity purchased, will be quoted. For 50 bundles or more black sheets at 4c. per lb., base, and galvanized, 4.75c., base; for 10 to 49 bundles black sheets are 4.25c. and galvanized, 5.10c., base; and for one to nine bundles black sheets are 4.50c. and galvanized, 5.45c., base. There is a 25c. per 100 lb. extra for corrugated sheets.

Imports.—In the week ended April 14 a total of 8250 gross tons of ore arrived at this port, 6250 tons of iron ore from Algeria and 2000 tons of chrome ore from Portuguese Africa. Pig iron arrivals totaled 1055 tons, of which 649 tons was Indian and 406 tons Dutch iron. Steel arrivals consisted of 72 tons of structural shapes, 66 tons of hoops and bands and seven tons of steel bars from France and 369 tons of bars and 200 tons of structural shapes from Belgium.

Old Material.—Prices are unchanged. Buying by eastern Pennsylvania consumers is light. A Harrisburg mill has bought bundled sheets at $10.50 per ton, delivered, and yard grade of heavy melting steel at $11 per ton, delivered. A Phoenixville company, which has been offering $10 per ton, delivered, for machine shop turnings is now offering $10.50 per ton for a sizable tonnage. No. 1 heavy melting steel is unchanged at $13.50 to $14 per ton, delivered, and shipments are going to Bethlehem, Conshohocken and Coatesville.

Prices per gross ton delivered consumers' yards, Philadelphia district:

No. 1 heavy melting steel	$13.50 to	$14.00
Scrap T rails	13.00 to	13.50
No. 2 heavy melting steel	11.00 to	11.50
No. 1 railroad wrought	14.50 to	15.00
Bundled sheets (for steel works)		10.50
Machine shop turnings (for steel works)		10.50
Heavy axle turnings (or equivalent)	12.00 to	12.50
Cast borings (for steel works and rolling mill)	10.50 to	11.00
Heavy breakable cast (for steel works)	15.50 to	16.00
Railroad grate bars	12.00 to	12.50
Stove plate (for steel works)		12.00
No. 1 low phos., heavy, 0.04 per cent and under	17.50 to	18.00
Couplers and knuckles	15.50 to	16.00
Rolled steel wheels	15.50 to	16.00
No. 1 blast furnace scrap	10.50 to	11.00
Machine shop turnings (for rolling mill)	11.00 to	11.25
Wrought iron and soft steel pipes and tubes (new specifications)	12.00 to	12.50
Shafting	17.50 to	18.00
Steel axles	19.00 to	20.00
No. 1 forge fire	11.00 to	11.50
Steel rails for rolling	14.75 to	15.25
Cast iron carwheels	15.50 to	16.00
No. 1 cast	16.00 to	16.50
Cast borings (for chemical plant)	14.50 to	15.00

New York

Steel Shipments Heavy But New Demand Lessens—Pig Iron Quieter

NEW YORK, April 17.—Buying of pig iron is confined mainly to small lots for early delivery. The volume of this business is of fair proportions, bookings by local sellers having totaled 7500 tons for the week, or about 500 tons more than in the previous week. While there is virtually no interest in iron for third quarter delivery, shipments to foundries are increasing, indicating a gain in melt. The Chrome Steel Works, Carteret, N. J., has bought 1000 tons of low phosphorus, and the Lorain Steel Co., Johnstown, Pa., is expected to close in a day or two on a like tonnage. Pending business in foundry grades is light, probably totaling less than 1000 tons. A tentative inquiry is current, however, for 2000 to 3000 tons. Buffalo foundry iron is still available at $16 to $16.50, base furnace. Eastern Pennsylvania producers continue to quote $20, base furnace, for foundry, without obtaining much business. All of the Dutch iron recently unloaded at Bridgeport, Conn., has been sold.

Prices per gross ton, delivered New York district:

Buffalo No. 2 fdy., sil. 1.75 to 2.25	$20.91 to $21.91
East. Pa. No. 2 fdy., sil. 1.75 to 2.25	20.39 to 22.52
East. Pa. No. 2X fdy., sil. 2.25 to 2.75	20.89 to 23.02
East. Pa. No. 1X fdy., sil. 2.75 to 3.25	21.39 to 23.52

Freight rates: $4.91 from Buffalo, $1.39 to $2.52 from eastern Pennsylvania.

Finished Steel.—Although shipments of steel to consumers in this district on specifications against contracts continue at an undiminished rate, the amount of new buying is extremely light. Most of the larger users have provided for their needs for all of this month and in not a few instances for most, if not all, of next month. With such wide coverage, there have been few tests of prices on those products which in other markets have shown weakness, notably sheets and cold-rolled strip steel. Black sheets are available at 2.80c. and 2.85c., Pittsburgh, while current sales of galvanized sheets are at 3.65c. to 3.75c., Pittsburgh. Blue annealed sheets are still holding to 2.10c. on a majority of transactions, notwithstanding that 2c., Pittsburgh, has been done in other districts on some of the larger sales. A few makers of cold-rolled strip have taken orders at 2.75c., Pittsburgh, for three tons or more, but other makers have succeeded in getting higher prices. In plates, shapes and bars the price situation is unchanged, except that the most recent advance of $1 a ton is not holding on lots of a carload or more, bars being obtainable at 1.85c., Pittsburgh; shapes at 2c., Bethlehem, and plates at 2c., Coatesville. The New York Central Railroad has distributed orders for a few thousand tons of steel on which bids were publicly taken a few weeks ago. The plate tonnage was divided among at least three mills on quotations of 1.85c., delivered Newberry Junction; 1.85c., Cleveland mill, and 1.90c., West Seneca, N. Y. Structural steel awards bulked large, but were made up of a few good-sized tonnages, among which were 5000 tons of subway work and 4400 tons for the Governor Clinton Hotel in New York. New bids will be asked for on 10,000 tons of fabricated steel for the Jackson Avenue subway in Long Island City. Projects pending include 12,000 tons for a bridge at Charleston, S. C., and 3000 tons for a bridge over Lake Champlain.

Mill prices per lb., delivered New York: Soft steel bars, 2.19c. to 2.24c.; plates, 2.17½c. to 2.22½c.; structural shapes, 2.14½c. to 2.19½c.; bar iron, 2.14c.

Cast Iron Pipe.—Prices of Northern makers of pressure pipe are slightly firmer, but have shown no tendency to advance. At the opening of bids today by the Department of Purchase, New York, on 2700 tons of water pipe, low bidders were the Warren Foundry & Pipe Co. on 1000 tons at $38.40 per net ton, delivered, the Donaldson Iron Co. on 1000 tons at $37.90 per net ton, delivered, and the United States Cast Iron Pipe & Foundry Co. on 700 tons at $38.25. White Plains, N. Y., has awarded 500 tons and Bloomfield, N. J., 100 tons of water pipe to the Warren Foundry & Pipe Co. An inquiry for a contract in Colombia specifies 20 kilometers of 24-in. water pipe (about 9000 tons).

Prices per net ton, delivered New York: Water pipe 6-in. and larger, $36.25 to $37.25; 4-in. and 5-in., $41.25 to $42.25; 3-in., $51.25 to $52.25; Class A and gas pipe, $4 to $5 extra.

Warehouse Business.—Although quantity differentials are now in effect on plates, shapes, bars, hoops, bands, diamond pattern plates and blue annealed sheets, the current volume of purchasing has not as yet provided much of a test. April business has been good and, although orders are small, the total for the month is expected to exceed that of March.

Coke.—Buying is in small volume. Prices of Connellsville coke are weak. Standard foundry is offered at $3.50 per ton, Connellsville, and standard furnace at $2.75 to $2.85 per ton, Connellsville. Delivered prices

Warehouse Prices, f.o.b. New York

	Base per Lb.
Plates and structural shapes	3.30c.
Soft steel bars and small shapes	3.25c.
Iron bars	3.24c.
Iron bars, Swedish charcoal	7.00c. to 7.25c.
Cold-finished shafting and screw stock—	
Rounds and hexagons	3.40c.
Flats and squares	3.90c.
Cold-rolled strip, soft and quarter hard,	5.15c. to 5.40c.
Hoops	4.50c.
Bands	4.00c.
Blue annealed sheets (No. 10 gage)	3.90c.
Long terne sheets (No. 24)	5.80c.
Standard tool steel	12.00c.
Wire, black annealed	4.50c.
Wire, galvanized annealed	5.15c.
Tire steel, 1½ x ½ in. and larger	3.30c.
Smooth finish, 1 to 2½ x ¼ in. and larger	3.65c.
Open-hearth spring steel, bases	4.50c. to 7.00c.

Machine bolts, cut thread:	Per Cent Off List
¾ x 6 in. and smaller	55 to 60
1 x 30 in. and smaller	50 to 50 and 10
Carriage bolts, cut thread:	
½ x 6 in. and smaller	55 to 60
¾ x 20 in. and smaller	50 to 50 and 10
Coach screws:	
½ x 6 in. and smaller	55 to 60
1 x 16 in. and smaller	50 to 50 and 10

Boiler Tubes—	Per 100 Ft.
Lap welded steel, 2-in	$17.33
Seamless steel, 2-in	20.24
Charcoal iron, 2-in	25.00
Charcoal iron, 4-in	67.00

Discounts on Welded Pipe

Standard Steel—	Black	Galv.
½-in. butt	46	29
¾-in. butt	51	37
1-3-in. butt	53	39
2½-6-in. lap	48	35
7 and 8-in. lap	44	17
11 and 12-in. lap	37	12
Wrought Iron—		
½-in. butt	5	+19
¾-in. butt	11	+ 9
1-1½-in. butt	14	+ 6

3-6-in. lap	11	+ 6
7-12-in. lap	3	+16

Tin Plate (14 x 20 in.)

	Prime	Seconds
Coke, 100 lb. base box	$6.45	$6.20
Charcoal, per box—	A	AAA
IC	$9.70	$12.10
IX	12.00	14.25
IXX	13.90	16.00

Terne Plate (14 x 20 in.)

IC—20-lb. coating	$10.00 to $11.00
IC—30-lb. coating	12.00 to 13.00
IC—40-lb. coating	13.75 to 14.25

Sheets Box Annealed—Black, C. R. One Pass

	Per Lb.
Nos. 18 to 20	3.80c. to 4.00c.
No. 22	3.95c. to 4.15c.
No. 24	4.00c. to 4.20c.
No. 26	4.10c. to 4.30c.
No. 28*	4.25c. to 4.45c.
No. 30	4.50c. to 4.70c.

Sheets, Galvanized

	Per Lb.
No. 14	4.35c.
No. 16	4.45c.
No. 18	4.35c. to 4.60c.
No. 20	4.50c. to 4.75c.
No. 22	4.55c. to 4.80c.
No. 24	4.70c. to 4.95c.
No. 26	4.95c. to 5.20c.
No. 28*	5.20c. to 5.45c.
No. 30	5.60c. to 5.85c.

---

*No. 28 and lighter, 36 in. wide, 20c. higher per 100 lb.

of special brands are: To northern New Jersey, Jersey City and Newark, $8.71 to $8.81 per net ton; to New York and Brooklyn, $9.59 to $9.69 per net ton. By-product coke is quoted at $9 to $9.40 per net ton, Newark or Jersey City, N. J., and $10.06 to $10.29 per ton, New York or Brooklyn.

Ferroalloys.—Interest centers in the price which will prevail on contracts for ferromanganese for second half. This may develop in the near future. Thus far no alloy is reported to have been sold for that delivery. There is some talk that a higher price than the present quotation of $100, seaboard, may be announced. Specifications on present contracts, which cover requirements, are said to be expanding. New business in spiegeleisen is confined to small lots at prevailing quotations. Specifications on contracts for other ferroalloys are reported heavy.

Reinforcing Bars.—Parker & Graham, Inc., Paterson, N. J., has been awarded the contract for a highway bridge across the Raritan River at New Brunswick, N. J., which will require 1700 tons of concrete reinforcing bars. A considerable tonnage of bars is being placed for road work in New Jersey, mostly in small contracts. Road work is also becoming more active in Westchester County and lower New York State, but here as well as in New Jersey wire mesh is being used in considerable quantities. The Truscon Steel Co. will supply 400 tons of bars for a section of the New York subway. On another section in Long Island City, the original bids on the general contract have been rejected and the job will be readvertised. The 2c., Pittsburgh, mill price is being adhered to on the usual run of small jobs. Warehouse prices are unchanged.

Old Material.—All grades of scrap remain at last week's prices. Shipments to eastern Pennsylvania consumers are for the most part confined to No. 1 heavy melting steel, yard grade of heavy melting steel, machine shop turnings, borings and turnings, stove plate, locomotive grate bars and heavy breakable cast. Some specification pipe is moving to Lebanon and Columbia, Pa., consumers, brokers paying $12 and $12.50 per ton, delivered. While there is still pressure from buyers to obtain lower prices, the market seems to have reached bottom in that sellers are unwilling to enter into contracts at less than the current quotations.

Dealers' buying prices per gross ton f.o.b. New York:

No. 1 heavy melting steel	$10.00 to	$10.85
Heavy melting steel (yard)	6.75 to	7.25
No. 1 heavy breakable cast	11.25 to	12.00
Stove plate (steel works)	7.75 to	8.00
Locomotive grate bars	8.00 to	8.50
Machine shop turnings	6.50 to	7.25
Short shoveling turnings	6.50 to	7.25
Cast borings (blast furnace or steel works)	6.25 to	7.25
Mixed borings and turnings	6.50 to	7.25
Steel car axles	15.50 to	16.00
Iron car axles	23.75 to	24.75
Iron and steel pipe (1 in. dia., not under 2 ft. long)	7.75 to	8.25
Forge fire	6.75 to	7.00
No. 1 railroad wrought	10.00 to	10.50
No. 1 yard wrought, long	8.50 to	9.00
Rails for rolling	10.00 to	10.50
Cast iron carwheels	10.75 to	11.25
Stove plate (foundry)	8.50 to	9.00
Malleable cast (railroad)		10.00
Cast borings (chemical)	11.00 to	11.50

Prices per gross ton, delivered local foundries:

No. 1 machinery cast	$13.75 to	$14.25
No. 1 heavy cast (columns, building materials, etc.), cupola size	11.75 to	12.25
No. 2 cast (radiators, cast boilers, etc.)	11.25 to	11.75

Warehouse Prices, f.o.b. Cleveland

	Base per Lb.
Plates and structural shapes	3.00c.
Soft steel bars	3.00c.
Reinforcing steel bars	2.25c. to 2.75c.
Cold-finished rounds and hexagons	3.65c.
Cold-finished flats and squares	4.15c.
Hoops and bands	3.65c.
Cold-finished strip	*5.95c.
Black sheets (No. 24)	3.75c.
Galvanized sheets (No. 24)	4.40c. to 4.60c.
Blue annealed sheets (No. 10)	3.25c.
No. 9 annealed wire, per 100 lb.	$2.90
No. 9 galvanized wire, per 100 lb.	3.35
Common wire nails, base per keg	2.90

*Net base, including boxing and cutting to length.

Cleveland

Motor Industry Still Principal Steel Buyer—Ore Prices Named

CLEVELAND, April 17.—Orders and specifications for steel bars, plates and structural material are fairly plentiful, but they are for small tonnages. The same situation applies to sheets and to hot-rolled strip steel in this territory. Orders from the automotive industry continue heavy, particularly for auto body sheets and hot-rolled strip steel, and some of the mills are filled up on these two products until late in May. With the rather slow but steady increase in production by the Ford Motor Co., larger steel orders are coming from that company.

Prices are holding firm at 1.85c., Pittsburgh, for steel bars, plates and structural material and quite a few small lot miscellaneous orders are being taken at 1.90c. Local mills quote steel bars at 1.85c., Cleveland. Sheet prices are weak except on auto body sheets, which are holding at the recent decline, now generally in effect. There is also irregularity in wide strip steel.

Structural orders continue light, the largest of the week being 1200 tons, and not much new inquiry is coming out.

The announcement of the reestablishment of last year's ore prices for 1928 attracted less interest than usual because this was generally expected.

Pig Iron.—Sales decreased further the past week, the business taken by Cleveland interests totaling 17,000 tons, compared with 26,000 tons during the previous week. Much of the business was in small lots from consumers who are buying from hand to mouth or small foundries that are purchasing only enough iron to carry them through the second quarter. There is little new inquiry. Prices are well stabilized at the quotations that have prevailed for some time. Lake furnaces are adhering to $17 for No. 2 foundry and malleable iron, except for shipment to competitive points, principally in southern Ohio, where some irregularity exists. Lake furnaces are asking $16.75 for shipment to these competitive points, but this price is being shaded. In Michigan the market is firm at $18. Shipping orders show some gain from foundries outside of the automotive industry and automobile foundries are taking fully as much iron as last month. Most furnaces are shipping more iron than they are making.

Prices per gross ton at Cleveland:

N'th'n No. 2 fdy., sil. 1.75 to 2.25	$18.50
Southern fdy., sil. 1.75 to 2.25	22.00
Malleable	18.50
Ohio silvery, 8 per cent	28.00
Basic, Valley furnace	17.00
Standard low phos., Valley furnace	$26.50 to 27.00

Prices, except on basic and low phosphorus, are delivered Cleveland. Freight rates: 50c. from local furnaces; $3 from Jackson, Ohio; $6 from Birmingham.

Sheets.—Mills are getting heavy specifications for auto body sheets from the Detroit territory, but new demand has slowed down somewhat, as consumers placed large orders last month against old contracts. Consumers in this territory are ordering small lots for immediate needs. Blue annealed sheets have settled down to 2c., Pittsburgh base, the regular 2.10c. price having virtually disappeared. Black sheet prices appear to be holding steadily at recent reductions, the common range being 2.75c. to 2.80c., Pittsburgh. Galvanized sheets are weak. These are quoted at 3.65c., Pittsburgh. Auto body sheets are holding at the recent $3 a ton price reduction to 4c. Metal furniture sheets, following black sheets downward, are $2 a ton lower.

Strip Steel.—Specifications against contracts for hot-rolled strip from the automotive industry are heavy, but new demand is moderate. Mills were able to close considerable tonnage at prices that prevailed during the first quarter and somewhat below current quotations. However, the market lacks strength, and there are reports of quotations only slightly above some of the low net prices at which first quarter business was taken. The demand for cold-rolled strip is not as heavy as for hot-rolled material. While large buyers have been able to contract at 3c., base Cleveland, or 2.75c. for three tons and over, the regular 3.15c. base is being maintained for small consumers. While there has been shading of $1 a ton on fender stock to 4.15c., this material is lower than auto body sheets when extras are added, and consequently has not declined with the latter, being generally quoted at 4.20c.

Iron Ore.—Ore prices that prevailed last year were reestablished by the sale of a round tonnage April 16, more complete details of which will be found in another column.

Semi-Finished Steel.—While not much new business is being placed, the demand is holding up to recent volume and the leading local producer continues to operate 13 out of 14 open-hearth furnaces. Quotations are unchanged at $33, Cleveland. Irregularity in forging billets is indicated by a car lot sale at $37.

Warehouse Business.—Sales show a slight gain over those in March. Some seasonal demand has developed from the building field. Sheets are moving slowly. Prices are being well maintained.

Cold-Finished Steel.—The Ford Motor Co. recently placed some business with parts makers in this territory that has resulted in an increase in specifications. Locally, the price is firm at 2.25c., Cleveland, but irregularities are reported in the Detroit territory.

Wire Products.—Nails are moving better than recently. The market is holding to $2.65 per keg in this territory, although lower prices are reported in southern Ohio.

Reinforcing Bars.—New inquiry is confined to small lots and the only award of any size during the week was for 100 tons. The price for stock shipment remains around 2.25c. Rail steel bars are quoted at 1.75c., mill.

Coke.—Coke shipments are fair, but there is little new demand. Prices are unchanged at $7.75, Painesville, for Ohio by-product foundry coke and $3.75 to $5.10, ovens, for Connellsville grades. There is still a range of from $2.50 to $2.75 on heating coke.

Bolts, Nuts and Rivets.—Bolts and nuts continue to move in good volume in specifications against contracts. While rivets are rather slow, they are more active than recently.

Old Material.—The firmer market situation that has developed in the Pittsburgh territory has not been reflected in any added strength in the Cleveland market. No new business is coming from the mills and, with shipments closely restricted, dealers have little tonnage to place against existing orders. Dealers are able to buy car lots of heavy melting steel at $13.50, or 25c. a ton under the more commonly quoted price. They are showing caution in buying scrap for future delivery, believing that if there is any reduction in mill operations in the early summer scrap prices may go lower.

Prices per gross ton, delivered consumers' yards:

Basic Open-Hearth Grades		
No. 1 heavy melting steel	$13.75 to	$14.00
No. 2 heavy melting steel	13.25 to	13.50
Compressed sheet steel	12.75 to	13.00
Light bundled sheet stampings	11.50 to	11.75
Drop forge flashings	12.00 to	12.50
Machine shop turnings	8.00 to	8.50
No. 1 railroad wrought	11.50 to	12.00
No. 2 railroad wrought	13.50 to	14.00
No. 1 busheling	11.00 to	11.25
Pipes and flues	9.00 to	9.50
Steel axle turnings	12.50 to	13.00
Acid Open-Hearth Grades		
Low phosphorus forging crops	16.50 to	17.00
Low phosphorus, billet, bloom and slab crops	17.00 to	17.50
Low phosphorus sheet bar crops	16.50 to	17.00
Low phosphorus plate scrap	16.00 to	16.50
Blast Furnace Grades		
Cast iron borings	10.00 to	10.25
Mixed borings and short turnings	10.00 to	10.25
No. 2 busheling	10.00 to	10.25
Cupola Grades		
No. 1 cast	16.50 to	17.00
Railroad grate bars	11.00 to	12.00
Stove plate	12.00 to	12.50
Rails under 3 ft	18.00 to	18.50
Miscellaneous		
Railroad malleable	15.00 to	15.50
Rails for rolling	16.25 to	16.50

Company Activities and Commission Decisions

The Jones & Laughlin Steel Corporation on April 3 completed two years without a fatality at its South Side works, Pittsburgh. An average force of 5100 men worked approximately 30,000,000 man-hours in that period. The departments of the works located on the north bank of the Monongahela River, employing about 2000 men, have gone 90 days without a lost-time accident.

—

Acme Steel Co., Chicago, reports that the sales for the first quarter of 1928 were approximately 32 per cent ahead of the same period last year, and were the largest in the history of the company. The company recently placed in operation a new electro-galvanizing sheet plant.

—

The American Steel & Wire Co. has recently put in operation a new welded-fabric mill addition at its Anderson, Ind., plant.

—

The Carnegie Steel Co. will rebuild and enlarge No. 2 stack at its Ohio Works, Youngstown. At completion the furnace will have a capacity of 800 tons daily and will be the largest of the group of six furnaces. The Pennsylvania Engineering Works, New Castle, Pa., will do the work.

—

Two combined coke pushers, coal levelers and door extractors will be installed at the South Chicago plant of the Youngstown Sheet & Tube Co. by the Wellman-Seaver-Morgan Co., Cleveland, which has been awarded the contract by the Koppers Co., general contractor for the coke oven plant.

—

The McClintic-Marshall Co. has removed its district sales office in Cincinnati from 624 Union Central Building to room 1208 in the same building.

In a proposed report to the Interstate Commerce Commission last week, R. J. Olentine, examiner, passing upon a complaint of the Denver Rock Drill Mfg. Co., Denver, Colo., held that rates and minima on plain bar steel, in carloads, from Syracuse, N. Y., and Milwaukee to Denver are not unreasonable.

—

Dismissing a complaint of the Federated Metals Corporation, New York, the Interstate Commerce Commission, in a report made public last week, held that rates on brass and copper ingots, in carloads, from Pittsburgh, Chicago and St. Louis to points in Official Classification territory are not unreasonable. Commodity rates equivalent to sixth class are generally maintained from Chicago to Pittsburgh. From St. Louis fifth class rates apply with but few exceptions.

—

Termination of the receivership of the Standard Stamping Co., 2000 North Broadway, St. Louis, in effect since July, 1926, will probably be accomplished, following an order by Federal Court, asking George W. Weigand and his sons, majority stockholders in the company, to purchase the stock of James L. Minnis, principal minority stockholder.

—

The Federal Trade Commission has resumed the taking of testimony in the case of the Aluminum Co. of America in which certain contracts and agreements made by the company for the sale of sheet aluminum are questioned.

—

Orders received by the General Electric Co., Schenectady, N. Y., for the first three months of the present year amounted to $79,925,840, compared with $77,550,581 for the corresponding quarter in 1927 and with $86,433,658 for the first quarter of 1926.

San Francisco

Reinforcing Steel Awards 7000 Tons —5200 Tons for Drainage Work

SAN FRANCISCO, April 14 (*By Air Mail*).—Among the more important awards this week were 5200 tons of bars for a drainage improvement project at Los Angeles and 376 tons for a factory for Johns-Manville Co. at Pittsburg, Cal. Demand generally is considered fair for this season of the year. Much new work is in sight.

Pig Iron.—Both sales and inquiries for foundry pig iron were limited to small lots for prompt shipment, and little or no improvement is noted in general demand for castings. Importations of foreign iron in January totaled close to 1400 tons, Los Angeles foundries taking 850 tons. The bulk of this material, 1047 tons, came from the British Indies. Prices continue unchanged.

Prices per gross ton at San Francisco:

*Utah basic	$25.00 to $26.00
*Utah foundry, sil. 2.75 to 3.25	25.00 to 26.00
**Indian foundry, sil. 2.75 to 3.25	24.00 to 25.00
**German foundry, sil. 2.75 to 3.25	24.25

---

*Delivered San Francisco.
**Duty paid, f.o.b. cars San Francisco.

Bars.—Reinforcing steel bar awards totaled close to 7000 tons. In addition to the tonnages mentioned above, 420 tons for a warehouse at Seattle and 240 tons for the Transportation Building in the same city were awarded. The largest pending project calls for 1220 tons for Drainage Improvement District No. 22 at Los Angeles, bids on which have been opened. January importations of foreign bars totaled 4322 tons, compared with 3675 tons for the same month last year. Of this total, 4041 tons came from Belgian producers, San Francisco taking 1749 tons and Portland 1496 tons.

Plates.—The Pittsburgh-Des Moines Steel Co. was low bidder on 445 tons for siphons for the Kittitas Canal project in Washington. The only other inquiry up for figures calls for 700 tons for a car float for the Santa Fe at San Francisco. Prices continue unchanged at 2.30c. c.i.f.

Shapes.—Fabricated awards this week totaled 1066 tons. The Moore Dry Dock Co. took 250 tons for hangars at Oakland and McClintic-Marshall Co. was awarded 150 tons for the city of Los Angeles. Considerable new work is being planned, and it is thought that most of it will come out for figures during the next 30 days. Pending business exceeds 10,000 tons. C. J. Nystedt of Stockton got the general contract for a bridge over the Sacramento River at Freeport, calling for 606 tons; the steel contract has not been let. Los Angeles is calling for bids on 685 tons of I-beams by April 23. Importation of foreign material during January totaled 1936 tons, as against 2674 tons in January, 1927. San Francisco took 1149 tons. More than 1800 tons came from Belgian mills. Domestic plain material is firm at 2.35c. c.i.f.; foreign shapes are quoted at about 1.50c., c.i.f., duty paid.

Cast Iron Pipe.—Demand for cast iron pipe has improved, but awards were not heavy this week. George Herz & Co., San Bernardino, took 129 tons of 8 to 24-in. class B pipe for San Bernardino, Cal. An unnamed interest took 526 tons of 4 to 8-in. class B pipe for the East Palo Alto Waterworks District, Redwood City, Cal. Bids will be opened next week on the largest tonnages of cast iron pipe ever to come up for figures on the Coast. The Wildcat and Sequoia aqueducts in Oakland will require respectively 17,440 and 13,250 tons of 50 to 60-in. class C pipe. B. Nicoll & Co. were low on 234 tons of 24-in. class B pipe for Los Angeles. Long Beach, Cal., will open bids on April 17 for 8744 tons of 4 to 30-in. class B pipe. Monrovia, Cal., opens bids on April 16 for 2764 tons of 4 to 20-in. classes A and B pipe. Imports of cast iron pipe for January totaled 1823 tons, as against 6013 tons for the same month last year. Seattle took the largest portion, or 965 tons. More than 1400 tons came from French makers. Prices now range from $35 to $36 a ton, delivered, on 6-in. and larger.

Warehouse Prices, f.o.b. San Francisco

	Base per Lb.
Plates and structural shapes	3.15c.
Soft steel bars	3.15c.
Small angles, 3/16-in. and over	3.15c.
Small angles, under 3/16-in	3.55c.
Small channels and tees, ¾-in. to 2¾-in.	3.75c.
Spring steel, ¼-in. and thicker	5.00c.
Black sheets (No. 24)	4.95c.
Blue annealed sheets (No. 10)	3.90c.
Galvanized sheets (No. 24)	5.50c.
Structural rivets, ½-in. and larger	5.65c.
Common wire nails, base per keg	$3.40
Cement coated nails, 100-lb. keg	3.40

Standard Pipe.—E. W. Redman, Fresno, Cal., took 125 tons of 2 to 8-in. O. D. pipe for the Armona Public Utility District at Armona, Cal. The only pending inquiry of size involves 710 tons of 4 to 20-in. lapweld pipe for Monrovia, Cal., bids on which go in April 16. Pipe prices have advanced 5 per cent, reflecting the advance last week in the Eastern markets. Imports of tubular products in January aggregated 1089 tons, compared with 5117 tons in January, 1927. Of the total, Los Angeles took 850 tons.

Coke.—Sales and inquiries are confined to small lots. Prices on English beehive and by-product coke range from $16 to $17 a net ton on the former, delivered dock, and from $11.50 to $13 on the latter.

Youngstown

Losses in Bar Output Offset by Gains in Steel Pipe

YOUNGSTOWN, April 17.—Bar mill operations in this district have suffered a recession from the recent rate of activity because of the fact that makers of cold-finished steel bars and shafting drew very heavily against first quarter contracts last month and now are ordering sparingly. But such loss as this decline in new bar business has created in ingot production has been largely made good by a better demand for standard-weight pipe and a heavier operation of furnaces making that product. This is the reaction to the higher prices recently announced by steel pipe makers under the lead of the Youngstown Sheet & Tube Co. On consigned accounts, jobbers are protected in price changes for 60 days and jobbers who handle tubular goods on their own account had a period of grace within which they could order at the old prices, for delivery at convenience of the mill, the tonnage equivalent to what mill records showed was a month's supply. The advance took the shape of a withdrawal of a so-called preferential discount of 5 per cent; on retailers' carloads, the discount was card plus two fives, and now is card and 5 per cent. While oil country goods continue to sell slowly, there is a better tone to the pipe market as a result of the increased activity in standard-weight pipe and the prospect that with the revision in prices there will come a passing of the irregularity and uncertainty that for months has marked the secondary market.

Much disappointment is felt locally over the recent price developments in the sheet market, especially the drop in price of automobile body sheets, which up to the time that one or two small producers voluntarily receded, gave promise of holding firmly to 4.15c., base. There is no complaint over the volume of sheet orders, but prices are keenly competitive and maintenance of the prices named for this quarter is not regarded as now possible, since on black sheets 2.80c., base, Pittsburgh, is fairly common and even 2.75c., base, is being encountered in some districts. The decline in black sheets has brought no further weakening in galvanized sheets, which are holding rather well at 3.65c., base, which was quoted before there was any definite decline in black sheets. In the formulation of schedules a year ago with the change in base gages, there was a spread of 85c. per 100 lb. between black and galvanized sheets and today's prices of 2.80c. and 3.65c. are in the same alinement. There is some shading in blue annealed sheets, but generally, 2.10c. for stock narrower than 40 in. is holding well.

Tin plate mills in this area are all well occupied, and there is no complaint among strip makers as to the volume of business; there is not much satisfaction, however, over the prices at which strips, both hot- and cold-rolled, are moving. Good movement of wire, fence and fencing materials is noted, but it is generally on contracts written at less than is being asked on second quarter contracts. Nails still reflect in demand the fact that jobbers are heavily stocked as a result of large December purchases and liberal shipments over the first quarter of the year. Semi-finished steel is moving to non-integrated manufacturers steadily. There is no activity in pig iron, except for the purchases recently made by the A. M. Byers Co. of 10,000 tons of No. 3 foundry for its Girard, Ohio, works and a like amount of Bessemer iron for its Warren, Ohio, works. Scrap is firm, as the mills are demanding deliveries against old orders and the dealers are finding it necessary to go high to get enough tonnage to meet their obligations.

A good deal of new construction work is in process in the Youngstown district steel plants. The Carnegie Steel Co. is rebuilding its No. 2 blast furnace at its Ohio works, and when the work, which is being done by the Pennsylvania Engineering Works, New Castle, Pa., is completed the furnace will have a capacity of 1000 tons daily, making it the largest producing unit in the Valley districts. The Newton Steel Co., Newton Falls, Ohio, is making changes calculated to improve mill performance. The Trumbull Steel Co. has taken out a license under the patents of the Cold Metal Process Co., Youngstown, to install a mill for making strip tin plate.

Birmingham

Steel Market Continues Firm, but Pig Iron Demand Is Light

BIRMINGHAM, April 17.—The pig iron market continues to drift along, activity consisting of a fair number of spot sales in small lots. Producers have a good size tonnage of second quarter iron unsold. Stocks were increased during the last week when sales dropped below the average of recent weeks. The Tennessee company changed furnace No. 2 at Bessemer from basic to recarburizing iron on April 7 and furnace No. 6 at Ensley from recarburizing iron to foundry on April 11. Seventeen furnaces are in blast, nine of which are on foundry, six on basic, one on recarburizing iron and one on ferromanganese.

Prices per gross ton, f.o.b. Birmingham district furnaces:

No. 2 foundry, 1.75 to 2.25 sil.	$16.00
No. 1 foundry, 2.25 to 2.75 sil.	16.50
Basic	15.00

Finished Steel.—The market continues firm. More buyers are showing a tendency toward closing contracts. Inquiries are developing at a fair rate, and sales officials anticipate a satisfactory volume of business for the quarter. Structural steel fabricators and bar manufacturers report sales at a low rate during the past two weeks. A number of good projects are in prospect. The Tennessee company is now operating seven or eight open hearths at Ensley instead of eight or nine. Five are still in operation at Fairfield and the Gulf States Steel Co. continues to work four at Alabama City.

Cast Iron Pipe.—Sales for the past week were light and showed a decided drop from the preceding week. A fair volume of small orders constitutes the only new business. Inquiries are being received from Southern and Northern municipalities, and buying is expected to improve within the next two weeks. Shipments are increasing gradually. Base prices remain at $29 to $31.

Coke.—A fair amount of activity is found in spot sales of carload lots. Forward buying has been at a standstill during the past two weeks. All important consumers are covered for the second quarter and most of them are covered for the third quarter. Quotations continue at the same base price of $5 for both spot and contract.

Old Material.—Sales of heavy melting steel and steel rails have shown a noticeable improvement during the past week, and inquiries are more numerous. New business in other lines continues small. No changes have occurred in prices.

Prices per gross ton, delivered Birmingham district consumers' yards:

Heavy melting steel	$9.50 to $10.00
Scrap steel rails	11.00 to 11.50
Short shoveling turnings	8.00 to 8.50
Cast iron borings	8.00
Stove plate	14.50
Steel axles	19.00 to 20.00
Iron axles	20.00 to 21.00
No. 1 railroad wrought	10.00 to 10.50
Rails for rolling	13.00
No. 1 cast	14.50
Tramcar wheels	12.50 to 13.50
Cast iron carwheels	12.00 to 13.00
Cast iron borings, chemical	13.50 to 14.00

St. Louis

Pig Iron Buying Active—Steel Operations Continue at High Rate

ST. LOUIS, April 17.—Buying of pig iron continues active. The St. Louis Gas & Coke Co. sold about 10,000 tons, while a leading Southern interest disposed of 1000 tons. Prices are firm. Melters are beginning to inquire for prices on their third-quarter requirements, although makers have not yet opened their books for that period. Of the local maker's sales, 5000 tons was to a radiator company, 1000 tons to a northern Illinois stove foundry, 600 tons to an East St. Louis melter and 200 tons to a southern Illinois concern, all foundry iron, and 1000 tons of malleable iron to an Illinois consumer; all for second quarter shipment. The largest of the Southern maker's orders was for 350 tons to a stove plant. Most of the buying is by melters outside of St. Louis. Inquiries total about 2000 tons, including 1000 tons for a local concern.

Prices per gross ton at St. Louis:

No. 2 fdy., sil. 1.75 to 2.25 f.o.b. Granite City, Ill.	$19.50 to $20.00
Northern No. 2 fdy., delivered St. Louis	20.66
Southern No. 2 fdy., delivered	20.42
Northern malleable, delivered	20.66
Northern basic, delivered	20.66

Freight rates: 81c. from Granite City to St. Louis; $2.16 from Chicago; $4.42 from Birmingham.

Coke.—Buying of foundry coke is in fair volume, consumers in the district finding it convenient to order from local by-product ovens as they require supplies. Dealers have not begun to buy domestic grades.

Finished Iron and Steel.—The volume of business received during the week by the Granite City Steel Co. showed a slight falling off, but more orders calling for small quantities were received than for some time, which is regarded as indicating that purchasers do not desire to build up stocks of too great proportions. Galvanized sheets are not active, but specifications are coming in at a rate warranting operations of approximately 75 per cent of capacity of this department of the Granite City Steel Co.; all other departments are operating at 100 per cent, the backlog of orders indi-

Warehouse Prices, f.o.b. St. Louis

	Base per Lb.
Plates and structural shapes	3.25c.
Bars, soft steel or iron	3.15c.
Cold-finished rounds, shafting and screw stock	3.75c.
Black sheets (No. 24)	4.45c.
Galvanized sheets (No. 24)	5.25c.
Blue annealed sheets (No. 10)	3.60c.
Black corrugated sheets (No. 24)	4.50c.
Galvanized corrugated sheets	5.30c.
Structural rivets	3.75c.
Boiler rivets	3.75c.
	Per Cent Off List
Tank rivets, $\frac{7}{16}$-in. and smaller, 100 lb. or more	70
Less than 100 lb	65
Machine bolts	60
Carriage bolts	60
Lag screws	60
Hot-pressed nuts, squares, blank or tapped, 200 lb. or more	60
Less than 200 lb	50
Hot-pressed nuts, hexagons, blank or tapped, 200 lb. or more	60
Less than 200 lb	50

cating a continuance of this rate for some time. Structural fabricators report that business is extremely dull. Reinforcing bar awards for the week totaled 465 tons, including 300 tons for an apartment house.

Old Material.—The market for old material continues weak. The only price change is a reduction of 50c. a ton on No. 1 machinery cast. Consumers are buying almost nothing, pending depletion of their stocks, and dealers are trading among themselves for the few unfilled orders on their books. Railroad lists: Southern Railway, 8700 tons; Chesapeake & Ohio, 9298 tons; International & Great Northern, 3260 tons; Chicago, Milwaukee & St. Paul, 1000 tons; Nickel Plate, 37 carloads, and Frisco Lines, 24 carloads.

Prices per gross ton, f.o.b. dealers' yards and delivered St. Louis district consumers' works:

Heavy melting steel	$10.75 to $11.25
No. 1 locomotive tires	12.00 to 12.50
Heavy shoveling steel	10.75 to 11.25
Miscellaneous standard-section rails, including frogs, switches and guards, cut apart	12.00 to 12.50
Railroad springs	13.00 to 13.50
Bundles sheets	8.75 to 9.25
No. 2 railroad wrought	10.75 to 11.25
No. 1 busheling	9.50 to 10.00
Cast iron borings	8.75 to 9.25
Iron rails	13.00 to 13.50
Rails for rolling	12.75 to 13.25
Machine shop turnings	6.50 to 7.00
Steel car axles	17.50 to 18.00
Iron car axles	23.50 to 24.00
Wrought iron bars and transoms	21.00 to 21.50
No. 1 railroad wrought	10.00 to 10.50
Steel rails, less than 3 ft	15.00 to 15.50
Steel angle bars	11.50 to 12.00
Cast iron carwheels	13.00 to 13.50
No. 1 machinery cast	13.00 to 13.50
Railroad malleable	10.75 to 11.25
No. 1 railroad cast	13.00 to 13.50
Stove plate	12.50 to 13.00
Agricultural malleable	12.00 to 12.50
Relaying rails, 60 lb. and under	20.50 to 23.50
Relaying rails, 70 lb. and over	26.50 to 29.00

Canada

Pig Iron Weaker—Larger Demand for Structural Shapes and Bars

TORONTO, ONT., April 17.—Canadian industrial plants are in a fairly strong position with regard to orders booked, while prospective business is in sufficient volume to warrant optimism on the part of iron and steel interests. Canada's external trade in iron and steel and their products is also in a favorable position. In February, Canada exported 3217 tons of steel to the United States; and in January and February exports totaled 8214 tons, which compares with 9330 tons for the first two months of last year. February imports of iron and steel from the United States amounted to 76,160 tons, and in January and February imports from this source totaled 137,807 tons, which compares with 108,109 tons for the first two months of 1927.

Pig Iron.—A steady demand for foundry and malleable iron for prompt delivery continues. Most of the current sales are one or two cars, but some orders for 100 to 200 tons have been placed. There is one inquiry for 1000 tons. Some recent transactions have been put through at $23.10, a decline of 50c. a ton, while others have been booked at $23.60, Toronto. In the Montreal market most of the sales are made at $24.50.

Prices per gross ton:

Delivered Toronto	
No. 1 foundry, sil. 2.25 to 2.75	$23.10 to $23.60
No. 2 foundry, sil. 1.75 to 2.25	23.10 to 23.60
Malleable	23.10 to 23.60
Delivered Montreal	
No. 1 foundry, sil. 2.25 to 2.75	$24.50 to $25.00
No. 2 foundry, sil. 1.75 to 2.25	24.50 to 25.00
Malleable	24.50 to 25.00
Basic	24.00
Imported Iron at Montreal Warehouse	
Summerlee	33.50
Carron	33.00

Structural Steel.—Demand grows for structural steel and reinforcing bars. Sales for the past week totaled close to 5000 tons for the Toronto and Montreal districts alone, while other large contracts are pending. For an extension of the Robert Simpson Co. store, Toronto, 2800 tons of structural steel and 1000 tons of reinforcing bars will be purchased; approximately 4000 tons of reinforcing bars and steel will be required for the new elevator for the Playfair interests to be erected in Toronto; 4000 tons of structural steel will be needed for the steel towers for the Detroit-Windsor international suspension bridge. While some contracts for steel have been placed for new bridges, there is 10,000 tons of bridge steel pending.

Old Material.—Following the active buying movement of the past month, during which time a number of consumers placed second quarter contracts, the demand has fallen off, and current sales are mostly in small tonnages for immediate needs of consumers. The price situation is unchanged.

Dealers' buying prices:

	Toronto	Montreal
Per Gross Ton		
Heavy melting steel	$9.00	$8.00
Rails, scrap	10.00	10.00

Malleable scrap	13.00	....

Boston

Concessions on Large Sizes of Cast Iron Pipe—Steel Scrap Higher

BOSTON, April 17.—Pig iron sales in New England the past week were the smallest for any like period this year. The largest amount sold by any one stack was 500 tons and this was in small lots. Connecticut foundries are taking in iron on contract quite freely, and on the present basis of consumption many of them will be in the market for tonnages before long, but the outlook for business in other New England States is not particularly encouraging. No. 2 plain and No. 2X Buffalo iron is still available at $16 a ton, furnace, all-rail shipment, and New York State furnaces and the Mystic Iron Works are meeting the delivered price. Several hundred tons of Indian No. 2X iron was sold at $21.75 and $22 a ton, Boston, duty paid.

Prices of foundry iron per gross ton, delivered to most New England points:

Buffalo, sil. 1.75 to 2.25	$20.91 to $21.91
Buffalo, sil. 2.25 to 2.75	21.41 to 22.41
East. Penn., sil. 1.75 to 2.25	23.15 to 23.65
East. Penn., sil. 2.25 to 2.75	23.65 to 24.15
Virginia, sil. 1.75 to 2.25	25.71
Virginia, sil. 2.25 to 2.75	26.21
Alabama, sil. 1.75 to 2.25	22.91 to 24.77
Alabama, sil. 2.25 to 2.75	23.41 to 25.27

Freight rates: $4.91 from Buffalo, $3.65 from eastern Pennsylvania, $5.21 all rail from Virginia, $6.91 to $8.77 from Alabama.

Coke.—Consumption of by-product foundry coke in Connecticut is increasing perceptibly, and there is also slight improvement in other New England States. New England foundry coke is still $11 a ton, delivered within a $3.10 freight rate zone. The Connecticut Coke Co., through coal dealers, is soliciting heating coke orders in Connecticut.

Shapes and Plates.—Fabricators are figuring some good-sized tonnages, which, with numerous small lots, give the market a more active appearance. Steel mill representatives quote 1.90c. per lb., base Pittsburgh, on standard shapes, but in the past week a mill took a round tonnage at 1.85c. Plate mills apparently are holding to 1.90c. per lb., base Pittsburgh, but no large tonnages to test prices have been in the market recently.

Cold-Rolled Strip.—New business is coming in slowly, current buying being on a hand-to-mouth basis. The American Steel & Wire Co. continues to quote 3.30c. per lb., base Worcester, Mass., for 1 to 3 ton lots.

Old Material.—No. 1 heavy melting steel is higher, $9.50 a ton on cars at shipping points for Pittsburgh district delivery and $9.25 for shipment to other Pennsylvania consuming points having been paid in several instances in the past week. Scrap T rails are doing better in price and quite a tonnage of relaying rails, including 600 tons shipped via the Panama Canal for a Pacific Coast lumber operation, have been sold at slightly better prices. Girder rails have been sold at $8.10 a ton on cars at shipping point, although $8 seems to be the average top price. Mixed borings and turnings were sold last week at $5.75, $6 and $6.25 on cars, whereas in the previous week nothing higher than $6 was reported. There is little demand for steel turnings except for blast furnace consumption, and prices have dropped. Bundled skeleton has been sold at prices ranging from $5.60 to $6.50 a ton on cars. The Mystic Iron Works continues to buy miscellaneous material, including pipe and stove plate, at $10 a ton, delivered. Machinery cast and textile cast in Boston is slow, but small yards outside of the city are selling quite a little tonnage direct to foundries.

Buying prices per gross ton f.o.b. Boston rate shipping points:

No. 1 heavy melting steel	$9.25 to	$9.50
Scrap T rails	8.50 to	9.00
Scrap girder rails	7.50 to	8.00
No. 1 railroad wrought	10.00 to	10.25
No. 1 yard wrought	7.50 to	8.00
Machine shop turnings	5.50 to	5.75
Cast iron borings (steel works and rolling mill)	6.00 to	6.25
Bundled skeleton, long	5.75 to	6.25
Forge flashings	6.60 to	7.25
Blast furnace borings and turnings	5.75 to	6.25
Forge scrap	6.00 to	6.50
Shafting	13.00 to	13.50
Steel car axles	15.50 to	16.00
Wrought pipe (1 in. in diameter, over 2 ft. long)	7.50 to	8.00
Rails for rolling	10.00 to	10.25
Cast iron borings, chemical	9.50 to	10.00

Prices per gross ton delivered consumers' yards:

Textile cast	$13.50 to	$14.00
No. 1 machinery cast	15.00 to	15.50
No. 2 machinery cast	13.00 to	13.50
Stove plate	10.00 to	10.50
Railroad malleable	13.00 to	13.50

Cast Iron Pipe.—Brockton, Mass., has purchased 550 tons of 24-in. pipe for its water department from R. D. Wood & Co. and 350 tons of 24-in. pipe for its sewerage commission from the Warren Foundry & Pipe Co. Wellesley, Mass., has bought 350 tons of 6, 8 and 12-in. pipe from the Warren Foundry & Pipe Co., and Quincy, Mass., bought 350 tons of 6 to 12-in. cement lined pipe from the same maker. Everett, Mass., has contracted with the Warren company for its 1928 pipe requirements; the amount is not specified, but it probably will be several hundred tons. Winthrop, Mass., has placed 200 tons of 8-in. pipe with a Boston jobber. The United States Cast Iron Pipe & Foundry Co. was the low bidder on 2600 tons of 12 and 18-in. pipe required by Attleboro, Mass., bids for which were opened last week; no award has been made. Competition for business in New England is keen, but a majority of sales of 6 to 12-in. pipe are at $39.10 a ton, delivered common Boston freight rate points. Concessions are being made on larger sizes, however. Small pipe remains at $44.10 a ton, delivered, as most foundries are well sold ahead. The usual $5 differential is asked on class A and gas pipe.

Cold-punched nuts	50 and 5
Stove bolts	70 and 10

*Including quantity differentials.

Cincinnati

Recession in Demand for Steel Products—Pig Iron Sales About 2500 Tons

CINCINNATI, April 17.—Pig iron sales in the past week amounted to about 2500 tons, practically all of which consisted of lots ranging from 250 tons down to single carloads. That the market is likely to remain quiet during the remainder of the month is shown by the absence of inquiries. In fact, the only sizable pending transaction is 3500 tons of Northern and Southern foundry iron for a local consumer. Prices are unaltered, with southern Ohio foundry quoted at $19, base Ironton; Tennessee and Alabama iron, at $16, base Birmingham, and Jackson County silvery at $25, base furnace, for 8 per cent. Northern Ohio makers are reported to be asking a minimum of $16.50, base furnace.

Prices per gross ton, delivered Cincinnati:

So. Ohio fdy., sil. 1.75 to 2.25		$20.89
So. Ohio malleable	$20.14 to	20.89
Alabama fdy., sil. 1.75 to 2.25		19.69
Alabama fdy., sil. 2.25 to 2.75		20.19
Tennessee fdy., sil. 1.75 to 2.25		19.69
Southern Ohio silvery, 8 per cent		26.89

Freight rates, $1.89 from Ironton and Jackson, Ohio; $3.69 from Birmingham.

Finished Material.—Lessened demand for finished steel products, as reflected in the decreased volume of specifications and orders, is having an effect on prices of sheets and common wire nails. In the sheet market, several small mills have attempted to stimulate buying by reducing quotations from $2 to $3 a ton and as a defensive measure larger producers have been compelled to follow suit. The result has been that galvanized stock is selling rather generally at 3.65c., base Pittsburgh, as against the former price of 3.75c. Blue annealed sheets are selling at 2c., base Pittsburgh, to large users, with small consumers paying $2 a ton more, while automobile body sheets are quoted at 4c., base Pittsburgh. Black sheets range from 2.75c. to 2.85c., base Pittsburgh, with the intermediate price of 2.80c. quoted in many cases. Bookings of common wire nails have been only fair, and competition for second quarter business is intense. Some sales of nails have been made at $2.50 a keg, base Ironton, but a considerable proportion of the orders is being taken on the basis of $2.55 to $2.60, base Pittsburgh. There has been no perceptible improvement in structural steel, movement of which is lagging. Bars, structural shapes

Warehouse Prices, f.o.b. Cincinnati

	Base per Lb.
Plates and structural shapes	3.40c.
Bars, soft steel or iron	3.30c.
New billet reinforcing bars	3.15c.
Rail steel reinforcing bars	3.00c.
Hoops	4.00c. to 4.25c.
Bands	3.95c.
Cold-finished rounds and hexagons	3.85c.
Squares	4.35c.
Black sheets (No. 24)	4.05c.
Galvanized sheets (No. 24)	4.90c.
Blue annealed sheets (No. 10)	3.60c.
Structural rivets	3.85c.
Small rivets	65 per cent off list
No. 9 annealed wire, per 100 lb.	$3.00
Common wire nails, base per keg	2.95
Cement coated nails, base 100 lb. keg	2.95
Chain, per 100 lb.	7.55
	Net per 100 Ft.
Lap-welded steel boiler tubes, 2-in.	$18.00
4-in.	38.00
Seamless steel boiler tubes, 2-in.	19.00
4-in.	39.00

and plates are quoted at 1.85c., base Pittsburgh, to contract users and at 1.90c. to small consumers. Sales of cold-rolled bars and strips have been holding up fairly well.

Reinforcing Bars.—New billet bars are quoted at 1.85c. to 1.90c., base Pittsburgh, and rail steel stock at 1.80c. to 1.85c., base mill.

Warehouse Business.—While several jobbers report that shipments out of warehouses are running about 15 per cent ahead of those in March, others have not participated in the increased volume of sales and therefore are somewhat disappointed at the total tonnage which they have booked since the first of the month. Prices are firm and unchanged.

Coke.—By-product foundry coke specifications continue to show a downward trend, although shipments are still in liberal volume. Several dealers report that sales of by-product domestic coke are larger than normal for April because of the low price in effect this month. Producers in this district are encountering competition in by-product foundry coke from Birmingham companies, which are naming delivered prices lower than those of companies at Indianapolis, Portsmouth and Ashland. This condition especially applies in southern Ohio and in southern Indiana.

Foundry coke prices per net ton, delivered Cincinnati: By-products coke, $9.02; Wise County coke, $7.09 to $7.59; New River coke, $9.09 to $9.59. Freight rates, $2.14 from Ashland, Ky.; $2.59 from Wise County and New River ovens.

Old Material.—Steel plants in this district are accepting contract shipments at a normal rate and also are buying small tonnages. However, they are willing to pay only the lowest prices. Many items on railroad lists which were closed last week are reported to have brought slightly less than in March. There is a fair demand for foundry grades, but blast furnace items are weak.

Dealers' buying prices per gross ton f.o.b. cars, Cincinnati:

Heavy melting steel	$11.50 to $12.00
Scrap rails for melting	11.75 to 12.25
Loose sheet clippings	8.50 to 9.00
Bundled sheets	9.50 to 10.00
Cast iron borings	8.00 to 8.50
Machine shop turnings	7.50 to 8.00
No. 1 busheling	10.00 to 10.50
No. 2 busheling	7.00 to 7.50
Rails for rolling	12.50 to 13.00
No. 1 locomotive tires	12.75 to 13.25
No. 1 railroad wrought	10.00 to 10.50
Short rails	15.75 to 16.25
Cast iron carwheels	12.25 to 12.75
No. 1 machinery cast	15.50 to 16.00
No. 1 railroad cast	13.00 to 13.50
Burnt cast	7.50 to 8.00
Stove plate	8.25 to 8.75
Brake shoes	9.50 to 10.25
Railroad malleable	12.00 to 12.50
Agricultural malleable	11.50 to 12.00

Britain Supplies More Than Half of World's Tin Plate Exports

WASHINGTON, April 17.—Estimating that six-tenths of the tin plate entering export markets of the world is of British origin, three-tenths of American manufacture and the remaining tenth predominantly of German origin, with small amounts from other countries, the iron and steel division of the Department of Commerce, has prepared detailed figures showing the export movement of this product during 1927, 1926 and 1925. Shipments from Great Britain during those years were 472,029 gross tons, 375,041 tons and 511,355 tons; from the United States, 253,890 tons; 250,782 tons and 161,383 tons, and from Germany, 29,116 tons; 19,513 tons and 10,033 tons, respectively.

In 1926, exports of tin plate from Great Britain were placed at 65.6 per cent of the total output of that country as against 66.7 per cent in 1925. The German exportation represented 19.8 per cent of production in 1926 and 11.2 per cent in 1925. American exportations were 14.1 per cent of the total product made in 1926 and 9.7 per cent in 1925. Production of tin plate in Great Britain was declared to be 571,200 tons in 1926 and 766,600 tons in 1925; in the United States, 1,782,306 tons and 1,657,794 tons, and in Germany, 89,637 tons and 98,788 tons, respectively. In France production for 1926 was fixed at 63,132 tons and in India for that year the estimate was 34,400 tons.

Buffalo

Steel Plant Operations Continue at About 85 Per Cent

BUFFALO, April 17.—Pig iron inquiry and sales have been very light, though the foundry melt is rising and shipping directions are good. Prices continue firm in the district at $17 for No. 2 plain, 1.75 to 2.25 per cent silicon, and $17.50 for malleable. The Eastern Malleable Iron Co. is seeking 1500 to 2500 tons of malleable. Most of the remaining inquiry is for carload lots.

Prices per gross ton, f.o.b. furnace:

No. 2 plain fdy., sil. 1.75 to 2.25	$17.00
No. 2 foundry, sil. 2.25 to 2.75	17.50
No. 1X foundry, sil. 2.75 to 3.25	18.50
Malleable, sil. up to 2.25	17.50
Basic	16.50 to 17.00
Lake Superior charcoal	27.28

Finished Iron and Steel.—Operations continue at about 85 per cent for most of the plants. Bars, shapes and plates are firm. Sheet business is good, but prices are weaker. On especially desirable tonnage, black and galvanized sheets have been shaded $2 a ton. Considerable pipe business was taken following the notice of intention to increase the price and before the new price actually went into effect. Jobbers generally specified up to the limit of their allotment. Bolt and nut business is good. A local maker is running double turn and three shifts in some instances. The Rochester Gas & Electric Co. will erect a gas holder requiring 800 tons of reinforcing bars and a considerable tonnage of structural steel.

Old Material.—A reported purchase of 1000 tons of heavy melting steel is said to have been made at $14.75. Mills are consuming large quantities of material. A local consumer expects soon to receive shipment of hydraulic bundles and flashings purchased in Detroit. Two boats are loaded, ready for the opening of navigation. This scrap, about 30,000 tons, was purchased from consumers.

Prices per gross ton, f.o.b. Buffalo consumers' plants:

Basic Open-Hearth Grades	
No. 1 heavy melting steel	$14.50 to $15.00
No. 2 heavy melting steel	12.75 to 13.25
Scrap rails	13.75 to 14.25
Hydraulic compressed sheets	13.00 to 13.50
Hand bundled sheets	9.00 to 9.50
Drop forge flashings	12.00 to 12.50
No. 1 busheling	13.25 to 13.75
Heavy steel axle turnings	12.50 to 12.75
Machine shop turnings	8.25 to 8.75
Acid Open-Hearth Grades	
Railroad knuckles and couplers	15.50 to 16.00
Railroad coil and leaf springs	15.50 to 16.00
Rolled steel wheels	15.50 to 16.00
Low phosphorus billet and bloom ends	17.00 to 17.50
Electric Furnace Grades	
Heavy steel axle turnings	12.75 to 13.25
Short shoveling steel turnings	10.75 to 11.25
Blast Furnace Grades	
Short shoveling steel turnings	10.50 to 11.00
Short mixed borings and turnings	9.50 to 10.00
Cast iron borings	9.75 to 10.25
No. 2 busheling	9.00 to 9.50
Rolling Mill Grades	
Steel car axles	17.00 to 17.50
Iron axles	22.00 to 23.00
No. 1 railroad wrought	12.50 to 13.00
Cupola Grades	
No. 1 machinery cast	14.50 to 15.00
Stove plate	13.00 to 13.50
Locomotive grate bars	12.00 to 12.50
Steel rails, 3 ft. and under	16.50 to 17.00
Cast iron carwheels	13.00 to 13.50
Malleable Grades	
Railroad	15.00 to 15.25
Agricultural	15.00 to 15.25
Industrial	15.00 to 15.25

Warehouse Prices, f.o.b. Buffalo

	Base per Lb.
Plates and structural shapes	3.40c.
Soft steel bars	3.30c.
Reinforcing bars	2.75c.
Cold-finished flats, squares and hexagons	4.45c.
Rounds	3.95c.
Cold-rolled strip steel	5.85c.
Black sheets (No. 24)	4.30c.
Galvanized sheets (No. 24)	5.15c.
Blue annealed sheets (No. 10)	3.80c.
Common wire nails, base per keg	$3.65
Black wire, base per 100 lb.	3.90

*Refinery quotation; delivered price ¼c. higher.

NEW YORK, April 17.—Tin is the only market that is at all active, and a good business has been done at slightly lower prices. Very little buying of copper is noted, but quotations are firm. Lead and zinc are also inactive at practically unchanged prices.

Copper.—Another week of very light business is recorded in electrolytic copper. There is almost no domestic demand, but there has been fair buying for export. Leading producers continue to maintain firmly quotations at 14.25c., delivered in the Connecticut Valley. From one or two sources less than carload lots can be bought at slight concessions; the lowest level reported is 14.17½c., delivered. It is believed that domestic consumers must still buy considerable metal for May and that foreign buyers must contract for considerable copper for both April and May. Because of this some expect another buying movement in the near future. Copper statistics for March are not particularly impressive, showing only a slight increase in refined stocks but a loss in output at the mine as compared with February's figures. Lake copper is not particularly active, but is steady at 14.25c., delivered. A good business has been done.

Tin.—Sales for the week ended Saturday, April 14, were between 1400 and 1500 tons, consisting principally of transactions among dealers, although some was bought by consumers, who are showing more interest. It is believed that the latter have considerable to buy for May and June. It is stated that supplies are none too plentiful. There was some pressure to sell prompt tin last week by dealers, with the result that it fell into strong hands, rendering the price for that delivery very firm, with some possibility of a premium developing. The principal interest now is in May delivery and a feature is the heavy consumption. About 400 tons changed hands yesterday, Monday, and today the market was moderately active in spot and nearby, with spot Straits tin quoted at 52.75c., New York. Prices in London today were about the same as those of a week ago, with spot standard quoted at £234 17s. 6d., future standard at £235 10s. and spot Straits at £239 7s. 6d. The Singapore price today was £237 15s. Arrivals thus far this month have been 4295 tons, with 5585 tons reported afloat.

Lead.—Demand is very light, which is to be expected after the heavy buying in March and early April. A fair business is being done each day, however. The leading interest continues to quote 6.10c., New York, as its contract price, and in the outside market the quotation is very firm at 6.10c., St. Louis.

Zinc.—Conditions and prices have changed little during the week. There is no anxiety on the part of producers to sell, and consumers are well covered for their nearby requirements of prime Western zinc. Quotations have been practically unchanged at 5.72½c., St. Louis, or 6.07½c., New York. Sales of ore last week at Joplin were the largest in a long time at close to 21,000 tons, with production approximating 10,000 tons. The price is unchanged at $38 per ton. Statistics for March showed that stocks of zinc increased only 239 tons over February's. Production and deliveries, however, were larger than in the preceding month, and there were more retorts active at the end of March.

Nickel.—Wholesale lots of ingot nickel are quoted at 35c., with shot nickel at 36c. and electrolytic nickel at 37c. per lb.

Metals from New York Warehouse

Delivered Prices Per Lb.

Tin, Straits pig	54.50c. to 55.50c.
Tin, bar	57.00c. to 58.00c.

Seamless Tubes—	
Brass	25.12½c.
Copper	26.00c.
Brazed Brass Tubes	26.75c.
Brass Rods	16.50c.

Antimony.—Fairly heavy sales have been made lately, and the market is stronger, with Chinese metal for all positions quoted at 10.25c. per lb., New York, duty paid.

Aluminum.—Virgin metal, 98 to 99 per cent pure, is quoted at 23.90c. per lb., delivered.

Non-Ferrous Metals at Chicago

Chicago, April 17.—Sales of non-ferrous metals in this district are in small volume. Prices are steady except for tin and zinc. Buyers are showing little interest in the old metal market.

Prices, per lb., in carload lots: Lake copper, 14.25c.; tin, 53.50c.; lead, 6.15c.; zinc, 5.90c.; in less-than-carload lots, antimony, 11.50c. On old metals we quote copper wire, crucible shapes and copper clips, 10.50c.; copper bottoms, 9.50c.; red brass, 9.25c.; yellow brass, 7c.; lead pipe, 4.75c.; zinc, 3.25c.; pewter, No. 1, 30c.; tin foil, 36c.; block tin, 45c.; aluminum, 11.75c.; all being dealers' prices for less-than-carload lots.

REINFORCING STEEL

Two Drainage Projects Take 10,250 Tons—Awards Total 16,700 Tons

A SEWER project at Stickney, Ill., taking 5000 tons, and a drainage improvement job at Los Angeles, calling for 5250 tons, brought the week's awards to 16,700 tons, one of the highest figures of the year. New pending work amounting to 5100 tons included 1000 tons for a factory building at Chicago and 1220 tons for another drainage improvement job at Los Angeles. Awards follow:

Boston, 600 tons, loft building, to Concrete Steel Co.

Westchester County, N. Y., 100 tons, road work; from Christopher Brothers, general contractors, to Concrete Steel Co.

New York, 400 tons, section of subway; from Corson Construction Co., general contractor, to Truscon Steel Co.

Oak Park, Ill., 200 tons of rail steel bars, Fair Oakes Garage, to unnamed bidder.

Cleveland, 100 tons, laboratory for Cleveland Clinic, to Patterson Leitch Co.

Chicago, 650 tons, office building at Van Buren Street and West Jackson Boulevard, to Kalman Steel Co.

Chicago, 100 tons, addition to Michael Reese Hospital, to Kalman Steel Co.

Chicago, 1500 tons, addition to Soldier Field, to Olney J. Dean & Co.

Chicago, 500 tons, Woolworth Building, to unnamed bidder.

Chicago, 130 tons of rail steel bars, Edgewater Hospital, to Calumet Steel Co.

Stickney, Ill., 5000 tons, extension to a former sewer contract, to Olney J. Dean & Co.

Milwaukee, 300 tons, building for Sears, Roebuck & Co., to American System of Reinforcing.

St. Louis, 300 tons, apartment house at 3745 Lindell Boulevard, to Laclede Steel Co.

St. Louis, 100 tons, apartment house at Delmar Boulevard and Westgate Avenue, to Missouri Rolling Mills Corporation.

San Francisco, 212 tons, paving work near French Camp, to unnamed bidder.

Berkeley, Cal., 100 tons, warehouse on Shattuck Avenue, to Gunn, Carle & Co.

Seattle, 420 tons, warehouse for William Volker & Co., to Northwest Steel Rolling Mills.

Seattle, 240 tons, Transportation Building, to Northwest Steel Rolling Mills.

Seattle, 100 tons, Fairview School, to Pacific Coast Steel Co.

Pullman, Wash., 100 tons, home economics building for Washington State University, to Pacific Coast Steel Co.

Walla Walla, Wash., 100 tons, sewage disposal plant, to Truscon Steel Co.

Eugene, Ore., 100 tons, machine shops for Southern Pacific Co., to Mercer Steel Co.

Old Metals, Per Lb., New York

The buying prices represent what large dealers are paying for miscellaneous lots from the smaller accumulators and the selling prices are those charged consumers after the metal has been properly prepared for their uses.

	Dealers' Buying Prices	Dealers' Selling Prices
Copper, heavy crucible	12.00c.	13.50c.
Copper, heavy and wire	11.75c.	12.875c.
Copper, light and bottoms	10.00c.	11.25c.
Brass, heavy	7.00c.	8.50c.
Brass, light	6.00c.	7.50c.
Heavy machine composition	9.50c.	10.625c.
No. 1 yellow brass turnings	7.75c.	9.00c.
No. 1 red brass or composition turnings	8.75c.	9.75c.
Lead, heavy	5.00c.	5.50c.
Lead, tea	4.00c.	4.50c.
Zinc	3.00c.	3.50c.
Sheet aluminum	12.50c.	14.50c.
Cast aluminum	12.50c.	14.00c.

Phoenix, Ariz., 263 tons, paving work between Globe and Safford, to unnamed bidder.

Los Angeles, 5257 tons, Drainage Improvement District No. 23 to unnamed bidder; general contract to Will F. Peck, Los Angeles.

Reinforcing Bars Pending

Inquiries for reinforcing steel bars include the following:

New Brunswick, N. J., 1700 tons, highway bridge over Raritan River; general contract to Parker & Graham, Inc., Paterson, N. J.

Crown Point, N. Y., 450 tons of bars and 200 tons of mesh for Lake Champlain bridge.

Rochester, N. Y., 800 tons, gas holder for Rochester Gas & Electric Co.

Chicago, 1000 tons, factory building, Scott Joy, architect.

Chicago, 100 tons, warehouse for R. C. Wieboldt & Co.

Chicago, 200 tons, garage, Rissman & Herschfield, architects.

Chicago, 400 tons, building for Nu-Art Engraving Co., Austin Co., general contractor.

Aurora, Ill., 350 tons, reservoir, Cope & Fisher, Decatur, Ill., low bidders on general contract.

Chicago, 250 tons, Austin High School, Harvey A. Hanson Construction Co., general contractor.

Chicago, 500 tons, Sholem Temple.

Los Angeles, 1220 tons, Drainage Improvement District No. 22, Torson Construction Co., Long Beach, low bidder.

RAILROAD EQUIPMENT

Southern Pacific Inquires for 550 Additional Freight Cars—200 Phosphate Cars Bought

THE Southern Pacific has doubled its original inquiry for 500 flat cars and 50 gondolas. Other fresh inquiries include 500 steel box car underframes for the Chicago, Rock Island & Pacific and 250 bodies for the St. Louis-San Francisco. The Atlantic Coast Line has purchased 200 phosphate cars. Inquiries for more than 100 passenger cars by several railroads also featured the week's business, details of which follow:

Atlantic Coast Line has ordered 200 phosphate cars from Tennesse Coal, Iron & Railroad Co.

New York, New Haven & Hartford is inquiring for 50 to 100 steel underframes for passenger cars.

Western Maryland has placed orders for miscellaneous plates and shapes for reconditioning approximately 500 hopper cars.

Northern Pacific has ordered 50 caboose car underframes from Pacific Car & Foundry Co.

Standard Oil Co. of New Jersey has ordered six 50-ton steel box cars from Pressed Steel Car Co.

Baltimore & Ohio will purchase 10 combination baggage and mail cars.

Chicago, South Shore & South Bend will buy 15 motor cars and five trailers.

Chicago, Rock Island & Pacific will purchase 500 box car underframes for cars to be built in its Armourdale, Kan., shops.

Chicago & North Western has ordered five motor car bodies from Pullman Car & Mfg. Corporation.

Union Pacific has ordered four motor car bodies from Pullman Car & Mfg. Corporation.

St. Louis-San Francisco will purchase 250 car bodies.

Cleveland, Cincinnati, Chicago & St. Louis will buy 40 passenger cars.

Southern Pacific will purchase 500 flat cars and 50 gondola cars, in addition to like numbers on which prices were recently asked. This railroad is also in the market for 25 coaches, five compartment coaches, 10 baggage and 6 baggage-postal cars.

FABRICATED STRUCTURAL STEEL

Highway Bridge at Charleston, S. C., Will Take 12,000 Tons—Awards of 35,450 Tons

WITH a highway bridge over the Cooper River at Charleston, S. C., which will take 12,000 tons and a bridge across Lake Champlain at Crown Point, N. Y., requiring 3000 tons, new projects brought out during the week totaled 40,800 tons. Awards amounted to 35,450 tons, the largest 6000 tons for a bridge approach at St. Louis and 5000 tons for a section of the subway in New York. Awards follow:

South Boston, 200 tons, New York, New Haven & Hartford Railroad freight shed, to New England Structural Co.

Boston, 114 tons, bridge, Brighton district, Boston & Albany Railroad, to Boston Bridge Works, Inc.

Ayer, Mass., 850 tons, transmission towers for New England Power Construction Co., to American Bridge Co.

Bangor & Aroostook Railroad, 315 tons, bridge at Monticello, Me., to an unnamed fabricator.

New York, 5000 tons, section 2, route 109, of subway; from Rodgers & Hagerty, Inc., general contractor, to American Bridge Co.

New York, 4400 tons, Governor Clinton Hotel, Seventh Avenue and Thirty-first Street, to Hedden Iron Construction Co.

New York, 1000 tons, Waterside Tie Station for New York Edison Co., to Levering & Garrigues Co.

Liverpool, N. Y., 200 tons, high school, to Union Structural Steel Co.

Harrison, N. J., 950 tons, building for Otis Elevator Co., to Shoemaker Bridge Co.

Central Railroad of New Jersey, 160 tons, bridge at Scranton, Pa., to American Bridge Co.

Philadelphia, 150 tons, building for Philadelphia Electric Co., to Belmont Iron Works.

Hot Springs, Va., 450 tons, hotel, to American Bridge Co.

Southern Railway, 730 tons; 550 tons for viaduct at Clouds, Tenn., and 180 tons for miscellaneous bridges, to Virginia Bridge & Iron Co.

Buffalo, 155 tons Junior beams for Dupont Rayon Co. building, to Jones & Laughlin Steel Corporation.

Lock Haven, Pa., 150 tons Junior beams for Lock Haven High School, to Jones & Laughlin Steel Corporation.

Butler, Pa., 3500 tons, mill extension, American Rolling Mill Co., to McClintic-Marshall Co.

New Castle, Pa., 110 tons, Weingartner Realty Co. garage, to American Bridge Co.

Cleveland, 1200 tons, two bridges for Cleveland Union Terminals Co., to Fort Pitt Bridge Works.

Cleveland, 112 tons, Fairview Village high school, to Wellman-Seaver-Morgan Co.

Dayton, Ohio, 400 tons, Dayton-Biltmore Hotel, to American Bridge Co.

Newark, Ohio, 160 tons, Midland Theater, to Massillon Bridge & Structural Co.

Middletown, Ohio, 400 tons, gas producer building and extension to open-hearth building American Rolling Mill Co., to Jones & Laughlin Steel Corporation.

New Orleans, 3100 tons, wharf sheds, to Lukens Steel Co.

Appleton, Wis., 350 tons, building for Consolidated Water Power & Paper Co., to Wisconsin Bridge & Iron Co.

Wisconsin Rapids, Wis., 550 tons, digester house and warehouse for Consolidated Water Power & Paper Co., to Wisconsin Bridge & Iron Co.

Marinette, Wis., 200 tons, interstate bridge, to Wisconsin Bridge & Iron Co.

Chicago, 1100 tons, building for Chicago Motor Club, to Gage Structural Steel Co., local; previously reported to American Bridge Co.

Chicago, 100 tons, power plant for Chicago, Burlington & Quincy Railroad, to Midland Structural Steel Co., local.

Chicago, 275 tons, addition to Sheridan Trust & Savings Bank Building, to Worden-Allen Co.

Davenport, Iowa, 500 tons, Rock Island Railroad bridge, to Fort Pitt Bridge Works.

Des Moines, Iowa, 700 tons, court building, to Des Moines Steel Co.

St. Louis, 6000 tons, southern approach to Free Bridge, to American Bridge Co.

Kansas City, Mo., 1400 tons, building for Sheffield Steel Corporation, to Kansas City Structural Steel Co.

Oakland, Cal., 250 tons, hangars for Port Commission, to Moore Dry Dock Co.

Redwood City, Cal., 125 tons, theater, to Golden Gate Iron Works.

Pittsburg, Cal., 376 tons, factory for Johns-Manville Co., to Dyer Brothers.

Pittsburgh, 511 tons, National Biscuit Co. building, to Fort Pitt Bridge Works.

Los Angeles, 150 tons, structural steel for city work, to McClintic-Marshall Co.

San Diego, Cal., 165 tons, cotton warehouse, to National Iron Works.

Structural Projects Pending

Inquiries for fabricated steel work include the following:

Boston, 400 tons, apartment house on Newbury Street.

Boston, 150 tons, Thompson Spa building on Summer Street.

Middletown, N. H., 227 tons, two bridges.

State of New Hampshire, 145 tons, bridges at Bethlehem, Lisbon and Wentworth.

Maine Central Railroad, 325 tons, bridges.

Crown Point, N. Y., 3000 tons, bridge over Lake Champlain from Crown Point to Chimney Point, Vt.; bids early in May.

State of New York, 200 tons, highway bridge.

Jamaica, N. Y., 400 tons, building for Cox Baking Co.

Rochester, N. Y., 1000 tons, Benjamin Franklin High School, to F. L. Heughes & Co.

State of New Jersey, 160 tons, highway bridge near Flemington.

West End, N. J., 900 tons, H. T. Parson residence; bids in.

Lehigh Valley Railroad, 950 tons, bridge at Newark, N. J.

Philadelphia 1400 tons, apartment building on Spruce Street; bids in.

Philadelphia, 1000 tons, building for Jefferson Medical College; bids in.

Sunbury, Pa., 1600 tons, bridge over Susquehanna River.

Baltimore & Ohio Railroad, 1900 tons, bridges.

Charleston, W. Va., 1800 tons, Kanawha Valley Bank; bids in.

Charleston, S. C., 12,000 tons, Cooper River bridge; bids in.

Newark, Del., 153 tons, engineering building for University of Delaware, general contractor Northeast Construction Co.

Philadelphia, 900 tons, apartment building at Fifteenth and Spruce Streets, general contractor Foundation Co.

Cleveland, 1200 tons, Lake Shore Hotel.

Cleveland, 350 tons, Y. M. C. A. technical schools.

Madison, Wis., 135 tons, overhead bridge on Janesville-Stoughton-Madison State trunk highway; bids close April 25.

State of Illinois, 900 tons, highway bridges; A. C. Wood, Rockford, Ill., low bidder on five bridges; Hansell-Elcock, Chicago, low bidder on one bridge, and Continental Bridge Co., Chicago, low bidder on two bridges.

Chicago, 2000 tons, reconstruction of Fine Arts Building, Jackson Park; Graham, Anderson, Probst & White, architects.

Chicago, 700 tons, building for Crane Co.; Graham, Anderson, Probst & White, architects.

Chicago, 1700 tons, bridge for Baltimore & Ohio.

Minneapolis, 1100 tons, office building for Northern States Power Co.

St. Joseph, Mo., 2100 tons, bridge across Missouri River.

Denver, Colo., 445 tons, siphons for Kittitas Canal project, Yakima, Wash.; Pittsburgh-Des Moines Steel Co., low bidder.

Shreveport, La., 300 tons, overhead crossing for Kansas City Southern Railroad.

New Orleans, 1000 tons, coffee sheds.

McGill, Nev., 600 tons, building at Kimberly mine.

Monterey, Mex., 370 tons, building for American Smelting & Refining Co.

Sacramento, Cal., 600 tons, bridge over Smith River, Del Norte County; Park Schramm Co., Portland, low bidder on general contract.

San Francisco, 100 tons, addition to store, 1041 Market Street; bids being taken.

Riverside, Cal., 300 tons, Riverside Drive crossing over Pacific Electric Co. tracks; bids being taken by Pacific Electric Co., Los Angeles.

Los Angeles, 685 tons, I beams for city; bids April 23.

Chehalis, Wash., 100 tons, bridge over Chehalis River for Grays Harbor County; Car Bjork, low bidder.

Olympia, Wash., 220 tons, bridge over McKenzie River near Coburg; bids April 20.

Kettle Falls, Wash., 1100 tons, bridge.

The Bank of Pittsburgh has been appointed receiver of the Consolidated Coke Co., Pittsburgh, upon petition of the National Transportation Co., to which the Coke company is indebted in the sum of $16,438. The Marine Trust Co., Buffalo, has entered suit against the company for payment of a note for $9,000. Assets of the company are given as $2,000,000, subject to mortgage indebtedness of $586,000, while accounts payable amount to $211,266. The receivership, it is believed, will obviate the possibility of forced liquidation of the company.

PERSONAL

H. D. Savage, for many years vice-president of the Combustion Engineering Corporation, 200 Madison Avenue, New York, has been elected president of the company, succeeding Joseph V. Santry, who has resigned. George T. Ladd, who has been prominently identified with the Combustion company and other subsidiaries of the International Combustion Engineering Corporation, has been elected vice-chairman of the board of the Combustion Engineering Corporation. Before entering the pulverized fuel field Mr. Savage was head of the Ashland Fire Brick Co., Ashland, Ky., and participated in the organization of and served as first president of the Refractory Manufacturers' Association. In 1914 he became president of the American Arch Co., and two years later, went with the Locomotive Pulverized Fuel Co. as vice-president. When the Combustion Engineering Corporation purchased the Lopulco Pulverized Fuel Systems in 1920, Mr. Savage became associated with the former company as directing head of the pulverized fuel division. He holds offices in a number of the other subsidiaries of the International company and is a member of numerous technical societies and clubs. Mr. Ladd, who is president of the Ladd Water Tube Boiler Co. and the Heine Boiler Co., has for many years been identified with the manufacture and installation of steam boilers.

H. D. SAVAGE

G. T. LADD

—

James A. Farrell, president of the United States Steel Corporation, will sail Saturday on the Conte Grande for a stay of several weeks in Europe.

—

H. B. Hazerodt has resigned as manager of the Detroit branch of the Black & Decker Mfg. Co., Towson, Md., and has been succeeded by J. H. Walker, who has been in the company's Detroit sales organization for the last five years. The company has just removed its offices and showroom in that city to 11501 Woodward Avenue. H. L. Balke is now associated with the company's Kansas City, Mo., branch, succeeding S. D. Shawgo in the territory around Omaha, Neb. G. F. Parr has taken the place of J. H. Hutton in the Buffalo territory and G. N. McCarthy has succeeded H. B. Austin in the same office, Mr. Austin having been transferred to Chicago. J. A. Murray is now associated with the Baltimore office, succeeding Curtiss Watts.

—

J. E. Mullen, formerly assistant sales manager of the R. D. Nuttall Co., Pittsburgh, has been placed in charge of the company's commercial activities which are now being handled through the Westinghouse Electric & Mfg. Co., of which the Nuttall company is a subsidiary. Mr. Mullen's headquarters will be at the Nuttall plant, McCandless Avenue and Butler Street, Pittsburgh.

—

M. S. Sternberg has been appointed general superintendent of the Hubbard Steel Foundry Co., East Chicago, Ind., succeeding the late Robert W. Freeland. H. A. Forsberg, formerly production engineer for that company, has been made assistant general superintendent.

—

William C. Hays, formerly vice-president and a director of J. K. Larkin & Co., Inc., New York, has formed the Hays Steel & Wire Corporation, with offices and warehouse at Metropolitan and Woodward Avenues, Brooklyn. The company will distribute general steel products, including bars, shapes, bands, plates, nails, wire, sheets and bolts.

—

Irving C. Bolton, treasurer Warner & Swasey Co., Cleveland, has been elected a director of the Cleveland Chamber of Commerce. Among the other new directors are L. R. Scafe, treasurer and general manager Fisher Body Ohio Corporation, and A. S. Rodgers, president White Sewing Machine Corporation.

—

Walter E. Foster, who has been in the Bridgeport, Conn., office of the Reading Steel Casting Co., has been transferred to the Chicago office and made sales manager of the company.

—

Edward P. Geary has been appointed district sales manager of a sales office recently opened at 375 Ellicott Square, Buffalo, by the Colonial Steel Co., Pittsburgh. L. O. Burrell and J. S. Smith are also associated with the office, the territory of which includes Erie, Pa., western New York State and Ontario, Canada.

—

E. H. Gartrell was elected president and general manager of the Ashland Fire Brick Co., Ashland, Ky., at a recent meeting of directors. John Russell was named vice-president and E. M. Weinfurtner, secretary and treasurer.

—

A. M. Branum, formerly in the Chicago office of the Jones & Laughlin Steel Corporation and for a time with Joseph T. Ryerson & Son, Inc., Chicago, has joined the Chicago sales organization of the Bethlehem Steel Co.

—

Frederick A. Westphal, since 1922 assistant superintendent of the rod and wire department at the Aliquippa works, Jones & Laughlin Steel Corporation, Pittsburgh, resigned March 15 and has been appointed superintendent of the wire department now under construction by the Sheffield Steel Corporation, Kansas City, Mo. He was graduated from the United States Naval Academy in 1916 and soon became associated with the American Steel & Wire Co., first as foreman at its Worcester, Mass., plant and later as wire rope engineer in the New York office. With the exception of two years as a field artillery officer with the First Division, American Expeditionary Forces, he remained with the Steel & Wire company until his association with the Jones & Laughlin company in 1922.

—

Arthur R. Adelberg, recently district sales manager at Philadelphia for the Cyclops Steel Co., Titusville, Pa., and the Universal Steel Co., Bridgeville, Pa., has resigned to become associated with the Duraloy Co., Pittsburgh. He will specialize in the sale of chrome iron and other noncorrosive and heat resisting castings and rolled products, with headquarters at the company's Eastern sales offices, 136 Liberty Street, New York.

—

A. N. Bakhtiarov, chief engineer of the Yurt, or Soviet Southern Ore Trust, accompanied by other officials of the organization, has arrived in the United States to make a three months' study of American production methods and mining equipment.

Nelson G. Craig has been appointed district sales manager at Philadelphia, with offices at 1420 Walnut Street, of the Oliver Iron & Steel Corporation, Pittsburgh. He was formerly associated with the Rumsey Electric Co., Philadelphia.

Charles T. Scott, formerly associated with Briggs & Turivas, Inc., and the Republic Rolling Mill Corporation, Chicago, has organized the Scott Steel Co., 110 South Dearborn Street, Chicago, to deal in iron and steel.

Prof. Franz A. Kartak, since 1921 head of the department of electrical engineering, Marquette University, Milwaukee, has been appointed dean of the college of engineering. He succeeds Frank C. French, dean since 1924, who is returning to his former home at Lake City, Colo. Professor Kartak received his bachelor of science degree in electrical engineering at the University of Wisconsin in 1909, and the degree of electrical engineer at Wisconsin in 1911. He went to Marquette from the School of Engineering of Milwaukee. Prof. William D. Bliss, head of the Marquette mechanical engineering department, has resigned to accept a similar position at Texas Agricultural and Mechanical College, College Station, Tex. Professor Bliss became associated with Marquette University in 1914 and will remain until the close of the school year, assuming his new duties Sept. 1.

W. H. Bowden, Maytag Co., Newton, Iowa, spoke on April 16 at a meeting of the Quad-City Foundrymen's Association at the LeClaire Hotel, Moline, Ill.

Carl F. Scott, manager of building equipment sales, General Electric Co., Schenectady, N. Y., has been made assistant sales manager of the Gurney Elevator Co., New York. He is a graduate of Haverford College, Haverford, Pa., and has been with the General Electric Co. since 1908.

L. G. Bradley, well known in the machinery business in the Detroit district, has just returned from a trip to England as the American representative for the purchase of machinery of Alfred Herbert, Ltd., Coventry, England, and established offices in the Boyer Building, Detroit.

Thomas J. Bray, Jr., has been appointed assistant general superintendent Republic Iron & Steel Co., Youngstown, Ohio, succeeding Caleb Davies, Jr., who resigned recently to become vice-president American Tar Products Co., Pittsburgh.

T. J. Bray Resigns Republic Presidency

THOMAS J. BRAY

Thomas J. Bray, for 17 years president of the Republic Iron & Steel Co., Youngstown, has announced his resignation from that office and retirement from active business, effective May 1. On that date he will be 61 years of age and will have completed 41 years of active association with the steel industry. During his identification with the Republic company it has expanded from a producer of rolled iron products to one of the country's largest independent steel producers and since he has been chief executive, the company has built two blast furnaces, the entire open-hearth plant, the by-product coke ovens and the tube works.

Mr. Bray was born at Pittsburgh and attended the public schools in that city. His first work was as an apprentice in pattern making with the Lewis Foundry & Machine Co., Pittsburgh, at which he was engaged from 1883 until 1886. During the next four years he became chief draftsman of this company and was also identified with the Riverside Iron Works, Benwood, W. Va., later the Riverside works of the National Tube Co., a plant designed and built by his father and of which the elder Mr. Bray was for a time superintendent.

In 1890 the younger Mr. Bray left the Lewis company to enter Lehigh University, and four years later was graduated from that institution with the degree of mechanical engineer. Upon leaving college he went with the Ohio Steel Co., Youngstown, now the Ohio works of the Carnegie Steel Co., but severed that connection a few years later to become associated with McGill & Co., Pittsburgh. He was secretary and mechanical engineer of that company in 1901 when it became a part of the United Engineering & Foundry Co. and remained with the latter company for the next five years as chief engineer.

Upon going with the Republic company in 1906 he was assistant to the president and a short time later became vice-president in charge of operations. He was elected president of the company in April, 1911.

Mr. Bray is a member of the American Iron and Steel Institute, the (British) Iron and Steel Institute and the American Society of Mechanical Engineers. He is a director of the Dollar Savings & Trust Co., Youngstown, and of a number of other financial and industrial organizations.

Honor Edgar C. Felton

Edgar C. Felton was tendered a testimonial dinner at the University Club in New York, April 14, by fellow workers in the one-time Pennsylvania Steel Co., of which he was president when it became a part of the Bethlehem Steel Co. The dinner was in commemoration of his arriving at the age of 70 years and proved not only a personal tribute to Mr. Felton but an indication of the notable esprit de corps of the organization of which Mr. Felton was the head.

John C. Jay, who was vice-president and general manager of sales of the company when it was merged into the Bethlehem company, organized the dinner, which was attended by no less than 80 men, some of whom had come a considerable distance. R. W. Gillispie was toastmaster, and among those who spoke were W. H. Donner, now head of the Donner Steel Co.; Frederick W. Wood. formerly president of the Maryland Steel Co., which was a part of the Pennsylvania Steel property; J. V. W. Reynders, now a consulting engineer in New York; Frank A. Robbins, Jr., now general superintendent of the Steelton works of the Bethlehem Steel Co., as the Pennsylvania Steel plant is now known, and Charles S. Clark, who represented the company in Boston for many years. Among those present also were John B. Downes, formerly superintendent of the Steelton rail mill and now 80 years of age, and F. W. Cram, ex-president of the Bangor & Aroostook Railroad. The messages received included a cablegram from Thomas Blagden, Jr., from Sydney, Australia, where he represents the White Motor Co.

A huge birthday cake with 70 candles, carried in by four chefs, was a feature of the dinner. Mr. Felton was presented with a silver box in commemoration of the event.

The V. E. Montgomery Co., 408 First National Bank Building, Cincinnati, pig iron and coke dealer, has been appointed exclusive sales agent in the Central, North Central and Western States for the foundry and furnace beehive coke manufactured by the Wise Coal & Coke Co., Dorchester Junction, Va.

OBITUARY

Harmon W. Hendricks, president of Hendricks Brothers, Inc., 49 Cliff Street, New York, who died at his home in that city on March 31, had been identified with the manufacture of copper and sale of non-ferrous metals for more than 50 years. He was in his eighty-third year and was the last of three brothers to be associated with the firm which had conducted business in this country for 125 years. The company operates copper rolling mills at Soho, N. J., and also the Belleville Copper Rolling Mills, Belleville, N. J., which have been in continuous operation since 1813. The firm also conducts a jobbing business in non-ferrous products of all kinds.

Robert J. Hanna, treasurer Weirton Steel Co., Weirton, W. Va., died at the Homeopathic Hospital, Pittsburgh, April 9, following an operation. He was 45 years of age and had been identified with the Weirton company for nine years.

Robert C. Garrison, superintendent of the Salem, Ohio, works of the American Steel & Wire Co., died April 11, aged 52 years. He had been in poor health for several months. Mr. Garrison's first employment with the Steel & Wire company was as a timekeeper in one of its Cleveland plants. In 1917, after various promotions, he was made assistant superintendent of the Consolidated works, Cleveland, and in the following year, assistant superintendent of the H. P. Works, Cleveland. He was appointed superintendent of the Salem plant in 1924.

A. L. Broomall, manager renewal parts engineering department, Westinghouse Electric & Mfg. Co., East Pittsburgh, died at his home in Wilkinsburg, Pa., April 10. He was 44 years old, and had been identified with the Westinghouse company since his graduation from Lehigh University in 1906.

George J. Smiley, sales manager in the Middle West for the Remington Arms Co., Inc., New York, died on April 12 at the Battle Creek Sanitarium, Battle Creek, Mich., following a week's illness. He was a brother of John B. Smiley, recently president of the Remington company.

William W. Sharp, district sales manager at Akron, Ohio, for the Pierce, Butler & Pierce Mfg. Corporation, New York, died on April 9 at the Cleveland Clinic Hospital, Cleveland, following an illness of six months. He was 39 years of age and was president and general manager of the Mill & Mine Supply Co. and the Akron Warehouse Co., both of Akron, until those companies were absorbed by the Pierce, Butler & Pierce organization in August, 1926.

John Penn Brock, general manager of the Lebanon, Pa., plant of the Bethlehem Steel Co., died suddenly in Rome, Italy, on April 9, aged 48 years. He entered the service of the Pennsylvania Steel Co. in 1903 and filled various positions at Steelton. On Feb. 1, 1907, he went with the American Iron & Steel Mfg. Co. at Lebanon, and became its vice-president and general manager. Upon the acquisition of the company in 1917 by the Bethlehem Steel Co., he was appointed to the position of general manager of this and all the steel producing properties in Lebanon and Cornwall which now constitute the Lebanon plant. He was graduated from Yale University in 1900.

Elmer E. Kiger, for some years steam engineer of the Lackawanna plant of the Bethlehem Steel Co., died suddenly April 5 at Hamburg, N. Y. He was graduated from Cornell University in 1898.

Henry W. King, for years prominently identified with the structural steel fabricating industry in Cleveland as president of the King Bridge Co., which discontinued fabricating work a few years ago, died at his home in Kirtland Hills Village, a Cleveland suburb, April 14, aged 65 years.

A. W. Grant, Jr., for the last 12 years associated with the Koppers Co., Pittsburgh, died on April 5 at the Sewickley Valley Hospital, aged 41 years. He was graduated from Virginia Polytechnic Institute in 1907 and received his mechanical engineering degree from Cornell University in 1909. For the next two years he was engaged in steam engineering work for the Baldwin Locomotive Works, Philadelphia, and eastern steel companies. Before going with the Koppers Co. he was associated for five years with the United Gas Improvement Co., Philadelphia.

Otis Williams, for some years associated with the Clark Machine Co., St. Johnsville, N. Y., died recently at St. Petersburg, Fla., aged 68 years. Before going with the Clark company he had been engaged in the manufacture of agricultural machinery.

R. J. Davis, formerly eastern operating manager of the American Bridge Co., with office in Philadelphia, died April 9, at his home in that city. He was 59 years of age and had been with the American Bridge Co. from 1902 until 1923, when he resigned to become manager of the structural steel shop of the New York Shipbuilding Corporation, Camden, N. J. He continued in that position under the American Brown Boveri Electric Corporation, the new owner of the shipyard, until the structural steel branch of the business was discontinued. For the past year Mr. Davis had been in failing health and had not been active.

Conference on Warehouse Distribution

(*Concluded from page* 1089)

pipe; copper sheets; electrical equipment; fence wire, poultry netting and reinforcing mesh; files; fire extinguishers; granite ware; hacksaw blades and saws, hand and crosscut saws; hoes and handled implements; horse nails; horse shoes; hose, rubber; insulating and plaster board; lawn mowers; lead pipe; leather belting; machine tools; manila rope; milling cutters; paint, linseed oil and white lead; pipe and tubing (iron and steel); plow goods (fitted plow lays, cultivator shovels, etc.); rubber belting, sandpaper, emery cloth and emery wheels; set and cap screws; shovels; silverware; small rivets; steel sheets, including galvanized and roofing products; stove bolts; taps and dies; tin plate; tools—mechanics' and machinists'; tool steel; twist drills and reamers; valves and fittings; vises; washers; wheel goods; window glass and glassware; wire fence; wire nails; wire rope; wire screen; wood and machine screws.

"The discussion will not be limited to the distribution plan of the bolt, nut and rivet industry, but will be open for any constructive suggestions pertaining to the selling and distribution problem.

"If the meeting is called and proves successful, consideration should be given by each industry to the appointment of one man as its representative on a national committee to carry on the work with the jobbers' chairmen.

"Should such a committee of manufacturers be appointed, there would be a condition whereby 34 jobbing executives and approximately 35 manufacturing executives would represent the leading industrial and jobbing interests of the United States, covering the hardware and mill supply lines.

"Should this proposal meet with the universal approval of our manufacturing interests, this meeting would bring together the most representative gathering of executives in the history of American business, and would create an opportunity to put squarely before the country as a whole the great importance to all classes, particularly to labor, of a movement having for its purpose the stabilization of industry."

Machinery Markets and News of the Works

DEMAND CONTINUES FAIR

Slight Recessions from March Volume in Some Quarters

Inquiries Are Still Numerous, However, and Outlook at Least for Remainder of This Month Is Good

UNFILLED orders of machine tool builders are in large volume, and the rate at which business is being received this month indicates that many of the machine tool plants will be working at present capacity until well toward the end of the first half of the year. While in certain sections of the country and in certain lines of tools there have been slight recessions in buying activity this month compared with March, the average seems to be holding up well.

The automotive industry is believed to have done the major part of its spring buying and no further activity of note in that field is expected before fall. Railroad buying is disappointingly small, and the principal signs of encouragement are renewed inquiries from the New York Central, which has bought very little this year, and the prospect that the Santa Fe will close next week on a list of considerable size.

In the East, inquiries have been more numerous and sales have been holding fairly close to the April level. The General Electric Co. has issued inquiries for 25 or 30 tools, and requests for prices on single machines come from all sections of the industrial field. New York sales offices are figuring on about 8 or 10 tools wanted by Dwight P. Robinson & Co. for export.

Tractor plants in the Middle West are among those whose machine tool needs figure prominently in the Chicago market. Fresh inquiry has grown in that territory, and while sales for the first half of April fell below those of the last half of March, the outlook is sufficiently promising to cause expectations of a larger volume during the remainder of the month.

The Cleveland and Cincinnati districts are experiencing a slight recession in buying, partly because of the fact that the automotive industry has satisfied its needs for the present. The Kelsey Wheel Co., Detroit, has bought a number of tools, including drilling machines and lathes. A Cleveland turret lathe manufacturer has sold seven machines for export.

The National Machine Tool Builders' Association reports that March business was better for its members than that of January. The March figures show an upward trend for the industry for the sixth consecutive month. That month's sales were again higher than in any month since May, 1920, and were at about the level reached in the summer of 1919.

New York

NEW YORK, April 17.

CONSIDERABLE inquiry for machine tools has come out in the past week, including 25 or 30 tools wanted by the General Electric Co. and a number for the New York Central Railroad. Scattered inquiry for single machines also is fairly large. Sales for the first half of April have run a little behind the same number of days in March, but the interest of buyers is still so keen that sellers entertain hope that the month will close with a total volume equal to that of last month. Dwight P. Robinson & Co., New York, are inquiring for eight or ten tools for export.

Among purchases by railroads in past week were the following: Boston & Maine, Nos. 10 and 20 Stanley drills; Chicago, Rock Island & Pacific, 36-in. Aurora drill; New York Central Railroad, two Ransom grinders and 24-in. Aurora drill. Cornell University has purchased a No. 111 Ransom drill.

Included in purchases by industrial users of tools was a list of second-hand machines by a Pittsburgh steel company. This list consisted of a 21-in. x 22-ft. LeBlond lathe, 30-in. x 45-ft. Pond lathe, 6-ft. Ridgeway radial drill, 24-in. Safety Emery Wheel Co. grinder, and 4 5/8-in. Bement horizontal boring mill. A company in Pennsylvania has purchased an extra heavy-duty, end-driven axle lathe; a Chicago manufacturer, 1500-lb. single frame Niles steam hammer; an Indiana company, 14-in. Pratt & Whitney vertical surface grinder; a Chicago manufacturer, duplex hand centering machine; a foundry in Chicago, rebuilt 6 x 14-in. Pratt & Whitney thread milling machine; a Chicago forging maker, two No. 3 Pratt & Whitney die sinkers; a Baden company, 13 x 30-in. Pratt & Whitney lathe; a Cincinnati machine tool builder, 13 x 30-in. and 16 x 60-in. Pratt & Whitney lathes; an Eastern electric manufacturer, 12-in. vertical shaper; a Bridgeport, Conn., company two No. 11 multiple spindle drills; a Philadelphia electric company, 13 x 36-in. lathe; a New York company, 20-in. Niles-Acme shaper for shipment to Louisville, Ky.; a Pittsburgh company, Williams 2-in. single-spindle bolt machine for installation in West Virginia.

Newburgh Public Service Corporation, Newburgh, N. Y., is said to be planning to rebuild motor bus service, repair and garage building, destroyed by fire March 31, with loss in excess of $125,000.

W. C. Winters, 2772 Fulton Street, Brooklyn, architect, has plans for a one-story automobile service, repair and garage building, 50 x 300 ft., at Flushing, L. I., to cost about $100,000 with equipment.

Board of Education, Glen Cove, L. I., plans installation of manual training equipment in new high school to cost close to $1,000,000. William J. Beardsley, 49 Market Street, Poughkeepsie, N. Y., is architect.

R. H. Macy & Co., Broadway and Thirty-fourth Street, New York, has plans for a two-story automobile service, repair and garage building for company trucks and cars, to cost more than $110,000 with equipment. R. D. Kohn, 56 West Forty-fifth Street, is architect.

New Jersey Zinc Co., 160 Front Street, New York, has work under way on an addition to its plant at Aquashicola, near Palmerton, Pa., for metal slab production, to cost more than $100,000 with equipment.

American Gas & Electric Co., 30 Church Street, New York, is arranging an appropriation of about $46,000,000 for expansion and betterments in light and power utilities in different parts of the country. Approximately $17,000,000 will be used for completion of addition to steam-operated generating plant at Philo, Ohio, operated by Ohio Power Co., Canton, Ohio, an affiliated organization; a fund of $12,000,000 will be used for new steam-electric generating plant near Pennsville, N. J., for Atlantic City Electric Co., Atlantic City, N. J., another subsidiary, and for service at Wilmington, Del. About $7,000,000 will be expended for steel tower and other transmission lines, including 132,000-volt line from Philo to Fostoria, Ohio; and $4,000,000 will be employed for new power substations and distributing facilities in different localities.

Hinsdale Iron Works, Inc., 1058-64 Rockaway Avenue, Brooklyn, has taken out a permit for a one-story addition, 60 x 100 ft., to cost close to $20,000 with equipment. C. A. Levitt, 2995 Bedford Avenue, is architect.

United Electric Light & Power Co., 130 East Fifteenth Street, New York, has completed plans for two one-story equipment storage and distributing buildings, 35 x 136 ft., with repair facilities, to cost about $55,000. Thomas E. Murray, Inc., 55 Duane Street, is engineer.

Board of Education, Great Neck, L. I., plans installation of manual training equipment in new junior and senior high school to cost $750,000, for which bids have been asked on general contract. Guilbert & Betelle, Chamber of Commerce Building, Newark, N. J., are architects.

Beam-O-Lite Sign Co., New York, has leased space in building at 135-9 West Twenty-sixth Street for manufacture of display signs. Initial production will be given over largely to assembling.

General Electric Supply Corporation, 190 Sixth Avenue, New York, a subsidiary of General Electric Co., Schenectady, has leased seven-story building at 585-91 Abingdon Square, totaling 125,000 sq. ft. floor space, for new equipment storage and distributing plant. Present works will be removed to new location.

Ovens, power equipment, conveying and other machinery will be installed in two-story plant to be erected by Cox Baking Co., Van Wyck Avenue, Jamaica, L. I., 50 x 300 ft., to cost about $100,000. C. B. Comstock, 110 West Fortieth Street, New York, is architect and engineer.

Calumet & Arizona Mining Co., New Cornelia Copper Co., and Phelps Dodge Corporation, 99 John Street, New York, have completed agreement to acquire an interest in Nichols Copper Co., Laurel Hill, L. I., and will use electrolytic refining plant of that company for a large portion of combined output from mines. Nichols company, in association with other interests noted, plans construction of new copper refinery in Texas, or other southwestern locality, to cost close to $3,500,000 with machinery. Site is being selected.

John Nordmeyer, 260-2 Tenth Avenue, Paterson, N. J., has plans for a one-story machine shop to cost about $18,000 with equipment.

Roepke Pan Machine Corporation, 161 Ogden Street, Newark, manufacturer of machinery, plans new one-story plant, 125 x 125 ft., at Newton Falls, Ohio, and will remove present plant to new location. Temporary quarters will be occupied at Newton Falls pending completion of new plant.

Forstner Chain Corporation, 646 Nye Avenue, Irvington, N. J., manufacturer of watch chains, metal novelties, etc., has awarded general contract to W. J. MacEvoy Construction Co., 85 Academy Street, Newark, for a three-story addition, 60 x 120 ft., to cost about $75,000 with equipment. Edward C. Epple, 9 Clinton Street, Newark, is architect.

Queens Borough Gas & Electric Co., Rockaway district, Queens Borough, New York, has arranged for bond issue of $4,000,000, a portion of proceeds to be used for extensions and improvements, including transmission line and power station construction.

Doehler Die Casting Co., Brooklyn, has removed its executive offices to 386 Fourth Avenue, New York.

Radworth Mfg. Corporation, 302 Park Avenue, Brooklyn, has been formed to make bell ringing transformers, conduit fittings and porcelain bushings. Company has its own shop and machinery and equipment have been purchased.

Doerfler-Hofstetter Mfg. Co., Inc., manufacturer of dies and tools, has started operations in its plant at 24 Scott Street, Newark.

St. Louis

St. Louis, April 16.

REVISED plans are being drawn by Imperial Casket Co., 1415 St. Louis Avenue, Kansas City, Mo., for a two-story plant to cost $45,000 with equipment. W. J. Koch, Mutual Building, is architect.

Chevrolet Motor Co., Flint, Mich., has acquired about 30 acres at Kansas City, Mo., and is reported planning a new assembling plant to cost more than $350,000 with equipment.

Usona Mfg. Co., 3510 Chouteau Avenue, St. Louis, manufacturer of architectural and ornamental iron products, has awarded general contract to Gillespie & Daly, International Life Building, for a one-story addition, 75 x 80 ft., to cost approximately $24,000 with equipment.

Atlas Tool & Mfg. Co., 5707 Manchester Avenue, St. Louis, is said to be planning a one-story addition, to cost close to $40,000 with equipment.

Arkansas Portland Cement Co., affiliated with Oklahoma Portland Cement Co., Ada, Okla., is arranging for early erection of new mill near Shaal, Ark., to cost in excess of $1,000,000 with machinery.

Associated Motor Terminals Co., St. Louis, is contemplating erection of a six-story service, repair and garage building, 88 x 130 ft., to cost close to $300,000 with equipment.

Colonial Steel Co., 928 Main Street, St. Louis, has awarded general contract to W. C. Harting Construction Co., International Life Building, for a one-story storage and distributing plant, 50 x 85 ft., to cost about $28,000 with equipment.

Benson Motor Co., Community Building, North Kansas City, Mo., has work under way on a one-story and basement service and repair building, to cost close to $50,000 with equipment. John C. Lawrence, Commercial Building, is architect.

U. & I. Boiler & Machine Works, Inc., Tonkawa, Okla., recently organized by G. W. Larabee, Tonkawa, and associates, plans early operation of a local plant, including boiler and tank shop. J. W. Duncan, Tonkawa, is also interested in company.

Cities Service Co., Wichita, Kan., has authorized immediate construction of pipe line from Wichita to Kansas City, Mo., for natural gas service, about 130 miles, to cost in excess of $400,000. Headquarters are at 60 Wall Street, New York.

W. H. Owen Motor Co., 1618 Tower Grove Avenue, St. Louis, is completing plans for a one-story service, repair and garage building, 85 x 200 ft., to cost about $70,000 with equipment. Nolte & Nauman, Fullerton Building, are architects.

Ford Motor Co., Detroit, is planning a two-story factory branch and distributing plant, 100 x 140 ft., at Apache, Okla., to cost about $120,000 with equipment.

City Council, Perryville, Mo., plans installation of centrifugal pumping machinery, 75,000-gal. elevated steel tank and auxiliary equipment, in connection with municipal waterworks. A bond issue of $125,000 is being arranged. Burns & McDonnell Engineering Co., Interstate Building, Kansas City, Mo., is engineer.

Oklahoma Gas & Electric Co., Oklahoma City, Okla., has work under way on addition to steam-operated power plant at Harrah, Okla., to increase capacity by 30,000 kw.

New England

Boston, April 16.

THE machine tool market continues dull. The largest order closed the past week was for a 250-lb. pneumatic hammer to a Utica, N. Y., shop, and another hammer of the same type to an Indiana firm. Dealers continue to receive inquiries, mostly for single machines and small ones, but orders are slow in being placed. Where expensive tools have been under negotiation prospects for buying are apparently as far away as they were one or more months ago. There is still need for new metal working equipment throughout New England, but replacement programs are not being actively put forth. In contrast with dealers, the majority of New England machine tool makers are fairly busy with orders received from other sections of the country.

Small tools are still selling slowly, users ordering only in small lots.

B. L. and F. S. Ashmun, Bridgeport, Conn., have acquired Armstrong Mfg. Co., that city, manufacturer of chucks and dies.

Carl J. Malmfeldt, 15 Lewis Street, Hartford, Conn., architect, will close bids next week on a two-story and basement trade school for that city, 76 x 256 ft., with two wings, 41 x 51 ft.

W. N. Craw Novelty Co., Norwalk, Conn., toys and novelties, has reincorporated with a capital stock of $250,000, and will add equipment for manufacture of new products.

Keeler & Lang, Inc., recently organized, manufacturer of paints, varnishes and oils, has purchased Matthews & Willard plant, Scovill Mfg. Co., Waterbury, Conn., and will install motors, paint mixing, grinding, conveying and other equipment.

Bassick Co., Newark, N. J., a subsidiary of Stewart-Warner Co., Chicago, has purchased plant of Columbia Phonograph Co., Bridgeport, Conn., and will consolidate manufacture of automobile accessories at latter plant.

City Council, Springfield, Mass., has authorized an appropriation of $234,000 for new pumping plant for sewage system, and will soon call for bids for equipment. City engineer is in charge.

The Crane Market

INQUIRY for locomotive cranes continues good, but the overhead crane field is rather inactive. The Amtorg Trading Corporation is reported to have closed on both its lists of cranes for Russia. Still pending is the list of cranes and steam shovels inquired for by Dwight P. Robinson & Co., New York, for use in Argentina and the five 10-ton locomotive cranes for the Boston & Maine Railroad. New inquiry for overhead cranes is light, but there is a substantial volume of old inquiry still in the market. Electric hoists and chain blocks are in good demand and some sizable sales both in the domestic and export markets are reported. The Lehigh Coal & Navigation Co., Philadelphia, is reported about to close on a 10-ton, 20-ft. span, single I-beam, hand power crane.

Among recent purchases are:

Amtorg Trading Corporation, 165 Broadway, New York, six 15-ton, kerosene-driven crawl-tread locomotive cranes for Russia from two American makers; nine 50-ton standard locomotive cranes for Russia from Industrial Brownhoist Corporation.

Standard Traprock Corporation, 26 Cortlandt Street, New York, 40-ton, 4-motor floor controlled overhead crane from unnamed builder.

Boston & Maine Railroad, 5-ton, overhead traveling crane from unnamed builder.

Silverstone & Ervin, Bridgeport, Conn., 5-ton, 9-ft. 6-in. span, 2-motor overhead crane for city of Bridgeport from Box Crane & Hoist Corporation.

Pittsburgh Plate Glass Co., for Ford City, Pa., works, four 20-ton cranes from Cleveland Crane & Engineering Co., and two 5-ton cranes from Alliance Machine Co.

Spang, Chalfant & Co., Inc., for Economy, Pa., works, bloom charger from Alliance Machine Co.

Chicago, Burlington & Quincy, Chicago, 3-motor, 5-ton, 54-ft. span gantry crane from Whiting Corporation.

National Packaging Machinery Co., 172 Green Street, Jamaica Plain, Boston, has purchased three-story and basement mill at Newton, Mass., with tract of six acres. Purchasing company will remodel and remove to new location.

Townsend Motor Car Co., Derby Street, Salem, Mass., has awarded general contract to Pitman & Brown, 11 Washington Street, for one-story addition to service and repair department, 70 x 200 ft., to cost close to $75,000 with equipment.

R. Hight Rines, Portland, Me., has awarded contract to Morton C. Tuttle Co., Boston, for a two-story garage, 90 x 150 ft., to cost $90,000. Webster & Libby, Portland, Me., are architects.

Whiting Body Works, Westboro, Mass., has leased a portion of factory on Milk Street for manufacture and repair of automobile bodies.

United States Gypsum Co., 300 West Adams Street, Chicago, has plans under way for initial units of plant at Charlestown, Boston, for manufacture of building blocks and other cast gypsum products. Entire project is reported to cost in excess of $1,000,000 with equipment.

Blackstone Valley Gas & Electric Co., Pawtucket, R. I., is completing plans for a four-story and basement addition, 20 x 152 ft., to its No. 1 steam-operated electric generating plant, to cost about $125,000.

New England Telephone & Telegraph Co., 50 Oliver Street, Boston, has leased a building at Somerville, Mass., for service and repair shop, with garage facilities, for company automobiles and trucks.

New England Public Service Co., 131 State Street, Boston, operating Tilton Electric Light & Power Co., Middlebury Electric Co., Windsor Electric Light Co., and other light and power utilities, has arranged for a preferred stock issue of $4,387,500, a portion of proceeds to be used for expansion and improvements.

General Electric Welding Co., 206 Hunts Avenue, Pawtucket, R. I., has been organized to engage in electric welding, particularly for automotive manufacturers and large machine and railroad shops. Building and equipment have been purchased, but company is in market for steel tank plates and structural shapes.

Cleveland

CLEVELAND, April 16.

MACHINE-TOOL dealers and manufacturers are doing a fair volume of business in single machines and some report a gain over March. The inquiry situation is spotty, new inquiries having increased with some and fallen off with others. The Kelsey Wheel Co., Detroit, is buying some equipment, including several drilling machines and lathes. Not much business is coming from Michigan automobile manufacturers. Tire manufacturers in Akron who recently have been buying a moderate amount of new machine tool equipment now seem well supplied and the market is dull in that city. Foreign business shows more life. A Cleveland turret lathe manufacturer booked export orders for seven machines the past week.

Bids have been asked on general contract by Acme Auto Radiator Co., 7707 Carnegie Avenue, Cleveland, for a one-story addition, 40 x 175 ft., to cost about $60,000 with equipment. T. C. Cerny, 4025 East Fifty-second Street, is architect.

Department of Public Service, City Hall, Cleveland, has plans for a one-story pumping plant and filtration works in Nottingham district, for municipal water system, to cost in excess of $300,000 with equipment. A. L. Quayle, City Hall, is city engineer.

Willys-Overland Co., Toledo, Ohio, has acquired a tract of 20 acres in Laguna-Maywood industrial district, Los Angeles, as site for a new automobile assembling plant. Initial units are reported to cost close to $1,000,000 and are scheduled to be ready for service in August.

Standard Electric Stove Co., 1720 North Twelfth Street, Toledo, is considering a new plant unit to cost upward of $100,000 with equipment.

Industrial Rayon Co., Ninety-eighth Street and Walford Avenue, Cleveland, plans construction of a steam power plant and machine shop at new mill at Covington, Va. Entire project is reported to cost more than $2,000,000.

Ironton Mfg. Co., Ironton, Ohio, manufacturer of metal roofing, siding, etc., has acquired property near Front and Mulberry Streets, and is said to be planning an addition.

American Steel Abrasives Co., Galion, Ohio, maker of steel shot and eversharp steel grit, is erecting a two-story addition, 40 x 80 ft., which will nearly double its capacity.

Gulf States

BIRMINGHAM, April 16.

PLANS have been filed by Alamo Iron Works, Corpus Christi, Tex., for a one-story addition, 20 x 150 ft., to cost about $23,000.

Atchison, Topeka & Santa Fe Railway Co., Galveston, Tex., has plans for a one-story power house at its shops at Cleburne, Tex., to cost more than $80,000 with equipment. Frank Merritt is chief engineer.

Texas Airplane Corporation, R. F. D. No. 1, San Antonio. C. W. Payne, secretary, is planning erection of one-story works, 22 x 100 ft., for assembling and repair of aircraft.

Houston Gas Securities Co., Houston, Tex., operating Houston Gas & Fuel Co., and Houston Gulf Gas Co., has acquired Southern Gas Co., operating natural gas properties in vicinity of Laredo, Tex., and will consolidate with system. New owner is considering extensions and improvements, including pipe line construction.

Clarence W. King, Giddens-Lane Building, Shreveport, La., architect, will soon begin work on new automobile service, repair and garage building, to cost about $85,000 with equipment.

Texas Gulf Power Co., Fort Worth, Tex., has acquired light and power plant, and waterworks at Strawn, Tex. Plans are under way for expansion in power station and installation of additional machinery. Extensions will be made in transmission lines.

Town Council, Rolling Fork, Miss., is asking bids until May 1 for equipment for municipal power plant, including one Diesel oil engine, 120 to 180 hp., direct-connected to generating unit, with capacity of 90 to 140 kva., with exciter, switchboard, instruments and auxiliary equipment.

Humble Oil & Refining Co., Houston, Tex., is reported planning an addition to its refinery at Ingleside, Tex., for sulphuric acid recovery. Humble Pipe Line Co., affiliated organization, has acquired right-of-way from Aransas Pass to Harbor Island, vicinity Fort Aransas, Tex., and will construct new pipe line.

Crystal Ice & Fuel Co., Clarksdale, Miss., is planning construction of one-story ice-manufacturing plant at Yazoo City, Miss., to cost about $50,000 with equipment.

McGough Motor Co., 206 Dexter Avenue, Montgomery, Ala., is completing plans for a two-story service, repair and garage building, 104 x 200 ft., to cost close to $85,000 with equipment. Okel & Cooper, Bell Building, are architects.

Ouachita Natural Gas Co., Shreveport, Tex., B. D. Hunter, president, has authorized construction of pipe line from Alto, Richland Parish, to Sterlington and Sarepta, Webster Parish, to cost more than $3,000,000 with booster stations, etc. At last noted place, connection will be made with natural gas system of Magnolia Gas Co.

Federal Electric Co., 8700 South State Street, Chicago, manufacturer of electric signs, etc., is reported considering establishment of new factory branch at Dallas, Tex., for manufacture of Neon illuminated displays, to cost more than $30,000 with equipment.

Water Works Commission, Phenix City, Ala., is asking bids until April 26 for pumping station, water purification plant and auxiliary equipment for a municipal waterworks. Warren E. Darrow, Columbus, Ga., is engineer.

Joseph Finger, Keystone Building, Houston, Tex., architect, has asked bids on general contract for a two-story automobile service, repair and garage building, 125 x 125 ft., to cost close to $200,000 with equipment.

American Service Co., Houston, Tex., operating ice-manufacturing and cold storage plants, is disposing of a note issue of $3,150,000, a portion of fund to be used for expansion and improvements.

Spears & Co., El Paso, Tex., are considering rebuilding portion of cottonseed oil mill recently destroyed by fire, with loss more than $35,000 including equipment.

West Texas Utilities Co., Quanah, Tex., has begun work on first unit of new steam-operated electric power plant at Lake Pauline, near Quanah, and will soon proceed with other units with capacity of 60,000 hp. Four new transmission lines will be built. Entire project will cost in excess of $500,000 with equipment.

Philadelphia

PHILADELPHIA, April 16.

BIDS have been asked by Philadelphia Rapid Transit Co., 810 Dauphin Street, Philadelphia, on general contract for a one-story motor bus repair shop, 282 x 406 ft., comprising machine shop, overhauling and reconditioning department, parts division and other mechanical departments, to cost in excess of $250,000 with equipment.

Pyramid Motor Freight Corporation, Hancock and Columbia Streets, Philadelphia, has awarded general contract to John I. Dillon, 1804 North Front Street, for a one-story machine shop for motor truck repairs and reconditioning, to cost about $17,000 with equipment.

Domenick Leberi & Son, 1137 South Broad Street, Philadelphia, operating a general iron works, have filed plans for a new one and two-story works, 60 x 112 ft., and 20 x 60 ft., to cost close to $24,000 with equipment.

Department of Public Works, Bureau of Water, City Hall, Philadelphia, is asking bids until April 26 for motor-driven pumping equipment and auxiliaries for Belmont pumping plant, contract No. 916; and for electrical equipment, switchboards, etc., for same station, contract No. 917.

Roller Bearing Co. of America, Inc., 141 Frelinghuysen Avenue, Newark, N. J., has arranged for purchase of former plant of Mercer Motor Car Co., Whitehead Road, Trenton, N. J., comprising 11 acres and factory buildings totaling 175,000 sq. ft. floor space, for production of roller bearings for automobiles and industrial equipment. Present works will be removed to new location. David H. Litter and Alan Jones head purchasing company.

Eastern Shore Public Utilities Corporation, Salisbury, Md., is negotiating for purchase of municipal electric light and power plant at Dover, Del., and plans expansion in that district, including transmission line construction.

Board of Education, Royersford, Pa., is considering installation of manual training equipment in two-story high school to cost $135,000, for which plans are being drawn by Hasness & Albright, 213 Walnut Street, Harrisburg, Pa., architects.

A State charter has been secured by Reading Airplane Co., Reading, Pa., with capital stock of $20,000, and work will soon begin on plant for production of aircraft and parts, with repair division. Company was formed recently by Allen K. Owen, 21 South Eleventh Street, who will be treasurer of organization; and Lloyd A. Gass, 115 Jefferson Street, Hyde Park, Pa.

Leon H. Brendlinger, 1130 Windsor Street, Reading, Pa., formerly connected with William Remppis Co., Reading, manufacturer of ornamental iron and steel products, is organizing a company to construct and operate a plant at Mount Carmel, Pa., for similar line of production, including iron fencing, fire escapes, etc. Property has been secured and work on initial unit will soon begin. R. J. Best and H. C. Ebinger, Reading, are also interested in new company.

Harrisburg Airport Corporation, Harrisburg, Pa., care of F. Brewster Wickersham, Harrisburg, attorney, now being formed by local interests with capital stock of $25,000, plans early establishment of airport on property now being acquired, to include hangars, repair shops for planes and motors, oil storage and distributing works, etc. Frank A. Robbins, Jr., Chamber of Commerce, is interested in project.

Philadelphia Suburban Counties Gas & Electric Co., Philadelphia, will make extensions in transmission lines for connection of plant on Barbados Island, Norristown, Pa., with Conowingo hydroelectric power project of Philadelphia Electric Co. A power substation and switching station will be installed at Bridgeport, Pa. Day & Zimmermann, Inc., Sixteenth and Walnut Streets, Philadelphia, is engineer.

Pittsburgh

PITTSBURGH, April 16.

ONE machine tool dealer has booked three vertical shapers, but in general orders have been for single tools which, so far this month, have not been as numerous as during the first eight or ten weeks of the year.

Plans have been approved by Baltimore & Ohio Railroad Co., Baltimore, for extensions and improvements in engine house and locomotive repair shops at New Castle, Pa., to cost about $150,000 including equipment.

Shenango Motor Co., Washington Street, New Castle, Pa., has awarded general contract to Paul Esposito, 782 Franklin Street, Woodlawn, Pa., for a two-story service, repair and garage building, to cost $180,000 with equipment. F. H. Foulk, Fairmount Cedar Building, Cleveland Heights, Ohio, is architect.

Gauley Power Co., Charleston, W. Va., has applied for permission to construct and operate a hydroelectric generating plant on Gauley River, Fayette County, with initial capacity of 60,000 hp. A transmission line will be built. Entire project is reported to cost more than $600,000.

Board of Education, Woodlawn, Pa., contemplates installation of manual training equipment in an addition to high school to cost about $125,000. Carlisle & Sharrer, Martin Building, Pittsburgh, are architects.

Penn-Ohio Edison Co., Sharon, Pa., is completing arrangements for a merger with Northern Ohio Power Co., and plans expansion and improvements, including transmission line construction.

American Metal Co., Ltd., American Zinc & Chemical Co., Langeloth Coal Co., and Clymac Molybdenum Co., all of Pittsburgh, have removed their offices to 2010 Clark Building.

Address of Lewis Foundry & Machine Co., formerly at 1514 Farmers Bank Building, Pittsburgh, is now P. O. Box 1591, Pittsburgh.

Trico Fuse Mfg. Co., Milwaukee, has removed its Pittsburgh office to larger quarters at 405 Penn Avenue. William A. Bittner is in charge.

Detroit

DETROIT, April 16.

PLANS are being prepared by Board of Trustees, Michigan School for the Blind, Lansing, for one-story power house, to cost about $100,000 with equipment. Installation will include two 175-hp. boilers, automatic stokers, coal and ash-handling equipment, etc.

Bohn Aluminum & Brass Corporation, 2512 East Grand Boulevard, Detroit, has awarded general contract without competition to Krieghoff Co., French Road, for one-story addition to foundry, to cost about $60,000 with equipment. Christian W. Brandt, Francis Palms Building, is architect.

Hupp Motor Car Corporation, 3641 East Milwaukee Street, Detroit, has purchased for expansion plant of Huebner Lumber & Mfg. Co., consisting of close to four acres and factory buildings.

Briggs Mfg. Co., 11631 Mack Avenue, Detroit, manufacturer of automobile bodies, has awarded general contract to W. J. Kauffman, 10610 Shoemaker Avenue, for a three-story addition, 30 x 130 ft., to cost upward of $60,000 with equipment.

Monroe Auto Equipment Co., Monroe, Mich., is completing plans for a one-story addition, to cost more than $150,000 with equipment.

Sears, Roebuck & Co., Arthington and Homan Avenues, Chicago, will proceed with a new multi-story storage and distributing plant at Detroit, to cost close to $500,000 with equipment. Company will also build similar unit in western part of city, to cost approximately $550,000 with equipment.

Graham-Paige Motor Corporation, West Warren Street, Detroit, has plans for a one-story service, repair and garage building at Sault Ste. Marie, Mich., to be occupied under lease by Wynn Auto Sales Co., Sault Ste. Marie, local representatives, to cost close to $45,000.

Grand Rapids Gas Light Co., Grand Rapids, Mich., plans rebuilding booster pumping station destroyed by fire April 7, with loss in excess of $100,000 including equipment.

Commonwealth Brass Co., 6781 Commonwealth Avenue, Detroit, has awarded general contract to Grant Powers, 4847 Whitfield Avenue, for a two-story addition, to cost close to $35,000 including equipment. Burrowes & Eurich, 415 Brainard Street, are architects.

Board of Education, Ecorse, Mich., is said to be planning installation of manual training equipment in new two-story high school to cost upward of $175,000, for which superstructure will soon begin. Joseph G. Kastler, Detroit Savings Bank Building, Detroit, is architect.

Electric Sprayit Co., Inc., formerly at Detroit, is now located at 320 East Colfax Street, South Bend, Ind.

South Atlantic States

Baltimore, April 16.

BIDS are being asked by C. Hoffberger & Co., 530-48 East Monument Street, Baltimore, operating ice and cold storage plants, for a new eleven-story cold storage and refrigerating plant, to cost $900,000 with machinery. J. H. Wickersham, Appel Building, Lancaster, Pa., is engineer. J. H. Hoffberger is president.

Disappearing Screen Co., Inc., Berkeley, Cal., has leased building at 264 Colvin Street, Baltimore, for an Eastern works for manufacture of patented screens and kindred products.

Board of District Commissioners, District Building, Washington, is asking bids until April 25 for three vertical type, motor-driven pumping units for sewage system, including shafting, couplings, bearings, automatic controls and starting equipment; until April 21, for 1000 water meters.

G. N. Ray, 1219 Connecticut Avenue, N. W., Washington, architect, will soon take bids for a four-story automobile service, repair and garage building, to cost about $250,000 with equipment.

Consolidated Gas, Electric Light & Power Co., Lexington Building, Baltimore, has authorized increase in capital stock from 1,450,000 to 1,500,000 shares, no par value, a portion of proceeds to be used for expansion, including acquisition of Mount Washington Electric Light & Power Co., Patapsco Electric & Mfg. Co., and other light and power utilities, with extensions in transmission lines and power facilities.

Roanoke River Power Co., Richmond, Va., is arranging for early construction of hydroelectric power plant on Roanoke River, taking lands in Mecklenburg County, Va., and Warren, Vance and Granville Counties, N. C. Station will have initial capacity of 70,000 hp.; a 60-mile transmission line will be built to Danville, Va., for connection with system of Appalachian Power Co., which is interested in project. It will cost in excess of $1,000,000.

Burge & Stevens, Marietta Building, Atlanta, Ga., architects, will soon take bids on general contract for a five-story automobile service, repair and garage building, 88 x 135 ft., to cost close to $300,000 with equipment.

Water and Light Department, Thomasville, Ga., D. R. Pringle, superintendent, is asking bids until May 7 for one 2000-kw. steam turbine, with generator and accessories; and for one 4500 sq. ft. condenser, with auxiliaries, for municipal light plant.

Fogle Furniture Co., Winston-Salem, N. C., has plans for a new three-story factory, 64 x 145 ft., to cost more than $40,000 with equipment. F. A. Fogle is president.

General purchasing officer, Panama Canal, Washington, is asking bids until May 2 for 22,000 ft. wire rope; 10,000 ft. plow steel wire rope; 5000 ft. cast steel wire rope; 70,000 lb. wire nails; drills, stocks and dies, reamers, vises, wrenches, tinners' snips, and other tools and equipment, Panama schedule 1872; until April 27 for trench pumps, chain blocks, pipe pushing jack, etc., Panama schedule 1870.

Lindsay-McMillan Co., 93 South Water Street, Milwaukee, manufacturer of refined oils, etc., has purchased five acres at Savannah, Ga., as site for new plant for production of heavy core oils. Initial units will be one-story and will cost upward of $60,000 with equipment.

Clinchfield Sand & Feldspar Corporation, Hearst Tower Building, Baltimore, is arranging for early construction of feldspar crushing, grinding and pulverizing mill in vicinity of Brookneal, Va. A portion of equipment will be secured from a plant at Charlotte, N. C., and additional machinery acquired. Company will operate feldspar quarries at Moneta, Va., for raw material supply.

East Coast Utilities Co., Richmond, Va., operating Northwest Carolina Utilities, Inc., Hermitage Ice & Storage, Inc., Virginia East Coast Utilities, Inc., and other power and light utilities, ice plants and water systems, is arranging an expansion and improvement program to cost about $1,000,000.

Buffalo

Buffalo, April 16.

CONTRACT has been let by Trico Products Co., 624 Ellicott Street, Buffalo, manufacturer of automobile accessories, to J. W. Cowper Co., Fidelity Building, for a new plant unit to cost $200,000 with equipment.

New York Air Brake Co., Watertown, N. Y., has arranged for increase in capital from 300,000 to 500,000 shares of stock, no par value, a considerable portion of proceeds to be used for development of new products.

King Mfg. Co., 254 Rano Street, Buffalo, manufacturer of radio equipment, is planning for expansion in output; manufacture of cabinet sets will be decreased and output concentrated on metal-encased sets.

Rochester Auto Inn, Inc., care of Steele & Stone Co., National Bank of Rochester, Rochester, N. Y., has awarded general contract to Turner Construction Co., Buffalo for a six-story service, repair and garage building, to cost about $225,000 with equipment. Gordon & Kaelber, Sibley Block, are associate architects.

Stockholders of Savage Arms Corporation, Utica, N. Y., have authorized formation of a subsidiary to take over and expand electrical household equipment division for increase in manufacture of electric washing machines, etc. J. Stevens Arms Co., Chicopee Falls, Mass., a subsidiary, will be continued as heretofore, and production of firearms and sporting weapons will be concentrated at that plant.

Continental Can Co., Syracuse, N. Y., is said to be planning early call for bids on general contract for new multistory plant at Chicago, to cost in excess of $500,000 with equipment. Francisco & Jacobus, 360 North Michigan Avenue, Chicago, are architects and engineers.

Taylor Brothers Aircraft Co., 42 Allen Street, Rochester, N. Y., has been organized to make airplanes and airplane equipment, particularly two and four-place monoplanes. Equipment and materials have been purchased.

Chicago

Chicago, April 16.

FROM the standpoint of actual orders, the week just closed has not been satisfactory to machine tool dealers. Volume of sales has fallen for the first two weeks in April below that of the last 14 days in March. However, new inquiry has grown and propositions on which quotations have been made are numerous, so there is some promise that order books will be swelled during the remainder of the month. Many of the new requests for prices come from tractor plants at Chicago and Peoria, Ill., and Waterloo, Iowa.

The railroad field is none too promising. The Santa Fe, which is asking for revised figures on a number of items, has not started to buy against its list. The Burlington is taking prices on a 6-ft. radial and a 20-in. drill. A forging plant has purchased a 32-in. shaper. The general contract for the Austin High School, Chicago, has been signed and this project will now go ahead.

Bliss & Laughlin, Inc., Harvey, Ill., manufacturer of turned shaftings and cold drawn and cold rolled steel has purchased for expansion plant and property of Hotchkiss, Blue & Co., adjoining. Property consists of five acres, two of which are improved with buildings.

Bids will soon be asked by Chicago Pump Co., 2336 Wolfram Street, Chicago, for a one-story addition to cost about $35,000 with equipment. Alfred S. Alschuler, 20 West Jackson Boulevard, is architect.

Rapid Roller Co., 812 West Austin Avenue, Chicago, manufacturer of printing rollers, etc., has awarded general contract to G. L. Arquette, 180 North Michigan Avenue, for a three-story plant unit, 100 x 125 ft., to cost in excess of $200,000 with equipment.

John Deere Co., Moline, Ill., manufacturer of agricultural equipment, will soon begin work on one-story foundry, to cost more than $35,000 with equipment.

Iowa Public Service Co., Waterloo, Iowa, is disposing of a preferred stock issue of $500,000, a portion of proceeds to be used for extensions and improvements, including transmission line construction.

City Council, Aitkin, Minn., is planning extensions and improvements in municipal electric light and power plant, including installation of additional equipment. Extensions will be made in transmission lines.

Kremer Motor Co., 1518 Hennepin Avenue, Minneapolis, Minn., will soon take bids on general contract for a one-story service, repair and garage building, 150 x 155 ft., to cost about $110,000 with equipment. P. E. Crosier, New York Life Building, is architect.

Super-Power Co. of Illinois, 72 West Adams Street, Chicago, affiliated with Commonwealth Edison Co., Illinois Power & Light Corporation and other utilities, is disposing of a bond issue of $10,000,000, a portion of proceeds to be used for power plant construction and transmission lines. Work is now under way on new generating plant at Powerton, Ill.

Wyoming-Mystic Iceless Refrigerator Co., Cheyenne, Wyo., is planning erection of new plant, reported to cost in excess of $35,000 with equipment.

Lyons Metal Products, Inc., Aurora, Ill., has been organized as step in probable consolidation of Lyons Metallic Mfg. Co., Aurora; Durant Co., Chicago, and Fred Medart Mfg. Co., St. Louis. New company will manufacture steel lockers, office furniture and store fixtures. General offices will probably be maintained at Aurora.

Gunite Corporation, Rockford, Ill., has been organized to manufacture gunite and other alloys and metals. Company at present occupies part of plant of Rockford Malleable Iron Works where manufacture has been started.

Harrington-Seaberg Co., Moline, Ill., manufacturer of police, fire alarm and traffic signal equipment and electric flashers, has let contract to Axel Carlson Construction Co., local, for four-story factory, 62 x 135 ft., to cost $75,000. Another unit, 94 x 135 ft., will be erected later.

Joseph L. Lieberman Iron Co., Chicago, has removed its offices to 604 Lake Michigan Building, 180 North Michigan Avenue.

Cincinnati

CINCINNATI, April 16.

VOLUME of machine tool sales the first half of April was only slightly less than that in the last two weeks of March, so that bookings this month are expected to be well maintained even though the total business probably will show a mild recession from the high level of the previous 60 days. Purchases by automobile companies are sporadic and inquiries from the Detroit district are indicative of a slowing down in buying. This trend however, is seasonal and should not cause undue apprehension. In fact, the bulk of the new machinery needed by the automotive industry during the first half of 1928 has been purchased and buying on a large scale is not anticipated until fall.

Most of the business placed with local builders has come from manufacturers in many different lines, the average order calling for one or two tools. The Santa Fe is reported to be ready to close in the next week for equipment on its recent list, while one or two carriers in the Southwest are inquiring for individual tools. The American Mond Nickel Co., Hyde, Pa., has closed for a heavy end-driven axle lathe.

Board of Education, Hamilton, Ohio, is considering installation of manual training equipment in a new two-story junior high school to cost $500,000, for which plans will be drawn by F. J. Mueller, Rentschler Building, architect.

City Council, Columbus, Ohio, will carry out expansion and improvement program for municipal light and power plant and system to cost $525,000. Work will include installation of 7500-kw. steam-electric power unit, with condensers, boilers and auxiliary equipment; automatic power substation on Nicholas Street, extensions in transmission lines and distributing system.

Air Corps, Material Division, Wright Field, Dayton, Ohio, will receive bids until April 27 for 73 propeller assemblies and 62 solid aluminum alloy blades, circular 300.

Victor Chemical Works, Inc., 343 South Dearborn Street, Chicago, has acquired 10 acres at West Nashville, Tenn., as site for new plant for production of phosphoric acid, etc., initial unit to cost in excess of $1,000,000 with equipment.

S. H. McKay, Nashville, Tenn., city clerk, is asking bids until April 24 for two high-lift and two low-lift pumping units for municipal waterworks, with capacity of 10,000,000 gal. per day in pairs, with auxiliary apparatus. W. W. Southgate is engineer.

Ducktown Copper & Iron Co., Ducktown, Tenn., is considering rebuilding machine shop and wood-working plant at local Mary mines, recently destroyed by fire, with loss close to $25,000 with equipment.

City Council, Union City, Tenn., is planning extensions and improvements in municipal power plant, including installation of 1000-kw. steam turbine-electric unit and accessories. A special election has been called May 10 to approve bonds.

Board of County Supervisors, Springfield, Ohio, will receive bids until April 30 for a gravel crushing plant, including power unit of at least 50-hp. capacity; also for portable bin of not less than 15 yd. capacity. Former bids were recently rejected. W. H. Sieverling, county surveyor, is in charge.

Board of Shelby County Commissioners, Memphis, Tenn., E. W. Hale, chairman, has plans for a new County workhouse at Mullins Station, near Memphis, to include a one-story machine and repair shop, one-story forge shop, one-story automobile service and repair building for motor trucks, and canning plant. Entire project will cost $400,000. Hanker & Cairns, Court Square Building, are architects.

Board of Education, Newark, Ohio, has asked bids on general contract for a new manual arts school, to cost more than $100,000 with equipment. Vernon Redding & Associates, Walpark Building, Mansfield, Ohio, are architects.

Columbus Structural Steel Co., Columbus, Ohio, is now structural department of International Derrick & Equipment Co., Columbus.

Milwaukee

MILWAUKEE, April 16.

MACHINE-TOOL demand is maintaining the relatively satisfactory rate of March, and with new inquiry most makers are expecting a favorable volume during the current month. Orders being booked are at least offsetting deliveries and production schedules are kept fairly even. Automotive industries, while not buying heavily or in lots, are furnishing a fair quantity of business, although at this time each year the bulk of requirements usually has been filled, except for replacements and unexpected needs.

George J. Meyer Mfg. Co., 598 Clinton Street, Milwaukee, has acquired buildings and real estate of Worthington Pump & Machinery Corporation, Cudahy, for about $250,000. Meyer company, which manufactures machinery for brewers, bottlers and dairy plants, has not indicated what disposition it intends to make of property, which consists of 27 acres and buildings aggregating 500,000 sq. ft. Worthington plant, formerly known as Power & Mining Machinery Co., was abandoned about four years ago, when equipment was purchased by Allis-Chalmers Mfg. Co.

Badger Meter Mfg. Co., 841 Thirtieth Street, Milwaukee, manufacturer of water meters, is taking bids through Martin Tullgren & Sons, architects, 20 Prospect Avenue, local, for erection of an extension, 60 x 120 ft., to be used as foundry addition and carpenter shop. A light crane is included in equipment for which inquiry is being made. An investment of $50,000 is planned.

Racine Screw Works, Racine, Wis., whose plant at Fifteenth and Clark Streets was destroyed by fire Feb. 25, is preparing to begin active production, following completion of reorganization. Jerome J. Ritter is retiring. Albert O. Falkenrath will continue as president, with other officers to be chosen from new interests entering corporation. A factory building probably will be leased or purchased. Complete new equipment, consisting largely of automatic screw machines, will be acquired.

Delta Mfg. Co., 658 Third Street, Milwaukee, manufacturer of metal specialties, is awarding contracts for erection of a new shop, 40 x 90 ft., costing about $35,000. Architect is F. F. Drolshagen, 82 East Wisconsin Avenue, local.

Wisconsin Power & Light Co., 16 North Carroll Street, Madison, Wis., is starting erection on a work shop, garage and storage building, 50 x 60 ft., two stories, at Berlin, Wis. Kramp Construction Co., Berlin, is general contractor, and architects are Balch & Lippert, Madison.

Kenosha Brick Co., Route 3, Kenosha, Wis., is preparing to erect new dry kilns, kiln sheds and other facilities for developing a new clay depository near Kenosha. Investment will be about $75,000.

Board of Industrial Education, Manitowoc, Wis., is taking steps toward establishment of a vocational training school to cost $250,000, as recommended by Wisconsin State Board. Work is expected to start next fall. Otto H. Senglaub is president, and A. L. Nimz, director.

Common council, Waukesha, Wis., has approved plans by Alvord, Burdick & Howson, engineers, 8 South Dearborn Street, Chicago, for new sewage disposal plant and has authorized bond issue of $190,000 to cover cost. Bids on plant and equipment will be requested shortly. Morgan R. Butler is mayor.

B & B Mfg. Co., Racine, Wis., has been incorporated with $30,000 capital stock to manufacture tools, dies, jigs, fixtures, etc., and is establishing local plant at DeKoven Avenue and Chicago & North Western tracks. Principals are Clem S. Bonin and Ernest C. Bruce.

Madison-Kipp Corporation, Madison, Wis., has purchased mechanical force feed lubricator division of Detroit Lubricator Co., Detroit. Latter company will continue manufacture of hydrostatic type lubricators and locomotive force feed lubricators. Equipment involved in purchase will be removed to Madison where new line will be handled.

Husky Wrench Co., Milwaukee, maker of automotive and industrial tools, has completed arrangement with J. H. Williams & Co., Buffalo, whereby combination wrench sets composed of Williams Superrenches and Husky socket wrenches will be offered to trade. Combination has been arranged only for selling purposes and will not affect management of either company.

Pacific Coast

SAN FRANCISCO, April 11.

NEGOTIATIONS are under way by Continental Can Co., 155 Montgomery Street, San Francisco, for property at Sacramento, Cal., as site for new plant to cost in excess of $500,000 with equipment. Headquarters are at 1 Pershing Square, New York. Project will be carried out in conjunction with canning plant of California Co-Operative Producers, Inc., foot of Fourteenth Street, Oakland, Cal., at same location, to cost approximately $300,000 with machinery.

Dahlstrom Metallic Door Co., 3350 East Slauson Avenue, Los Angeles, has awarded general contract to William P. Neil Co., 4814 Loma Vista Avenue, for a one-story addition.

Floco Motors Corporation, Los Angeles, recently organized by Frank L. Odenbrite, 138 West Seventeenth Street, and associates, with capital stock of $1,000,000, is planning erection of new works for manufacture of automobiles. Property is being secured near city. Initial unit will be one story, 100 x 150 ft., and will be supplemented with other buildings.

Officials of Pacific Lumber Co., Scotia, Cal., are completing plans for construction of a pulp and paper mill near its redwood lumber mills, to utilize waste from that plant for raw material supply. Initial plant is reported to cost in excess of $900,000 with machinery. Application has been made to use water in this section for power supply.

Hofius-Ferris Equipment Co., Spokane, Wash., manufacturer of mechanical equipment, has filed plans for a new plant, consisting of main unit, one story, 90 x 180 ft., with machine shop, 35 x 80 ft., office building and warehouse, to cost close to $45,000. An overhead traveling crane will be installed.

Great Northern Railway Co., Hilyard, Wash., is planning to rebuild portion of local locomotive repair shops destroyed by fire April 2, with loss reported in excess of $80,000 with equipment. Headquarters are at St. Paul, Minn.

Pacific Power & Light Co., Portland, is planning extensions and improvements in power substations and transmission lines in Lewiston-Clarkson, Idaho, district, to cost approximately $90,000.

Brunswick-Balke-Collender Co., Los Angeles, manufacturer of talking machines and parts, billiard tables, etc., has asked bids on general contract for a one-story plant, 177 x 320 ft., to cost approximately $100,000 with equipment. A boiler plant will be built. Headquarters are at 623 South Wabash Avenue, Chicago. John P. Kempel and Walter E. Erkes, Bank of Italy Building, Los Angeles, are architects.

Board of County Supervisors, Hall of Records, Los Angeles, has filed plans for a new repair and maintenance shop for road and other equipment to cost $50,000.

Cyclone Fence Co., Waukegan, Ill., subsidiary of United States Steel Corporation, has purchased Standard Fence Co., Oakland, Cal., and Northwest Fence & Wire Works, Portland, Ore. These two companies have heretofore been Pacific Coast agents of Cyclone Fence Co.

Walworth Oregon Co., M. L. Kline Co., Bowles Co., and Peerless Pacific Co., all of Portland, Ore. have merged and will operate under name of Consolidated Supply Co.

Republic Supply Co. of California, Los Angeles, has purchased Associated Supply Co., local distributer of oil well supplies, particularly products of Youngstown Sheet & Tube Co. Business of two companies will be consolidated and Republic company will act as distributer in California for tubular goods made by Youngstown company.

Barde Steel Co., Seattle, will erect three two-story warehouses, 37 x 120, 32 x 120 and 67 x 120 ft., respectively.

Balzer Machinery, Portland, has been appointed representative in that territory for Gardner-Denver Co., maker of portable air compressors and rock drills. Latter company was recently formed by merger of Gardner Governor Co., Quincy, Ill., and Denver Rock Drill Co., Denver.

Seattle office of Crouse-Hinds Co., maker of electrical equipment, has been closed, and business will hereafter be handled through its San Francisco office.

Franklin Iron Works Co., Inc., Mount Vernon, Wash., has changed its name to Franklin Steel & Machinery Co.

Indiana

INDIANAPOLIS, April 16.

PROPERTY of Davis Motor Car Co., Richmond, has been acquired by Automotive Corporation of America, Inc., lately organized, which will take over and expand plant. Production of motor cars will be continued and in addition new owner will provide facilities for manufacture of four-wheel jacking and parking device, parkmobile attachments and other accessory equipment. W. E. Byrd is president of purchasing company.

Indiana Refining Co., Lawrenceville, Ill., has plans under way for a two-story oil storage and distributing plant at Fort Wayne, to cost about $55,000 with equipment. A similar plant will be constructed at Terre Haute, Ind., to cost close to a like amount.

Board of Trustees, Indiana University, Bloomington, has plans for steam power plant, to cost $140,000 with equipment. C. R. Ammerman, Continental Bank Building, Indianapolis, is engineer, and bids will be asked from last-noted office.

Belden Mfg. Co., 2300 Western Avenue, Chicago, manufacturer of electric wires, cables, etc., is having plans drawn for second unit at new plant at Richmond, to cost more than $60,000 with equipment. J. W. Muller, First National Bank Building, Richmond, is architect.

Glenn Locomotive Co., recently formed by John S. Glenn, Sr., Cincinnati, and associates, with capital stock of $200,000, has taken over portion of plant of Interstate Car & Foundry Co., 3823 Massachusetts Avenue, Indianapolis, for repair and reconditioning of locomotives. Boiler shop, machine shops, forge and blacksmith shop, pipe shop, wood-working shop and other departments will be operated. A plant formerly operated at Cincinnati will be discontinued.

International Harvester Co., 606 South Michigan Avenue, Chicago, is reported planning a factory branch and distributing plant at Fort Wayne, to cost in excess of $350,000 with equipment.

Hare Motor Sales Co., 210 West Fourth Street, Bloomington, has asked bids on general contract for two-story service, repair and sales building, to cost $70,000 with equipment.

Foreign

BIDS are being asked by State Electricity Commission, 22-32 William Street, Melbourne, Australia, until Sept. 3, for switchgear for Yallourn power scheme, comprising 120,000-volt switchgear equipment for Richmond Terminal station, specification No. 28/20; and 135,000-volt switchgear for Yallourn power station extension, specification No. 28/21. Specifications available at offices of Bureau of Foreign and Domestic Commerce, Custom House, New York, and 33 South Clark Street, Chicago.

Electric Power Corporation (Elektrowerke Aktiengesellschaft), Berlin, Germany, is disposing of a bond issue of $5,000,000 in United States, a portion of fund to be used for extensions and improvements, including completion of

new steam-operated electric power plant stations with capacity of 80,000 kw. and transmission line construction.

Plans are being arranged for a new cellulose and paper mill in vicinity of Ussuri Station, Siberia, to be operated under direction of Russian Soviet Government. Plant is estimated to cost close to $5,000,000 with machinery. American-Russian Chamber of Commerce, 50 Broad Street, New York, has information regarding project.

Municipal Council, Johannesburg, South Africa, has authorized fund of £510,000 (about $2,448,000) for a municipal electric light and power plant, with initial output of 39,000 kw. American Consulate, C. H. Hall, Jr., Johannesburg, has information regarding project.

Soviet Southern Ore Trust, operating in Yurt mining district, Russia, has an appropriation of $9,000,000 for capital construction during 1928, and will increase plants for production of iron ore and manganese. Representatives of Trust, headed by A. N. Bakhtiarov, chief engineer, are now on a visit to United States to investigate methods of production and mining machinery. Purchases of equipment will be made through Amtorg Trading Corporation, 165 Broadway, New York, official buying agency for Russian Soviet Government, and delegation Trust will make headquarters at that office.

A company in Norway is planning construction of new plant for production of nitrate of lime, ammonia, soda and kindred products, including sulphuric acid. Large expenditure will be made for machinery. Information at office of Bureau of Foreign and Domestic Commerce, Washington, reference Norway No. 272193; also, at American Consulate, Oslo, Norway, Louis G. Dreyfus, Jr., consul general.

Canada

TORONTO, April 16.

MACHINE tool sales throughout the Dominion are being maintained at a good level. Sales for the week ranged from one to two tools to an order and were in fairly large volume. Present purchases are mostly for replacement, although there is also some buying for automobile repair shops and garages and for other small shop installation. The Canadian National Railways, which will start work soon on additions to its shops at Point St. Charles, will require a large number of tools, as well as equipment for an electric plant there.

The Steel Co. of Canada, Ltd., Hamilton, Ont., will make further extensions to its plant for which tools and general equipment will be purchased later in the year. Small tool sales have shown considerable improvement since the first of the year.

Bids are being received by T. T. Irving, regional chief engineer, Canadian National Railways, New Union Station, Toronto, for addition to shops at Point St. Charles, Montreal.

Chrysler Corporation of Canada, Ltd., Box 249, Windsor, Ont., has started work on an addition to its plant which is expected to be completed by May 15. It will be two stories, 100 x 400 ft.

T. Strachan, president of General Metal Devises, Ltd., Oakville, Ont., is calling for bids for erection of a plant, 60 x 300 ft. Company will manufacture electrical fixtures, etc.

International Nickel Co., Sudbury, Ont., in connection with its building and development program, has awarded contract to Fraser Brace & Co., for construction of its entire surface plant, on which work will be started immediately.

Plant of Canadian Edge Tool Co., Galt, Ont., was destroyed by fire following an explosion. It was recently acquired by Rae Machine Co., Hamilton, Ont.

Plant of Canada Brass Co., Merrickville, Ont., was totally destroyed by fire with loss of $30,000.

Shawinigan Engineering Co., Ltd., Shawinigan Falls, Que., is contemplating construction of a power plant at Shawinigan Falls to cost $30,000.

McEachren Construction Co., 244 Ridout Street, London, Ont., has contract for erection of a $35,000 addition to plant of Empire Brass Mfg. Co., Ltd., Dundas Street East, London. Architects are Watt & Blackwell, Bank of Toronto Chambers, London. Building will be two stories and basement, 40 x 60 ft.

Western Canada

Cork Province Mines, Ltd., has awarded contract to Bartholomew, Montgomery & Co., engineers, Vancouver, B. C., for installation of a hydroelectric plant to cost $60,000, to take care of increased mine and mill requirements. Construction work will be started immediately. Contract also includes erection of a substation adjoining mill.

City Council, Prince Albert, B. C., plans addition to power house to cost $100,000. Installation will include new turbine, mechanical overhead feeds and two new boilers.

Bids will be received until May 8 by S. E. O'Brien, secretary, Department of Public Works, for one 4-ton electric traveling crane for Assembly Wharf at Port Alberni, B. C. Tenders can be secured at office of district engineer, Post Office Building, Victoria, B. C., and at Post Offices, Vancouver and Port Alberni, B. C.

Winnipeg Electric Co., Winnipeg, Man., will erect a terminal station to cost approximately $750,000 to take care of production of Seven Sisters Falls development. It will have a capacity of 50,000 hp., with provision for doubling that amount.

NEW TRADE PUBLICATIONS

Pneumatic Coal Separators.—American Coal Cleaning Corporation, Welch, W. Va. Bulletin 28 of 12 pages illustrates and describes pneumatic coal separators operating under the Sutton, Steele and Steele patents. The process is described in some detail, with a number of drawings and photographic reproductions. The company is distributing also a pamphlet on the cleaning of coal, with special reference to pneumatic separation, which has been reprinted from the Journal of the Society of Chemical Industry (Great Britain).

Compensated Draft.—Hagan Corporation, Pittsburgh. Bulletin 104 of 12 pages is devoted to the Hagan system of automatic control of forced-draft stoker-fired boilers. It is illustrated with line drawings showing methods of control, and giving curves and chart diagrams indicating practice.

Speed Recorder.—Esterline-Angus Co., Indianapolis. Four-page folder illustrating and describing a speed recorder for steam turbine use. Annotated chart shows the use of the recorder.

Eye Comfort.—Curtis Lighting, Inc., 1119 West Jackson Boulevard, Chicago. Loose-leaf folder of several pages devoted to the subjects of shadows, lights and settings of lights to avoid shadows, and the general subject of guarding against eye-strain from improperly installed lighting equipment.

Pulverizing Machinery.—Abbé Engineering Co., 30 Church Street, New York. Bulletin 23, describing pulverizing, grinding and mixing machinery manufactured by company. Included are jar, laboratory, pebble, ball, tube and attrition mills, rotary cutters, crushers, and disintegrators.

Refractory Materials.—Laclede-Christy Clay Products Co., 1711 Ambassador Building, St. Louis. Leaflet dealing briefly with Laclede fire bricks for various refractory purposes.

Wrenches.—Husky Wrench Co., Milwaukee. Catalog 28, listing the Husky line of interchangeable socket wrenches and soft tap hammers.

Refractory Guns.—Quigley Furnace Specialties Co., Inc., 26 Cortlandt Street, New York. Bulletin 301, dealing with Bitumen guns, an adaptation of the Quigley refractory gun, for shooting hot or cold materials as a protective coating on metal, concrete, stone, brick, wood, cork or other surfaces.

Cranes and Shovels.—Universal Power Shovel Co., Detroit. Bulletin 6, an engineering, sales and service manual, describing the construction and uses of the Wilford line of shovels, trench hoes, clamshells, cranes, draglines and backfillers.

Industrial Fencing.—Cyclone Fence Co., Waukegan, Ill. Catalog 101, 64 pages, describing with many illustrations the uses of various types of industrial, municipal and residential fences manufactured by the company.

Transmission Machinery.—Foote Brothers Gear & Machine Co., 215 North Curtis Street, Chicago. Catalog 68, 192 pages, listing the various types of friction clutches and transmission machinery manufactured by the company's A. Plamondon division.

Oil Burners and Preheaters.—Alexander Milburn Co., 1416 West Baltimore Street, Baltimore. Bulletin B-200D, devoted to the company's type A oil burner and preheater. Burner is of atomizing type utilizing cheap grades of fuel and requires no preheating.

Boiler Furnaces.—Erie City Iron Works, Erie, Pa. Leaflet briefly describing the Vortex furnace for applying pulverized coal to small boiler furnaces and "Some Fundamentals of Water Cooled Furnace Design," by Prof. W. J. Wohlenberg, a paper designed to provide understanding of the use of principal types of water cooled furnaces.

THE IRON AGE

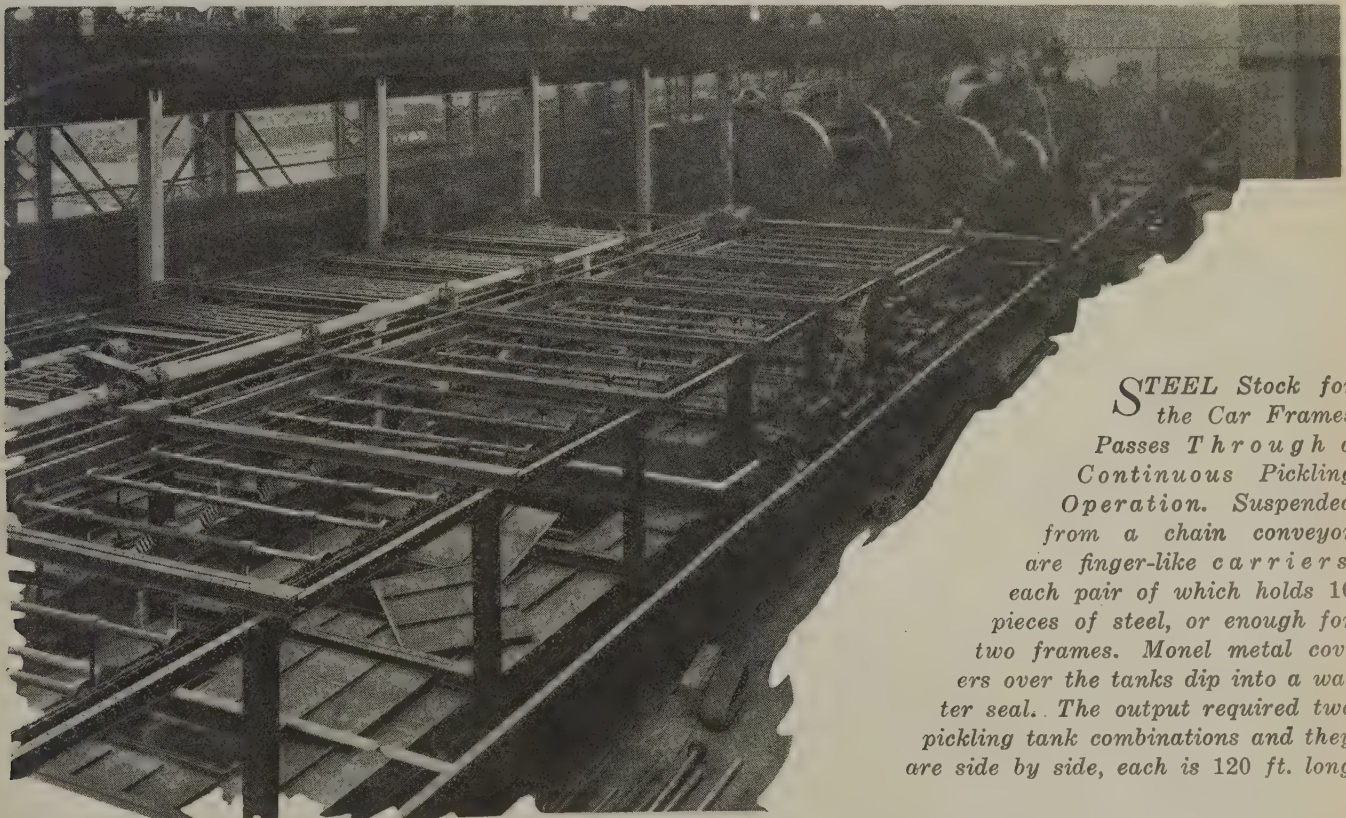
Making the Ford Motor Car Frame

Continuous Pickling Tanks, Through Which Steel Stock Passes, One Feature of Plant—Swivel Carrier for Holding Frames in Riveting Operations

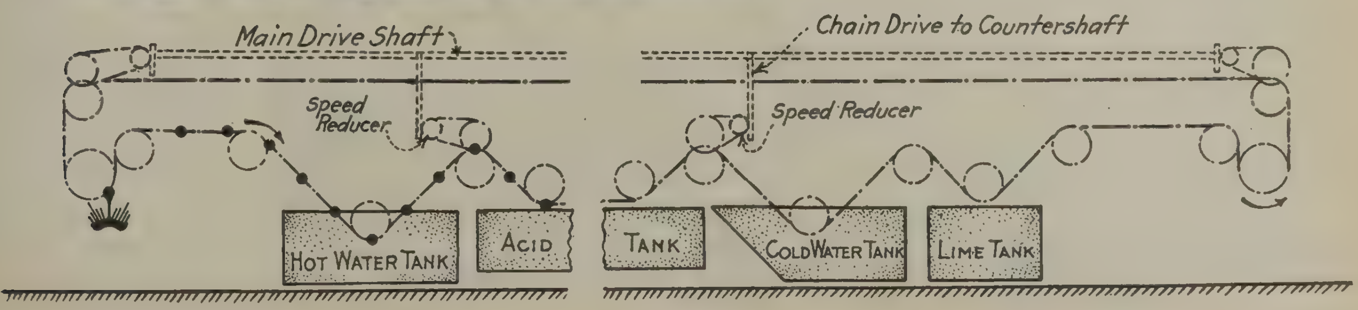
BY FAY LEONE FAUROTE*

IN one end of the Steel Building at Fordson is one of the most interesting and typically Ford process lines to be found in the whole plant. It is the frame fabrication and assembly line. All operations necessary to form and finish this important component are carried on in a continuous process and when the frames arrive at the end they are painted and ready for assembly. Even the pickling and liming tanks form a part of this sequence and the washing and drying likewise.

A service crane delivers the stock direct from the Ford mill cut to size for the five main sections of the frame; the two side members, right and left; the three cross members, front, center and rear. The main sections are made of No. 9 U. S. gage hot rolled open-hearth steel, "type L," pickled and limed and held to a thickness of between 0.140 and 0.160 in. The steel



STEEL Stock for the Car Frames Passes Through a Continuous Pickling Operation. Suspended from a chain conveyor are finger-like carriers, each pair of which holds 10 pieces of steel, or enough for two frames. Monel metal covers over the tanks dip into a water seal. The output required two pickling tank combinations and they are side by side, each is 120 ft. long



---

*Mechanical engineer, New York, and co-author of "Ford Methods and the Ford Shops," published in 1915. On page 1080, of THE IRON AGE of April 19, the author discussed the $25,000,000 changes required to produce the new Ford model.

In the Background Is the Group of Large Presses, at the Discharging End of the Pickling Tanks, for Forming the Side Members. The steel for the cross members is brought by an underground conveyor to the triple row of presses more prominent in the picture

has an elastic limit of 42,000 lb. per sq. in. minimum, and is capable of being elongated in the transverse direction to form various parts of the frame lugs, attachments and the like. The Brinell hardness is held to 131 minimum.

At the head of the process line are two pickling tanks, Ford designed and built (see drawing and photographs) through which a chain conveyor moves. This chain has finger-like carriers suspended from it at regular distances. Each carrier is capable of holding ten sheets of steel and each batch as loaded contains both side members and cross members. Due to the fact that there are two tanks and two main process lines in operation side by side, stock comes through at the other end in proper proportions for assembly and spares. Steel in process first goes into a hot water tank, 10 ft. x 14 ft. 8½ in. x 4 ft. 3¼ in., which is lead lined and has a capacity of 4750 gal. Here it is washed preparatory to pickling.

The acid tank, in which it is next immersed, is 56 ft. long, 12 ft. wide and 2 ft. 9 in. deep. It is constructed of two thick timber sheetings with a continuous lamination extending over the bottom, ends, and sides of 2 in. mastic cement. The whole tank is bolted together longitudinally, transversely, and vertically, through ends, sides and bottom with 1 in. alcumite or aluminum bronze acid-resisting bolts and lined throughout with ¼ in. sheet lead. A 2-in. channel runs entirely around the top which is kept filled with running water. Into this is immersed the bottom edge of a Monel metal gas-tight hood which covers entirely all parts of the equipment emitting acid vapors.

The acid tank requires approximately 4¼ tons of sulphuric acid for each charge. The actual working capacity of the acid tank is 56 ft. x 2 ft. 6 in. x 12 ft., equaling 12,600 gal.

At the other end is a cold water tank and a liming tank used for neutralizing the acid. The former is a lead-lined tank 11 ft. 3 in. x 4 ft. 3 in. x 12 ft., and holds 4300 gal. The lime tank is 6 ft. 6 in. x 12 ft. x 4 ft. 3 in. and holds 2400 gal.

The whole tank construction is 120 ft. long and 18 ft. 6 in. wide; the equipment is electrically driven and has a capacity of 2000 frames each 8 hr.

When the conveyors are running 2 ft. 8 in. per minute the duration of immersion of the steel stock is 20 min. Five hundred plates are in process at one time, or approximately 7½ tons of steel.

As soon as the metal emerges from the pickling and liming and final washing, the side members, one right and one left, are coated for forming and fed to the first two of six large Bliss, Hamilton and Toledo presses, which blank and form them. The cross members, meanwhile, pass by an underground conveyor to a triple row of presses farther down the line where they are blanked and formed. Now the parts are again ready for a thorough washing which is given to them just before they are put on the conveyor. Under the balcony (see view of presses in frame department) is a sub-assembly. This work is done on small Ferracute presses.

The components now ascend by conveyor to the upper floor, which is really a mezzanine balcony. Here they begin the assembly proper. Knurled rivets are used to hold the parts together, and as they reach the first stage the frame is mounted on a swivel carrier which allows the frame to move from press to press as the assembly riveting requires. The carrier is very flexible and allows the frame to be shifted about in an easy manner, turned up and down as the numerous riveting operations demand.

Finally the assembled frame reaches the inspection table, a metal platform, opposite the head of the line but at some distance to the right and on the upper floor. Here the inspectors test the frame for squareness and quality of workmanship. It is then hung back on the conveyor, passed around an intervening wall and into a washing, drying and painting corridor. This work is done in transit, the fumes from enameling liquid being carried out through a chimney conduit above. The frame emerges finished and almost dry, the latter process being entirely completed before the frame reaches its railroad car destination on the other side of the shop. Here it is packed for transportation to the assembly lines elsewhere.

Typical operations on the left hand side member for a left hand control car are:

1. Pickling consists of washing in hot water, pickling in sulphuric acid, rinsing in cold water and neutralizing in lime water. Production: 400 per hour.

2. After being oiled, by passing over an oiling roller, it is inserted in a No. 14 Bliss press, with a capacity for blanking 250 an hour.

3. A No. 96½-H Hamilton press then pierces all holes at the rate of 240 members per hour after which a No. 16815¼ Hamilton press channel-forms the sides and front ends (240 an hour).

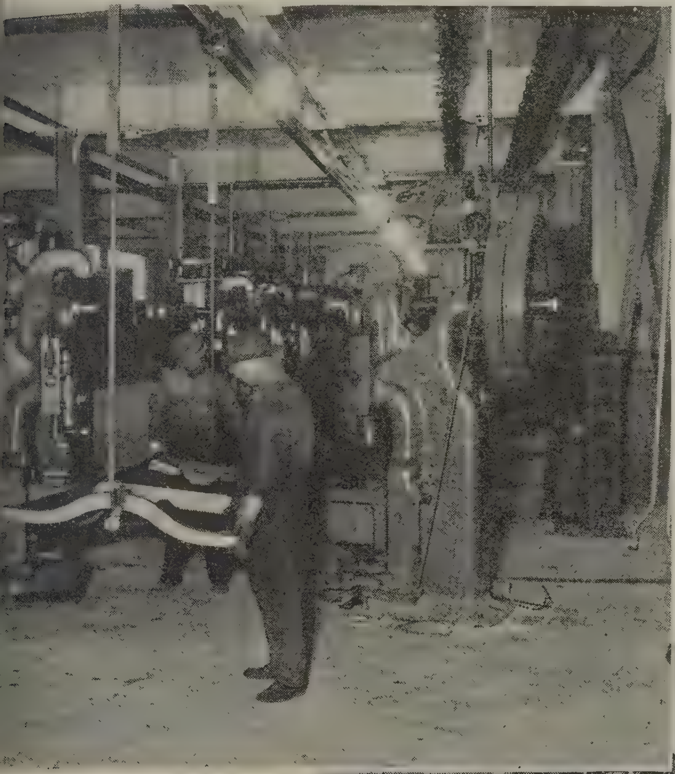
4. A No. 20 Cincinnati drill press then countersinks three holes, a PA-3 Ferracute press folds the rear end lugs, these last two operations taking place at the rate of 300 per hour.

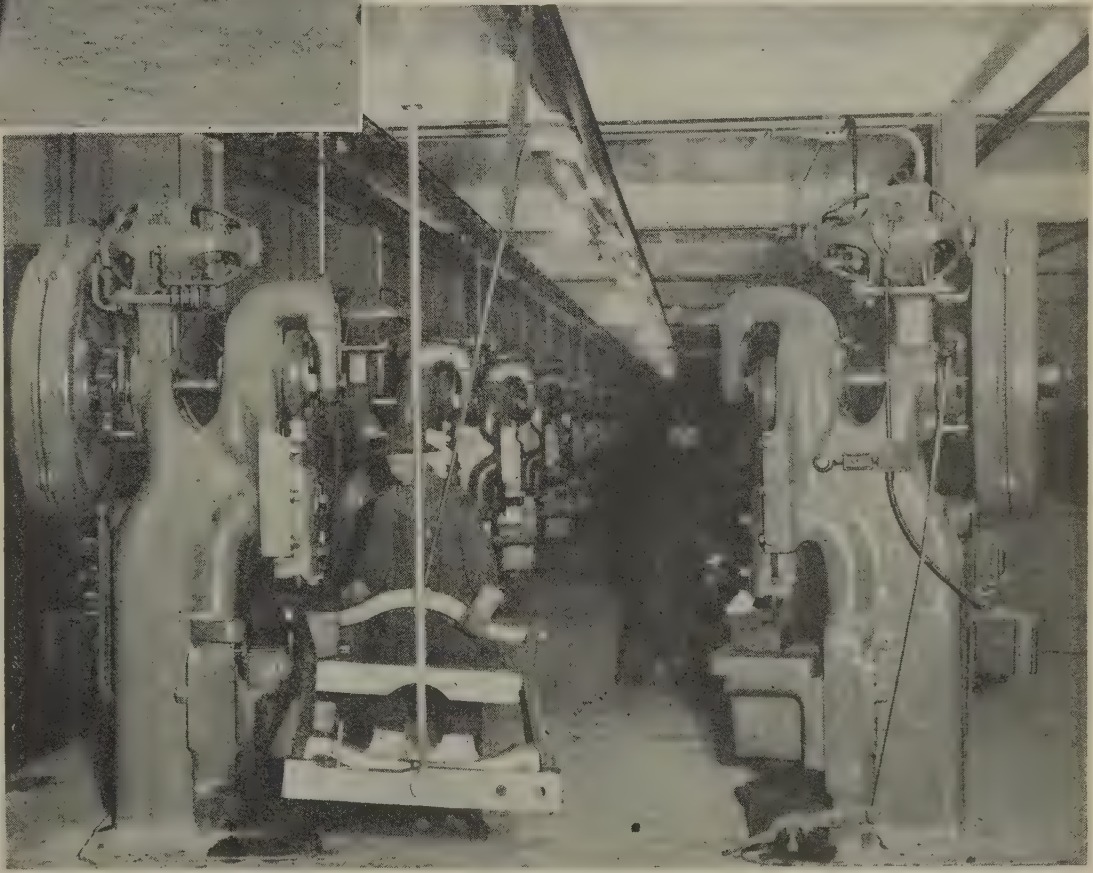
In the meantime, on through the process line, similar operations have taken place on the companion side member, and on the three cross members.

Intensive Safety Work Decreases Accidents

At the fifth annual safety engineering conference of the Western Pennsylvania Safety Council, held at Pittsburgh Chamber of Commerce April 19, it was brought out that fatal accidents have continued to show an appreciable decrease in all industries represented at the conference, but speakers were unanimous in declaring that this desirable development does not justify any relaxation in safety work. Indeed, the more common opinion was that cooperative effort on the part of the State, the employer and the workman to make work even safer is just as essential today as it was when safety work started in an organized way.

The Pennsylvania State Department of Labor and Industry was represented by H. D. Immel, director of the bureau of inspection. Speakers included Earl F. Blank, safety director and G. H. McClain, safety engineer Jones & Laughlin Steel Corporation, Pittsburgh; J. A. Oartel, chief of safety bureau Carnegie Steel Co., Pittsburgh; S. F. McKee, assistant to president Pressed Steel Car Co., Pittsburgh; W. G. Helsel, works manager Standard Steel Car Co., Butler, Pa.; W. F. Dittmer, supervisor of safety Westinghouse Electric & Mfg. Co., East Pittsburgh; J. A. Northwood, safety engineer Cambria works, Bethlehem Steel Co., Johnstown, Pa.; W. E. Megraw, safety director H. H. Robertson Co., Ambridge, Pa., and E. F. Harris, superintendent of employment and safety Mesta Machine Co., West Homestead, Pa. P. F. Fenlon, safety director Duquesne works, Carnegie Steel Co., presided at the morning session; John T. Ryan, vice-president Mine Safety Appliance Co., Pittsburgh, in the afternoon; and W. H. Boyce, commercial manager Pittsburgh Railways Co. presided at the banquet in the evening, which concluded the conference. There was a registration of more than 200.





An Unusually Flexible Swiveling Carrier Facilitates Riveting as the Frame Is Moved from Press to Press

Casting Radiators Continuously

Rotating Annular Rings Used for Molding and Pouring—Handling Labor Much Reduced—Hydraulic Assembly on Revolving Tables

BY J. B. NEALEY*

HEATING by direct radiation is accomplished through the use of radiators. Hot water, steam and vapor are utilized and, until recently, radiators of different designs were ordinarily used for hot water and steam. Radiators are now almost entirely in one type for all three mediums. The Richmond Radiator Co., Uniontown, Pa., puts out a full line, known in the trade as Richmond tube radiators and wall radiators.

As radiators are made almost exclusively of cast iron, the foundry occupies a proportionately large part of any plant given over to their production. The Richmond foundry occupies a space 172 x 200 ft. It has a large volume of output in proportion to its working force and to the space utilized. This is due to the speeding up of production by the use of a continuous molding machine which eliminates all unnecessary handling, reduces labor to a minimum and keeps the men working at an unusually high rate of speed.

The machine consists of two large annular rings set close together, one for molding and the other for pouring. The first is made up of two big cast iron rings, joined together to form a circular frame about 15 ft. in diameter. This frame is set on rollers and is rotated by a motor. Molding machines are mounted on this frame at intervals and when rotated each molding machine passes successive workmen, each performing some operation until the flask is made up. The flask is then transferred to the pouring ring, where the pouring and shake-out take place.

The place each workman occupies around the ring is called a station and the operations, in sequence, are as follows:

1. Pattern is mounted on molding machine.
2. Pattern cleaned by brush and compressed air.
3. Chaplets set in to hold core.
4. Flask set on molding machine.
5. Flask filled with sand from overhead conveyor.
6. Sand rammed with automatic rammer.
7. Excess sand cleaned off.

The flask is then made up and is ready for pouring, and at the last station is lifted by air hoist and transferred to the pouring circle.

The pouring circle is similar in construction to the one described, except that it is flat to receive the flasks and is 25 ft. in diameter. The increased size is to give a sufficient cooling period between pouring and shake-out. The stations and operations as here performed follow:

1. Cores set in mold.
2. Flasks stacked three high.
3. Metal poured.
4. Castings shaken out.

The castings are shaken out over a grid, and the sand drops through on to a belt conveyor, which removes it to a bucket elevator. The latter elevates it to overhead storage bins into which it drops, passing through revivifiers as it does so. The castings are hooked on to another belt conveyor and taken to the

cleaning room. The flasks are returned to the molding crew.

The system of core making, baking and handling is designed to give the greatest production with a minimum of time and labor. The core ovens are arranged in a single row, and the core making department parallels this on one side, in a space 50 x 100 ft., while the core storage occupies a similar position on the other side, with a space 50 x 186 ft. The cores are made and run into the oven from one side and when baked are run out the other side into the storage room, where there is space for 2,000,000 ft. of radiation.

Mechanical Handling Features Core Room

All cores are stacked on racks as made up and the racks are placed on cars which are run into the ovens. A system of tracks is laid out for the cars to run on. Four sets of tracks run into the core making room and between these are the core makers' benches. As fast as the racks are filled up they are lifted on to the cars by means of hoists on overhead monorail tracks. This monorail system serves also to bring in sand from another building. Tracks parallel the ovens on the front and in the rear, both running the entire length of the line. The loaded cars can be run on to the first line from the core making rooms and charged therefrom into any oven. When discharged on to the other side they can be run along the track to any one of eight cross tracks which run out into the cooling and storage rooms.

The core department and the foundry are served with connecting monorail systems and the cores, after being unloaded and stacked, are placed in baskets suspended from the monorail and delivered to the molders.

The core ovens are each 10 ft. wide, 8 ft. high and 14 ft. deep from entrance to rear. They are heated with gas burned in two or three long pipe burners, running from front to back, and located close to the bottom. Each oven holds a single rack which contains from 150 to 450 cores, according to size. A temperature of 400 deg. Fahr. is maintained and the baking periods range from 2 to 3 hr., according to core mixtures, size, etc. Each oven has a recording pyrometer for temperature control.

Revolving Brushes Clean Castings as They Pass on Conveyor

The cleaning room, 50 x 100 ft., is equipped with brushing machines for cleaning the castings. These machines consist of two sets of revolving wire brushes with a traveling conveyor just below. The radiator sections are placed on the conveyor and are taken automatically under and in contact with the brushes. They are then turned over and passed through a second time.

The machine, test and assembly building is 100 x 205 ft. The sections are stacked on skids and handled from one operation to another with high-lift trucks. They are first set between two clamps with water hose and filled with water, a pressure of 120 lb. being put on in order to detect any leaks.

A battery of 12 reaming machines next receives the sections, and the port holes are reamed out. The port in one side of the leg section is then threaded, when they are ready for assembly.

Completed radiators are made up of a number of sections ranging from two to 60, the latter being for long halls in public buildings. They are put together in a hydraulic assembly machine consisting of four tables in the form of a cross. Enough sections for a unit are put on the first table, with a leg section at each end. Malleable iron push nipples are placed between adjacent sections, fitting into the ports.

The table is then revolved to the second and then to the third station, where the unit is elevated about 2 ft. and forced together in a horizontal press. This makes the joints watertight and as strong as the casting itself. Revolved to the last station, long bolts are put in and the nuts tightened, which completes the assembly.

The radiators are then set up on the testing floor, filled with water and tested for leaks at 100 lb. pressure.

Zinc Institute Elects New Officers—To Study New Uses

R. M. Roosevelt of New York, vice-president of the Eagle-Picher Lead Co., was elected president of the American Zinc Institute, which held its annual convention at Hotel Statler, St. Louis, April 17, 18 and 19. Other officers elected are as follows: Vice-presidents, Jesse G. Starr of Joplin, Mo., president Quenton Smelter Co.; Percy B. Butler, Joplin, manager Barnsdall Zinc Co., and John A. McCarthy, Anaconda Copper Co., New York; secretary, Stephen S. Tuthill, New York, and treasurer, Howard I. Young, vice-president American Zinc, Lead & Smelting Co., East St. Louis, Ill. Edgar L. Newhouse, chairman of the board American Smelting & Refining Co., New York, was elected a director, to succeed Alex J. McCay, resigned.

The report of Secretary Tuthill for the year ended April 1, showed production of 1,332,200 metric tons of zinc, while consumption was 1,319,700 metric tons, a surplus output of 12,500 tons. He pointed out that in the three months ended March 31, 1928, the world's stock of refined zinc had increased 6800 tons. Mr. Tuthill said:

"It is necessary to concede that production is continuing slightly to outstrip the world's consumption of zinc and we have often encountered an obstinacy in the trade to accept unpalatable facts. The average gain in world consumption in the last four years has been 90,000 tons annually. Assuming this to be a normal yearly increase in consumption, it would mean that the world would call for a production of not less than 1,750,000 tons by 1932."

One of the means proposed to promote the further uses of zinc was an alliance with the Sheet Steel Trade Extension Committee, and it was decided to raise a substantial fund for research work to help determine the quantity of zinc most desirable for zinc coating. F. C. Wallower, chairman of the zinc-coated products committee, will have charge of the fund.

The by-laws of the institute were changed so that its work may be carried on by the executive committee, without waiting for action by the institute or its directors. The executive committee is composed of President Roosevelt, ex-officio chairman; A. P. Cobb, president of the New Jersey Zinc Co., New York; William Zimmer, vice-president of the American Metal Co., New York; J. A. McCarthy, Anaconda Copper Co., of New York, and Percy B. Butler, manager of the Barnsdall Zinc Co., Joplin, Mo. The two alternates to the executive committee are E. H. Wolff, president of the New Chicago Mines Corporation, Joplin, and William A. Ogg, president of the American Zinc, Lead & Smelting Co., Boston.

The will of the late Oberlin Smith, founder and for many years president of the Ferracute Machine Co., Bridgeton, N. J., and in 1890 president of the American Society of Mechanical Engineers, provides for a bequest of $1,000 to the United Engineering Society.

Gear Manufacturers Make Second Visit to Rochester

ALTHOUGH fewer than usual new technical standards were proposed for adoption, there was much of technical and general interest for those attending the convention of the American Gear Manufacturers Association, held at the Seneca Hotel, Rochester, N. Y., April 19, 20, and 21. This meeting, the twelfth annual, is the second held in Rochester, the previous visit having been in October, 1921.

Membership in this association includes many able technical men and executives, and the vigorous interchange of views at these meetings must work for individual and group progress, bearing fruit in increasingly better service to users of the industry's products.

Among the features of the meeting was the presentation of comprehensive data relating to non-metallic materials for gears and the adoption of standard nomenclature for bevel gears. A paper on the contact of standard worm gears was well received, and an illuminating contribution was an address on the value of research to the present day manufacturer. Progress reports and discussion of the future work of the association's several standardization committees, including the metallurgical, formed a large share of the deliberations, as heretofore.

An outstanding event was luncheon and inspection of the Gleason Works, Rochester. The informal banquet, augmented by delegations from the Gleason Works and other companies, was unusually well attended.

Election of officers resulted in the choice of A. F. Cooke, vice-president Gears & Forgings, Inc., Cleveland, as president, to succeed E. J. Frost, president Frost Gear & Forge Co., Jackson, Mich., who has held that office since May, 1925. B. F. Waterman, engineer Brown & Sharpe Mfg. Co., Providence, was elected first vice-president and E. W. Miller, chief engineer Fellows Gear Shaper Co., Springfield, Vt., was chosen as second vice-president. W. G. Jones, president W. A. Jones Foundry & Machine Co., Chicago, was elected treasurer to succeed C. F. Goedke, Chicago district sales manager Gears & Forgings, Inc. T. W. Owen, with headquarters at 3608 Euclid Avenue, Cleveland, continues as secretary of the association.

Balloting for four new members of the association's executive committee resulted in the selection of E. J. Frost; E. W. Miller; F. B. Drake, Johnson Gear Co., Berkeley, Cal.; and P. L. Tenney, general manager Muncie Products Division, General Motors Corporation, Muncie, Ind

The next meeting of the association will be held in Buffalo early in October.

Urges Better Facilities as Means of Meeting Competition

USE of up-to-date equipment, efficient coordination of shop processes and the elimination of waste within individual shops, were advocated by President E. J. Frost, in his address opening the convention, as an avenue to lower costs and the better meeting of competition.

As a text or key thought for his message, Mr. Frost quoted the following:

> When a business firm attempts to mold its entire policy to meet the prices of its competitor, that business is entering a labyrinth, the center of which is the chamber of despair. Highest quality never can be given nor obtained at the lowest prices. If a price can be sacrificed, quality must be sacrificed. If quality is sacrificed, society is not truly served.

"While this is true," he said, "it is equally true that progress is going on all about us and we must, if we are to continue in business, at least try to fit into the picture as it is, although this may differ radically from what we would like to have it.

"After we have been in business for a number of years, some of us, I fear, lose our pep so that we are content to try to whittle along with more or less antiquated equipment and growl at the fellow who provides himself with up-to-date machinery and tools, and who, as a logical consequence, is able to make more attractive prices and still have a satisfactory profit.

"It is not safe for us to forget that general development is bound to come and that the constant cheapening of all commodities has a tendency to broaden sales and make for quantity production, a 'round robin' more or less desirable.

"It is well for us to bear in mind, both as an industry organization and as individual members of the association, the responsibility that must be ours in this, the most wonderful age of progress and material achievement the world has ever seen. We must bear our share in the general program of reduction of costs to the consumer, so long as such reductions can be legitimate and be accomplished through increased efficiency of men, methods and machines.

Larger Production by Eliminating Waste

"Quality must not be sacrificed for quantity, but a larger product must be obtained through better education of our producers, through elimination of wastes that are common in almost all shops, and through creating an active interest on the part of the workmen so that will make each man feel that he is not a mere routine worker, but that he is a definite unit in a coordinated whole. The office should also bear its share of the program by buying satisfactory materials at right prices, by seeing that the materials are in the shop on time, that jobs are started in their proper sequence, and by giving maximum care to the selection of the most efficient machine tools and small tools, furnaces and other equipment.

"Good will and peace of mind among workmen are wonderful assets in any manufacturing plant," he said in another part. "These things have to be cultivated, if not actually earned by the management through relationships that are founded on mutual understanding and a working adaptation of the Golden Rule. As Charles M. Schwab put it: 'Today, cooperative action is essential as a means of advancing the interests of any industry. The day of the individualist, when personal interest overshadowed all other motives, has passed. It has been forcibly demonstrated that individual prosperity depends absolutely upon the success of the industry; that no individual can permanently prosper at his industry's expense."

Bevel Gear Nomenclature Adopted as Recommended Practice

REPORTS submitted by the several subcommittees of the association's general standardization committee, which is headed by B. F. Waterman, Brown & Sharpe Mfg. Co., Providence, formed a large share of the deliberations of the meeting, as heretofore.

An outstanding committee accomplishment brought before the meeting was the bevel gear nomenclature submitted by F. E. McMullen, Gleason Works, chairman of the bevel and spiral bevel gear committee, which worked in conjunction with the nomenclature committee, headed by D. T. Hamilton, Fellows Gear Shaper Co. The suggested nomenclature, which was presented in printed data sheet form, covers 89 items. Definitions, formulas and illustrations are arranged as shown in the accompanying reproduction of one of the pages, but only those terms that have a dimensional value are symbolized. The report was accepted by the association as a suggested standard for future design, and the large amount of work of the committees involved was recognized by a vote of thanks.

A. F. COOKE, President-Elect of the American Gear Manufacturers Association, Is Vice-President of Gears & Forgings, Inc., Cleveland. Mr. Cooke was for many years vice-president of the Fawcus Machine Co., Pittsburgh, which recently merged with other companies to form Gears & Forgings, Inc.

Nomenclature for herringbone gears is being worked upon jointly by the nomenclature committee and the herringbone committee, the acting chairman of which is A. A. Ross, engineer, metal gear department, General Electric Co., Lynn, Mass.

Metallurgical Committee Considers Adding New Steels

Proposed revision of A. G. M. A. recommended practice for forged and rolled alloy steels for gears has been submitted to the membership by the metallurgical committee, the chairman of which is C. B. Hamilton, Jr., Hamilton Gear & Machine Co., Toronto, Canada. The revision consists of changes to make the standard conform to the style of the A. S. T. M.

It was pointed out by Mr. Hamilton that his committee is not attempting to make standards, but that its task is the selection of suitable steels and other materials for gears, and the excluding of unsuitable materials.

A questionnaire is to be submitted to the membership regarding the desirability of adding the S. A. E. 2512 high manganese, high-sulphur type of steel to the association's list. The questionnaire will also ask opinion as to whether S. A. E. 3140 steel, not now on the list, should be included, and whether S. A. E. Nos. 2345 and 6145 steels, now included, should be omitted because the S. A. E. Nos. 2350 and 6150 are also in the association's list of recommended steels for gear uses. It is felt that the specifying of these closely similar steels may not be desirable.

Addition of a qualifying footnote to the association's recommended practice for keyways in holes in gears, to show how it differs from the A. S. M. E. and A. E. S. C. standard, was proposed by R. B. Zerfey, engineer Tool Steel Gear & Pinion Co., Cincinnati, chairman of the keyway committee, and accepted by the association. The inclusion of a keyway for holes 5/16 in. to 7/16 in., inclusive, and extending the diameter of holes from 6 to 13 in., not now part of the A. S. M. E. standard, is being discussed by the sectional committee.

Work to be completed by the committee includes material for keys, in conjunction with the metallurgical committee and review of existing spline shaft standards for purpose of recommending tolerances and limits. In connection with the latter, it was suggested by Mr. Zerfey that the S. A. E. spline shaft standards be printed by the library committee and followed as closely as possible. The standards for Woodruff keys, proposed as American standard by the A. S. M. E. and the A. E. S. C. were also recommended for printing in form of A. G. M. A. data sheets.

Certain changes in terms and symbols, suggested by the nomenclature committee, have been made in the full depth tooth recommended practice, for both 14½-deg. and 20-deg. pressure angle, prepared by the tooth form committee, the chairman of which is H. J. Eberhardt, secretary Newark Gear Cutting Machine Co., Newark, N. J. The standards, adopted a year ago by the association, are ready for printing.

Progress was reported by the spur gear committee, headed by J. L. Williamson, engineer Fellows Gear Shaper Co., which is carrying on an extensive investigation relating to the horsepower of steel pinions. Expression of opinion relating to the advisability of working on standards for backlash for automotive transmission gearing was requested by Mr. Williamson. It was voted that because requirements depend on engine characteristics, no attempt be made to standardize this item.

The sprocket committee, with C. O. Bartlett, professor of machine design, Purdue University, Lafayette, Ind., chairman, is working on standards for roller chains having heavier side bars, and to be known as the extra heavy series.

Working on Preferred Pitches for Non-Metallic Gears

Work on recommendations for preferred pitches for non-metallic gear materials, undertaken by the non-metallic gearing committee, with T. C. Roantree, Westinghouse Electric & Mfg. Co., East Pittsburgh, chairman, is making progress. Difficulties were said to have been encountered in that general practice has shown there had been no general relationship established between diametral pitches, face widths, pitch line velocities and horsepower ratings. A plan is being considered whereby the arbitrary selection of a certain range of face widths, based on general practice, will be established for certain groups of horsepower ratings and with these, a table of preferred pitches can be more readily prepared.

Printed data sheets listing the horsepower ratings per inch of face of laminated phenolic or rawhide spur pinions of 1 to 12, 18 and 50 Dp, pitch line velocities ranging from 100 to 3000 ft. per min., and teeth ranging from 12 to 60, have been issued by the library committee, the chairman of which is E. J. Noble, chief engineer Horsburgh & Scott Co., Cleveland.

Gives New Data on Strength of Non-Metallic Pinions

Interesting data relating to a recent series of tests on the strength of gear teeth, made on the Lewis machine at the Massachusetts Institute of Technology, were given by Earle Buckingham, associate professor of engineering standards and measurements, of the M. I. T. Professor Buckingham's remarks were of the nature of a progress report, submitted in place of E. W. Miller, chief engineer, Fellows Gear Shaper Co., Springfield, Vt., who is the A. G. M. A. representative on the A. S. M. E. special research committee on gears.

Two series of tests on the Lewis machine have been completed since the association's last meeting. One of these was a load test of a 60-tooth, 10 pitch, non-metallic pinion with a 160-tooth cast iron gear, the gears and pinions being loaded to the point where they failed.

It was found that the actual loads required to break the teeth of the non-metallic pinion were from 15 to 22½ times the A. G. M. A. safe load rating for that particular combination. This markedly higher safety factor was attributed to the fact that because of the elasticity of the non-metallic material under load, two or three teeth are in mesh and share the load. The contact of these three teeth was at the tip, near the pitch line and near the root, respectively. The gears were of 14½-deg. composite tooth form.

It was pointed out that with the non-metallic gears, somewhat the same condition is obtained as in the screw thread, i.e., in that the strength is not directly proportional to pitch. The length of contact must be taken into account in figuring the strength.

Noise in Gears Due to Inaccuracy

In reply to a question relating to the difference in noise between a 20-deg. pressure angle and a 14½-deg. angle gear, Professor Buckingham said that it is difficult to say whether it is due to pressure angle or inaccuracy. Inaccuracies, he stated, will develop more noise than any other factor in tooth design. Wear tests have not been attempted, but in this he also is of the belief that accuracy is a fundamental factor. Further in regard to noise, it was pointed out that in the non-metallic material, which is very elastic, the error would have to be relatively great to interfere with the effect of having several teeth sharing the load, deformation of 1/64 in. being possible, which is much beyond the probable errors. With the metallic gear, with only one tooth in contact, the difference in noise of operation between a gear having inaccuracy of 0.002 in. and another having 0.003 in. was very noticeable.

Another interesting deduction from the non-metallic gear tests is that reduction in strength of gears due to inertia loads follows the same curve as obtained from the safe working stresses formula at different speeds of the A. G. M. A.

Discusses the Future of Non-Metallic Gearing Material

SOMETHING of the history and use of laminated phenolic gearing material was outlined by T. C. Roantree, Westinghouse Electric & Mfg. Co., East Pittsburgh, in a paper on "Non-Metallic Materials, the Part They Will Play in the Future of Gear Materials," presented at the second general session of the A. G. M. A. annual meeting.

This laminated phenolic product, a self-retaining material, was first used as a gearing material about 14 years ago. Early applications were experimental but as time went on the product underwent gradual changes, and it is now possible, said Mr. Roantree, to manufacture non-metallic gearing material that is unusually uniform in structure and with high tooth-carrying capacity. The material is said to be successfully used not only for spur gears, but for bevel, worm and herringbone gears, including herringbone of the Sykes tooth form. Quietness of operation is an outstanding feature of gears of this material, and to the reduction in noise was attributed, in many cases, the substitution of the non-metallic material for the satisfactorily performing metal gear. Another feature was said to be reducing of vibration, this being due to the resilient property of the material, which functions upon the meshing of its teeth with those of the metal mating gear.

It was stated that from recent tests it has been concluded that the tooth strength of the non-metallic material did not decrease as rapidly as in metals, when the pitch line velocity of the gear was increased. This element was said to be sufficient to change the Barth equation in the Lewis formula from $\frac{600}{600+V}$ to $\frac{150}{200+V} + 0.25$. This change, in addition to establishing an added value, was said to rank the material as essentially a high-speed product because of its ability to function more satisfactorily in the higher ranges than several of the metals used for gears, unless the metals have been heat treated.

The non-metallic material was also said to have advantages in conditions where the atmosphere is laden with dust particles, such as in cement mills, foundries, etc., in which applications the grinding action that develops when these particles fall upon the revolving gear teeth is relieved. The surface of the non-metallic material is less hard and more flexible than the metal and thereby decreases the abrasive action; the lesser particles may also imbed themselves. Gears of the laminated phenolic material can be used in an atmosphere filled with acid fumes; and may in some cases even be submitted to occasional splashes of the acid solution. They are said to have been used to advantage in pickling, galvanizing and plating operations.

Used for pinions, the non-metallic material is said to result in less wear on the metal gears with which the pinions mesh. This preservation of the tooth surfaces of the large metal gear was stressed as prolonging the life of the gear, and, in many cases, justifying replacement of a metal pinion with one of non-metallic material.

It was estimated that 3,000,000 gears of this material will be used in the automotive industry during 1928. During the three-year period prior to 1928 the use of this material has trebled, said Mr. Roantree.

Presents Analysis of Worm Gear Contact

A paper on the "Contact of Standard Worms," by J. C. O'Brien, Pittsburgh Gear & Machine Co., Pittsburgh, presented at the closing session of the meeting, was received with interest. It was pointed out that the theory of the subject has been ably presented by other writers, but that in general, worms of special design or of unusual proportions were selected for analysis. While these special worms may have illustrated particular features of theory which the writers desired to emphasize, the procedure also leaves open to individual interpretation, the application of their various theories to the "common garden variety" of worms.

For his analysis, Mr. O'Brien used worms selected from the range of sizes recommended by the A. G. M. A. worm gear committee, selecting the sizes which he believes show average conditions of contact.

The construction and use of Rockwell dilatometers for the Volcrit method of heat treatment were described and illustrated by means of lantern slides and moving pictures, by S. P. Rockwell, Stanley P. Rockwell Co., Hartford, Conn., at evening session.

Lubrication of automobile transmissions and rear axles was dealt with in an address by G. A. Round, assistant chief engineer, Vacuum Oil Co., in an address on "Gear Lubrication." One of the biggest problems of the lubrication manufacturer, he said, is leakage; good gears are made and then put in cases that won't hold the oil. The factor of space in transmission cases, for the oil to get rid of its air, was stressed as of importance, most leaking in transmission being due to increase of oil level.

In rear axles leakage was stressed as even more serious because its oil often gets on to the brake surfaces. There is little increase in level due to foaming of the lubricant, but peculiarities of design increase the liability to leakage. In regard to lubricant circulation, it was said that the rear axle presents a real problem.

Mr. Round's paper gave evidence of much scientific research into the problems under discussion. Some of the instruments devised for making gear shifting measurements were described and illustrated by lantern slides. Data were given on the life of lubricants and the amount of foreign material in them, and in this connection it was said that it was found that at 200 deg. Fahr. a good lubricant will normally increase in viscosity at the rate of 5 per cent in 1000 miles. The importance of making provision in transmissions and rear axles for drainage of oil was emphasized.

Research Essential to Present Day Manufacturers

A CONVINCING case for "The Value of Research to the Present Day Manufacturer" was made by C. E. Skinner, assistant director of engineering Westinghouse Electric & Mfg. Co., in an address at the first general session, April 20. Intelligently directed and applied, research is not only of value to the manufacturer but is essential to his very existence, he said.

Prior to the Great War we had in the United States quite a number of industrial research laboratories, some of them already operating in a very large way, said Mr. Skinner, but the growth of industrial research has been very rapid since the war.

The fact that in the beginning of the industrial research era the newer industries were largely the ones which established and operated extensive research programs, was attributed to these newer industries, in being founded largely on the results of fundamental scientific research, found it necessary to continue research for further development and for the control of their materials and processes. As an example, he pointed to the electrical industry, which is hardly a half century old and yet within which may be found some of the oldest and most extensive industrial research laboratories in the country. Modern chemical and electrochemical industries demand constant attention from the scientist and technician, said Mr. Skinner, because the very foundations of these industries are laid in scientific research.

The enormous strides which have been made in those industries which have carried out definite research programs, has no doubt had much to do with the present day sympathetic attitude of almost every industry in the country to the question, he continued. The larger manufacturers are, in the main, carrying on programs of research within their own organizations, while many smaller companies have a nucleus of research workers or have combined in cooperative research programs. In some other countries, notably Great Britain, industrial research is fostered by the state.

Recent census figures were said to indicate that there are upward of 1000 industrial research laboratories in the United States, and upward of 10,000 trained research workers, aided by a small army of assistants, glass blowers, mechanics, etc. Statistics giving the annual expenditure in this country for industrial research are not available but was said to run into many millions of dollars, a number of individual laborataries having a budget of a million or more dollars a year. These were pointed out as very impressive figures and as constituting in themselves a very definite answer to the question as to whether research is of value to manufacturers.

It has become almost a trite saying, said Mr. Skinner in another part, that the results of fundamental research provide us with the scientific curiosity of yesterday, which becomes the basis of industrial investigation and development of today, and the household necessity of tomorrow.

Scientific Curiosity of Yesterday, a Household Necessity of Tomorrow

General functions more or less common to the work of all industrial research laboratories were outlined. It was stated that as a rule the principal function of such a laboratory is to develop new and useful products and processes for the industry it serves. In some cases its main function may be in cooperating with customers, to develop new uses for products already established. It may be established for the main purpose of improving manufacturing processes, or aiding the development of new devices and applications based on some outstanding invention which provides the main product of the manufacturers served. Most industrial laboratories find that an inevitable part of their work consists in curing and anticipating troubles either with the product, the processes involved or in the application of the product.

Recent surveys were said to indicate that the notable advances in industry as the result of research now come mainly from the well-organized industrial research laboratories.

Advertising Based on Sales Research

Advertising plans adopted a year ago to broaden the electrical markets of the Westinghouse Electric & Mfg. Co., East Pittsburgh, were outlined in an address by J. C. McQuiston, publicity director of the Westinghouse company.

The plan involves the use and coordination of technical and trade papers, to reach the industries, and of newspapers, to reach communities. The plan was based on sales research. The fields for the various products of the company were studied comprehensively and advertising planned accordingly.

Large Attendance at Banquet

Augmented by a large delegation from the Gleason Works, which had earlier in the day been hosts to members of the A. G. M. A., and by guests from other companies, the informal banquet, held on the evening of April 20, was marked by an unusually large attendance.

Dr. Dexter S. Kimball, dean of the college of engineering Cornell University, was the chief speaker, and E. J. Frost, president of the association, was toastmaster. A brief address was made by James E. Gleason, president Gleason Works, and the new officers were introduced by F. W. Sinram, president Gears & Forgings, Inc., Cleveland, and honorary president of the association. An elaborate vaudeville entertainment, furnished by talent from the Gleason Works, was one of the features of the evening. Songs by J. L. William-

Design of Galvanizing Furnaces

Economical Operation Demands Furnace Setting Which Protects Pot from Direct Impact of Flame—Hot Spots Produce Much Dross

BY MILTON EPSTEIN*

IN choosing an industrial furnace a plant manager carefully considers a large number of factors, since he wants the product of this furnace made at a minimum cost consistent with high quality. Most articles require heat in their making. This heat is available from a number of sources—electricity, gas or oil, or the crude fuels may be used to generate it. Sometimes an apparently more expensive fuel such as electricity may be the most economical, due to features of control and cleanliness. In other operations it has been found that superior equipment can be designed for but one fuel, and this of course would limit the choice of the buyer.

Galvanizing or zinc coating is an industrial heating process that can be successfully conducted with nearly all of the fuels that are available. Furnaces have been built and operated using electricity, gas, oil or coke. The choice of any of these fuels depends on the local conditions.

It will probably be of value to those in the galvanizing industry to present some data obtained over a period of years at a single plant where coke, gas and oil have been used in the production of hot galvanized metalware. It is the object to present this data in a disinterested manner, and it should be borne in mind in interpreting it that fuel conditions and prices differ in various territories.

It is well known that during the process of coating iron with zinc there is formed a material known as dross. This is an alloy of zinc and iron analyzing about 95 per cent zinc. Dross is heavier than the molten zinc (spelter), and therefore sinks to the bottom of the pot.

Published data show that the formation of dross increases very rapidly with the increase in temperature. Dross will form more than three times as fast at a temperature of 860 deg. Fahr. as it will at 820 deg. At higher temperatures the rate increases greatly, as shown in the table.

The dross, in sinking to the bottom of the pot, has a tendency to prevent the transmission of heat into the

melted zinc and causes the container to run hotter than it should. From these facts it can be seen that the design of a successful galvanizing furnace should be such that the outside temperature of the pot is kept as low as possible, and that little or no heat should be transferred into the pot below the dross line.

A study of the sketches showing typical furnace designs for gas, oil and coke brings out the following facts:

The usual design for coke furnaces used in metalware plants gives no protection to the pot. The coke is piled into the combustion chamber, and in order to obtain a sufficient temperature to produce the proper tonnage the heat must be transferred directly into the pot at every available surface. Higher temperatures are thus produced in the combustion chamber, and it has been found that pots fired with coke do not last very long and much greater amounts of dross are produced. As regards this point, it is almost an axiom that high dross formation is the concomitant of low pot life. The zinc combines with the iron of the pot to form galvanizing dross, and the pot is eaten through from the inside, this being the normal manner in which it springs a leak.

Although there are a number of designs of gas-fired furnaces being used throughout the country, one that has found favor introduces a mixture of gas and air through burners located at or near the bottom of the pot; these flames blow into refractory beds, which cause immediate and complete combustion of the gas. The sides of the pot are protected with refractory tile, and this superior construction results in longer pot life. On tests it has been shown that pot life is more than doubled and dross is reduced 30 or 40 per cent.

The latest designs of oil-fired furnaces remove the high-temperature zones even farther from the pot. Oil is fired into combustion chambers located parallel to the length of the pot and about 15 or 18 in. away. Here it is completely consumed, and the hot gases pass through flues, pierced through the side of the combustion chambers and so arranged that an even distribution of heat is obtained throughout the length of the pot. Refractory tiles protect the pot, and are arranged to be of such a height that the normal dross line will always be covered. With these conditions a minimum of heat is transmitted into the pot below the dross line.

Tests taken on gas and coke-fired galvanizing pots operated side by side over a period of months show the following comparison:

Production conditions:
Pot operated 16 hr. and held at melting point 8 hr.
Average weight of black steel galvanized in each pot: 7460 lb.

Costs:		Coke-Fired Pot		Gas-Fired Pot
Fuel	700 lb.	$3.50	8900 cu. ft.	$6.00
Power		——		0.60
Dross		7.35		4.91
Pot		1.16		0.50
Labor for drossing		1.48		0.74

Cost of dross represents the difference between the cost of the metallic zinc absorbed in the dross and the market value of the dross for resmelting. The fuel figures represent average daily figures taken over a month of 25 operating days.

Oil-fired furnaces installed at this same plant at a later date were studied carefully, and these figures were obtained:

Production conditions:
Pot operated 16 hr. and held at melting point 8 hr.
Weight of black steel galvanized in each pot: 9100 lb.

Costs:		Oil-Fired Pot		Gas-Fired Pot
Fuel	52 gal.	$3.12	10,500 cu. ft.	$7.03
Power		0.40		0.60

Exact production figures regarding the amount of dross formed, pot life and labor for drossing are not available, but it has been found that there is not much variation between the gas and oil furnaces on these costs.

In summarizing the results of these three fuels, the table at bottom of page will set forth the relative value of the various features involved.

American Rolling Mill Co. to Spend $2,000,000 at Butler, Pa.

The American Rolling Mill Co. has made a definite start upon a program of plant improvement at its Butler, Pa., works, for which there will be an expenditure somewhat in excess of $2,000,000. Contract for the structural steel for the new buildings, amounting to 3500 tons, recently was awarded to the McClintic-Marshall Co. The expenditures for new equipment will be for operations beyond the hot mills, in annealing, pickling and cold-rolling. The system of cold-finishing now in successful use at the company's Ashland, Ky., works is to be largely duplicated.

Study Course on Heat Treatment with Gas Fuel

An intensive course of instruction on metallurgy, with particular attention to heating processes wherein gas-fired furnaces are used, will be given at Massachusetts Institute of Technology, June 18 to 28, under sponsorship of the New England Gas Association and the American Gas Association.

This will be the seventh annual study course given under the auspices of these associations. Students will be housed in a school dormitory, and will use the institute's metallurgical and gas laboratories for solving assigned problems. Professors Wilkes, Williams and Homerburg will lecture on combustion, metallurgy and metallography respectively. Furnace engineers will also discuss modern furnaces and competitive fuels. Details concerning registration, fees and other matters can be obtained from Robert L. Gifford, 231 Main Street, Pawtucket, R. I.

The eighteenth annual convention of the German Foundrymen's Association will be held in Berlin, May 5 and 6. An interesting program of technical papers on gray iron, cast steel, malleable iron, and other foundry subjects has been arranged.

Comparison of Gas, Coke and Oil for Galvanizing under Similar Conditions

	Cost of fuel Gas=1.0	Dross Formation Gas=1.0	Pot Life Gas=1.0	Regulation	Cost of fuel and calorific value
Coke	0.57	1.49	0.4	Poor	$10 per ton

Oil	0.45	1.0	1.0	Good	140,000 B.t.u. 6c. per gal.

Steel Consumers' Earnings Analyzed

Profits of Automotive Industry Led Steel Consuming Groups in 1927, Though Farm Implement, Electrical Machinery and Office Equipment Makers Gained

LED by record earnings in the automotive industry, particularly by the General Motors Corporation, 114 companies in the iron and steel consuming groups had profits in 1927 which exceeded in the total the earnings for 1926. These companies last year reported net profits of $665,109,000, a return of 15.3 per cent on a total stockholders' investment of $4,356,152,000, the stockholders' investment being taken as the sum of the common and preferred stock and total surplus. In 1926 these same companies earned $648,841,000 on a stockholders' investment of $4,004,040,000, a return of 16.2 per cent. Although 1927 was a year of slightly higher net profits, increased liabilities, especially in the surplus columns of some of the highly prosperous companies, made the per cent return slightly lower.

But the picture of earnings in 1927 by the principal steel consuming industries cannot be drawn true when grand totals only are examined. More than half, or $336,752,000, of the total for the 11 chief consuming groups examined must be credited to the automotive industry, which registered a return of 24.9 per cent on a stockholders' investment of $1,352,300,000. In 1926 this same group, made up of 24 manufacturers of automobiles, trucks and airplanes, had profits of $299,215,000, a return of 26.1 per cent on the considerably lower stockholders' investment of $1,141,439,000. These figures, however, do not take into consideration the rather sharp decrease in the surplus of the Ford Motor Co. during 1927 and they do include the record earnings of $239,265,000 reported last year by the General Motors Corporation, a return in this case of 37.7 per cent on a stockholders' value of $634,257,000 and an increase of 35.4 per cent over the $176,699,000 earned in 1926.

The automotive industry as a whole did not fare nearly so well in 1927 as in the preceding year. Not including the Ford and General Motors organizations, the 23 companies analyzed had net profits last year of $97,487,000, a return of 13.6 per cent on a stockholders' investment of $718,043,000, as compared with profits of $122,516,000 in the preceding year and a return of 18.7 per cent on an investment of $654,423,000. Last year's decline under 1926 amounted to 20.4 per cent, a figure which is changed to an increase when the General Motors profits are included.

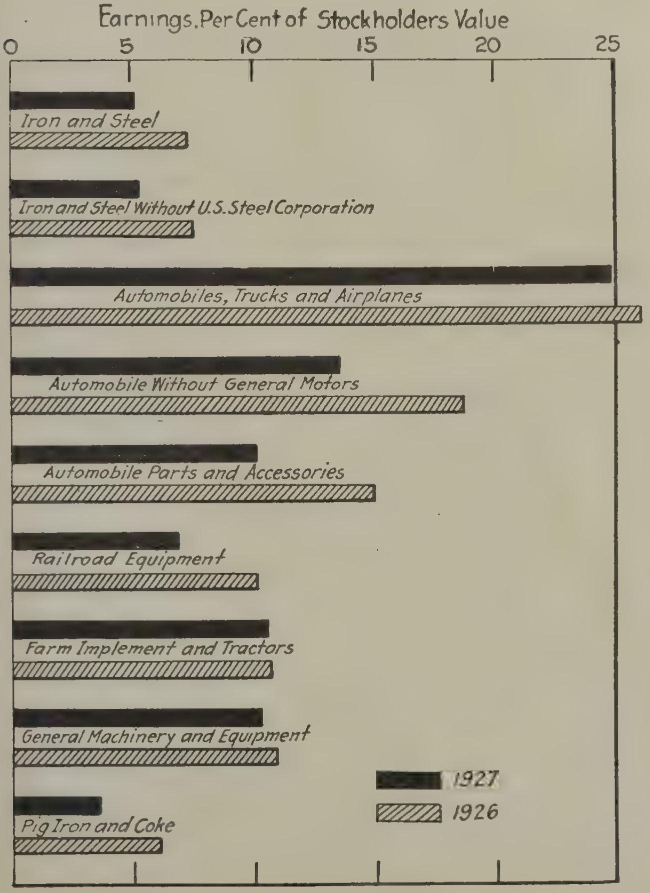
Of the 24 companies included in this analysis, 15 made poorer showings in 1927 than in 1926, seven reporting deficits. No deficits appeared as a result of 1926 operations. Two of the nine companies reporting higher earnings in 1927 were manufacturers of airplanes. The Willys-Overland Co., the Hudson Motor Car Co. and the Reo Motor Car Co. also had much better returns than in 1926.

Iron and Steel Industry Again at Bottom

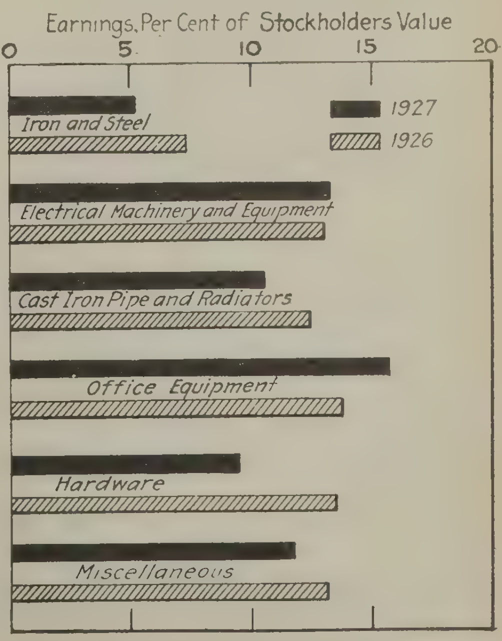
If 1927 was a poor year for the automotive group when considered without its most spectacular member, it was less profitable for the steel industry and even worse for a group of four companies whose chief products are pig iron and coke. A group of 23 steel making companies, with an ingot capacity of more than 85 per cent of the entire industry, had net earnings of only $157,656,000, a return of 5.2 per cent on a total stockholders' investment of $3,017,644,000, and the investment is nearly three-fourths as large as the investment in the combined consuming groups. In the preceding year the return was 7.3 per cent, the decline in net profits having been 25.2 per cent.

As the accompanying table shows the variation in earnings for the two years was about the same either with or without the Steel Corporation. However, the return of independent companies was slightly higher than that of the leading interest in both years in direct contrast to the experience of the automotive industry.

The analysis of a group of four producers of merchant pig iron and coke may be considered as fairly representative of that industry, which has suffered seriously since the war period. These companies earned only $3,246,000 on a stockholders' investment of $88,873,000 in 1927, a return of 3.6 per cent. In 1926



STOCKHOLDERS' Value Is Taken as Sum of Common and Preferred Stock and Surplus, and Earnings Are Net for Common and Preferred Stock After All Deduction for Interest, Taxes, Depreciation and Depletion



the same companies had profits of $5,016,000, or a return of 6.1 per cent on an investment of aproximately $82,048,000.

Farm Implement Makers Did Better

The farm implement, electrical machinery and office equipment groups all reported slightly better profits in 1927 than in 1926. Of the seven makers of farm implements and tractors making up this group, only one reported lower profits in 1927 than in 1926, and the gain in the group as a whole was 6.6 per cent. The International Harvester Co., which accounted for about half the profits of this industry, fared no better comparatively than the smaller companies.

Comparison of Earnings of 10 Important Iron and Steel Consuming Groups With Iron and Steel Makers

(In Thousands of Dollars)

Classification	No. of Companies	1927 Total Stockholders' Investment	1927 Net Profits	1927 Per Cent Earnings to Stockholders' Investment	1926 Total Stockholders' Investment	1926 Net Profits	1926 Per Cent Earnings to Stockholders' Investment	Per Cent Gain or Loss in 1927
Iron and Steel	23	$3,017,644	$157,656	5.2	$2,877,002	$210,842	7.3	—25.2
Without Steel Corporation	22	1,325,558	69,759	5.3	1,246,555	94,175	7.5	—25.9
Pig Iron and Coke	4	88,873	3,246	3.6	82,048	5,016	6.1	—35.3

Without General Motors	23	718,043	97,487	13.6	654,423	122,516	18.7	—20.4
Automobile Parts and Accessories	15	193,615	19,521	10.1	194,276	29,300	15.0	—33.4
Railroad Equipment	13	486,697	33,293	6.8	433,013	43,834	10.1	—20.0
Farm Implements and Tractors	7	418,045	44,408	10.6	390,773	41,662	10.7	+ 6.6
General Machinery and Equipment	15	341,832	35,284	10.3	339,854	36,877	10.9	— 4.4
Electrical Machinery and Equipment	7	670,896	89,161	13.3	635,035	83,167	13.1	+ 7.2
Cast Iron Pipe and Radiators	9	212,017	22,386	10.5	208,024	26,058	12.5	—14.1
Office Equipment	8	160,544	25,297	15.7	164,577	22,601	13.7	+11.9
Hardware	7	98,100	9,213	9.4	98,866	13,539	13.5	—31.9
Miscellaneous	9	422,106	49,794	11.8	398,183	52,588	13.2	— 5.3
Total	141	$7,462,669	$826,011	11.1	$6,963,090	$864,699	12.4	— 4.5
Total Steel Consuming Companies	114	4,356,152	665,109	15.3	4,004,040	648,841	16.2	+ 2.5

In the electrical machinery and equipment classification, although the group as a whole registered an increase in profits of 7.2 per cent over 1926, the gain was made entirely by the three larger interests, the General Electric Co., the Westinghouse Electric & Mfg. Co. and the Western Electric Co., Inc. Four smaller companies reported sharp declines.

The office equipment makers, however, reported well distributed gains. Seven of the eight companies analyzed had higher profits in 1927 than in 1926 and the decrease in the case of the General Fireproofing Co. was very slight. The eight companies had a return of 15.7 per cent on total stockholders' investment in 1927, as compared with 13.7 per cent in 1926, the gain in profits having been 11.9 per cent.

Automotive Parts and Accessories Declined

The most pronounced reductions in profits were shown by the automotive parts and accessories makers, the hardware group and the manufacturers of railroad equipment. Only four of the 15 companies included in the automotive parts group had better returns in 1927 than in the preceding year and in the case of one of these companies the gain was only in the form of a smaller deficit. The decrease in the industry as a whole amounted to 33.4 per cent.

A group of six companies the principal products of which are hardware, firearms and kindred products registered a decline in earnings last year of 31.9 per cent. This decrease was general, ranging from 16 to 72 per cent, and the return on stockholders' investment for the group was 9.4 per cent in 1927, as compared with 13.5 per cent in the preceding year.

Railroad equipment makers' profits declined 20 per cent, the J. G. Brill Co., the General American Tank Car Corporation and the Pressed Steel Car Co. having been the only companies of the 13 included in the group which made better showings last year than in 1926. Especially sharp declines were reported by the locomotive makers.

Manufacturers of machinery and equipment as a group reported only slightly lower profits in 1927, the decline having been 4.4 per cent. Gains and losses were general, distributed among the 15 companies included in the group. Machine tool makers, as in the previous year, had small profits.

A considerable decline, 14.9 per cent, was shown by the makers of cast iron pipe, radiators and kindred products, while a group of nine miscellaneous consumers of iron and steel reported a decline of 5.3 per cent in net earnings. Included in this group were the American Can Co., the American Safety Razor Corporation, the Continental Can Co., Inc., the Crane Co., the Gillette Safety Razor Co., the Oil Well Supply Co., the Standard Sanitary Mfg. Co., the Walworth Co. and the White Sewing Machine Corporation.

Study of Stresses in Joints of Big Diameter Pipe

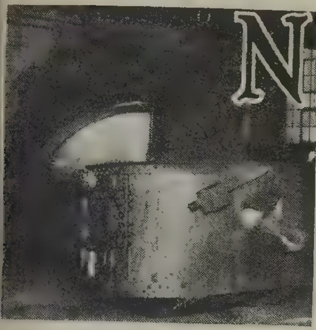
In this issue is a series of pictures showing methods used to manufacture large diameter water pipe on the Pacific Coast. The Mokelumne pipe line, for which the pipe was made, was designed to have girth seams welded in the field, and some 5 miles of the pipe was made for butt joints. Considerable difficulty was experienced in the first field joints made, and contraction cracks opened up in many of them. The cause of this phenomenon (which does not appear in long pipe lines of smaller diameter) was obscure and its discussion raised several contentious opinions.

In view of the added fact that a water famine impended, the chief engineer of the project, A. P. Davis, ordered that the remainder of the pipe be manufactured for riveted girth seams. At his request Prof. L. T. Jones and Prof. W. S. Weeks of the University of California made a careful study of the stresses existing in the welded portion of the pipe. The results and conclusions are contained in the University of California *Publications in Engineering*, Vol. II, No. 9, which may be obtained from the University Press, Berkeley, Cal., for $1. It may be concluded from the report that the troubles with the girth seams were due to a failure to follow proper and well understood welding practices. A procedure control is outlined by which "a 65-in. pipe line can be either electrically or acetylene-welded without fear of breakage."

Life of Heat-Resisting Alloy Castings

As Much Dependent on Design and Foundry Practice As on Composition

BY DAVID EVANS*



NOTWITHSTANDING the great reliance placed on chemical analyses of heat-resisting alloys, many users and some producers are questioning today whether composition is as vital a criterion as has been supposed. The impression is rapidly gaining ground that foundry practice and control are equally as important as the mixture of metals from which heat-resisting alloy castings are made.

Patents cover a considerable range in the percentage of the various elements entering into these alloys. In these claims and specifications it is found, for example, that nickel content varies from 3 per cent to 60 per cent.

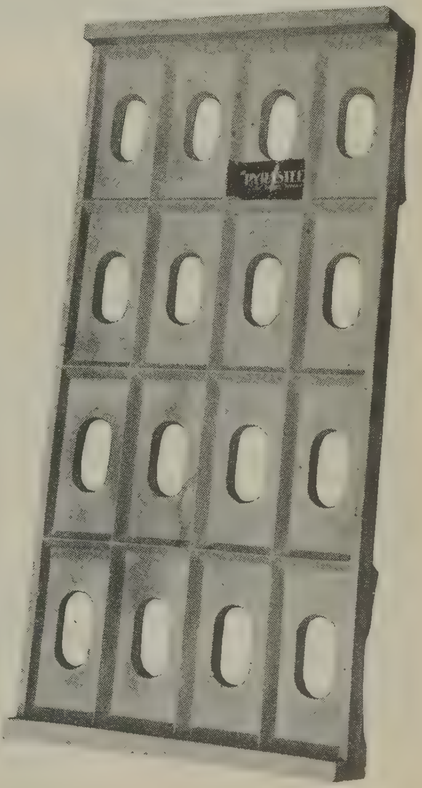
A recent investigation outlines a series of chemical analyses of heat-resisting alloy steel carburizing boxes, all of which were similar in design and were used in the same furnace under identical conditions. The nickel content of all these boxes was close to 60 per cent. In service these boxes showed a life in the furnace varying from 75 hr. for the poorest box to 7000 hr. for the best box. This indicated that there was a great difference in the actual physical characteristics of these boxes, and that the life was dependent in great measure on such characteristics and not alone on the chemical analysis of the material.

To all appearances one of these boxes failed because it was poured at an improper temperature. Another failed because of incorrect design. Failure of the others was apparently a matter of grain growth due to segregation. The experience with these boxes leads to the conclusion that, no matter what the formula may be, the best heat-resisting alloy steel cannot be produced without properly solving the age-old problems of design, molding, drying, venting, melting and pouring. It is not so much a question of seeking revolutionary changes in foundry practice as the careful painstaking adaptation of the principles of good foundry methods.

Selection of materials is the first step in good foundry practice. A good heat-resisting alloy must be non-oxidized metal throughout. This means that the foundryman cannot expect to get good uniform results using returned and scrapped alloy—and the same holds true if he buys miscellaneous alloy scrap on the market or attempts to use old heat-resisting alloy steel boxes which have been in service. It is advantageous in making such alloys to charge and melt rapidly. Pouring temperatures for the alloy are generally slightly higher than temperatures for ordinary steel. If temperatures are high enough, it is possible to cast heat-resisting alloys in thin sections.

In addition to a good formula and proper foundry practice, there is a third important element, namely, the proper design of alloy steel parts. Cases are not infrequent in which a simple change of design of a part increases its life several fold. The accompanying illustration shows a good example of the importance of design. This grid was formerly a corrugated solid plate with a half flange on each end. When loaded with heavy forgings and charged into an oil-fired furnace of the pusher type, the corrugated pans warped and some developed cracks which rendered them unfit for service. The design was changed so that the grid has a full flange at both ends. Numerous holes, 2 in. x 4 in., permit the rapid absorption of heat through all parts of the forging, and a minimum amount of material is in contact with the grid. The advantages gained from the new design were a lighter casting, freedom from distortion, a quicker heating operation and the substitution of material at about half the price of the alloy formerly used.

Experience leads one to believe that, somewhere in the maze of formulæ, there must be a combination of elements that is well-balanced. This analysis, when properly assembled in an electric furnace and made into castings of proper design, carefully molded with material selected for that particular purpose, must result in a better heat-resisting alloy. A producer of heat-resisting alloy steel must guard against segregation.



Grid, Formerly a Solid Corrugated Plate, Redesigned to Increase Life and Efficiency, by Providing Holes and Full Flanges at Each End

It is not sufficient that the foundryman produce a satisfactory commodity part of the time. It is essential that he turn out dependable heat-resisting alloys day in and day out under all sorts of conditions. This requires a careful study of the mixture, strict grading of raw materials, accurate and painstaking control of foundry practice, and experience in the design of heat-resisting alloy castings.

The nineteenth annual convention of the American Steel and Heavy Hardware Association will be held at the Copley-Plaza Hotel, Boston, May 22, 23 and 24.

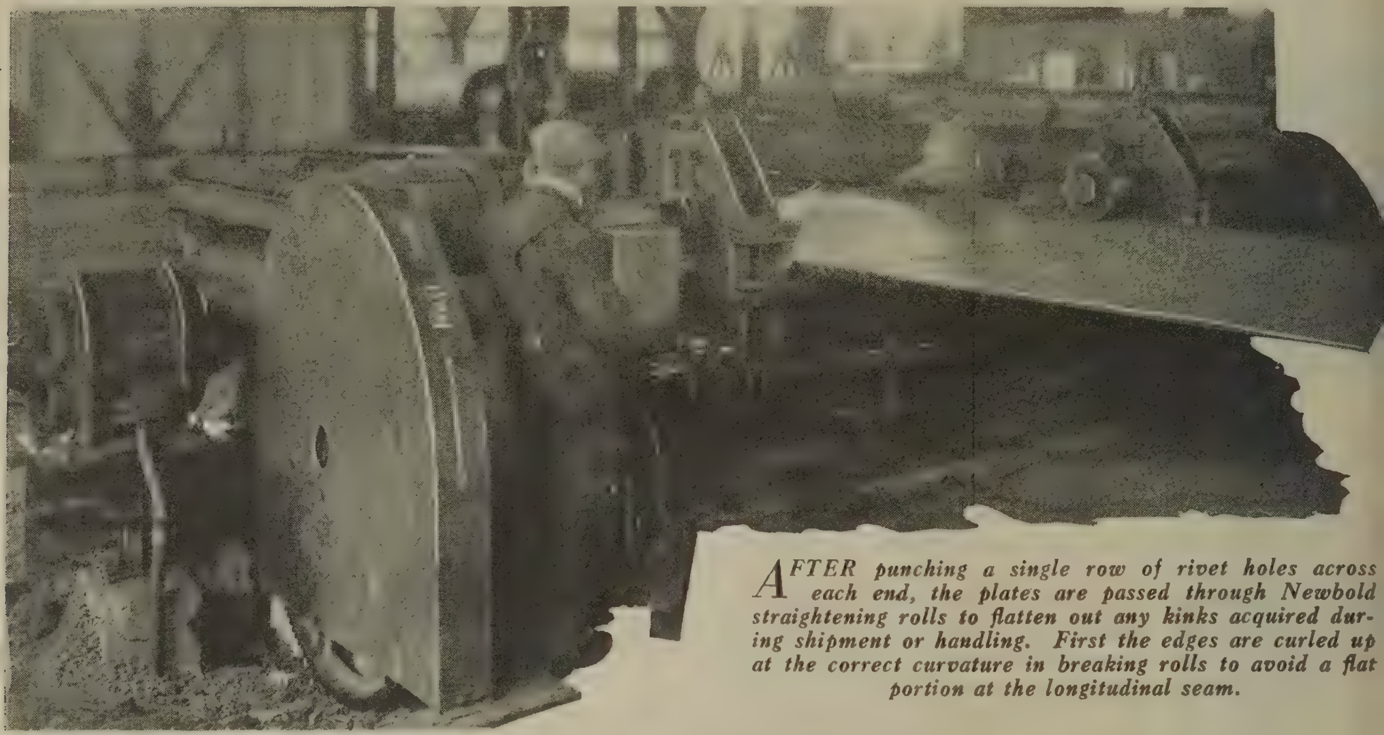
---

*Chicago Steel Foundry, Chicago.

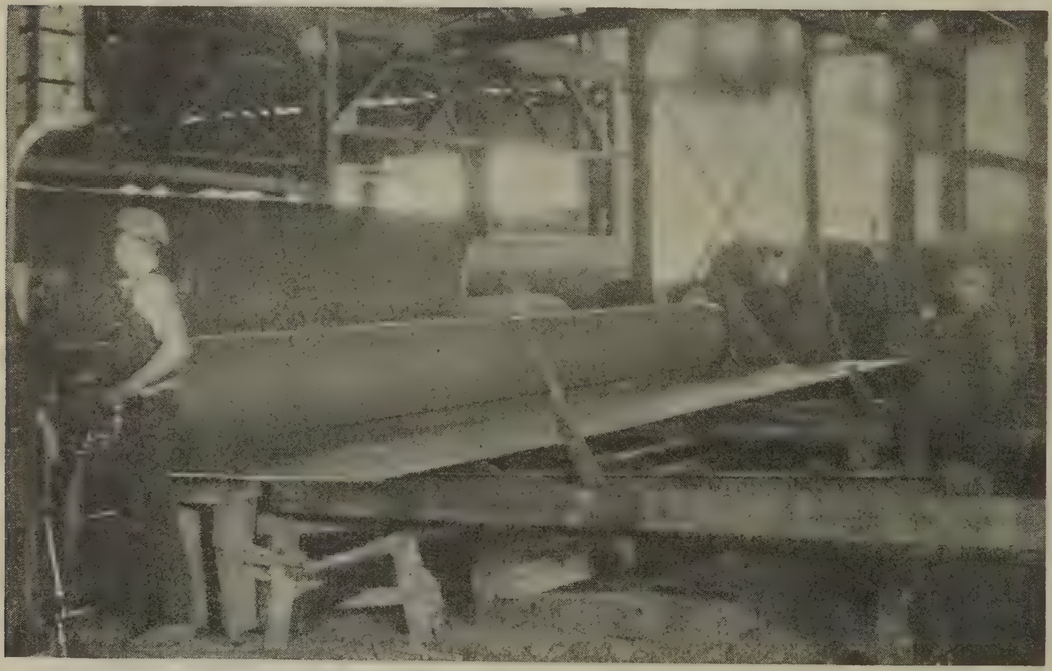
Water Pipe, Five Tons per Se

WATER for irrigation or city consumption is frequently carried long distances in the Western States. Piping for this purpose is so bulky it must be manufactured near the line.

A noteworthy example is an aqueduct bringing water from the Mokelumne River to Berkeley and other cities on the eastern shore of San Francisco Bay. For about 80 miles water passes through a welded pressure pipe, 65 in. in diameter, made of



AFTER punching a single row of rivet holes across each end, the plates are passed through Newbold straightening rolls to flatten out any kinks acquired during shipment or handling. First the edges are curled up at the correct curvature in breaking rolls to avoid a flat portion at the longitudinal seam.



THEN powerful bending rolls with 30-ft. throat form the plate into a long half-cylinder.

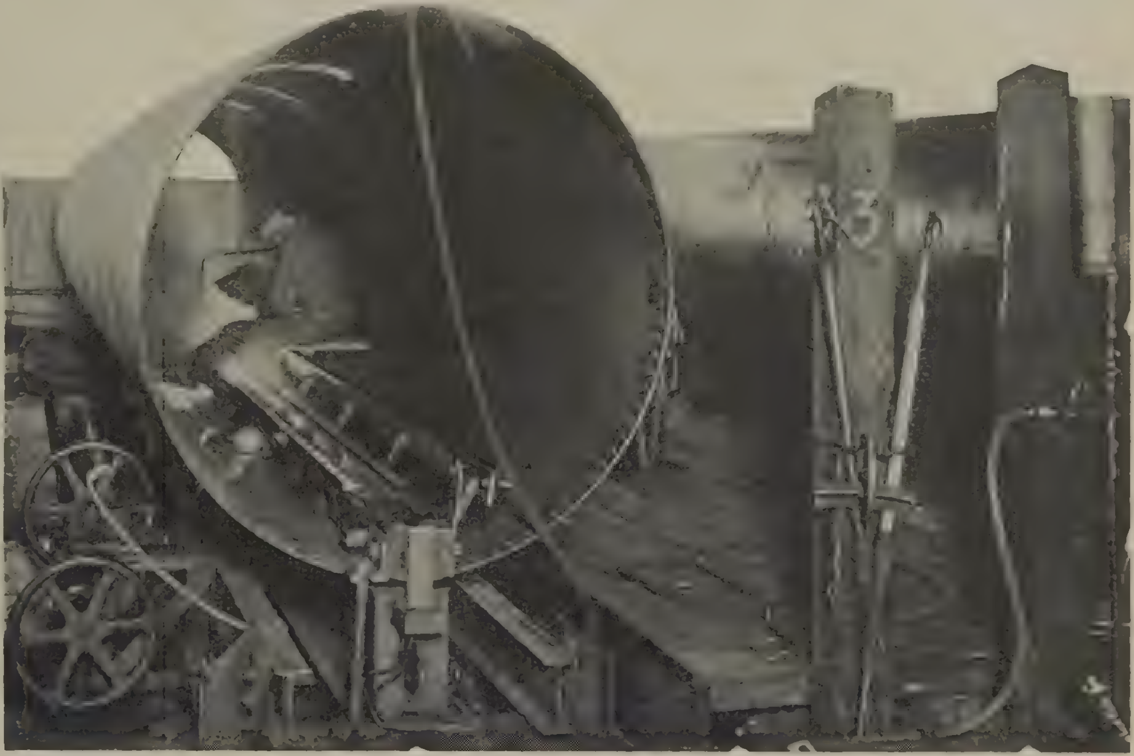
TO assemble one pipe length, a half-cylinder is dropped into a cradle between horizontal I-beams, its mate is inverted above, and the two are "tack welded" with a few short hand-made welds.

CARNEGIE LIBRARY OF ATLANTA

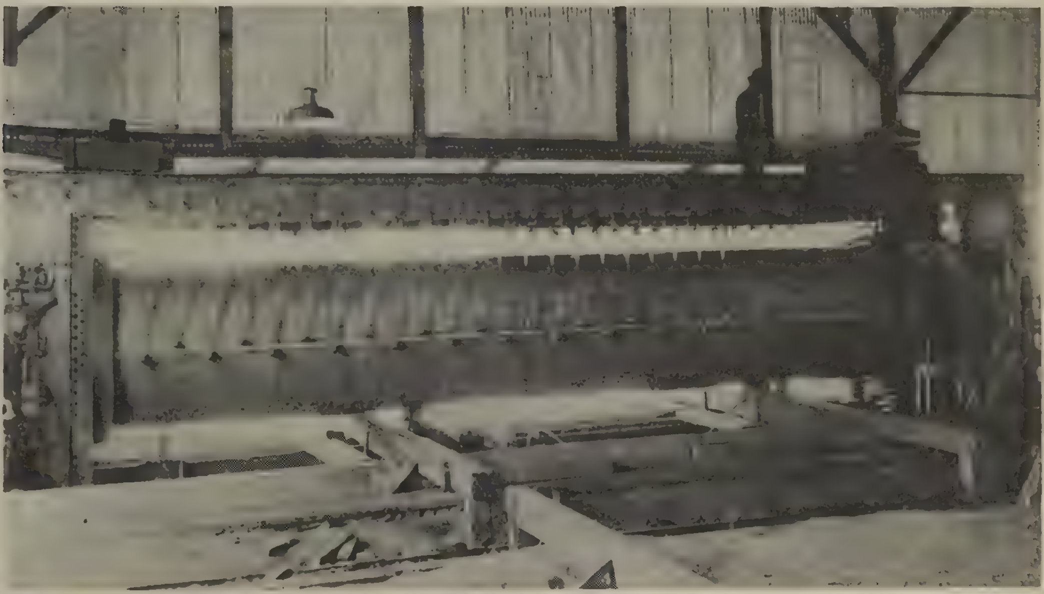
on, Fabricated in California

plates up to ½ in. thick. Nearly 75,000 tons of steel was shipped from the Carnegie Steel Co. for this project.

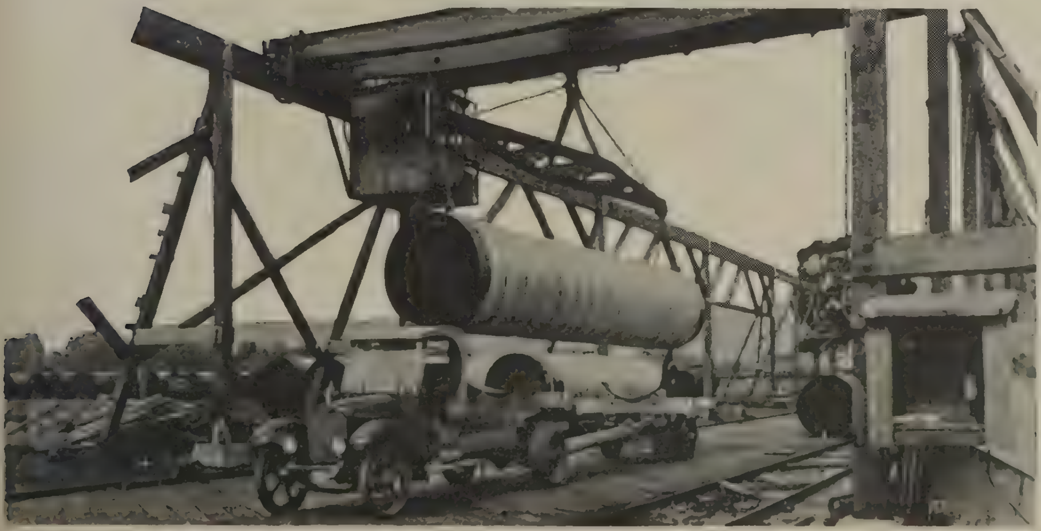
The pipe was made during 1926 for the East Bay Municipal Utility District by the Steel Tank & Pipe Co. of Berkeley, Cal. The welding equipment was furnished by the Lincoln Electric Co., Cleveland, through whose courtesy these pictures were secured. The welding operations in making the pipe are described in the captions below.



LONGITUDINAL seams are made by a battery of eight Lincoln automatic welders. The heat of the carbon arc melts clear through the abutting edges as well as a strip of reinforcing metal covering the joint. One passage of the carriage, and the work is done. Then the hold-down clamps are relieved, the pipe is rotated 180 deg., and the opposite longitudinal seam is made in the same manner.



PIPE sections are taken endwise from the welding machines by overhead trolleys, then rolled along skidways to test. While carrying hydrostatic pressure sufficient to stress the metal to 22,000 lb. per sq. in. each joint is struck vigorously with a series of hammers.



AFTER the pipe has been rust-proofed with tar and wrapped with canvas, it is transferred from the storage dock to 5-ton truck trailers. The trucks deliver the pipe to the line, where caterpillar cranes swing each section into the trench.

Automatic Gear Cutter Made Heavier and Capacity Increased

The Brown & Sharpe Mfg. Co., Providence, has redesigned its No. 13 automatic gear cutting machine to provide for easier handling and increase in productive capacity. The machine is adapted for cutting spur and bevel gears, clutches, segments and similar work, and is intended for jobbing shop use as well as for production operations.

The machine has been made heavier throughout and the capacity increased to 4 diametral pitch in cast iron and 5 diametral pitch in steel. It is of the motor-in-the-base type and when motor driven, the motor is entirely inclosed in a compartment cast in the base of the machine. Cooling air is circulated about the motor through louvers at front and rear of the compartment. Adjustment of the pre-stretched driving chain is made by movement of the plate on which the motor is mounted. The cutter slide, of rigid construction and with the counterweight arrangement integral with the machine, has a maximum travel of 5½ in. and a minimum of ½ in., which adapts the machine for work requiring short strokes.

Convenience of Set-Up Adapts the Machine for Jobbing Shops as Well as for Production Operations

The oiling system has been simplified to enable the operator to lubricate all parts of the machine conveniently. The weight of the redesigned unit is approximately 4000 lb.

Electric Glue Pot

A compact electric glue pot, arranged so it may be carried to the job, is being put out by the Black & Decker Mfg. Co., Towson, Md. The glue is maintained at a constant temperature of 150 deg. Fahr., for smooth, tight joints. The heating element is a nichrome ribbon, with mica plates and thermostatic control. The element is tightly sealed with asbestos to eliminate fire hazards, short circuits, etc.

The Heating Element of the Glue Pot, Which Is Portable, Is a Nichrome Ribbon

The glue container, of 2 qt. capacity, is cast aluminum, machined to fit a gray iron receptacle, thereby conserving heat. The sides of the pot are sloped to minimize spillage, and a heavy iron wiper across the center of the glue container prevents waste from drippage. The pot is made for either 110 or 220 volts alternating current.

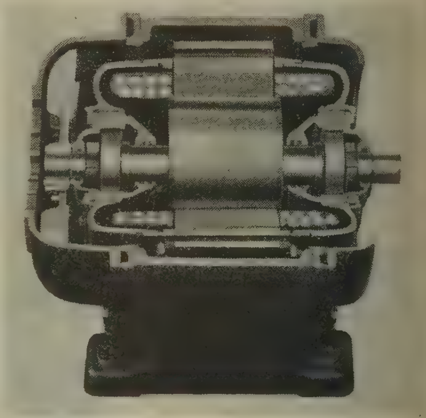
Totally Inclosed Electric Motor

A new type of completely inclosed, ventilated motor, with a 40-deg. rating, has been brought out by the American Electric Motor Co., Cedarburg, Wis., which company recently became a subsidiary of the Splitdorf-Bethlehem Electrical Co. An unusual test was made to demonstrate how effectively dust is excluded from the windings of this motor. A glass case was filled with a mixture of sand, iron filings and sawdust until the motor was half covered. An external fan on the motor churned this mixture, filling the air with it and completely surrounding the motor with thick dust. For two weeks the motor was run under these adverse conditions. When the motor was opened the windings were so clean, it is said, that a permanent magnet brushed over them showed no trace of filings. Nor had any sand or sawdust penetrated the cover.

Inclosing hoods hermetically seal the winding. The hoods are telescoped into a ring fastened to the stator laminations, the surfaces of which are machined.

Cooling of this Type P-K motor is unusual in that air is driven through, as well as over, the stator laminations. The stator core is perforated, thereby making it possible to remove the heat at the point where it originates. Air in the inclosed portion is agitated by malleable cast fans shrunk on the motor shaft.

The ball bearing is of the cage type. Either inclosing hood of the motor can be removed without disturbing the bearings, which remains on its shaft inclosed in its cage. No dust or grit can get into the bearing; nor can any grease escape, as felt washers are imbedded in the cap to keep it in.



Inclosing Hoods Hermetically Seal the Winding. The hoods are telescoped into a ring fastened to the stator laminations

The stator is removable. Should it be damaged it can be replaced in a few minutes. The rotor is of the usual construction with the exception of its winding. The end rings are electrically welded to the bars, forming an indestructible one-piece squirrel cage of uniform material.

Separation of coal and coal by-products from their attendant impurities by means of the Sutton, Steele & Steele pneumatic process is outlined in a booklet issued by the American Coal Cleaning Corporation, Welch, W. Va. The feeder and other elements of the equipment are described and illustrated, and a typical flow sheet and installations of the dry treating plants are included. In this process, which depends primarily upon the difference in specific gravity or density between the particles of material to be separated, only one operation is required. When inert bands are encountered the product is crushed to release them for the pneumatic process, and only the inert material is discharged as refuse. The dust generated is said to be recovered at small cost.

Business Analysis and Forecast

BY DR. LEWIS H. HANEY

DIRECTOR, NEW YORK UNIVERSITY BUREAU OF BUSINESS RESEARCH

GENERAL BUSINESS OUTLOOK

Favorable Factors

1. Retail trade gained in March and was above normal.

2. Automobile production and sales are in large volume.

3. Farm purchasing power recovered in February (possibly due in part to the extra day in that month).

4. Exports recovered in March.

5. Commodity prices are quite stable and a little higher.

6. Some improvement in the oil industry.

7. Continued strong financial position of most leading companies.

8. Light mercantile inventories.

Unfavorable Factors

1. The P-V line declines for the second month.
2. Building activity declined in March.
3. Decline in new business and unfilled orders in the steel industry.
4. Freight traffic failed to show the normal seasonal gain in March, indicating the limited business expansion.
5. Employment has shown only a small seasonal recovery.
6. Severe competition and narrow profits.
7. Large gold exports, increased rediscounts at the Reserve banks, high loan-deposit ratio, excessive brokers' loans.
8. Tightening money markets.
9. Winter wheat condition poor.
10. Possibilities of political unsettlement.
11. Rather heavy stocks of manufactured commodities in first hands.

CLEARLY a majority of the more significant factors that affect or indicate the general trend of business are unfavorable. Downturns in the P-V line, building activity and unfilled steel orders warrant a forecast that, to say the least, the general recovery in business will not reach anything approaching boom proportions, and that a little setback is probable before mid-year. Business, however, should be fair-to-good throughout the spring. Sustained retail trade, a firm general level of commodity prices and the improbability of any severe advance in money rates appear to be the most favorable aspects of the situation. It may be said, too, that an absence of inflation in business and a generally moderate expansion of industrial production are the rule. Thus, nothing but a pause in the recovery or a slight recession is indicated at present.

Barometer Continues to Point Downward

OUR P-V line (a ratio of commodity prices to the physical volume of trade) declined in February and March. This indicates that production in early 1928 has been stepped up more rapidly than requirements and that the ratio of demand to supply has declined. It indicates that the general condition of market demand is not sufficiently strong to support much further expansion in physical volume without price weakness developing. This is a condition that usually results in slackening business. The P-V line forecasts at least a minor setback some time between May and August.

As readers of this department of THE IRON AGE will know, it is our theory that steel production is so closely related to the general business situation that the forecasts of the P-V line apply to it. Accordingly, some decline in steel production within a few months, and one which probably will be greater than usual for the season, may be anticipated. We have nothing but precedent to go by in attempting to say when such a decline may come, and precedent allows considerable leeway, the lag having ranged from three to nine months. The present situation in some respects resembles 1923, but some similarity may be found also in the early part of 1924.

Perhaps the outcome will be somewhat between these two earlier periods. In other words, the adjusted

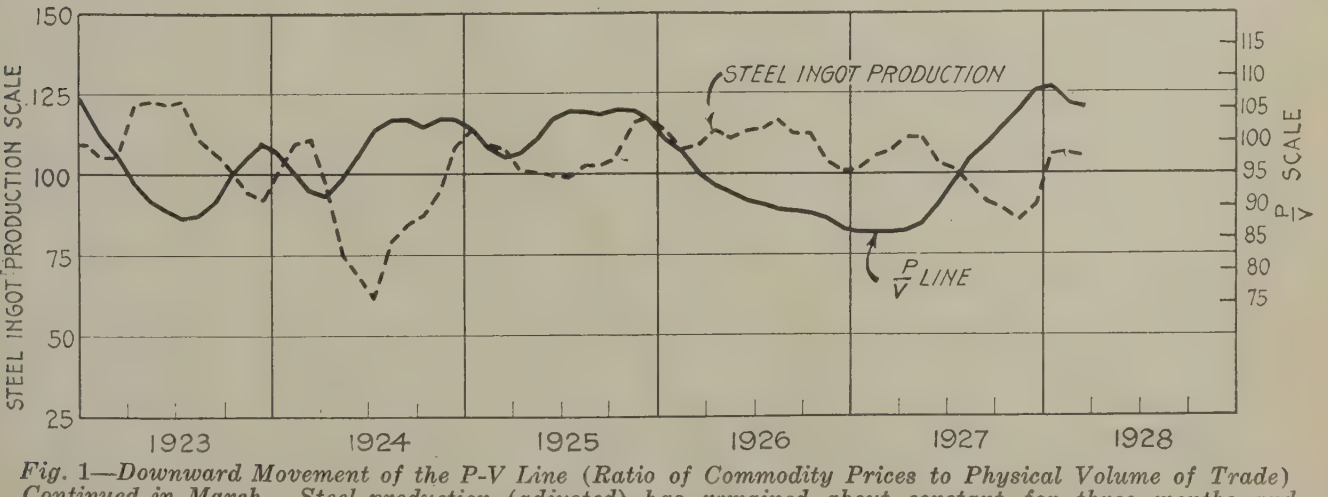


Fig. 1—Downward Movement of the P-V Line (Ratio of Commodity Prices to Physical Volume of Trade) Continued in March. Steel production (adjusted) has remained about constant for three months and heavy tonnages may be expected for several months

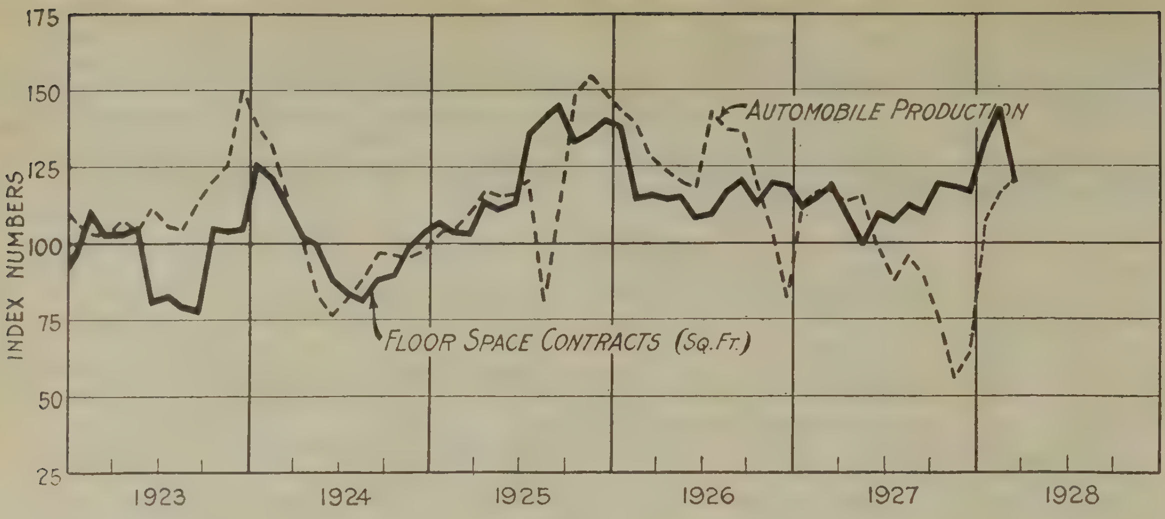

Fig. 2 — Building Activity Moved Downward in March. Improvement in the automobile demand for steel should proceed through the spring

steel production curve may rise in April, but not so much as in April, 1923. It may then hold up in May, with relatively little change in either direction, and then slump about mid-year. All we can say with much certainty is that there will probably be some recession in steel production by August, which will carry it below normal.

Scrap prices impress us as being in a highly uncertain position, the recent strength apparently being unusually speculative. The main trend of the price of heavy melting steel scrap at Pittsburgh was slightly downward through March, and it is doubtful if a sustained upturn has begun. At best, scrap prices are still too low to suggest a strong position.

It is particularly important, in judging the general outlook for business, to note the trend of the two industries that have been the leaders in our post-war prosperity. These industries—building and automobile—are also among the chief consumers of steel.

Opposing Indications Shown by Building and Automobiles

BUILDING activity (Fig. 2) showed a declining trend in March, and this is one of the most unfavorable developments affecting general business. Nearly always, so sharp a reaction as occurred last month marks a reversal of trend, and a downtrend in building activity nearly always anticipates a decline in business. The floor space in building contracts awarded during March amounted to 88,090,000 sq. ft., which compares with 87,892,000 sq. ft. in March, 1927, and is an increase over February. This increase, however, is much less than usual and our adjusted index for the month is only 118.6, against 144.1 in February. In each case the average for 1921-1927 equals 100.

Thus there was a sharp decline in the true trend of construction, and the March index shows the lowest annual rate of building found in any month since last November. The value of contemplated new construction as reported by the F. W. Dodge Corporation also declined in March and is relatively low compared with the volume of building contracts. The value of contracts awarded in March was 5 per cent below a year ago, while contemplated new work was 26 per cent lower. A similar sharp decline is shown by the building permits, which decreased in March, although usually they show a considerable gain in that month.

Automobile production increased a little more than usual in March. It is estimated that the total output of cars and trucks was 435,000, which compares with 417,700 a year ago, but is much below the 456,800 produced in March, 1926. Sales of General Motors cars made a new high record in March, and, as April is a peak month in this business, a further increase is probable. Not all companies, of course, are doing so well.

In fact, there are some less favorable indications concerning the automobile business. In the first place, the curve of automobile production shown in the accompanying chart looks much as though rounding off for a decline; the March increase was not large, considering the season, and current reports indicate that the expansion of automobile production has been checked. Insofar as this development may prevent over-production, it is good; but it may be an indication of a limited demand. In the second place, Ford production is gradually expanding and that probably means increased competition in the low-priced field. Finally, it is to be noted that the inventories of General Motors dealers have become quite large. Probably they are not excessive in view of the increased volume of sales, but they are the largest since early 1924.

On the whole, conditions as shown in the second

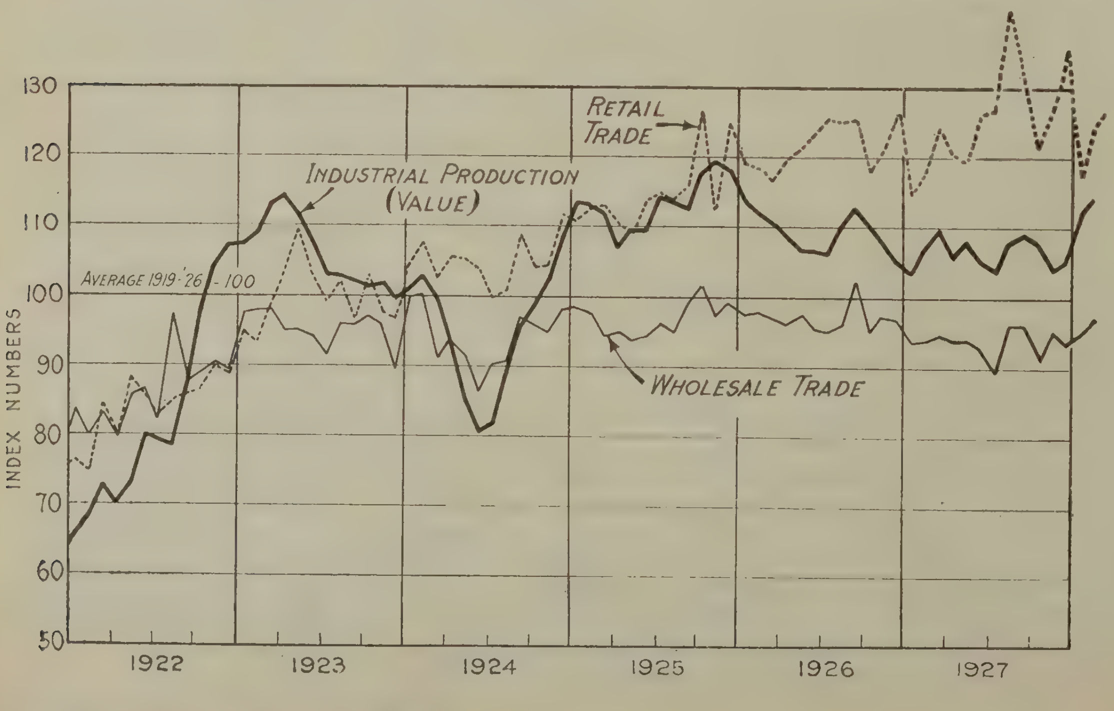

Fig. 3 — Favorable Indications Are Seen from the Relations of Retail Trade, Wholesale Trade and Industrial Output. Retail trade continues to show improved buying sentiment. Wholesale business remains slow, while industrial production is well in line with retail sales

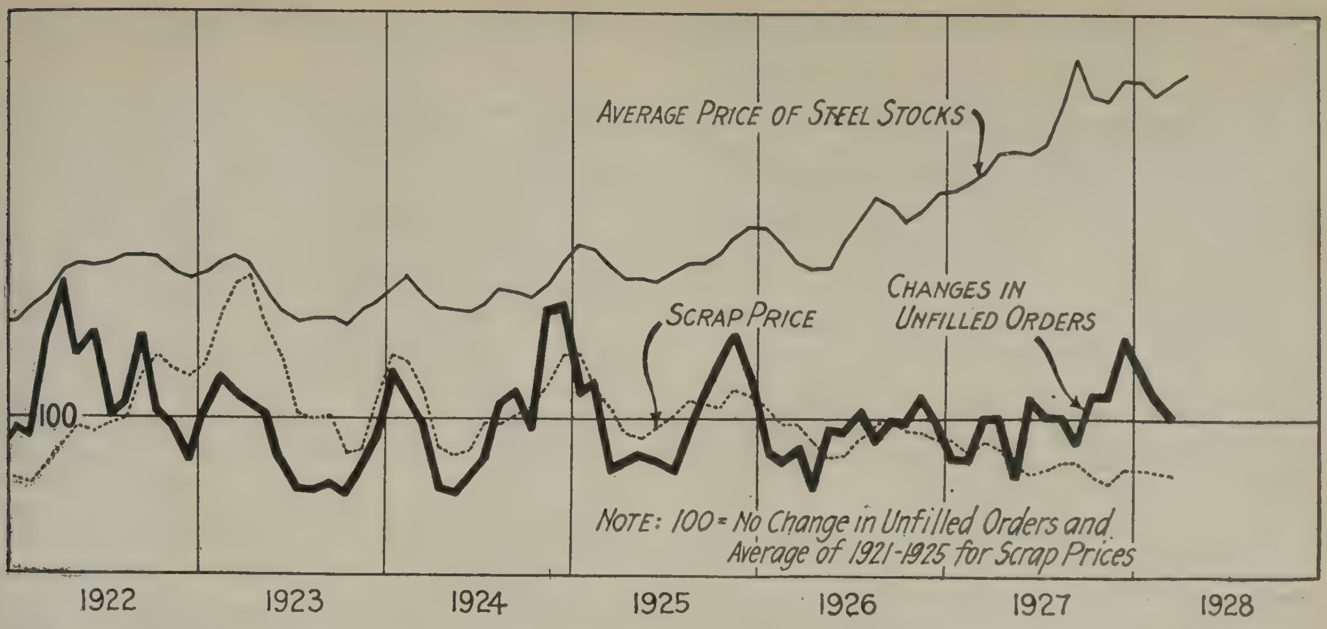

Fig. 4—All Three Indexes Point to Lower Operating Conditions. Unfilled orders declined in January; stock prices, though advancing recently, are irregular and scrap prices are weak

chart are not such as to suggest that the recent recovery in business will go very far or last very long.

Retail Trade Absorbs All the Goods Made

OUR third chart has two values: In the first place, it shows the trends of three fundamentally important business indexes; in the second place, it provides some basis for comparing the levels of these indexes, for the purpose of determining whether or not a maladjustment exists. Each curve is adjusted so as to eliminate the merely seasonal variations.

Apparently the general trend was upward in February and March. Retail trade gained more than usual for the season in both months, and in March was somewhat above the average of the last two years. Probably it may be said that retail sales averaged between 3 per cent and 4 per cent above normal. Wholesale trade showed a more than seasonal expansion in February, the latest month for which data are available, though it was not up to the average of the last two years and can be called normal only if we assume a prolonged general downward trend to characterize this branch of trade.

As to the total value of the industrial production of the country, estimated by using the Bradstreet index of commodity prices, we find it rising in February to the highest point since the beginning of 1926. Of course, such estimates are rough. But it is clear that, after a long, irregular decline between November, 1925, and the end of 1927, the value output of the country has made a good recovery.

As to the relative levels of these branches of industry and trade, it need only be noted that the level of retail trade is so high in comparison with the estimated total value of production that no general overproduction is indicated.

Decline in Unfilled Orders Significant

UNFILLED orders of the Steel Corporation, which (properly interpreted) are an excellent business barometer, declined in March, and there is reason to believe that this decline represents a decrease in new business. At least, this is indicated by the fact that the rate of change in the unfilled orders has shown a declining trend since last December, each successive increase being smaller—as is the way with unfilled orders when new orders are falling behind.

Meanwhile, after declining in January and February, the average price of a group of steel stocks recovered in March and early April, running counter to the trend of the unfilled orders barometer as shown in the chart. At this writing, the average retains a considerable part of the recovery. Such divergences are rare. During the past year and a half, however, speculation has been carried to great lengths, first as a result of very low money rates, and then under the influence of a speculative fever generated by the spectacle of the general advance in security prices. Under such circumstances a normal performance is hardly to be expected.

But the yields on representative securities have fallen below the cost of borrowing money, and signs are appearing that the speculative fever has nearly reached a crisis. As this is written the Boston and Chicago reserve banks have raised their discount rates, and brokers' loans as reported by the member banks of the Reserve System have crossed the four-billion-dollar mark. Time money has risen to 5 per cent. It is difficult, therefore, to see how the normal tendency of steel stocks to reflect a decline in the volume of new steel business can be counteracted much longer.

Steel Electrical Engineers Form Welding Committee

In order to meet the welding problems that develop in steel plants, the Association of Iron and Steel Electrical Engineers has organized a national welding committee, under the chairmanship of A. G. Place, Youngstown Sheet & Tube Co., Youngstown, Ohio. This committee held its first public conference in Cleveland, April 20, attended by about 200 men from northern Ohio centers. Inspection trips were arranged to the plants of the Cleveland Crane & Engineering Co. and the Lincoln Electric Co. These companies also tendered a dinner to the visitors.

In the evening, J. C. Lincoln spoke on "Arc Welding Is Selling Steel." He reviewed the growth of the industry and enumerated the fields in which welding is used. Welding, he declared, should be regarded as a new tool that is of great assistance to manufacturers. In welding many duplicate parts the use of the automatic arc welder will tend further to reduce manufacturing costs as compared with hand welding. In his opinion, welding offers a very important field for young men who are turning their attention to engineering.

---

*Schedule of the next instalments of the **Business Analysis and Forecast**, by Dr. Lewis H. Haney, Director New York University Bureau of Business Research, follows: **May 17**—Activity in Steel Consuming Industries; **May 24**—Position of Iron and Steel Producers; **May 31**—General Business Outlook.*

FABRICATED STRUCTURAL STEEL

Awards of 26,400 Tons With 12,000 Tons for Bridge at Charleston, S. C.

FALLING considerably below the average of recent weeks, awards amounted to 26,400 tons. Included was a highway bridge at Charleston, S. C., which took 12,000 tons. New projects calling for 21,800 tons included 8000 tons for a highway bridge in Missouri. Awards follow:

Boston, 440 tons, mercantile building, on Kneeland Street, to New England Structural Co.

Littleton, N. H., 227 tons, bridge, to American Bridge Works.

State of New Hampshire, 145 tons, three bridges, at Bethlehem, Lisbon and Wentworth, to American Bridge Works.

Bangor & Aroostook Railroad, 300 tons, bridge at Monticello, Me., to Bethlehem Steel Co.

New York, New Haven & Hartford Railroad, 675 tons; freight house, 175 tons, to New England Structural Co.; inspection shed, 500 tons, to American Bridge Co.

Bridgeport, Conn., 150 tons, high school, to American Bridge Co.

Westchester County, N. Y., 150 tons, highway bridge for Westchester County Park Commission, to unnamed fabricator.

Philadelphia, 225 tons, Frankford Nurse's Home, to Montgomery Iron & Steel Co.

Seaboard Airline Railway, 125 tons, bridge, to Virginia Bridge & Iron Co.

Charleston, S. C., 12,000 tons, Cooper River bridge; 8000 tons to McClintic-Marshall Co., and 4000 tons to Virginia Bridge & Iron Co.

Birmingham, 2000 tons, Warrior steam plant of Alabama Power Co., to Nashville Bridge Co.

Birmingham, 100 tons, No. 1 city furnace of Sloss-Sheffield Steel & Iron Co., to Ingalls Iron Works Co.

Pittsburgh, 300 tons, two barges for American Tar Products Co., to Jones & Laughlin Steel Corporation.

State of Michigan, 200 tons, highway bridge, to Massillon Bridge & Structural Co.

Chicago, 250 tons, temporary building for Chicago Board of Trade, to Wendnagel & Co., local.

Highland Park, Ill., 100 tons, building for Bowman Dairy Co., to Midland Structural Steel Co., Chicago.

Minneapolis, 1500 tons, building for University of Minnesota, to unnamed bidder.

Milwaukee, 400 tons, garage, to Wagner Architectural Iron Works, local.

St. Joseph, Mo., 1500 tons, St. Joseph Bridge across Missouri River, to Missouri Valley Bridge & Iron Co.

St. Joseph, 480 tons, approaches to St. Joseph Bridge across Missouri River, to St. Joseph Structural Steel Co.

St. Joseph, 2100 tons, highway bridge, to Mount Vernon Bridge Co., Mount Vernon, Ohio.

Freeport, Cal., 606 tons, bridge over Sacramento River, to Moore Drydock Co.

Los Angeles, 570 tons, church on Wilshire Boulevard, to Union Iron Works.

Los Angeles, 240 tons, sheds for city, to McClintic-Marshall Co.

Glendale, Cal., 400 tons, Masonic Temple, to Baker Iron Works.

San Diego, 400 tons, hangar for Government, to McClintic-Marshall Co.

Ontario, Cal., 307 tons plates, 16 and 18-in. welded pipe, to Los Angeles Mfg. Co.

San Francisco, 100 tons, store at 1041 Market Street, to Golden Gate Iron Works.

San Francisco, 145 tons, apartment building, Twentieth Avenue and Irving Street, to McClintic-Marshall Co.

San Andreas, Cal., 130 tons, train runway addition, Calaveras Cement Co., to McClintic-Marshall Co.

Oakville, Wash., 135 tons, bridge over Chehalis River, to Pacific Car & Foundry Co.

Structural Projects Pending

Inquiries for fabricated steel work include the following:

State of Vermont, 1300 tons, 13 bridges.

Boston, 1000 tons, furniture building.

Albany, N. Y., 1000 tons, St. Peters Hospital.

State of New York, 275 tons, highway bridges.

State of New Jersey, 125 tons, highway bridge.

State of New Jersey, 160 tons, highway bridge over Lehigh Valley Railroad; Smith & Fenstermacher, Allentown, general contractors.

Asbury Park, N. J., 500 tons, casino.

Philadelphia, 950 tons, apartment building at Fifteenth and Spruce Streets; Foundation Co., New York, general contractor.

Wilkes-Barre, Pa., 700 tons, savings bank.

Baltimore, 500 tons, cold storage warehouse.

State of Ohio, 300 tons, highway bridges.

New York Central Railroad, 400 tons, passenger station at South Bend, Ind.

Chicago, tonnage being estimated, Hyde Park State Bank Building; Merrick Construction Co., general contractor.

Chicago, 200 tons, Ogden National Bank Building.

Chicago, 2500 tons, garage, corner of Lake and Dearborn Streets; David T. Merredith, architect.

Chicago, 650 tons, approach to Crawford Avenue bridge; Underground Construction Co., low bidder on general contract.

Kenosha, Wis., 300 tons, Nash Theater.

Milwaukee, tonnage not stated, building for Northwest Mutual Life Insurance Co.

Milwaukee, tonnage being estimated, First Wisconsin National Bank Building.

Milwaukee, tonnage not stated, building for Milwaukee Gas & Light Co.

State of Missouri, 8000 tons, highway bridge.

Olympia, 650 tons, bridge over Queets River; bids May 8.

Los Angeles, 250 tons, apartment building, Kenmore Street and Wilshire Boulevard; bids being taken.

Los Angeles, 470 tons, apartment building, 5930 Franklin Street; bids being taken.

Los Angeles, 158 tons, hotel, Eighth and Lake Streets; bids being taken.

Los Angeles, 166 tons, city market Ninth and San Pedro Streets; bids being taken.

Los Angeles, 235 tons, store in Hollywood; bids being taken.

Long Beach, Cal., 680 tons, store, Fourth and Pine Streets; bids being taken.

Watsonville, Cal., 100 tons, cold storage plant; bids being taken.

Oakland, Cal., 380 tons, warehouse for Port Commission, foot of Fourteenth Street; bids being taken.

Sacramento, 947 tons, bridge over San Joaquin River at Herndon; C. Peterson, Fresno, low bidder.

San Francisco, 650 tons, plates, dredger and two scows for State Harbor Commission; bids May 9.

Report Opposes Revision of Pig Iron Rates from Granite City

WASHINGTON, April 24.—Declaring that the evidence is "wholly incompetent to prove the allegations," Attorney-Examiner Alfred G. Hagerty, in a report made public yesterday, recommended that the Interstate Commerce Commission dismiss the complaint of the St. Louis Gas & Coke Corporation which charged that rates on pig from Granite City, Ill., to Central, Western Trunk Line and Illinois territories are unreasonable and prejudicial.

The examiner held, moreover, that the level of the pig iron rates from Granite City into Western Trunk Line territory, although now slightly lower than the pig iron rates concurrently maintained in Central territory, might reasonably be as high, or slightly higher than the latter rates. He also declared that neither the scope of the case nor the evidence would permit the entry of an affirmative order prescribing a new adjustment based upon a rigid distance scale, such as suggested by the complainant.

Steel and Iron Capacities

The American Iron and Steel Institute announces that the survey of capacities which is made annually by the institute has now been completed and shows the following results:

Annual Capacities as of Dec. 31, 1927

Pig iron	49,808,320 gross tons
Steel ingots	59,435,766 gross tons
Steel castings	2,029,334 gross tons

Steel Pipe Price Protection Limited to 30 Days

YOUNGSTOWN, April 24.—While it has happened in the past that steel pipe makers have given jobbers handling consigned stocks 60-day protection on the occasion of price changes, the coverage on the change announced effective April 2 has been limited to 30 days on both consigned and direct jobbing accounts.

Caswell & Starke, Inc., brokers in tin and lead, will move May 1 to 17 State Street, New York, from offices at 99 John Street which the firm has occupied for 25 years.

National Association of Foremen to Meet at Canton

The fifth annual convention of the National Association of Foremen will be held in Canton, Ohio, Friday and Saturday, May 25 and 26. Plans have been made for visits to the Massillon, Ohio, plant of the Central Alloy Steel Corporation; the plant of the Hoover Co., manufacturer of electric cleaners, at North Canton; the Pennsylvania Railroad shops, and the plant of the Timken Roller Bearing Co. in Canton. The trade and vocational McKinley High School, Canton, will be opened to visiting foremen.

Speakers for the first day include F. A. Seiberling, president Seiberling Rubber Co. and founder of the Goodyear Tire & Rubber Co., who will speak on the "Requisites of the Foremen of Tomorrow"; A. B. Segur, consulting engineer, Chicago, whose topic will be "Conservation of Man Power through Motion Analysis," and W. Chattin Wetherill, University of Pennsylvania, who will talk on "Industrial Waste." After the close of the day's meeting there will be a banquet and entertainment, after which the meeting will be reconvened for the introduction of the new officers and an address by H. W. Hoover, president Hoover Co.

The speakers for the second day will be J. C. Wright, director of the Federal Board for Vocational Education, whose subject will be "Foremen Conferences," and Robert H. Spahr of the United States Chamber of Commerce, whose topic will be "The Foreman as an Executive."

Flat Rolled Steel Association's Headquarters in Cleveland

The National Association of Flat Rolled Steel Manufacturers, the combination of the National Association of Sheet and Tin Plate Manufacturers, the Cold-Rolled Strip Steel Institute and the Hot-Rolled Strip Steel Institute, will be located in the Terminal Tower Building, Cleveland, on or about May 1. The sheet and cold-rolled strip associations at present are in Pittsburgh and headquarters of the hot-rolled strip association has been at Canton, Ohio.

Arrangements are being made for a meeting of executives of the three industries to be held at White Sulphur Springs, W. Va., during the week of June 3. The work of making plans for the White Sulphur Springs meeting inaugurated by the National Association of Sheet and Tin Plate Manufacturers before the merger has been taken over by the new combined organization and executives of the three branches of the industry will be asked to attend.

Columbus-McKinnon Chain Co. Acquires Chisholm-Moore Hoist Division

The Columbus-McKinnon Chain Co., Tonawanda, N. Y., manufacturer of electric welded chain, tire chains and kindred products, has acquired control of the hoist division of the Chisholm-Moore Mfg. Co., Cleveland, manufacturer of chain hoists and trolleys, traveling cranes, electric hoists, track systems and malleable iron castings. There will be no change in the general offices or personnel of the Chisholm-Moore organization.

Gains in Both Imports and Exports of Iron and Steel in March

Washington, April 24.—Exports of iron and steel products in March aggregated 221,935 gross tons, an increase of 36,020 tons, or 19.4 per cent over February, while imports were 74,127 tons, a gain of 26,500 tons, or 55.6 per cent over the previous month, according to preliminary figures of the iron and steel division, Department of Commerce.

For the first quarter, exports amounted to 613,616 tons, as compared with 553,451 tons for the corresponding period of 1927, an increase of 1.9 per cent. Imports during the three months ended with March of the current year totaled 180,391 tons, as against 174,679 tons for the corresponding period of last year, a gain of 3.3 per cent. The principal products exported during March were scrap, 26,510 tons; boiler tubes and welded pipe, 23,214 tons, and tin plate, 22,755 tons. The chief imports were structural shapes, 17,131 tons; pig iron, 16,155 tons; steel bars, 9991 tons, and cast iron pipe, 6280 tons. Belgium led in imports of structural shapes; the United Kingdom in pig iron, and France in cast iron pipe.

Predict Increase in Iron and Steel Car Loadings in Second Quarter

Freight car requirements for loading iron and steel, based upon reports of trade conditions furnished by commodity committees of the shippers advisory boards to the American Railway Association, are estimated at 479,533 for the second quarter of 1928. This is an increase of 2.6 per cent over actual car loadings in the corresponding quarter last year. Car requirements for castings, machinery and boilers are estimated at 59,977, a decrease of 1.8 per cent over actual loadings in this classification in the second quarter last year.

Fabricated Steel Plate Orders Decline —Steel Furniture Shipments Up

Washington, April 24.—New orders for fabricated steel plate in March, based on reports received by the Department of Commerce from 51 firms, totaled 45,071 tons, or 56.4 per cent of capacity, as compared with 49,820 tons, or 62.4 per cent in February, and 55,407 tons, or 68.9 per cent in March, 1927.

March shipments of steel furniture stock goods, as reported to the Department by 33 manufacturers, were $3,169,351, as compared with $2,908,527 in February, and $3,080,931 in March, 1927. March shipments of shelving compiled from the reports of 15 companies, were $831,607, as compared with $681,999 in February and $690,783 a year ago.

Krupp Co. to Build New Blast Furnace and Use No Mixer

Reliable reports are to the effect that the Krupp Co. is to build a 750-ton blast furnace at its plant at Essen, Germany. This will be the first blast furnace to be erected at that plant. It is understood that no pig iron mixer will be used, but that instead the hot metal from the furnace will be transferred to a large tilting open-hearth furnace where preliminary refining will take place preparatory to the steel being finished in smaller steel refining furnaces, either open-hearth or electric.

McMyler-Interstate Co in Friendly Receivership

The McMyler Interstate Co., Bedford, Ohio, maker of locomotive cranes, steam shovels and other handling equipment, was placed in the hands of receivers April 23 on the application of a stockholder, who brought friendly action to protect the company. The petition stated that, while the assets far exceed the liabilities, the company has $2,000,000 in debts, and some of the creditors have refused to grant extensions, and the company has been unable to secure additional financing.

Hearing on Construction of Youngstown-Ohio River Connecting Line Cancelled

Washington, April 24.—Hearing on the application of the Pittsburgh, Lisbon & Western Railroad for authority to construct extensions of its line in Beaver County, Pa., and in Columbiana and Mahoning counties, Ohio, which had been set for April 26, before Examiner T. F. Sullivan of the Interstate Commerce Commission, has been cancelled. The cancellation was due to the fact that Examiner Sullivan was not prepared to proceed with the hearings at the time named.

This Issue in Brief

Business may suffer a little set-back before midyear, says Iron Age forecaster. However, conditions should be fair-to-good throughout the spring.—Page 1159.

High safety factor of non-metallic gears is attributed to elasticity, which permits two or three teeth to mesh and share the load. Actual strength, it is said, is not exactly proportional to the pitch. The length of contact must be taken into account.—Page 1149.

Galvanized furnaces should not be heated below the dross line, engineer declares, for the dross prevents the transmission of heat into the melted zinc, and causes the pot to overheat. Temperature should be carefully regulated, as the percentage of dross increases rapidly with increase in temperature, and furthermore high heat reduces pot life.—Page 1152.

Ford converts steel stock into finished car frames in one continuous process. Even the pickling and liming tanks are in sequence.—Page 1141.

Buyers of steel made considerably higher profits than producers. In 1927 the steel producers earned only 5.2 per cent profit on stockholders' investment, while manufacturers of automobiles, machinery, electrical equipment, hardware and other major products made of steel averaged 15.3 per cent.—Page 1153.

No manufacturer should evade his responsibility of reducing the cost to the consumer. But reductions must be accomplished by increased efficiency of men, methods and machines, and not by sacrificing quality, says association head—Page 1147.

Is reduced working hours the economic solution of the unemployment problem? No, says editorial writer, suggesting that modern mechanization is tending toward a sharper classification of labor. The superior group consists of those retained when improved mechanization releases a certain number of workers. The latter ought to accept employment in measure of their ability and according to opportunity.—Page 1166.

Noisy gears wear most quickly, says engineer. Inaccuracies, he believes, will develop more noise than any other factor in gear design.—Page 1149.

Reduces cost of radiator castings by making molds on a revolving annular ring. The flask is carried from one workman to another, each performing an operation. The finished mold is then transferred to another revolving ring, where the pouring and shake-out take place.—Page 1144.

Before blaming your competitor for cutting prices unfairly, find out if he is able to make a satisfactory profit by the use of up-to-date equipment. Some manufacturers, says gear association head, worry along with antiquated equipment and growl about price-cutting, without attempting to introduce economies into their own plants.—Page 1147.

Increases export sales 80 per cent by providing for direct representation. Machinery builder finds sales to Great Britain mount when agent is replaced by direct representative.—Page 1200.

Price weakness will develop if output increases, Dr. Haney indicates. Demand is not sufficiently strong to support further expansion, he declares. Ratio of demand to supply has already declined, owing to stepping up production more rapidly than requirements have warranted.—Page 1159.

March automotive vehicle output crosses the 400,000 mark. The number of units produced was 412,825, an increase of 27 per cent over February, and the best month since May, 1926.—Page 1196.

Employee lunch rooms are increasing in number. In 1916 less than 50 per cent of the 430 firms investigated by Washington had restaurant facilities; in 1928 about 70 per cent were so equipped. In the same period the number giving workers paid vacations increased from 16 to 133.—Page 1197.

Cleans castings automatically by conveying them under revolving wire brushes. The castings are then turned over and passed through a second time.—Page 1146.

Does a brand name help increase sales? German steel makers think so, for they are trying to revive the former practice of selling under brand names, believing that it will help in promoting export trade. —Page 1200.

You can't tell from its composition how long the carburizing box will last. Of a lot of carburizing boxes of the same composition and design, and used under the same conditions, one lasted 75 hr. and another 7000 hr. An important factor is foundry practice and control in making the casting.—Page 1155.

High Wages or Low or Both

HENRY FORD, that attractive personality who is now visiting Great Britain and who in foreign eyes symbolizes American mass production, prosperity, etc., has made some remarks that have set his hearers agog. One of these was to the effect that the trouble with British industry is that it does not pay sufficiently high wages. This was, of course, immediately and approvingly seized upon by the British labor leaders.

Mr. Ford once set the pace by increasing wages in his factory. The results were good. We are bound to infer from his recent remarks that he has never analyzed why they were good. Nevertheless he has become a prophet. It may be that one road toward arriving at the degree of prophet is to tell people what they like to hear, and being accidentally or occasionally right. We are unaware that this thought has been philosophically examined.

Mr. Ford's idea of wages is obviously an expansion of the old wage fund conception that there is somewhere a reservoir out of which flows the means for meeting a payroll. Let the disbursers be liberal and the workers will be happy. They will buy automobiles, radios and such things and the manufacturers thereof will be happy.

This is the universal hypothesis of labor unionism. On the face of things the only difference between Henry Ford and John L. Lewis is that the former would disburse high wages voluntarily while the latter would exact them.

Such a program does not make the farmers happy. Wherefore they appeal for bonuses, price-fixing, etc., to be paid by the manufacturers through taxation.

All of this is obviously the antithesis of the economic principle, that was evident in all primitive life, but has become obscured in the modern complexity, that workers get what they earn. The few remaining prospectors, of the type familiar to Bret Harte, who wash gold from river sands, are quite conscious of this fundamental principle.

Engineers engaged in a certain industry tell us that they are improving its practice so that in a given operation they will cause one man to make 10 units of production instead of four at present; and that they will pay that man a higher wage in dollars so that it will be commensurate with his responsibility, although his expenditure of muscular power will be much less and indeed insignificant.

In an industry in Great Britain one plant continues to operate with equipment of about three-quarters of a century ago, making an annual output of about one hundredth of a modern American unit. The answer to this paradox is that the owner of the little antique and his few men work together in the old-fashioned way, sharing the proceeds and being content so long as they afford modest food, shelter and clothing. They are the analogues of the few men in the world who still obtain a precarious living by washing gold from river sands. After all, such persons are fortunate in comparison with those who are attached to overmanned industries and can neither get work in them nor know what else to do with themselves.

When the capitalist, like Mr. Ford, raises wages he does not bestow them upon his employees, but he merely makes an advance, as a banker might, to enable them to earn more, and that he fully expects they will do, attracting to himself the best of workers. The engineer who modernizes plant, and while increasing the remuneration of individual workers reduces the required number of them, does something similar. Probably this is what Mr. Ford has vaguely in mind in his oft-repeated remarks; and he is really finding fault with management for not increasing production. Anyhow, that is not at all the thing that labor leaders understand him to mean.

High wages result from increased mechanization enabling workers to earn more and this is the proof of the economic theory, for otherwise an industry, or a country, would quickly become insolvent. Improved mechanization releases a certain number of workers and they cannot get high wages, or any wages, unless they earn them. The increasing unemployment in the United States, of which lately we have been hearing more, is clearly an outcome of this natural economic operation. It is, however, a sound economic theory that no country can have too much production. The problem, therefore, is to get expurged workers into new and needful production. This may not be immediately manageable at high wage scales.

We may venture the suggestion that modern mechanization tends toward a differentiation among labor or a sharper classification, which may be expressed in wages, i.e., in earnings. Well mechanized operations keep the superior workers and eliminate the inferior, who are relegated to earning what they can. The latter ought to accept employment in measure of their ability and according to opportunity. This is quite contrary to the popular idea that the solution of the unemployment problem is a general five-day week, or six-hour day, or both. That would be an equalizing, or leveling, process and a negation of the principle of maximum production.

Scholars or Dilettantes?

ONE of the paradoxes of college education, particularly among liberal arts students, is a lack of faith in scholarship. "Grinds" are looked at askance, and often more emphasis is put on extra-curricular activities than on classroom work. Too frequently parents send their children to college to acquire poise and finish and to advance the social fortunes of the family. The students themselves are likely to place great store in the value of making contacts with "important" personages, whether they be athletic heroes or scions of distinguished families. Classroom work is not looked upon as an end in itself, but as a means to an end.

With a smattering of books, some training in the social graces and the cultivation of the "best" people, many an undergraduate believes he will make the greatest progress on the road to success. Unfortunately "pull" is sometimes effective in making the first business connection following graduation. Moreover, the business man himself does not believe that a college can teach a boy business; consequently, he rarely selects applicants on the basis of their scholastic grades.

Faulty teaching has also contributed to the rise of dilettante education. In their study atmosphere, instructors can easily grow too soft to interpret life accurately or properly to relate theory to fact. The very word "academic" sets them apart from real life.

Whatever may have been the reason for it, the belief that scholarship is no index of subsequent success in life has been exploded. Addressing himself to the question, "Does Business Want Scholars?", Walter S. Gifford, president of the American Telephone & Telegraph Co., answers, "Yes." In the May number of *Harper's Magazine* Mr. Gifford presents results of a survey of college men in the employ of his company which shows clearly that the salaries of graduates in both arts and engineering courses are in close correlation with their scholastic standings. "While I do not believe that success in life can be rated by income," adds Mr. Gifford, "I do believe that as between one man and another working in the same business organization, success and salary—while not the same thing—will, generally speaking, parallel each other."

Business is a hard master; but if it has no room for dilettantes, it offers ample rewards for those who have learned how to work.

Automobile Supply and Demand

MUCH attention is being paid to current automobile production, with short range comparisons; but for information of value as to the future we must look to long range comparisons. The course has been disturbed by the disappearance of Ford production at the end of last May, with a partial restoration recently and the assurance that Ford cars will be coming out in larger volume at the time of year when other production is decreasing.

Before making the longer range comparison, it may be noted that the Department of Commerce report which came out this week puts the March production of cars and trucks in the United States at 412,825. Adding 9724 for Canada, the month's total is 422,549, showing a gain over the preceding March. February had a gain while January had not. First quarter production, cars and trucks, United States and Canada, has been as follows in six years:

1923	917,975
1924	1,114,136
1925	936,035
1926	1,164,885
1927	995,414
1928	998,723

It is commonly considered a good showing for automobile demand that output was more in this last quarter than in the same quarter of last year, seeing that Ford was a heavy producer in the first three months of 1927 and did almost nothing in this last quarter. But when one sees that the average of four and five years ago was a trifle above last quarter's showing he will want to look more deeply and broadly into the matter. This can be done by comparing production in twelve month periods through March. Such a comparison must stand, for the twelvemonth period just ended, the full force of the Ford defection from the producing ranks. If no great loss is shown we have reason to doubt the theory that at just about this time output is much short of supplying the public's desire for new cars. The following table shows the total production in the twelvemonth periods through March:

Car and Truck Production, United States and Canada.

Twelve months through March:	
1924	4,362,854
1925	3,558,063
1926	4,655,943
1927	4,333,881
1928	4,577,121

The short range view would be that the figures for the past two twelvemonth periods prove the case, for here is a gain of nearly 250,000 despite the almost complete absence of Ford. But we cannot imagine that it was in the past twelve months that the public was acquiring its great taste for automobiles. Why did production in the twelve months through March, 1927, show a large decrease from the corresponding period one year before and actually a decrease from the period three years before? The figures suggest that large gains in automobile production disappeared quite a while ago. When there was no room a year ago for claiming that a deficiency in supply existed, why had production been as light as it was during the preceding twelve months?

To supplement the argument we have this remarkable showing, that the production in the last twenty-four months has been 8,911,002, against 8,214,006 in the preceding twenty-four months, or 9 per cent gain. That is, the long range figures fail to show a steady increase and they also fail to show any recent deficiency in supply.

Only the Coal Strikers Left

REALLY nothing is left of the bituminous coal strike but the strikers. This is a fitting time to review the matter, when coal production statistics for the first two weeks of the second year of the strike are available. The daily rate of bituminous coal production was 1,256,000 net tons for the first week of this month and 1,236,000 tons for the second week. The fortnight's rate is the lowest for any fortnight since the 1922 strike, and is 8 per cent under the rate in the first fortnight of the 1927 strike, a year ago.

By no means is that decrease a suggestion of increasing effectiveness of the strike. If production was below consumption it was merely because consumers were drawing upon old stocks, unlikely to become valuable but in danger of spontaneous combustion as warm weather approaches.

Non-union mines in fact have had increased difficulty in finding markets, and prices already thoroughly shaken out have been showing further weakness. Only slack has advanced and slack ordinarily moves in the opposite direction from coal prices in general. In the Pittsburgh district there is a condition of much lump coal being on track, but no slack, because production of lump is light.

Prior to April 1, 1927, the trade fully expected a considerable amount of striking in non-union territory, but did not expect really interesting conditions to develop until three months or more had elapsed. As April and May passed without the United Mine Workers accomplishing anything important, Mr. Lewis was given credit in many quarters for strategy. His "masterly inactivity" was thought perhaps calculated to make coal scarce by allowing consumers to be lulled into such a sense of security that they would promptly consume much of the record high stocks of April 1, 1927, some 75,000,000 tons. But coal never did become scarce, and it was inability, not strategy, that kept the United Mine Workers from interfering with non-union production. Now there is still more inability.

What is left of the coal strike is the strikers. It is the strikers, not the strike, that arouses public interest. In other strikes the public became interested because coal got scarce. It is eminently proper that the public should be interested, also the United States Senate, but it has been easy to see that the interest takes the form of wishing the matter to be settled by the apparently easy route of putting the strikers back in their old jobs. The line of thought, or emotion, is that simply of getting the strikers out of the way. As long as there are strikers there will be interest, and very rightly, but when the interest merely takes the form of encouraging the strikers to remain strikers an error is committed, and a grievous injustice is done to the strikers themselves.

Did anyone really believe that the Senate investigation would lead to government relief of the situation? Coal miners are notable for the length of time they can prolong their strikes; but the Senate has a somewhat similar record for delay in action on subjects in which some of its members profess an interest.

The important public matter today is not the strike, which has faded out as an issue, but the strikers, who should be encouraged to get into employment. Thus far the public has been encouraging them to continue in the occupation of being strikers.

Sheet Association Secretary Defends Production Ratings

In view of the fact that the March report of the National Association of Sheet and Tin Plate Manufacturers showed production of sheets for that month to have been 103 per cent of capacity, the question has arisen whether the mill ratings revised last September are not again too low. Walter W. Lower, secretary-treasurer of the association, under whose supervision the report is compiled, does not think they are. Mr. Lower says that capacity is figured on an annual basis and, as experience has shown that suspensions for one cause or another mean an average loss of two weeks per mill per year, 50 weeks per year constitute 100 per cent operations and the reports of the association are based upon that premise.

The ordinary operation of sheet and jobbing mill is 16 turns per week, three for each of the first five days of the week and one on Saturday. Some mills are operated two turns on Saturdays, which makes it possible for production to exceed estimated capacity and there is also room for variation from the rated mill capacity in the kind of material that is rolled. If any considerable number of mills is engaged for a fair length of time on heavy gage material, the production, expressed in tons, rises and, conversely, it goes well below ratings if much light gage steel is produced in any one month. The capacity per month is based upon the number of turns it is possible to operate. Mills are not operated on Sundays and in the sheet association compilation, the Saturday operation is figured as one turn. In March there were four Sundays and five Saturdays and the reckoning was 71 working turns; in February, 67 working turns were figured and in January 70 turns. This month has five Sundays and four Saturdays, which means there will be only the same number of turns as in February.

Mr. Lower says the mill ratings are high enough, figured on an annual basis and making allowance for the fact that efficiency is higher in periods of cool weather than when the outside temperatures are high. Assuming March and July, both 31-day months, to have the same number of possible working turns, he says the production will be greater in March than in July. In short, the answer to a production of 103 per cent of capacity with an operation of 94 per cent of the mills is not that the mill ratings are low, but that ratings are figured from average performance for 50 weeks per year and 16 turns per week.

MATERIALS HANDLING

Meeting in Philadelphia Devotes Day to Foundry Practice and Plant Visits

MORE than 100 members and guests of the American Society of Mechanical Engineers were present at the opening session in Philadelphia, April 23, of the first "national materials-handling meeting," at the Benjamin Franklin Hotel. The two days are to cover the broad features of the subject, with special reference, the first day, to handling in foundries and, the second day, to interior and exterior handling in a wide variety of plants.

Following the morning session on Monday the party divided, for plant inspection, into five groups. These covered (1) Sears-Roebuck & Co., where luncheon was served, and the Atwater Kent Mfg. Co.; (2) Port Richmond coal piers and grain elevators of the Reading Railroad; (3) Curtis Publishing Co. and Victor Talking Machine Co., the latter across the Delaware River, in Camden; (4) United States Cast Iron Pipe Co., Burlington, N. J., where the deLavaud process of casting pipe centrifugally was seen; (5) terminals of the Pennsylvania and the Baltimore & Ohio railroads for handling perishable products and fruit—said to be the largest of the kind in the world.

System in Newark Foundry

At the morning session F. D. Campbell, chief engineer Eastern Steel Castings Co., told of a materials-handling system which his company has put in, to handle sand, molds, flasks, etc., in a plant the nature of the business of which is necessarily largely of a jobbing foundry nature. He reminded his hearers, also, that continuous pouring cannot exist in the ordinary steel foundry, as the metal is ready to pour only at stated intervals, some hours apart. An abstract of this paper will appear in an early issue of THE IRON AGE.

In response to questions from the floor, Mr. Campbell said that the limiting tonnage, below which it would not pay to install such a system would be one thing for sand, but quite a different thing for molds and flasks. The sand distribution system is necessarily an expensive one and small plants could not make it pay; the decision would have to be fitted individually to each case.

As to flasks and molds, however, a small equipment can be installed and tried out and, as experience demonstrates its value, additions can be made as needed. It can start with a small section of roller conveyor and expand as required, or as the needs are demonstrated. A modest investment will supply enough equipment with which to experiment.

Precision bearings are practically necessary for power-driven conveyors, but are too costly for gravity systems. This is particularly true when we consider the rapid changes being made in plants and consequent scrapping of equipment long before it wears out.

As to floor space occupied by the conveyors installed at Newark—this was saved by getting rid of unsightly piles of sand, flasks and materials, and, in addition, the process was speeded up to a marked degree and present capacity is much greater than that before. As the system is rarely at rest, many times as many pieces can be put through as could formerly be made.

About 200 tons of sand is in the system, some 10 tons being used to the ton of castings. This means a cycle of about 2½ hr., enough to restore used sand to proper temperature for re-use.

No defectives are experienced which can be traced to the roller conveyors. No attempt is made to work to thousandths of an inch, but the humps of sixteenths of an inch are rigidly eliminated.

In presenting his paper on "Materials-Handling Features of the de Lavaud Process of Casting Pipe Centrifugally," H. A. Hoffer, eastern sales manager United States Cast Iron Pipe & Foundry Co., showed a large number of lantern slides. About 4,000,000 lengths of de Lavaud pipe are now in use in the United States, the number of users being placed at 1670.

Speaking at the dinner, in the ballroom of the Benjamin Franklin Hotel, Charles D. Young, general purchasing agent Pennsylvania Railroad, Philadelphia, discussed procurement and its relation to inventory. He outlined four elements as the outstanding ones in this connection: Quality, price, time and place.

He made a plea against the piling up of unneeded reports and the compilation of little-used statistics. Signatures of several executives on papers of small moment came in for condemnation as evidencing either (1) perfunctory signing without examination or (2) examining minute details when they should have been doing important work.

Marked Progress of German Industries

Edward J. Mehren, vice-president McGraw-Hill Co., spoke on the strides which Germany is making toward rehabilitation. He pointed out that it is to materials handling that the United States will have to look in holding its own in the commercial struggle of the next quarter-century. Germany is applying scientific management, standardization of materials and simplification of varieties in a program of what they call "rationalization of industry." Industrial research in which a large portion of the time and money is diverted into "pure science," in hopes of developing something commercially valuable, is a second potential threat. In one large establishment the laboratory has 300 men—200 working on definite industrial problems and 100 scouting the broad fields of science for what can be found therein. Germany has become independent of Chilean nitrates, making her own from the air, with a surplus for export. Also the newly developed method of liquefaction of coal, going into commercial production this year, will cut down or abolish Germany's heavy imports of petroleum.

Thirdly, Germany's growing realization of the importance of good employee-employer relations is a strong factor in her improved condition. It is just being learned there that good wages mean good purchasing power.

Doctor Duisberg, head of the "Dye Trust," told Mr. Mehren that the United States might maintain its supremacy for another 20 years, "if your young people learn to work."

Music was furnished, after the addresses, by a 12-piece orchestra and a 14-voice glee club, both consisting of members of the Philadelphia Engineers' Club. To close the evening, the famous slow-motion pictures of Baron C. Shiba, head of the Aeronautical Society of Japan, were shown. Beginning at 2100 pictures a second (the ordinary motion picture is at 16 a second), the pictures shown advanced to 3430, then to 12,000, and finally to the maximum of 20,000 pictures a second. Most of the views were of air currents in contact with airplane wings or propellers. The fastest ones showed a bullet piercing an incandescent bulb. The bullet seemed to meander along and the bulb to crumble gradually into impalpable dust, which hovered long in view without falling to the floor.

Veeder Mfg. Co. and Root Co. Will Probably Be Consolidated

Purchase of the Veeder Mfg. Co., Hartford, Conn., manufacturer of counting and adding machines and devices, by Paine, Webber & Co., New York investment bankers, and recommendation by the directors of the Root Co., Bristol, Conn., maker of a line of counting and adding devices similar to the Veeder company and also hardware products, that the Root organization also be sold to the same bankers indicates a probable consolidation of the two companies. Curtis H. Veeder, founder of the Veeder company, and David J. Post are the principal owners of the Hartford company, and John T. Chidsey is president and general manager of the Root Co. The latter will probably head the consolidation.

Iron and Steel Markets

Crest of Production Passed

Steel Output Tapers as Pressure for Deliveries Recedes—Prices of Lighter Products Show Further Weakness—Mixed Tendencies in Scrap

PRESSURE for steel deliveries is growing less insistent, and production is commencing to recede from the high rate of March, when some mills had to work extra turns. Steel Corporation subsidiaries continue to operate at 90 per cent of capacity, but in the Greater Pittsburgh district average output for all mills has declined to 80 per cent from a recent maximum of 85 per cent.

The volume of specifications shows a natural shrinkage following the heavy releases prior to the last price advances. The extent to which specifying at that time covered consumers' requirements in this quarter is not yet clear, but there are indications that many buyers are protected until July 1. These commitments are the main support of present mill operations, but meanwhile backlogs are being reduced, and there is growing concern over new business, which, as yet, is of small proportions. At Chicago, where the recent buying movement lasted longer than elsewhere, new bookings have dropped to 50 per cent of shipments for the first time in many weeks. Shipping orders, however, continue to equal mill output, so that the operating rate in the Chicago district remains above 95 per cent.

Competition for new business has already become a major factor in the sheet market, causing a rather general abandonment of the prices announced for this quarter. Blue annealed sheets have declined $2 a ton to 2c., Pittsburgh, and width differentials have been waived. Black sheets are more generally quoted at 2.75c., Pittsburgh, a drop of $3 a ton from the last advance. On wide hot-rolled strip 1.85c., Pittsburgh, a decline of $1 a ton, is an increasingly common quotation.

Irregularity in wire nail prices is due primarily to the willingness of some mills to accept additional specifications against first quarter contracts carrying a price 10c. per keg lower than the second quarter quotation.

In plates, shapes and bars also there is a less effective effort to establish the last advance. For some time 1.90c., Pittsburgh, was obtainable on orders not covered by contracts, but recently mills have been accepting such business at 1.85c. Leading producers, however, have not given up their purpose to raise the market to 1.90c., and say that they will adhere rigidly to that figure on third quarter contracts.

Tin plate specifications for July shipment are due in the next three weeks, and during that period the price for the last half of the year will probably be announced. It is commonly expected that the present quotation of $5.25 per base box, Pittsburgh, will be reaffirmed.

Automobile manufacture, which remains a leading outlet for current steel production, shows no signs of a seasonal recession. The steady increase in Ford operations is expected to offset curtailment by other motor car builders. Adoption by the Ford company of a plan under which it will supply steel bars to forge shops with which it has placed contracts is expected to have a far reaching effect on the steel industry.

Railroad buying is featured by purchases of 31 locomotives, of which 20 were placed by the Texas & Pacific, and orders for 220 passenger train cars, of which 120 will be built for the New York Central. Builders of freight equipment have few definite inquiries before them, but liberal purchases in July or August, possibly totaling 30,000 to 40,000 cars, are said to be in prospect.

Bridge construction continues to bulk large in structural steel lettings. The Cooper River bridge at Charleston, S. C., taking 12,000 tons, has been awarded to two fabricators, while a highway bridge in Missouri, now being figured, calls for 8000 tons.

Basic pig iron, which is quoted by producers in the Valleys at $17, furnace, has been sold at $17, delivered, to an Ohio consumer, but apparently not by a Valley maker. Deducting the freight rate from Valley furnaces to the point of delivery, the f.o.b. furnace quotation, on this basis, would have been $15.87, which is lower than the average price for Valley basic for any month since November, 1915.

New England and other Eastern delivered prices on pig iron probably will be lower because of drastic reductions in rail freight rates from the Troy, N. Y., furnace to New England points and through the completion of arrangements for more widespread delivery of iron from Buffalo by barge or barge and rail. The New England rate cuts place Troy shipments on a mileage basis, with savings to consumers ranging from 41c. to $1.13 a ton.

The scrap market shows conflicting movements, with a decline of 25c. a ton on heavy melting steel at Pittsburgh and an advance of 50c. a ton on the same grade at Chicago and at St. Louis. In eastern Pennsylvania, prices on heavy melting steel have remained stationary for months. These divergences emphasize the fact that scrap is more largely influenced by purely local conditions than at any time in years, and definite price trends are no longer in evidence over any considerable period.

Welsh tin plate mills have reached a record for unfilled orders, with heavy buying even from France, but otherwise the British steel market is quiet.

THE IRON AGE composite price for finished steel has dropped to 2.355c. a lb., from 2.362c. last week. The pig iron composite price remains at $17.67 a gross ton.

*The average switching charge for delivery in the Chicago district is 61c. per ton.

On export business there are frequent variations from the above prices. Also, in domestic business, there is at times a range of prices on various products, as shown in our market reports on other pages.

Pittsburgh

Steel Demand Less Urgent—Lighter Products Weaken in Price

PITTSBURGH, April 24.—Whatever recession in steel output has occurred is merely a reflection of the fact that there is not the urgency as to deliveries of last month, when it was necessary for manufacturers of a number of finished products to work extra turns to accommodate delivery demands, which meant extra requirements of crude steel. New demands for finished steel products are lighter than they were 30 days ago, but that is regarded as a natural sequence to a period of heavy deliveries. Having anticipated their needs slightly on account of price considerations, buyers now are digesting their extra takings.

It usually happens that when new demand decreases there is some increase in desire on the part of the mills for orders sufficient to sustain an economical plant operation, and the present is no exception. It is this tendency which accounts for the price uncertainty that is seen in the lighter forms of steel. With blue annealed sheets definitely lower, all grades of sheets have now worked off from the levels to which they were advanced earlier in the year. Strip makers appear to have retained the advances they made around the end of last January on small-lot business, but have not been so successful on large tonnages. There is uncertainty in wire products' prices, but on account of generous treatment of contract buyers, the test of the higher prices still is deferred.

Between business specified late last month and scattering orders since received, most steel companies are able to maintain a fairly satisfactory operating rate. The most marked change that has taken place is that greater dependence is placed on current orders than was true a few weeks ago. The demand at no time this year has got out of the hand-to-mouth category, but in the past week or two, the range has shortened from about two weeks' to one week's requirements. The Youngstown district is not quite so busy as it was recently. The Carnegie Steel Co. recently took off one of its Edgar Thomson blast furnaces, but the average rate of ingot output for the greater Pittsburgh district still is at least 80 per cent of capacity.

It is pretty generally believed that the automotive industry has reached the limit of its steel takings and that there will be no further increase in purchases from that direction in the next few weeks. An ebbing is likely thereafter, as preparation for new models gets under way. The Ford Motor Co. seems to be gaining headway in production, and reports suggest that the May schedule of the Chevrolet Motor Co. is the largest in the company's history. The steel industry, however, regards some recession as likely in the motor car output, and would view the outlook more complacently if some other consuming industries showed signs of making good any slack that may develop in the use of steel for automobiles.

Dealers are taking a calmer view of the scrap market, and the price of heavy melting steel, which advances more because of dealer alarm than mill buying, has weakened.

Pig Iron.—Except for a fresh demonstration that Valley basic iron is merely nominal at $17, furnace, it has been an uneventful week in the Pittsburgh-Valley market. The American Steel Foundries is reported to have closed for 3000 to 5000 tons of basic at $17, delivered Alliance, Ohio. As the freight rate to that point from Youngstown is $1.13 per ton and $1.26 from the Shenango Valley, the Alliance figure would mean a price at what are regarded as the Valley furnaces of $15.74 to $15.87. Valley furnaces cannot ship into the Pittsburgh district and get a higher furnace price than $16 on account of competition from more favorably located Pittsburgh district furnaces. But Valley furnaces continue to quote $17, and there is no evidence that they have gone under that price, seemingly being content to hold their surplus rather than sell for less. The iron to go to Alliance, it is believed here, will be shipped from either Canton or Massillon, which points have a freight rate to destination of $1.01, making the furnace base $16. Small lots of Bessemer, malleable and foundry iron continue to move steadily at unchanged prices, but the market is very dull and it is a rarity for consumers to inquire for iron, most sales being developed by solicitation. The Carnegie Steel Co. recently took off one of its Edgar Thomson stacks.

Prices per gross ton, f.o.b. Valley furnace:

Basic	$17.00
Bessemer	17.50
Gray forge	16.75
No. 2 foundry	17.25
No. 3 foundry	16.75
Malleable	17.25
Low phosphorus, copper free	27.00

Freight rate to the Pittsburgh or Cleveland district, $1.76.

Ferroalloys.—The leading producer of spiegeleisen is taking last half business at the same prices as on first half contracts, or from $30 to $32, furnace, for 19 to 21 per cent material, according to the size of the order. There is a heavy movement of this alloy. Consumers are ordering out ferromanganese and ferrosilicon on contract purchases very steadily. New business amounts to little. Prices are unchanged.

Fluorspar.—Leading domestic producers are quoting gravel spar guaranteed to run 85 per cent calcium fluoride and not more than 5 per cent silica at $16 per net ton at mines, but have not been able to get much business at that price because so many users have coverage at from $1.50 to $2 a ton less.

Semi-Finished Steel.—Billets, slabs and sheet bars are moving well, in keeping with a well sustained operation of strip, tin and sheet mills. There is little or no open market activity, however. Makers are not having much success in getting either specifications or orders for wire rods at $44, base Pittsburgh. Most users still have tonnage due at lower prices, and seemingly only a few manufacturers canceled tonnage that was not specified by the end of March.

Bars, Plates and Shapes.—New business in these products is growing lighter, yet there is enough, when the specifications of late last month are included, to keep mill operations well up to the March rate. Shipments, however, are exceeding incoming orders and the prospect is for some slowing down in mill activities. Structural mills are well employed, but bar mill operations suffer from the fact that large users have fairly sizable stocks, and plate mill operations reflect light railroad car orders and only moderate activity in the sizes of pipe in which plates are used. Much of the tonnage moving is priced at 1.80c., base Pittsburgh, but on new business there is no evidence that less than 1.85c. is being done, and on small lots 1.90c. is fairly frequent. Fabricated steel prices are said to be irregular.

Rails and Track Supplies.—There continues to be a good movement of standard-section rails and of track supplies on old orders, but not much new business is coming in. Light-section rails are dull.

Wire Products.—Some manufacturers canceled orders for nails on first quarter contracts that were not specified by the end of March, but others did not, with the result that the effort to establish the market at $2.65, base, per keg, Pittsburgh, has not been successful. It is difficult to get either orders or specifications at that price, while some of the mills are willing to accept specifications against first quarter contracts carrying a price 10c. per keg less. The regular prices on other wire products have not yet come into play because manufacturers were so liberal about accepting specifications late last month on expiring first quarter contracts.

Tubular Goods.—The stimulation given the demand for standard-weight pipe by the price advance of April 2 still is felt in the movement from the mills, but there is not much activity in other kinds of pipe. A fairly good movement to the California fields of oil country pipe, almost all seamless, is noted, but demands from other producing districts are moderate. Mechanical tubing still is going well, but boiler tubes are in fair demand only.

Sheets.—Business holds up well; seemingly, the explanation is that producers are not so stiff about prices as to create resistance on the part of buyers. Blue annealed sheets have swung lower, in keeping with the recent weakening of other finishes and probably also because of increased price competition from hot-rolled strips, which lately have shown little real strength. There is no longer much recognition or observance of the width differentials on blue annealed sheets, which now are quoted at 2c. to 2.10c., base, regardless of width. Black sheets take a range of 2.75c. to 2.90c., but there is not much business at the top figure and the lower price is said to apply only on large tonnages or on finishes where extras are sufficient to permit a low base price. Galvanized sheets are fairly steady at 3.65c. to 3.75c. The American Sheet & Tin Plate Co. is operating its sheet mills at more than 80 per cent of capacity, with independents running about 10 points higher.

Tin Plate.—Specifications for July shipments of tin plate are due in the next three weeks and during that period the price to rule for the last half of the year probably will be announced. The common expectation is that the present price of $5.25, per base box, Pittsburgh, will be reaffirmed. Mills are well supplied with orders, and mill operations hold at 90 per cent or more of capacity. The Wheeling Steel Corporation, Weirton Steel Co. and the Jones & Laughlin Steel Corporation have all of their tin mills in operation, and the American Sheet & Tin Plate Co. is running at 92 per cent of capacity.

	Chrome Nickel Vanadium	4.15
	Carbon Vanadium	3.60

Above prices are for hot-rolled steel bars, forging quality. The ordinary differential for cold-drawn bars is 1c. per lb. higher. For billets 4 x 4 to 10 x 10 in., the price for a gross ton is the net price for bars of the same analysis. For billets under 4 x 4 in. down to and including 2½ in. squares, the price is $5 a gross ton above the 4 x 4 billet price.

Slabs with sectional area of 16 in. or over carry the billet price; slabs with sectional area of 12 in. to 16 in. carry a $5 extra above the billet price and slabs with a sectional area under 12 in. carry the bar price.

Band sizes are 40c. per 100 lb. higher.

Rails

	Per Gross Ton
Standard, f.o.b. mill	$43.00
Light (from billets), f.o.b. mill	36.00
Light (from rail steel), f.o.b. mill	34.00
Light (from billets), f.o.b. Ch'go mill	36.00

Track Equipment

	Base Per 100 Lb
Spikes, $\frac{9}{16}$ in. and larger	$2.8
Spikes, ½ in. and smaller	2.8
Spikes, boat and barge	3.0
Tie plates, steel	2.1
Angle bars	2.7
Track bolts, to steam railroads	$3.80 to 4.0
Track bolts, to jobbers, all sizes, per 100 count	70 per cent off lis

Carbon, 0.30% to 0.40%, base	50

Plus differentials for lengths over 18 ft. and for commercial exact lengths. Warehouse discounts on small lots are less than the above.

Cold-Finished Steel Bars and Shafting.—Not much change is noted in the general demand; while some of the motor car builders are ordering less freely for parts, the Ford Motor Co. is expanding its production and taking enough additional steel to offset largely the loss of tonnage in other directions. The price is firm at 2.20c., base Pittsburgh.

Hot-Rolled Flats.—Business still is good, but will not show as large volume for this month as last, either in production or shipments. March was a heavy production and shipment month, and a good many manufacturers worked mills extra turns to meet delivery demands. Pressure for supplies is less this month and extra mill turns have been cut off. On the general run of business, the ruling prices are 1.90c., 2.10c. and 2.20c., according to width, but large tonnage buyers have received preferential treatment.

Cold-Rolled Strips.—The market shows steadiness at 2.75c. for 3 tons or more of a size to large-lot buyers, and at 2.90c. for smaller users. Business is good, but demands are not quite as urgent as they were in March.

Bolts, Nuts and Rivets.—Consumers and jobbers are fairly well stocked and this month's specifications do not make as good a showing as last month's. Prices are well held.

Coke and Coal.—The market lacks activity and fresh features. Spot furnace coke is almost unsalable to pig iron producers, as those who are operating are covered by contracts and getting full shipments against them. There is almost no demand for coke for heating and only a limited market for beehive oven furnace coke for water gas making, because of cheaper supplies of by-product oven coke. Spot foundry coke also is slow, since so many users have contract supplies to draw upon. Slack coal is scarce because there is so little demand for lump coal and not much screening of coal is being done. The coal industry is interested in the freight rate situation as applying to Lake shipments, and while there is some talk that Northern roads will reestablish the 45c. differential through another cut in their rates, it is not generally accepted, as it would mean a freight rate war.

Old Material.—The market has stopped advancing on heavy melting steel, and while supplies still are scant, there is not as much pressure on the part of mills for deliveries as there was recently. Dealers who were alarmed over the reentrance of the Carnegie Steel Co. into the market and its purchase on direct bid of the Baltimore & Ohio steel and rails, take a calmer view of the situation. Dealers who paid $16 or more, Youngstown, for railroad steel now are trying to find buyers for it at that price, and may be obliged to sell it for less, since one road is demanding shipping instructions. Ordinary heavy melting steel has been sold to a Pittsburgh district melter at $15.25 and more is offered at that price, while $16 is as high as has been paid by any consumer for No. 1 railroad steel. The report that $16.50 was paid by dealers for No. 1 railroad steel, delivered Steubenville, Ohio, proves to be erroneous, and the company operating the steel plant there advises that $15.50 is the highest paid for that grade. Machine shop turnings are easy and blast furnace grades are freely offered. Compressed sheet scrap is scarce.

Prices per gross ton delivered consumers' yards in Pittsburgh and points taking the Pittsburgh district freight rate:

Basic Open-Hearth Furnace Grades:	
Heavy melting steel	$15.25 to $16.00
Scrap rails	15.00 to 15.25
Compressed sheet steel	15.00 to 15.50
Bundled sheets, sides and ends	14.00 to 14.50
Cast iron carwheels	14.50 to 15.00
Sheet bar crops, ordinary	16.00 to 16.25
Heavy breakable cast	13.00 to 13.50
No. 2 railroad wrought	15.50 to 16.00
Heavy steel axle turnings	13.00 to 13.50
Machine shop turnings	10.25 to 10.50
Acid Open-Hearth Furnace Grades:	
Railroad knuckles and couplers	16.50 to 17.00
Railroad coil and leaf springs	16.50 to 17.00
Rolled steel wheels	16.50 to 17.00
Low phosphorus billet and bloom ends	18.50 to 19.00
Low phosphorus, mill plate	17.50 to 18.00
Low phosphorus, light grade	16.50 to 17.00
Low phosphorus sheet bar crops	17.50 to 18.00
Heavy steel axle turnings	13.00 to 13.50
Electric Furnace Grades:	
Low phosphorus punchings	16.50 to 17.00
Heavy steel axle turnings	13.00 to 13.50
Blast Furnace Grades:	
Short shoveling steel turnings	11.00 to 11.25
Short mixed borings and turnings	11.00 to 11.25
Cast iron borings	11.00 to 11.25
No. 2 busheling	10.50 to 11.00
Rolling Mill Grades:	
Steel car axles	18.00 to 19.00
No. 1 railroad wrought	11.00 to 11.50
Sheet bar crops	17.00 to 17.50
Cupola Grades:	
No. 1 cast	14.50 to 15.00
Rails 3 ft. and under	15.50 to 16.00
Malleable Grades:	
Railroad	15.50 to 16.00
Industrial	15.00 to 15.50
Agricultural	14.50 to 15.00

Common wire nails, per keg	3.00
Cement coated nails, per keg	3.05

Pig Iron Freight Rates from Troy to New England Reduced

A decision of the Interstate Commerce Commission (Ref. 18387) places freight rates on pig iron from Troy, N. Y., to New England points on a mileage basis and results in general reductions ranging from 41c. to $1.13 per ton. The decision is retroactive. Action was brought by the Hudson Valley Coke & Products Co., Troy, in conjunction with the Manufacturers' Association of Connecticut.

The new rates, which will become effective on or about May 8, apply to rates from Troy to all points on the New York, New Haven & Hartford, Central New England and Central of Vermont railroads. The following are the new rates: 125 miles and less, $2.65 per ton; 126 to 160 miles, $2.85; 161 to 200 miles, $3.05; 201 to 240 miles, $3.25.

The Central Public Service Corporation has awarded a contract for the construction of a battery of 21 Becker-type combination coke ovens at Rockford, Ill., to the Koppers Construction Co., Pittsburgh. The installation will have a daily gas capacity of approximately 3,500,000 cu. ft. Auxiliaries will include two Koppers gas producers, a by-product plant for production of ammonium sulphate and a coal and coke handling plant.

Orders for 1245 steel boilers were placed in March with 72 manufacturers, according to a report of the Department of Commerce. The rating aggregated 1,334,128 sq. ft. of heating surface. This is the largest total of the year, comparing with 986 boilers and 1,165,225 sq. ft. in February. The current figure, however, is lower than that of a year ago, when orders covered 1413 boilers and 1,492,240 sq. ft.

Fort Wayne Rolling Mill Corporation, Fort Wayne, Ind., manufacturer of iron and steel bars and bands, small angles, channels and shapes, which has been in receivership, has been purchased by Joslyn Mfg. & Supply Co., Chicago.

Chicago

Consumers Buy More Cautiously—Prices of Some Steel Products Weaken

CHICAGO, April 24.—Greater caution in buying is indicated in several directions, and this, together with further unsteadiness in prices, tends to change the outlook in the Chicago steel market. Producers of plates and bars east of here are naming low prices to the south and east in territory that is normally conceded to Chicago mills because of freight rate advantages. The check in buying is shown by the fact that for the first time in many weeks new sales total not more than 50 per cent of shipments from steel plants. Two large consuming interests, the automobile and farm implement industries, do not appear to have assurance of the present high rate of output beyond the middle of May, and are curbing their purchases accordingly.

Notwithstanding the falling off in new buying, specifications against outstanding contracts are equal to mill output, which is holding to the high level of a week ago. No. 11 blast furnace at Gary, Ind., was put in blast on Saturday and No. 5, which is in need of repairs, was blown out last Wednesday. Steel mills are not putting any pig iron on the ground.

The railroad equipment market is sluggish so far as large orders are concerned. The Southern Pacific car purchase was of fair size, and the orders of the New York Central and the Pullman Co. for passenger equipment also were of importance, but even so the buying of rolling stock is well below what steel mills and car building companies have reasonably expected it might be.

Pig Iron.—A melter in Wisconsin has closed for 15,000 tons of Northern foundry iron with Chicago producers. A feature of this market is the sharp upturn in spot purchases, which have been unusually numerous. The price for Chicago district iron is unchanged at $18.50, base, per gross ton. Production is steady, and shipments are gradually growing heavier, causing sellers to expect that April deliveries will top those in March. Further evidence of weakness in silvery iron prices is indicated by business that is being taken at 25c. to 50c. below the quoted market. Carload orders for charcoal iron are being taken at $24, furnace.

Prices per gross ton at Chicago:

Northern No. 2 foundry, sil. 1.75 to 2.25	$18.50
N'th'n No. 1 fdy., sil. 2.25 to 2.75	19.00
Malleable, not over 2.25 sil	18.50
High phosphorus	18.50
Lake Superior charcoal, averaging sil. 1.50	27.04
Southern No. 2 fdy. (all rail)	22.01
Southern No. 2 (barge and rail)	21.18
Low phos., sil. 1 to 2 per cent, copper free	$28.50 to 29.00
Silvery, sil. 8 per cent	29.79
Bessemer ferrosilicon, 14 to 15 per cent	46.79

Prices are delivered consumers' yards except on Northern foundry, high phosphorus and malleable, which are f.o.b. local furnace, not including an average switching charge of 61c. per gross ton.

Ferroalloys.—This market is moderately active in small lots. Orders for ferromanganese are being taken at $100, seaboard, and spiegeleisen is steady at $31 to $32, Hazard, Pa., for the 19 to 21 per cent grade.

Prices delivered Chicago: 80 per cent ferromanganese, $107.56; 50 per cent ferrosilicon, $83.50 to $87.50; spiegeleisen, 19 to 21 per cent, $38.76 to $39.76.

Bolts, Nuts and Rivets.—Specifications dropped perceptibly early in the week, but in the last few days have recovered to the rate of early April. Release orders for these commodities in the three and a half weeks of April compare favorably with the corresponding period in March. Large quantities of small rivets are being specified in this district.

Coke.—Shipments of by-product foundry coke indicate that the melt of iron in this district is steady. Prices are firm at $9, local ovens, and at $9.50, delivered in the Chicago switching district.

Plates.—New business in plates to Western mills totals 4500 tons, the bulk of which is for delivery to Southwestern oil storage tank manufacturers. Competition for such business is unusually keen, and Chicago prices are not being maintained on orders for delivery in that territory. Producers are feeling the pinch of Eastern competition to the east of Chicago, and there is some unsteadiness in the price structure in that direction. Universal mills are well engaged and deliveries are not far from 30 days. Buyers can have sheared plates in two to three weeks. Car shops in this district are operating close to 70 per cent of capacity, and at this rate business on order books provides for about eight weeks' work. The absence of sizable inquiry, or prospects of large new business coming before the trade, is causing no little concern for the reason that about 90 days is needed from the time that inquiries are made until actual shop work begins. Specifications against the recent Chicago, Milwaukee, St. Paul & Pacific orders are now reaching mills in fair size. Among new car orders are 250 automobile and 175 tank cars for the Southern Pacific and 120 passenger cars for the New York Central. Twenty-five of the latter will be constructed by the Pullman Car & Mfg. Corporation. The North American Car Corporation will buy 50 express refrigerator cars.

Mill prices on plates per lb.: 2.00c., base Chicago.

Bands.—This commodity is in good demand, and orders placed this week total 3000 tons. Hot-strip mills are engaged at close to capacity.

Structural Material.—This is another week of comparative dullness in new structural business. Specifications coming to mills are of good size, and shops, especially those handling large work, are busy, but the problem of obtaining sufficient small orders to fill out shop schedules is serious. The attitude throughout the trade seems to be to get small orders at almost any price, and the result is that a few hundred tons of fabricated steel can be bought at pound prices no higher than several thousand tons would have been purchased for a month ago. Structural mills are well engaged, but new business falls well short of shipments, and backlogs are being reduced at a rapid rate. The Mount Vernon Bridge Co. has taken 2000 tons for a highway bridge at St. Joseph, Mo. A farm implement manufacturer expects to ask for prices next week on 2500 tons for a plant addition. Three new office buildings are being projected at Milwaukee.

Mill prices on plain material per lb.: 2.00c., base, Chicago.

Wire Products.—The last week has witnessed a drop in demand for wire and wire products. The change is not of large proportions, but it more or less marks the passing of the peak of the spring trade. Distributers in the South continue to order from mills in sizable quantities and larger shipments are being made to the Northwest. Throughout the Middle States and territory west of the Mississippi River users' requirements are lighter. Orders for nails continue spotty and small in the aggregate. In and near Chicago, prices are moderately steady at $2.75, base, per keg. At St. Louis, a highly competitive territory, $2.50 has been done in 100-keg lots. Specifications for wire from the manufacturing trade are steady. Mill output has been cut to 70 per cent of capacity. Stocks in the hands of producers are again well rounded and they are of ample size to care for the late spring trade.

Bars.—Users of mild steel bars continue to send in liberal specifications, with the result that bar mills are scheduled to the end of May. New buying is dragging. Here and there is evidence that production in some automobile plants has reached, if not passed, the seasonal peak. Farm implement manufacturers, now scheduled close to the end of next month, are showing some hesitation in making commitments beyond that time. Cold-drawn steel producers in this district continue to receive liberal specifications. As a general thing, prices for soft steel bars in and near Chicago are holding at 2c. This is also true to the north, but east of here Cleveland and Pittsburgh producers are cutting into the Chicago territory with delivered prices that are lower, by about $2 a ton, than quotations by Chicago mills. Demand for alloy steel bars is steady, and mills are engaged close to capacity. Prices are firm and differentials are holding. The iron bar market is quiet. Rail steel bar prices are steady at 1.85c. per lb., local mills. Specifications are slightly ahead of production, and new business is of sufficient size to maintain backlogs. Mill rollings are being diverted to products other than stock material for the manufacture of fence posts, because producers are anxious to reduce stocks on hand. Barn equipment manufacturers are now the largest single users of hard steel bars. Operations in bed making plants have been curtailed.

Mill prices per lb.: Soft steel bars, 2.00c. base, Chicago; common bar iron, 2.00c., base, Chicago; rail steel bars, 1.85c., base, Chicago Heights mill.

Reinforcing Bars.—Fresh inquiry bulks large and is keeping estimating departments well engaged. Notable among new requests for prices are 900 tons for the approach to the Crawford Avenue bridge and 500 tons for an 18-story apartment building, both in Chicago. Old inquiry is of such size that ordinarily it would signify a heavy spring demand, but it is so slow in developing into actual orders that dealers are inclined to consider much of it as dead. Prices show further evidence of weakness. As low as 2.15c. has been done on large tonnages of billet steel reinforcing bars out of Chicago warehouses. The spread in prices between heavy and light tonnage quotations is narrower than in the early spring. Prices for the rail steel commodity are 1.85c. to 1.95c., Chicago Heights.

Rails and Track Supplies.—Several small railroads have entered the market for 1928 requirements, and as a result mill order books have been enlarged by 3000 tons of standard-section rails. Inquiry is dull. Chicago mills have taken 10,000 tons of second quarter accessory business from the Pennsylvania Railroad. A Northern railroad will soon come in the market for 2000 kegs of spikes. Steel tie plates are steady at $43 a net ton. Light rail business is of car lot proportions. Chicago district rail mills are engaged at 90 per cent of capacity, and in some instances deliveries expected by railroads have not been made.

Prices f.o.b. mill, per gross ton: Standard-section open-hearth and Bessemer rails, $43; light rails, rolled from billets, $36. *Per lb.:* Standard railroad spikes, 2.80c.; track bolts with square nuts, 3.80c.; steel tie plates, 2.25c.; angle bars, 2.75c.

Cast Iron Pipe.—This market is uncommonly dull for this season of the year. Public lettings and fresh inquiry are light. Contractors, in many instances still busy on putting pipe in the ground that was ordered last fall and in the winter, are not actively concerned with making additional purchases. Rains and unseasonable weather are in part accountable for the backwardness of pipe laying. A few scattered orders have been entered from public utilities and the railroads. The American Cast Iron Pipe Co. has taken 200 tons for White Fish Bay, Wis. Dearborn, Mich., took bids April 24 on a round tonnage. Deliveries are improved, now averaging 30 to 45 days.

Prices per net ton, delivered Chicago: Water pipe, 6-in. and over, $36.20 to $39.20; 4-in., $40.20 to $43.20; Class A and gas pipe, $4 extra.

Warehouse Prices, f.o.b. Chicago

	Base per Lb.
Plates and structural shapes	3.10c.
Soft steel bars	3.00c.
Reinforcing bars, billet steel	2.15c. to 2.40c.
Cold-finished steel bars and shafting—	
Rounds and hexagons	3.60c.
Flats and squares	4.10c.
Bands	3.65c.
Hoops	4.15c.
Black sheets (No. 24)	3.95c.
Galvanized sheets (No. 24)	4.80c.
Blue annealed sheets (No. 10)	3.50c.
Spikes, standard railroad	3.55c.
Track bolts	4.55c.
Rivets, structural	3.60c.
Rivets, boiler	3.60c.
	Per Cent Off List
Machine bolts	60
Carriage bolts	60
Coach or lag screws	60
Hot-pressed nuts, squares, tapped or blank	60
Hot-pressed nuts, hexagons, tapped or blank	60
No. 8 black annealed wire, per 100 lb.	$3.20
Common wire nails, base per keg	3.00
Cement coated nails, base per keg	2.90

Sheets.—Prices in Chicago and to the north are holding, but in the southern and eastern sections of the Chicago territory concessions of $3 a ton are being made. Taking this district as a whole, mill prices are 2.85c. to 3c. for black, 3.70c. to 3.85c. for galvanized, and 2.15c. to 2.30c. for blue annealed. Mill backlogs are small, and current purchases assure operations for only a week in advance on all grades, except blue annealed sheets in the heavier gages. It is the common belief that the use of sheets has changed little over the past few weeks, but buyers, having recently bought heavily, are now intent on reducing supplies on hand. Sales by jobbers are brisk, but here again stocks are large and mills are now benefiting little by the larger business enjoyed by distributers.

Base prices per lb., delivered from mill in Chicago: No. 24 black, 2.90c. to 3.05c.; No. 24 galvanized, 3.75c. to 3.90c.; No. 10 blue annealed, 2.20c. to 2.35c. Delivered prices at other Western points are equal to the freight from Gary plus the mill prices, which are 5c. per 100 lb. lower than the Chicago delivered prices.

Old Material.—A steel mill purchase of 15,000 tons of heavy melting steel at $13.50 a gross ton, delivered, has served as a stimulant to the local scrap market. This advance of 50c. a ton in the heavy tonnage grade has brought about similar advances in many other grades. Reports that a cargo of heavy melting steel will be shipped from Chicago to a Lake Erie port cannot be confirmed. The cast iron boring market is quiet from the viewpoint of new purchases by consumers, but dealers are busy covering old contracts. Shipments of this grade are still coming here by rail from points in the East. Purchases and acceptances by steel foundries indicate that they are well engaged. Prices obtained by the Rock Island were high, but this list is a poor gage in the local market because of the extent of free delivery territory served by that railroad.

Prices delivered consumers' yards, Chicago:

Per Gross Ton		
Basic Open-Hearth Grades:		
Heavy melting steel	$13.00 to	$13.50
Shoveling steel	13.00 to	13.50
Frogs, switches and guards, cut apart, and miscellaneous rails	13.50 to	14.00
Hydraulic compressed sheets	11.50 to	12.00
Drop forge flashings	9.50 to	10.00
Forged, cast and rolled steel carwheels	15.00 to	15.50
Railroad tires, charging box size	16.25 to	16.75
Railroad leaf springs, cut apart	16.25 to	16.75
Acid Open-Hearth Grades:		
Steel couplers and knuckles	14.00 to	14.50
Coil springs	17.00 to	17.50
Electric Furnace Grades:		
Axle turnings	13.00 to	13.50
Low phosphorus punchings	14.00 to	14.50
Low phosphorus plate, 12 in. and under	14.25 to	14.75
Blast Furnace Grades:		
Axle turnings	10.00 to	10.50
Cast iron borings	9.25 to	9.75
Short shoveling turnings	9.25 to	9.75
Machine shop turnings	7.00 to	7.50
Rolling Mill Grades:		
Iron rails	14.00 to	14.50
Rerolling rails	14.00 to	14.50
Cupola Grades:		
Steel rails less than 3 ft.	15.00 to	15.50
Angle bars, steel	14.25 to	14.75
Cast iron carwheels	13.50 to	14.00
Malleable Grades:		
Railroad	13.00 to	13.50
Agricultural	12.00 to	12.50
Miscellaneous:		
*Relaying rails, 56 to 60 lb.	23.00 to	25.00
*Relaying rails, 65 lb. and heavier	26.00 to	31.00
Per Net Ton		
Rolling Mill Grades:		
Iron angles and splice bars	14.00 to	14.50
Iron arch bars and transoms	19.00 to	19.50
Iron car axles	21.50 to	22.00
Steel car axles	16.00 to	16.50
No. 1 railroad wrought	11.50 to	12.00
No. 2 railroad wrought	11.25 to	11.75
No. 1 busheling	10.00 to	10.50
No. 2 busheling	5.75 to	6.25
Locomotive tires, smooth	12.50 to	13.00
Pipes and flues	8.00 to	8.50
Cupola Grades:		
No. 1 machinery cast	14.00 to	14.50
No. 1 railroad cast	12.75 to	13.25
No. 1 agricultural cast	12.50 to	13.00
Stove plate	11.25 to	11.75
Grate bars	11.25 to	11.75
Brake shoes	11.00 to	11.50

---

*Relaying rails, including angle bars to match, are quoted f.o.b. dealers' yards.

Philadelphia

Sheet Prices Irregular—Plates, Shapes and Bars Sold at Contract Prices

PHILADELPHIA, April 23.—New business is confined to small lots both in pig iron and steel. Although the quotation for current purchases of plates, shapes and bars is still nominally $1 a ton higher than the second quarter contract prices of 1.85c., Pittsburgh, on bars, 2c., Bethlehem, on shapes and 2c., Coatesville, on plates, the lower quotation is not unusual, even on the smaller tonnages. Shipments on contracts are proceeding at a fair rate. Operations among eastern Pennsylvania mills range from about 60 per cent of capacity for the smaller producers to as high as 80 per cent by the leading independent.

Sheets still show decided irregularity in price. Eastern Pennsylvania mills are quoting 2.10c., Pittsburgh, on blue annealed, and 2.80c., Pittsburgh, on black sheets and are obtaining these prices on much of the current business, which is confined to small lots. Automobile body builders, however, have been able to buy sheets at concessions of $1 to $2 per ton, as has been the case in other districts.

Pig Iron.—Buying of foundry iron is limited to occasional carloads. The price of $20, base, is being firmly maintained. In some quarters there seems to be doubt that this basis would hold on a good-sized tonnage, but at present there is nothing under consideration to test the market. A small lot of high-silicon malleable was recently closed for third quarter delivery. About 6000 tons of basic is reported to have been purchased by a steel company in this district. Low phosphorus is quiet and prices are unchanged.

Prices per gross ton at Philadelphia:

East. Pa. No. 2 plain, 1.75 to 2.25 sil.		$20.76
East. Pa. No. 2X, 2.25 to 2.75 sil.		21.26
East. Pa. No. 1X		21.76
Basic (delivered eastern Pa.)	$19.50 to	20.00
Gray forge	19.75 to	20.25
Malleable	21.00 to	21.50
Standard low phos. (f.o.b. New York State furnace)	23.00 to	24.00
Copper bearing low phos. (f.o.b. furnace)	23.50 to	24.00
Virginia No. 2 plain, 1.75 to 2.25 sil.	24.54 to	25.04
Virginia No. 2X, 2.25 to 2.75 sil.	25.04 to	25.54

Prices, except as specified otherwise, are delivered Philadelphia. Freight rates: 76c. to $1.64 from eastern Pennsylvania furnaces; $4.54 from Virginia furnaces.

Billets.—Orders are slightly larger than for several months. Prices continue at $33 per ton, Pittsburgh, for rerolling billets and $38 per ton, Pittsburgh, for forging quality.

Bars.—Although 1.90c., Pittsburgh, is still quotable for small lots for prompt shipment, 1.85c., Pittsburgh, or 2.17c., delivered Philadelphia, which is the second quarter contract price, is being done on current purchases. Shipments on contracts are satisfactory, but new business is not of much consequence. Reinforced concrete projects, principally bridge construction, in this district are keeping stocks of reinforcing bars moving.

Warehouse Prices, f.o.b. Philadelphia

	Base per Lb.
Plates, ¼-in. and heavier	2.50c. to 2.60c.
Plates, $\frac{3}{16}$-in.	2.80c. to 3.00c.
Structural shapes	2.40c. to 2.60c.
Soft steel bars, small shapes and iron bars (except bands)	2.50c.
Round-edge iron	3.50c.
Round-edge steel, iron finished 1½ x 1½ in.	3.50c.
Round-edge steel, planished	4.30c.
Reinforcing steel bars, square, twisted and deformed	2.50c. to 3.00c.
Cold-finished steel, rounds and hexagons	3.35c.
Cold-finished steel, squares and flats	3.85c.
Steel hoops	3.60c.
Steel bands, No. 12 gage to $\frac{3}{16}$-in., inclusive	3.35c.
Spring steel	5.00c.
*Black sheets (No. 24)	4.00c.
†Galvanized sheets (No. 24)	4.75c.
Blue annealed sheets (No. 10)	3.15c.
Diamond pattern floor plates—	
¼-in.	5.30c.
$\frac{3}{16}$-in.	5.50c.
Rails	3.20c.
Swedish iron bars	6.60c.

*For 50 bundles or more; 10 to 49 bundles, 4.25c. base; 1 to 9 bundles, 4.50c. base.

†For 50 bundles or more; 10 to 49 bundles, 5.10c. base; 1 to 9 bundles, 5.45c. base.

Plates.—Small purchases of plates are at 2.05c., Coatesville, or 2.15c., delivered Philadelphia, but quotations of 2c., Coatesville, or 2.10c., Philadelphia, are reported to be obtainable on desirable new business. About 4000 tons of plates will be required for the Pennsylvania Railroad hulls, consisting of seven car floats and one steam lighter, awarded to American Brown Boveri Electric Corporation, Camden, N. J., and two tugboat hulls placed with the Pusey & Jones Co., Wilmington, Del. The Baldwin Locomotive Works has recently booked 16 locomotives; five from the Texas & Pacific; eight from a Western road and three from the Southern Pacific.

Shapes.—On new business and contracts 2c., Bethlehem, or 2.13c., delivered Philadelphia, represents the current market, and a few first quarter contracts at 1.95c., Bethlehem, or 2.08c., Philadelphia, are still in effect. The producer at Pencoyd is reported to be making shipments entirely on a delivered basis. The United Engineering Co. is the contractor on a new 23-story apartment building at Rittenhouse Square, estimated to require about 2000 tons of steel.

Sheets.—Blue annealed sheets are quotable at 2c. to 2.10c., Pittsburgh, black sheets at 2.75c. to 2.90c., and galvanized at 3.60c. to 3.75c. Eastern Pennsylvania mills are endeavoring to maintain the market at the former level, and on much of the small current purchasing seem to have succeeded, except in the case of automobile body builders, who have been successful in covering at the lower quotations.

Imports.—In the week ended April 21, a total of 7645 gross tons of pig iron arrived at this port, of which 7497 tons was from the United Kingdom and 148 tons from Sweden. Steel arrivals consisted of 12 tons of galvanized strip steel and 10 tons of scrap from the United Kingdom and 28 tons of iron bars from Sweden.

Warehouse Business.—There is a fair volume of buying from stock, but orders are still rather small. The new bases on black and galvanized sheets, which are applied as quantity differentials, have thus far been successfully maintained by jobbers in this district.

Old Material—For the second week prices of all grades of scrap have continued unchanged despite the absence of important buying by consumers. A mill using machine shop turnings has paid $10.50 per ton for a few small lots, following several weeks of offers to buy at $10 per ton, delivered. No. 1 heavy melting steel is moving to Bethlehem, Steelton and Conshohocken and yard grade to Pottsville and Phoenixville, Pa.

Prices per gross ton delivered consumers' yards, Philadelphia district:

No. 1 heavy melting steel	$13.50 to	$14.00
Scrap T rails	13.00 to	13.50
No. 2 heavy melting steel	11.00 to	11.50
No. 1 railroad wrought	14.50 to	15.00
Bundled sheets (for steel works)		10.50
Machine shop turnings (for steel works)		10.50
Heavy axle turnings (or equivalent)	12.00 to	12.50
Cast borings (for steel works and rolling mill)	10.50 to	11.00
Heavy breakable cast (for steel works)	15.50 to	16.00
Railroad grate bars	12.00 to	12.50
Stove plate (for steel works)		12.00
No. 1 low phos., heavy, 0.04 per cent and under	17.50 to	18.00
Couplers and knuckles	15.50 to	16.00
Rolled steel wheels	15.50 to	16.00
No. 1 blast furnace scrap	10.50 to	11.00
Machine shop turnings (for rolling mill)	11.00 to	11.25
Wrought iron and soft steel pipes and tubes (new specifications)	12.00 to	12.50
Shafting	17.50 to	18.00
Steel axles	19.00 to	20.00
No. 1 forge fire	11.00 to	11.50
Steel rails for rolling	14.75 to	15.25
Cast iron carwheels	15.50 to	16.00
No. 1 cast	16.00 to	16.50
Cast borings (for chemical plant)	14.50 to	15.00

The Chicago office of the Reading Iron Co., Reading, Pa., will be removed from 449 Conway Building to 1714 Engineering Building, 205 West Wacker Drive, effective May 1. R. A. Griffin is district sales representative.

New York

Steel Prices Easier as Business Lessens—Pig Iron Sales Fair

NEW YORK, April 24.—Pig iron buyers are showing little interest in their third quarter requirements, but purchases for current needs are in fair volume. Bookings of local sellers totaled about 9500 tons, or 2000 tons more than in the previous week. The Eastern Malleable Iron Co., Naugatuck, Conn., has closed for 2500 tons for water-and-rail shipment to its various plants. The first barge shipment of pig iron from Buffalo this season is expected to arrive in New York harbor May 7. It is likely that shipments by barge will be heavier than heretofore, because all producers are trying to reduce delivered prices through savings in freight. One important Buffalo producer is reported to have leased a storage yard at Jersey City, N. J., from which iron delivered by barge will be distributed to small consumers. Other furnaces are contemplating similar action. The Lorain Steel Co., Johnstown, Pa., has placed 1000 tons of low phosphorus with a domestic furnace. Competition from sellers of English hematite is becoming more severe, however, being felt as far west as the Chicago district. A recent sale of English hematite to the Falk Corporation, Milwaukee, Wis., totaled 1500 tons. The United States Cast Iron Pipe & Foundry Co., Burlington, N. J., has placed 2000 tons of low-silicon iron with an eastern New York furnace. The Farrell-Birmingham Co., Ansonia, Conn., has closed for 300 tons of No. 2X, and the Brooklyn Navy Yard has bought 100 tons of No. 3 foundry. Buffalo foundry iron continues to be quoted at $16 to $16.50, base furnace. Dutch foundry iron is a more important market factor, being offered at $20.50 to $21, duty paid, New York, for No. 1X and lower silicon grades.

Prices per gross ton, delivered New York district:

Buffalo No. 2 fdy., sil. 1.75 to 2.25	$20.91 to $21.91
East. Pa. No. 2 fdy., sil. 1.75 to 2.25	20.39 to 22.52
East. Pa. No. 2X fdy., sil. 2.25 to 2.75	20.89 to 23.02
East. Pa. No. 1X fdy., sil. 2.75 to 3.25	21.39 to 23.52

Freight rates: $4.91 from Buffalo, $1.39 to $2.52 from eastern Pennsylvania.

Reinforcing Bars.—A marked increase in the volume of small jobs placed in the last week brought out a fair aggregate tonnage, but few sizable contracts have either been placed or brought out for bids in the immediate district. A bridge at Charleston, S. C., will require 500 tons of bars. Distributers are quoting 2c., Pittsburgh mill, and the price seems to be holding except in cases where severe foreign competition is met. The Youngstown warehouse price is unchanged at 2.20c., or 2.57½c., on cars at New York, and out of New York warehouse the general quotations are 2.80c. for lots of 5 tons or more, 2.95c. for lots of 2 to 5 tons and 3.24c. for less than 2 tons, all delivered at job.

Finished Steel.—A further contraction in steel buying affecting not only new business but specifications against contracts, together with a more strongly marked tendency toward price concessions, are the market's chief developments. Weakness in prices is most marked on sheets, the minimum quotations on black and galvanized representing a drop of $3 a ton from those named for second quarter, while on blue annealed the decline is $2. Black sheets have been sold at 2.75c. to 2.90c., Pittsburgh, but 2.85c. and 2.90c. are obtainable only on small lots; galvanized sheets are now 3.60c. to 3.75c., attractive business usually bringing out quotations of either 3.60c. or 3.65c.; on blue annealed stock the range is 2c. to 2.10c. On plates, shapes and bars there has been no definite change in prices, but competition for business has virtually swept aside the maximum prices originally named as the second quarter contracting schedule. That advance carried steel bars, for example, to 1.90c., Pittsburgh, and for some time 1.90c. was obtainable on all orders not covered by contracts. In the past week or two, however, some mills have been accepting such miscellaneous orders at 1.85c., Pittsburgh. Likewise, on plates and shapes, on which Eastern mill basing prevails in this market, current orders are being taken at 2c., Coatesville, Pa., for plates, and at 2c., Bethlehem, Pa., for shapes, or their equivalents. Railroad equipment buying in the East looks somewhat more promising. The Erie is inquiring for 35 locomotives and probably will come into the market soon for 1000 freight cars. The New York Central has divided orders for 120 passenger cars. A bridge at Charleston, S. C., requiring 12,000 tons, will be fabricated by the McClintic-Marshall Co. and the Virginia Bridge & Iron Co.

Mill prices per lb., delivered New York: Soft steel bars, 2.19c. to 2.24c.; plates, 2.17½c. to 2.22½c.; structural shapes, 2.14½c. to 2.19½c.; bar iron, 2.14c.

Cast Iron Pipe.—There is very little municipal business, but private company inquiries specify some sizable tonnages of pressure pipe. A South American project

Warehouse Prices, f.o.b. New York

	Base per Lb.
Plates and structural shapes	3.30c.
Soft steel bars and small shapes	3.25c.
Iron bars	3.24c.
Iron bars, Swedish charcoal	7.00c. to 7.25c.
Cold-finished shafting and screw stock—	
Rounds and hexagons	3.40c.
Flats and squares	3.90c.
Cold-rolled strip, soft and quarter hard,	5.15c. to 5.40c.
Hoops	4.50c.
Bands	4.00c.
Blue annealed sheets (No. 10 gage)	3.90c.
Long terne sheets (No. 24)	5.80c.
Standard tool steel	12.00c.
Wire, black annealed	4.50c.
Wire, galvanized annealed	5.15c.
Tire steel, 1½ x ½ in. and larger	3.30c.
Smooth finish, 1 to 2½ x ¼ in. and larger	3.65c.
Open-hearth spring steel, bases	4.50c. to 7.00c.
Machine bolts, cut thread:	Per Cent Off List
¾ x 6 in. and smaller	55 to 60
1 x 30 in. and smaller	50 to 50 and 10
Carriage bolts, cut thread:	
½ x 6 in. and smaller	55 to 60
¾ x 20 in. and smaller	50 to 50 and 10
Coach screws:	
½ x 6 in. and smaller	55 to 60
1 x 16 in. and smaller	50 to 50 and 10
Boiler Tubes—	Per 100 Ft.
Lap welded steel, 2-in	$17.33
Seamless steel, 2-in	20.24
Charcoal iron, 2-in	25.00
Charcoal iron, 4-in	67.00

Discounts on Welded Pipe

Standard Steel—	Black	Galv.
½-in. butt	46	29
¾-in. butt	51	37
1-3-in. butt	53	39
2½-6-in. lap	48	35
7 and 8-in. lap	44	17
11 and 12-in. lap	37	12
Wrought Iron—

No. 22	4.55c. to 4.80c.
No. 24	4.70c. to 4.95c.
No. 26	4.95c. to 5.20c.
No. 28*	5.20c. to 5.45c.
No. 30	5.60c. to 5.85c.

---

*No. 28 and lighter, 36 in. wide, 20c. higher per 100 lb.

reported last week as requiring about 9000 tons is understood to be only in the preliminary stages. Both Northern and Southern makers are maintaining prices, and concessions even on large tonnages are less common. An inquiry from a local contractor in New Jersey calls for about 5000 tons of water pipe. Kearny, N. J., opened bids Tuesday on 50 tons of water pipe.

Prices per net ton, delivered New York: Water pipe 6-in. and larger, $36.25 to $37.25; 4-in. and 5-in., $41.25 to $42.25; 3-in., $51.25 to $52.25; Class A and gas pipe, $4 to $5 extra.

Coke.—There is only moderate activity in small lots of foundry grade. Prices are substantially the same as for several weeks. Standard furnace is quoted at about $2.75 per ton, Connellsville. Delivered prices of special brands of foundry coke are: To northern New Jersey, Jersey City and Newark, $8.71 to $8.81 per net ton; to New York and Brooklyn, $9.59 to $9.69 per net ton. By-product coke is quoted at $9 to $9.40 per net ton, Newark or Jersey City, N. J., and $10.06 to $10.29 per ton, New York or Brooklyn.

Warehouse Business.—Buying is slightly more active than earlier in the month, but individual orders are small. Most jobbers in this district are adhering to the new quantity differentials, which seem to be operating satisfactorily. On the basis of present business, April is expected to be a better month than March.

Old Material.—Buying by eastern Pennsylvania consumers is small, so that present activity in the scrap market is limited to shipments on contracts. Only a small tonnage of specification pipe is moving to consumers at Lebanon and Columbia, Pa., many yards seeming to prefer to cut their pipe small for shipment as yard steel. Stove plate is being shipped to a steel mill consumer at Phoenixville, Pa.; for shipments to foundry users brokers are paying about $10.50 per ton, delivered, on freight rates of $2.02 and $1.89 per ton. No. 1 heavy melting steel is quiet at $13.50 per ton, delivered to eastern Pennsylvania.

Dealers' buying prices per gross ton f.o.b. New York:

No. 1 heavy melting steel	$10.00 to $10.85
Heavy melting steel (yard)	6.75 to 7.25
No. 1 heavy breakable cast	11.25 to 12.00
Stove plate (steel works)	7.75 to 8.00
Locomotive grate bars	8.00 to 8.50
Machine shop turnings	6.50 to 7.25
Short shoveling turnings	6.50 to 7.25
Cast borings (blast furnace or steel works)	6.25 to 7.25
Mixed borings and turnings	6.50 to 7.25
Steel car axles	15.25 to 15.75
Iron car axles	23.75 to 24.75
Iron and steel pipe (1 in. dia., not under 2 ft. long)	7.75 to 8.25
Forge fire	6.75 to 7.00
No. 1 railroad wrought	10.00 to 10.50
No. 1 yard wrought, long	8.50 to 9.00
Rails for rolling	10.00 to 10.50
Cast iron carwheels	10.75 to 11.25
Stove plate (foundry)	8.50 to 9.00
Malleable cast (railroad)	10.00
Cast borings (chemical)	11.00 to 11.50

Prices per gross ton, delivered local foundries:

No. 1 machinery cast	$13.75 to $14.25
No. 1 heavy cast (columns, building materials, etc.), cupola size	11.75 to 12.25
No. 2 cast (radiators, cast boilers, etc.)	11.25 to 11.75

Cleveland

Weakness in Sheets, Strips and Nails—Steel Buying Smaller in Volume

CLEVELAND, OHIO, April 24.—The volume of specifications for steel bars, plates and structural material is not holding up this month to that in March, which is evidently because of the fact that consumers' needs are being taken care of by shipments against specifications on expiring contracts that poured in on the mills late last month. Specifications against second quarter contracts are moderate, and not much new business is coming out. New business is confined to small lots.

The automotive industry remains the backbone of steel consumption. This industry is as yet showing no evidence of a seasonal slowing down, although one car builder is curtailing production to bring out new models. It is believed that whatever check in output some of the motor car builders make in the next few weeks will be offset by the increase in production by the Ford Motor Co., which is slowly stepping up. An interesting development in the Ford industry, which will have a far-reaching effect on the steel industry, is a plan adopted by that company to supply steel bars in some sizes to manufacturers with which it has placed contracts for forgings. A precedent for this policy was adopted by the Ford company a few years ago, when it supplied pig iron to foundries with which it placed contracts for castings. The Ford company is now shipping steel bars to makers of its forgings in Cleveland and other cities and it is stated that the company will supply forging bars for its car parts to shops as far away as Boston.

Inquiry for steel in the building field continues light. Prices are holding steady at 1.85c., Pittsburgh, for steel bars, plates and structural material, and mills are able to get 1.90c. for small lots. Cleveland mills quote steel bars at 1.85c., Cleveland.

Pig Iron.—Activity increased in some sections the past week, during which Cleveland interests sold 20,000 tons of foundry and malleable iron. Much of the business came from Michigan and Indiana. Sales by furnaces in Cleveland were very light. Considerable of the buying was in small lots by foundries that purchase iron only as needed. The Lake furnace market in this territory is well stabilized at $17, furnace, but prices continue irregular in the more competitive sections of southern Ohio and Indiana, where some of the Lake furnaces quote $16.50. In Michigan the market is steady at $18, furnace. The American Steel Foundries has purchased 3000 to 5000 tons of basic iron for its Alliance, Ohio, plant at a delivered price of $17, or slightly lower, or at a price that figures back to less than $16, Valley furnace. Shipping orders from the motor car industry continue heavy. Business with jobbing foundries is still rather slow.

Prices per gross ton at Cleveland:

N'th'n No. 2 fdy., sil. 1.75 to 2.25	$18.50
Southern fdy., sil. 1.75 to 2.25	22.00
Malleable	18.50
Ohio silvery, 8 per cent	28.00
Basic, Valley furnace	17.00
Standard low phos., Valley furnace	$26.50 to 27.00

Prices, except on basic and low phosphorus, are delivered Cleveland. Freight rates: 50c. from local furnaces; $3 from Jackson, Ohio; $6 from Birmingham.

Sheets.—The demand is well sustained from the automotive industry, although specifications for auto body sheets are not quite as heavy as recently. Ohio mills generally are keeping up production, although one company has made a slight curtailment. New business is rather light in this territory, and buying is confined to early requirements. Black sheets appear well stabilized at the recently reduced price level of 2.75c. to 2.80c., Pittsburgh. Blue annealed sheets are commonly quoted at 2c., Pittsburgh. However, a price of 2.05c., Valley, has appeared on this grade for Cleveland delivery, equivalent to 1.95c., Pittsburgh, and the established 10c. per 100 lb. differential on sheets wider than 40 in. is not always being maintained. Weakness in galvanized sheets, for which the demand is very light, is more pronounced than recently. On this grade, quotations as low as 3.60c., Valley, have appeared, although 3.65c., Pittsburgh, is still the commonly quoted price.

Strip Steel.—There is not much new demand for hot-rolled strip, as mills are still making shipments against 1.75c. contracts, specifications for which were taken late in March. The hot-rolled strip market has a weak tone. On wide strip, 1.85c., Pittsburgh, is rather a common quotation, and the automotive industry evidently is able to place round lots at a lower price. Cold-rolled strip has generally settled down to 3c., base Cleveland, or 2.75c. for 3 tons and over, although some of the mills are getting $1 to $2 a ton more from small-lot buyers.

Wire Products.—Nails appear to be holding to $2.65, base Cleveland, in northern Ohio, but there is very little new demand. In central and southern Ohio $2.55 is commonly quoted.

Reinforcing Bars.—The Cleveland Union Terminals Co. is inquiring for a round lot, the tonnage not being specified, for three buildings recently placed with steel fabricators and for foundation work. Otherwise, the market is dull. Rail steel bars are unchanged at 1.75c., mill.

Semi-Finished Steel.—Sheet bars and slabs continue to move in good volume. The leading local producer is still operating at 100 per cent of capacity. Consumers are following a hand-to-mouth policy in ordering in small lots for a few days' requirements. No deviation from the regular $33 Cleveland price is reported.

Fluorspar.—Efforts of producers to establish the gravel fluorspar market at $16, mines, or an advance of $1 a ton, seem to have been successful. A Pittsburgh district consumer has purchased 500 tons at that price, and several car lot sales were made at the same figure.

Bolts, Nuts and Rivets.—Specifications for bolts and nuts are fair from the automotive and other consuming interests and from jobbers. The volume of business this month will be about the same as that in March. The industry is operating at about 70 per cent of capacity. Prices are firm. While the demand for rivets is only moderate, they are moving slightly better than recently. New orders for large rivets are against $3 per 100 lb. contracts.

Old Material.—The market shows a weaker tone because of the absence of a local demand. Scrap is coming into the market faster than the mills can take it, and dealers having old orders are able to buy small lots at concessions from recent prices. On No. 1 heavy melting steel $13.50 has become sufficiently common to become a recognized market price. Blast furnace grades show a decided weakness, small-lot sales being made at $9.25. May scrap lists have been issued by the Buick and Chevrolet motor car companies, and these show substantial reductions from the April lists. The Buick list amounts to 3500 tons and the Chevrolet list 2400 tons.

Prices per gross ton, delivered consumers' yards:

Basic Open-Hearth Grades	
No. 1 heavy melting steel	$13.50 to $13.75
No. 2 heavy melting steel	12.75 to 13.00
Compressed sheet steel	12.50 to 12.75
Light bundled sheet stampings	11.50 to 11.75
Drop forge flashings	12.00 to 12.50
Machine shop turnings	7.00 to 7.50
No. 1 railroad wrought	11.50 to 12.00
No. 2 railroad wrought	13.50 to 14.00
No. 1 busheling	11.00 to 11.25
Pipes and flues	9.00 to 9.50
Steel axle turnings	12.50 to 13.00
Acid Open-Hearth Grades	
Low phosphorus forging crops	16.50 to 17.00
Low phosphorus, billet, bloom and slab crops	17.00 to 17.50
Low phosphorus sheet bar crops	16.50 to 17.00
Low phosphorus plate scrap	16.00 to 16.50
Blast Furnace Grades	
Cast iron borings	9.25 to 9.50
Mixed borings and short turnings	9.25 to 9.50
No. 2 busheling	9.25 to 9.50
Cupola Grades	
No. 1 cast	16.50 to 17.00
Railroad grate bars	11.00 to 12.00
Stove plate	12.00 to 12.50
Rails under 3 ft	18.00 to 18.50
Miscellaneous	
Railroad malleable	15.00 to 15.50
Rails for rolling	16.25 to 16.50

Iron Ore.—Several sales were made during the week, following the reestablishment of last year's prices, and a consumer in the Buffalo territory has come into the market for its requirements for the year, aggregating 200,000 tons, part of which will probably be covered in a trade deal, as this consumer is also a mine owner. Shipping schedules for the season prepared by consumers having long term contracts average about the same as last year. Ice conditions still prevent an opening of the ore shipping season, and it is not expected shipments will start before May 10. The consumption of Lake ore during March amounted to 4,808,075 tons, a gain of 413,144 tons, compared with February. In March last year the amount consumed was 5,031,196 tons. Ore on hand at furnaces April 1 amounted to 18,690,656 tons, and the amount at furnaces and on Lake Erie docks on that date was 24,258,754 tons, compared with 24,808,525 tons on the same date a year ago. There were 167 furnaces in blast using Lake ore March 31, an increase of eight for the month. Central district furnaces during March consumed 2,320,561 tons, a gain of 184,877 tons over February; Lake front furnaces used 2,289,103 tons, an increase of 204,447 tons; all-rail furnaces consumed 123,564 tons, an increase of 7957 tons, and Eastern furnaces melted 74,847 tons, an increase of 15,863 tons.

Warehouse Prices, f.o.b. Cleveland

	Base per Lb.
Plates and structural shapes	3.00c.
Soft steel bars	3.00c.
Reinforcing steel bars	2.25c. to 2.75c.
Cold-finished rounds and hexagons	3.65c.
Cold-finished flats and squares	4.15c.
Hoops and bands	3.65c.
Cold-finished strip	*5.95c.
Black sheets (No. 24)	3.75c.
Galvanized sheets (No. 24)	4.40c. to 4.60c.
Blue annealed sheets (No. 10)	3.25c.
No. 9 annealed wire, per 100 lb	$2.90
No. 9 galvanized wire, per 100 lb	3.35
Common wire nails, base per keg	2.90

*Net base, including boxing and cutting to length.

STEEL COMPANY EARNINGS

Steel Corporation's for First Quarter Were $2.11 Per Share of Common Stock

Earnings of the United States Steel Corporation for the first quarter of 1928 were at the rate of $2.11 per share of common stock, after providing for the preferred stock dividend, and compare with $1.05 a share of common stock for the last quarter of 1927 and $2.81 for the first quarter of last year. Against a deficit of $4,963,499, after declaring the usual dividends, for the fourth quarter of 1927, the quarter just ended gave a surplus of $2,573,541. The following tables show also the earnings of recent years:

EARNINGS IN RECENT YEARS

Quarters	1928	1927	1926	1925	1924
1st	$40,934,032	$45,584,725	$45,061,285	$39,882,992	$50,075,445
2nd	....	46,040,460	47,814,105	40,624,220	41,381,039
3rd	....	41,373,831	52,626,826	42,400,419	30,718,415
4th	....	31,247,529	53,502,525	42,630,840	30,939,912

EARNINGS FOR FIRST QUARTER

	Earnings Before Charging Interest on the Subsidiary Cos.' Bonds Outstanding	Less: Interest on the Subsidiary Cos.' Bonds Outstanding	Balance of Earnings
Jan., 1928	$12,550,979	$651,430	$11,899,549
Feb., 1928	14,230,930	649,593	13,581,337
Mar., 1928	16,102,147	649,001	15,453,146
	$42,884,056	$1,950,024	

Total earnings after deducting all expenses incident to operations, also taxes and interest on bonds of the subsidiary companies		$40,934,032
Less, charges and allowances for depletion, depreciation and amortization, applied as follows:		
To depletion and depreciation reserves of subsidiary companies	$12,202,966	
To sinking funds on U. S. Steel Corporation bonds	2,823,927	
		15,026,893
Net income		$25,907,139
Deduct: Interest for the quarter on U. S. Steel Corporation bonds outstanding	$4,097,848	
Premium on bonds redeemed	477,420	
		4,575,268
Balance		$21,331,871
Dividends:		
Preferred, 1¾ per cent	$6,304,919	
Common, 1¾ per cent	12,453,411	
		18,758,330
Surplus for the quarter		$2,573,541

J. & L. and Republic Earnings Also Gain

Net income of the Jones & Laughlin Steel Corporation in the first quarter amounted to $2,903,457, compared with $1,397,123 in the preceding quarter and with $3,658,724 in the first quarter of 1927. Dividend disbursements in the 1928 quarter were $1,741,206, leaving an addition to surplus of $1,162,251.

The Republic Iron & Steel Co. net profits in the first quarter totaled $487,332, after all charges including bond interest. This compares with $483,854 in the preceding quarter and with $1,044,421 in the first quarter of 1927. After dividend requirements of $737,500 the deficit in the quarter just ended amounted to $250,168.

San Francisco

Pending Cast Iron Pipe Business 44,000 Tons—Structural Steel Active

SAN FRANCISCO, April 21 (*By Air Mail*).—Structural steel bookings this week again lead other steel products, and considerable new work has come out for figures. Interest was centered in the opening of bids for the Wildcat and Sequoia aqueducts in Oakland for the East Bay Municipal Utility District, requiring 8000 tons of plates. Included among the larger awards were 1220 tons of reinforcing bars for a sewer project in Los Angeles, 606 tons of structural shapes for a Freeport, Cal., bridge placed with the Moore Dry Dock Co. and 400 tons for a hangar at San Diego, taken by the McClintic-Marshall Co.

Pig Iron.—Quiet conditions continue in the foundry trade, and as a result sales and inquiries for pig iron have not been numerous. Another shipment of Indian iron totaling 850 tons has arrived on the Coast. Most of this shipment was unloaded at San Francisco, the rest going to Portland and Seattle. Prices are unchanged.

Prices per gross ton at San Francisco:

*Utah basic	$25.00 to $26.00
*Utah foundry, sil. 2.75 to 3.25	25.00 to 26.00
**Indian foundry, sil. 2.75 to 3.25	24.00 to 25.00
**German foundry, sil. 2.75 to 3.25	24.25

*Delivered San Francisco.

**Duty paid, f.o.b. cars San Francisco.

Bars.—Distributers of out-of-stock reinforcing steel bars report an increase in the number of projects coming up for figures, but the tonnages are small. Awards this week exceeded 1600 tons. Gunn, Carle & Co. took 100 tons for a store for the Santa Fe at Richmond. Prices are still low in the San Francisco district, and 2.25c. continues to be quoted. Merchant bar demand is limited to unimportant lots.

Plates.—Bids were opened on April 20 for 8000 tons for the Wildcat and Sequoia aqueducts in Oakland, but no award was made. The Los Angeles Mfg. Co. took 307 tons for a welded pipe line at Ontario, Cal., and the Western Pipe & Steel Co. booked 100 tons of 60-in. pipe for the Sacramento filtration plant. Bids will be opened on May 9 for a dredger and two steel scows for the State Harbor Commission at San Francisco, calling for 650 tons. Prices are firm at 2.30c. c.i.f.

Shapes.—The structural steel market continues active. Awards this week were in excess of 2400 tons. Important lettings included 570 tons for a church in Los Angeles, taken by the Union Iron Works, and 400 tons for the Masonic Temple at Glendale, Cal., booked by Baker Iron Works. Bids were opened on 947 tons for a bridge at Herndon, Cal., and the Park-Schramm Co., Portland, took the general contract for the Smith River bridge in Del Norte County, Cal. Pending business exceeds 8000 tons. Fabricated and erected prices both in the Los Angeles and San Francisco districts are low; less than $75 a ton erected has been quoted. Plain domestic material is firm at 2.35c. c.i.f.

Cast Iron Pipe.—Activity in the cast iron pipe market is pronounced and more than 44,000 tons is now up for figures or pending. Only 275 tons was placed this week, Robert McNair, Oakland, taking that amount of 2 to 10-in. class 150 pipe for Livingston, Cal. Bids were opened on April 20 for 17,440 tons and 13,250 tons of 50 to 60-in. class C pipe for the Wildcat and Sequoia aqueducts in Oakland for the East Bay Municipal Utility District. Alternate bids were also received on riveted steel pipe. Bids were opened on 2264 tons of 4 to 20-in. classes A and B pipe for Monrovia, Cal. The United States Cast Iron Pipe & Foundry Co. was low bidder on 8744 tons of 4 to 30-in. class B pipe for Long Beach, Cal. Camas, Wash., will open bids on April 30 for 152 tons of 2 to 8-in. class B. Bids will be opened on May 7 for 1799 tons of 30 and 36-in. class B pipe for the Venice Outfall sewer in Los Angeles. The Thomas Haverty Co., Los Angeles, was low bidder on 111 tons of 6 and 12-in. class B pipe for a sewer in Long Beach, Cal. Prices on 6-in. and larger remain around $35 to $36 a ton, delivered.

Steel Pipe.—Only one important project is up for figures at present. Monrovia, Cal., opened bids this week on 710 tons of 4 to 20-in. lapweld pipe, but no award has been made.

Track Material.—The Pacific Coast Railroad, a subsidiary of the Pacific Coast Cement Co., Seattle, is asking for quotations on 200 tons of 75-lb. rail.

Coke.—Demand for foundry coke, because of quiet conditions in the foundry trade, is limited to small lots. Another shipment of English beehive and by-product coke, totaling 4500 tons, is scheduled to arrive on the Coast early next month.

Warehouse Prices, f.o.b. San Francisco

	Base per Lb.
Plates and structural shapes	3.15c.
Soft steel bars	3.15c.
Small angles, $\frac{3}{16}$-in. and over	3.15c.
Small angles, under $\frac{3}{16}$-in	3.55c.
Small channels and tees, ¾-in. to 2¾-in.	3.75c.
Spring steel, ¼-in. and thicker	5.00c.
Black sheets (No. 24)	4.95c.
Blue annealed sheets (No. 10)	3.90c.
Galvanized sheets (No. 24)	5.50c.
Structural rivets, ½-in. and larger	5.65c.
Common wire nails, base per keg	$3.40
Cement coated nails, 100-lb. keg	3.40

Birmingham

Steel Market Firm—Pig Iron Sales Mostly Small Lots

BIRMINGHAM, April 24.—Pig iron buyers are still confining their orders to lots of 100 to 300 tons. Most of the consumers have covered their requirements for May, but tonnage booked for June is light. Two of the merchant producers report sales close to their make during April, while the third has piled some iron during the past two weeks. Foundry iron quotations remain on a $16 base. The Tennessee company changed furnace No. 5 at Ensley from basic to foundry on April 15. Seventeen furnaces continue in blast. Of this number 10 are on foundry, five on basic, one on recarburizing iron and one on ferromanganese.

Prices per gross ton, f.o.b. Birmingham district furnaces:

No. 2 foundry, 1.75 to 2.25 sil	$16.00
No. 1 foundry, 2.25 to 2.75 sil	16.50
Basic	15.00

Finished Steel.—Bookings and inquiries show no change from the level of the past several weeks. The market has a firm tone. Demand for structural steel and reinforcing bars is fair, but new business so far this month has been light. The Nashville Bridge Co. is beginning the fabrication of a 2000-ton order for the Warrior steam plant of the Alabama Power Co. The Ingalls Iron Works Co. has an order for 100 tons for the new No. 1 city furnace of the Sloss-Sheffield Steel & Iron Co. The Tennessee company is now working four open hearths at Fairfield; seven are being operated at Ensley. The Gulf States Steel Co. continues with four at Alabama City.

Cast Iron Pipe.—Demand has improved and prices are firmer at $29 to $31, base. No large sales were reported during the past week, but small-lot sales increased. Shipments have been sufficient to keep stocks on yards at about the same level for the past several weeks.

Coke.—Foundry coke is moving in fairly satisfactory volume. All new business is for prompt shipment. Both spot and contract quotations are unchanged from a $5 base.

Old Material.—A firmer market in a few lines continued through the past week. Sales were slightly larger. Prices have not been affected.

Prices per gross ton, delivered Birmingham district consumers' yards:

Heavy melting steel	$9.50 to $10.00
Scrap steel rails	11.00 to 11.50
Short shoveling turnings	8.00 to 8.50
Cast iron borings	8.00
Stove plate	14.50
Steel axles	19.00 to 20.00
Iron axles	20.00 to 21.00
No. 1 railroad wrought	10.00 to 10.50
Rails for rolling	13.00
No. 1 cast	14.50
Tramcar wheels	12.50 to 13.50
Cast iron carwheels	12.00 to 13.00
Cast iron borings, chemical	13.50 to 14.00

Cincinnati

Pig Iron Sales Small—Further Weakness in Sheets and Nails

CINCINNATI, April 24.—Pig iron sales in the past week have been the smallest this year, and the almost total absence of inquiries reflects the lack of interest among buyers. The foundry melt in this district is reported to have declined somewhat, so that melters are taking only a moderate amount of iron on current contracts. Furthermore, there is no factor in the price situation which would give the impression that there is likely to be an advance in the near future, and under the circumstances there is no incentive for forward purchasing. Quotations are virtually unchanged, with southern Ohio foundry bringing $19, base furnace; Tennessee and Alabama iron, $16, base Birmingham, and northern Ohio foundry, $16.50 to $17, base furnace.

Prices per gross ton, delivered Cincinnati:

So. Ohio fdy., sil. 1.75 to 2.25....	$20.89
So. Ohio malleable..............	$20.14 to 20.89
Alabama fdy., sil. 1.75 to 2.25...	19.69
Alabama fdy., sil. 2.25 to 2.75...	20.19
Tennessee fdy., sil. 1.75 to 2.25..	19.69
Southern Ohio silvery, 8 per cent	26.89

Freight rates, $1.89 from Ironton and Jackson, Ohio; $3.69 from Birmingham.

Finished Material.—The slackening pace at which mills are booking second quarter tonnages has contributed largely to the creation of an unsatisfactory price situation. In an endeavor to keep order books well filled, some producers have made concessions, especially on sheets and on common wire nails. In the past week blue annealed stock has been offered to automobile manufacturers at 1.90c., base Pittsburgh, a drop of $2 a ton from the previous low level and of $4 a ton from the schedule which recently prevailed. Only large users entitled to preferential treatment, however, have obtained 1.90c.; 2c. to 2.10c. is representative of the general market. Demand for black sheets is fair, with prices ranging from 2.75c. to 2.90c., base Pittsburgh. For galvanized sheets buyers are paying from 3.65c. to 3.75c., base Pittsburgh. Automobile body sheets are firm at 4c., base Pittsburgh, and specifications from the Detroit district have been sustained at a high rate this month. Increased orders for electrical sheets are noted. A nearby sheet maker is operating all of its units at full capacity and has a backlog sufficient to insure a continuation of production on the present scale for about three weeks. Considerable unevenness exists in common wire nails, because of the current practice of an Ironton, Ohio, mill of quoting $2.50 per keg at Ironton, plus a low water haul rate to Ohio River points. Even to customers whose plants cannot be reached by river, irregular quotations have been made. The amount of business placed in bars, structural shapes and plates has been only fair at best, and these heavy products are bringing 1.85c., base Pittsburgh, on contract tonnages and 1.90c. for small orders.

Reinforcing Bars.—The Pollak Steel Co. will supply 800 tons of rail steel bars for the State Hospital at Toledo, Ohio, and 220 tons for the Central Catholic High School in that city. New billet bars are firm at 1.85c. to 1.90c., base Pittsburgh; and rail steel bars at 1.80c. to 1.85c., base mill.

Warehouse Prices, f.o.b. Cincinnati

	Base per Lb.
Plates and structural shapes............	3.40c.
Bars, soft steel or iron..................	3.30c.
New billet reinforcing bars..............	3.15c.
Rail steel reinforcing bars..............	3.00c.
Hoops	4.00c. to 4.25c.
Bands	3.95c.
Cold-finished rounds and hexagons......	3.85c.
Squares	4.35c.

Galvanized sheets (No. 24)............	4.90c.
Blue annealed sheets (No. 10)..........	3.60c.
Structural rivets	3.85c.
Small rivets	65 per cent off list
No. 9 annealed wire, per 100 lb..........	$3.00
Common wire nails, base per keg..........	2.95
Cement coated nails, base 100 lb. keg.....	2.95
Chain, per 100 lb......................	7.55
	Net per 100 Ft.
Lap-welded steel boiler tubes, 2-in......	$18.00
4-in.	38.00
Seamless steel boiler tubes, 2-in..........	19.00
4-in.	39.00

Warehouse Business.—Several important jobbers declare that bookings continue to lag somewhat, with the result that shipments this month will be little better than those in March. Bars, structural shapes and plates are leading in volume of sales. Prices are steady and unchanged.

Coke.—Shipments of by-product foundry coke in the first 21 days of April showed a decrease of approximately 25 per cent from those in March, and this ratio probably will be maintained during the remainder of the month. Now that foundries supplying the automobile industry have reduced their volume of specifications, bookings of foundry coke in the next month are expected to continue at about the present rate or slightly lower. The Hamilton Coke & Iron Co., Hamilton, Ohio, fired its by-product ovens last week. This company has 45 new Koppers ovens with an annual capacity of approximately 292,000 net tons. About 183,000 will be required for the company's blast furnace, which will begin operating some time in May. The company has begun the marketing of its egg size domestic coke at $6, delivered in Cincinnati. Since the freight rate to this city is $1.26 a ton, this figures $4.74 at Hamilton. The quotation of $6, delivered, however, also applies on all tonnages destined for points having a freight rate less than $1.39. For shipment to consuming points with a freight rate above $1.39 the delivered price is $6.50. This schedule, as applied to Cincinnati, is 64c. a ton less than the delivered price from Ashland.

Foundry coke prices per net ton, delivered Cincinnati: By-product coke, $9.02; Wise County coke, $7.09 to $7.59; New River coke, $9.09 to $9.59. Freight rates, $2.14 from Ashland, Ky.; $2.59 from Wise County and New River ovens.

Old Material.—The volume of scrap moving into district steel plants on current contracts is fairly good, but forward buying is practically at a standstill. Foundries are purchasing material only in small lots. Prices are firm and unchanged.

Dealers' buying prices per gross ton f.o.b. cars, Cincinnati:

Heavy melting steel............	$11.50 to $12.00
Scrap rails for melting.........	11.75 to 12.25
Loose sheet clippings...........	8.50 to 9.00
Bundled sheets	9.50 to 10.00
Cast iron borings	8.00 to 8.50
Machine shop turnings	7.50 to 8.00
No. 1 busheling	10.00 to 10.50
No. 2 busheling	7.00 to 7.50
Rails for rolling	12.50 to 13.00
No. 1 locomotive tires	12.75 to 13.25
No. 1 railroad wrought	10.00 to 10.50
Short rails	15.75 to 16.25
Cast iron carwheels............	12.25 to 12.75
No. 1 machinery cast	15.50 to 16.00
No. 1 railroad cast	13.00 to 13.50
Burnt cast	7.50 to 8.00
Stove plate	8.25 to 8.75
Brake shoes	9.50 to 10.25
Railroad malleable	12.00 to 12.50
Agricultural malleable	11.50 to 12.00

Canada

Production of Pig Iron and Steel Shows Marked Gain

TORONTO, ONT., April 24.—Production of pig iron in Canada in March was 78,390 gross tons, an increase of 22 per cent over the 64,691 tons produced in February and 4 per cent above the 75,637 tons reported for March, 1927. For the three months ended with March pig iron production amounted to 208,087 tons, a gain of 17 per cent over the 178,049 tons reported for the first quarter of 1927. Production of steel ingots and castings for the first quarter totaled 301,373 tons, an increase of 32 per cent over the 221,552 tons produced in the corresponding period last year.

Pig Iron.—Advance contract placing is no longer a feature of the pig iron market, but spot sales are holding at a satisfactory level, both as to numbers and tonnages. Releases against contract are responsible for a large movement of foundry and malleable iron. It is expected that within the next two or three weeks spot sales will become greater in tonnages as direct water shipments will soon be possible from blast furnaces to consuming points in Ontario and Quebec. While a spread is quoted on both Toronto and Montreal iron prices, most of the orders going through are at the low level.

Prices per gross ton:

Delivered Toronto

No. 1 foundry, sil. 2.25 to 2.75	$23.10 to	$23.60
No. 2 foundry, sil. 1.75 to 2.25	23.10 to	23.60
Malleable	23.10 to	23.60

Delivered Montreal

No. 1 foundry, sil. 2.25 to 2.75	$24.50 to	$25.00
No. 2 foundry, sil. 1.75 to 2.25	24.50 to	25.00
Malleable	24.50 to	25.00
Basic		24.00

Imported Iron at Montreal Warehouse

Summerlee	33.50
Carron	33.00

Old Material.—Advance buying has practically stopped, and current demand is confined to small tonnages for the immediate needs of consumers. Most consumers are carrying light stocks. Prices are unchanged.

Dealers' buying prices:

Per Gross Ton

	Toronto	Montreal
Heavy melting steel	$9.00	$8.00
Rails, scrap	10.00	10.00

Standard carwheels	13.00	....
Malleable scrap	13.00	....

Buffalo

Pig Iron Inquiry Moderate—Steel Operations Sustained

BUFFALO, April 24.—Pig iron inquiry is quiet, but shipping directions are good. One inquiry before the market is for 500 tons of No. 2 plain. An Erie, Pa., user is inquiring for 500 to 1000 tons of No. 2X for third quarter delivery. Most of the furnaces have taken orders ranging from 100 to 300 tons of foundry and malleable. An order was placed by a central New York user for 600 tons of foundry. Numerous carload lots for prompt delivery have been placed. The price of $17 for No. 2 plain continues to hold in the Buffalo district, and one maker who had been quoting $16 to $16.50 for New England delivery, has sold iron in small tonnage for that territory at $17, though the lower prices have not been withdrawn. Twelve of the 18 blast furnaces in this district are blowing.

Prices per gross ton, f.o.b. furnace:

No. 2 plain fdy., sil. 1.75 to 2.25		$17.00
No. 2 foundry, sil. 2.25 to 2.75		17.50
No. 1X foundry, sil. 2.75 to 3.25		18.50
Malleable, sil. up to 2.25		17.50
Basic	$16.50 to	17.00
Lake Superior charcoal		27.28

Finished Iron and Steel.—Heavier orders for bars and shapes have been taken by Buffalo mills following an improved inquiry. Prices are firm. Automobile body and black sheet inquiry is fair. Bolt and nut business continues good, with railroad and automobile companies specifying freely. Wire business is considerably better. Two reinforcing bar contracts totaling about 350 tons were placed. Erie County intends to let a number of bridges and other work requiring about 500 tons of reinforcing bars. In warehouse business April has been the best month this year. Mill operation is about 85 to 90 per cent.

Old Material.—New buying has been very light during the week, but dealers have outstanding orders and are endeavoring to fill them, though scrap has been almost entirely cleared out of yards. Dealers are offering $14.75 freely against one order of heavy melting steel, strictly No. 1 grade. A sale of No. 2 steel, about 1000 tons, at around $13 is reported. Mill operation is very good and large quantities of scrap are being consumed. Specialties are quiet and stove plate shows a little strengthening with $13.50 to $13.75 the market.

Prices per gross ton, f.o.b. Buffalo consumers' plants:

Basic Open-Hearth Grades		
No. 1 heavy melting steel	$14.50 to	$15.00
No. 2 heavy melting steel	12.75 to	13.25
Scrap rails	13.75 to	14.25
Hydraulic compressed sheets	13.00 to	13.50
Hand bundled sheets	9.00 to	9.50
Drop forge flashings	12.00 to	12.50
No. 1 busheling	13.25 to	13.75
Heavy steel axle turnings	12.50 to	12.75
Machine shop turnings	8.25 to	8.75
Acid Open-Hearth Grades		
Railroad knuckles and couplers	15.50 to	16.00
Railroad coil and leaf springs	15.50 to	16.00
Rolled steel wheels	15.50 to	16.00
Low phosphorus billet and bloom ends	17.00 to	17.50
Electric Furnace Grades		
Heavy steel axle turnings	12.75 to	13.25
Short shoveling steel turnings	10.75 to	11.25
Blast Furnace Grades		
Short shoveling steel turnings	10.50 to	11.00
Short mixed borings and turnings	9.50 to	10.00
Cast iron borings	9.75 to	10.25
No. 2 busheling	9.00 to	9.50
Rolling Mill Grades		
Steel car axles	17.00 to	17.50
Iron axles	22.00 to	23.00
No. 1 railroad wrought	12.50 to	13.00
Cupola Grades		
No. 1 machinery cast	14.50 to	15.00
Stove plate	13.50 to	13.75
Locomotive grate bars	12.00 to	12.50
Steel rails, 3 ft. and under	16.50 to	17.00
Cast iron carwheels	13.00 to	13.50
Malleable Grades		
Railroad	15.00 to	15.25
Agricultural	15.00 to	15.25
Industrial	15.00 to	15.25

Warehouse Prices, f.o.b. Buffalo

	Base per Lb.
Plates and structural shapes	3.40c.
Soft steel bars	3.30c.
Reinforcing bars	2.75c.
Cold-finished flats, squares and hexagons	4.45c.
Rounds	3.95c.
Cold-rolled strip steel	5.85c.
Black sheets (No. 24)	4.30c.
Galvanized sheets (No. 24)	5.15c.
Blue annealed sheets (No. 10)	3.80c.
Common wire nails, base per keg	$3.65
Black wire, base per 100 lb	3.90

Pacific Northwest

Structural Business Fairly Active—Other Steel Lines Quiet

SEATTLE, April 21 (*By Air Mail*).—Generally quiet conditions prevail in the local steel trade, but prices are fairly strong. Jobbers say that orders in the first half of April were larger than in March, but the trade is buying only for nearby needs. Seattle is breaking all former records in building, and demand for building materials is active. The outlook for larger steel business is regarded as encouraging, as some large jobs are being figured that will likely be placed in the next few months.

Pig Iron.—Sales are in small lots only. Considerable quantities of foreign iron continue to come into the local market. Utah foundry and basic are $24 to $25 per gross ton, Seattle delivery.

Structural Material.—The Northwest Pulp & Paper Co. has placed the contract for its new plant at Astoria, Ore., the Austin Co. getting the contract for the buildings, and bids will be asked for shortly for the steel, about 1550 tons. On May 8, bids will be asked for for the Queets River bridge in Washington, about 500 tons. Other prospective work includes 600 tons for the Smith River bridge, 200 tons for a school at

Warehouse Prices, f.o.b. Seattle

	Base per Lb.
Plates and structural shapes	3.00c.
Soft steel bars	3.00c.
Tees, bar sizes	3.25c.
Reinforcing bars	3.00c.
Blue annealed sheets (No. 10)	3.90c.
Black sheets (No. 24)	4.90c.
Galvanized sheets (No. 24)	5.65c.
Structural rivets, ½-in. and larger	5.50c.

Cherry, Wash., and 800 to 1000 tons for the local Spokane Street bridge, bids to be asked for within 30 days. The Hofius Steel & Equipment Co. has taken 155 tons for motor sheds for the Great Northern at Appletree, Wash. Shapes are held firmly at 2.35c., Seattle delivery.

Plates.—It is expected 1500 tons of plates for the penstock at Cedar River will be placed within a week. Not much new work is in sight. Plates are 2.30c., Seattle.

Reinforcing Bars.—Considerable State work is being placed, about 500 tons in the past week. The two largest jobs in the market are 1800 tons for the Bon Marche store and 300 tons for the local Stimson Building. Prices remain firm, ranging from 2.20c. to 3c., depending on the order.

Railroad Spikes.—The Pacific Coast Forge Co. has taken an order for 3000 kegs of ⅝ x 6-in. spikes to be used in replacing about 78 miles of trackage between Kintyre and Bowden, Mont. Standard size spikes are held at $3 per 200-lb. keg, c.i.f. Seattle.

Sheets.—A slight betterment in demand for galvanized sheets is noted, but prices on all grades are inclined to weakness. Pacific Coast mills have an advantage over Eastern mills in the matter of freights into Seattle, and are taking a good part of the business offered. Asking prices, which are not firmly held, are: No. 24 galvanized, 4.25c.; No. 24 black, 3.50c.; and No. 10 blue annealed, 2.65c., Seattle.

St. Louis

Pig Iron Sales 6500 Tons—Heavy Melting Steel Up 50c.

ST. LOUIS, April 24.—Sales of pig iron continue large. The market is firm, and melters seem to feel that if there is any change in prices, which have remained stationary since last October, it will be upward. The St. Louis Gas & Coke Corporation sold about 5000 tons during the last week, including 2000 tons to a car manufacturer, 500 tons to a St. Louis melter and 350 tons to an elevator manufacturer. The leading Southern maker sold 1500 tons, of which 500 tons was the largest order, for April, May and June delivery. Business for third quarter is being taken at prevailing prices. A heating appliance manufacturer is in the market for a round tonnage.

Prices per gross ton at St. Louis:

No. 2 fdy., sil. 1.75 to 2.25 f.o.b. Granite City, Ill.	$19.50 to $20.00
Northern No. 2 fdy., delivered St. Louis	20.66
Southern No. 2 fdy., delivered	20.42
Northern malleable, delivered	20.66
Northern basic, delivered	20.66

Freight rates: 81c. from Granite City to St. Louis; $2.16 from Chicago; $4.42 from Birmingham.

Finished Iron and Steel.—Western mills are being crowded by railroads for deliveries of track accessories, and specifications for rails are heavier than mill capacities. However, new business from the railroads is light. Warehouse business is showing some improvement, the volume being about 10 per cent ahead of this period last year, buying in the St. Louis industrial district compensating for decreases in other sections of the trade territory. Business with structural fabricators is extremely light.

Warehouse Prices, f.o.b. St. Louis

	Base per Lb.
Plates and structural shapes	3.25c.
Bars, soft steel or iron	3.15c.
Cold-finished rounds, shafting and screw stock	3.75c.
Black sheets (No. 24)	4.45c.
Galvanized sheets (No. 24)	5.25c.
Blue annealed sheets (No. 10)	3.60c.
Black corrugated sheets (No. 24)	4.50c.
Galvanized corrugated sheets	5.30c.
Structural rivets	3.75c.
Boiler rivets	3.75c.
	Per Cent Off List
Tank rivets, $\frac{7}{16}$-in. and smaller, 100 lb. or more	70
Less than 100 lb.	65
Machine bolts	60
Carriage bolts	60
Lag screws	60
Hot-pressed nuts, squares, blank or tapped, 200 lb. or more	60
Less than 200 lb.	50
Hot-pressed nuts, hexagons, blank or tapped, 200 lb. or more	60
Less than 200 lb.	50

Old Material.—An East Side mill bought a large tonnage of heavy melting and heavy shoveling steel, the first purchase of consequence in several months. The business was distributed among several dealers, who immediately advanced their prices on these items 50c. a ton to stimulate shipments from the country. Otherwise, the old material market is virtually dead, with prices unchanged. Railroad lists include: Chicago & Alton, 1250 tons; Mobile & Ohio, 38 carloads; Missouri Pacific, 30 carloads, and Frisco Lines, 4 carloads.

Prices per gross ton, f.o.b. dealers' yards and delivered St. Louis district consumers' works:

Heavy melting steel	$11.25 to $11.75
No. 1 locomotive tires	12.00 to 12.50
Heavy shoveling steel	11.25 to 11.75
Miscellaneous standard-section rails, including frogs, switches and guards, cut apart	12.00 to 12.50
Railroad springs	13.00 to 13.50
Bundled sheets	8.75 to 9.25
No. 2 railroad wrought	10.75 to 11.25
No. 1 busheling	9.50 to 10.00
Cast iron borings	8.75 to 9.25
Iron rails	13.00 to 13.50
Rails for rolling	12.75 to 13.25
Machine shop turnings	6.50 to 7.00
Steel car axles	17.50 to 18.00
Iron car axles	23.50 to 24.00
Wrought iron bars and transoms	21.00 to 21.50
No. 1 railroad wrought	10.00 to 10.50
Steel rails, less than 3 ft.	15.00 to 15.50
Steel angle bars	11.50 to 12.00
Cast iron carwheels	13.00 to 13.50
No. 1 machinery cast	13.00 to 13.50
Railroad malleable	10.75 to 11.25
No. 1 railroad cast	13.00 to 13.50
Stove plate	12.50 to 13.00
Agricultural malleable	12.00 to 12.50

Relaying rails, 70 lb. and over	26.50 to 29.00

Boston

Further Cut in Pig Iron Freight Rates in Effect Next Month

BOSTON, April 24.—Effective May 8, the Boston & Albany Railroad will reduce freight rates on pig iron from Troy, N. Y., to competitive New England points on the New York, New Haven & Hartford Railroad in amounts ranging from 41c. to $1.13 per ton. The new rates will give the Troy furnace a further advantage over the Buffalo district. Under the new rates, Troy iron can be landed at Providence, R. I., for $3.05 a ton, contrasted with the present rate of $3.66, while Buffalo district iron delivered there by barge carries a rate of $3.78. The new rate from Troy to Florence, Mass., will be $1.13 a ton less than now. No move has been made by the railroads to permit the Mystic Iron Works to meet the new Buffalo barge and Boston & Albany rail rates, but it is intimated something is in prospect. It is apparent that New England foundries are to enjoy lower freight rates than they have had in years. The Mystic Iron Works in the last week sold 2500 tons of iron, all but 350 tons for New England delivery in third quarter. Other stacks did much less, yet aggregate sales of higher priced irons such as Alabama and western Pennsylvania and Susquehanna were quite satisfactory. Such irons were bought for mixture purposes. Buffalo district iron is still available at $16 to $16.50 a ton, base furnace, via all-rail shipment, and competitive irons figure on practically the same delivered basis. No open inquiries of importance are reported, but there is quiet sounding out the market for third quarter delivery, particularly by some of the largest Connecticut foundries, and one large tonnage probably will be placed within a fortnight.

Prices of foundry iron per gross ton, delivered to most New England points:

Buffalo, sil. 1.75 to 2.25	$20.91 to $21.91
Buffalo, sil. 2.25 to 2.75	21.41 to 22.41
East. Penn., sil. 1.75 to 2.25	23.15 to 23.65
East. Penn., sil. 2.25 to 2.75	23.65 to 24.15
Virginia, sil. 1.75 to 2.25	25.71
Virginia, sil. 2.25 to 2.75	26.21
Alabama, sil. 1.75 to 2.25	22.91 to 24.77
Alabama, sil. 2.25 to 2.75	23.41 to 25.27

Freight rates: $4.91 from Buffalo, $3.65 from eastern Pennsylvania, $5.21 all rail from Virginia, $6.91 to $8.77 from Alabama.

Coke.—The upward swing in by-product foundry coke consumption apparently has been checked, New England oven records show. Consumption by so-called specialty foundries is about normal, but by jobbing foundries as a whole is below normal.

Cast Iron Pipe.—Middleboro, Vt., has placed with a local contractor a two mile, 12-in. pipe line. The contractor, according to report, will be permitted to use sand spun pipe, which R. D. Wood & Co. will supply. Bids close May 8 for a two mile, 10-in. pipe line at Bloomfield, Conn. Chicopee, Mass., has placed privately 5400 ft. of pipe. East Bridgewater, Mass., will close bids April 30 on 100 tons of 6-in. pipe. Salem, Mass., closed bids April 24 on 100 tons of 6 and 8-in. pipe. The market for 4-in. pipe appears steady at $44.10 a ton, delivered common Boston freight rate points, and 6 to 12-in. at $39.10, but quotations on larger pipe are being shaded. The usual $5 differential is asked on class A and gas pipe.

Importations.—Receipts of foreign pig iron during the first half of April amounted to 809 tons—110 tons of Dutch iron and 699 tons of Indian. In the first half of March, importations were 119 tons, while in the first half of April, last year, they were 110 tons. Imports of ore in the first half of April were 14,218 tons.

Warehouse Business.—The number of orders passing through warehouses each day is increasing gradually, and individual orders call for larger amounts of material. An improvement in the small ironworking industry has materially helped warehouse sales. Prices are generally firm. Warehouses show a tendency to reduce stocks.

Reinforcing Material.—The American Steel & Wire Co. has sold 1000 tons of mesh and the Concrete Steel Co. 300 tons for road work in Connecticut at $80 a ton. An additional 400 tons will be placed shortly. New Hampshire will soon place 300 tons. Concrete bar sales continue in 5 to 50-ton lots. Competition is keen and prices irregular. The out-of-stock price of 2.90c. per lb., base, is only occasionally obtained. As low as 2.50c. was quoted in the past week.

Old Material.—Activity centers largely in No. 2 melting steel, scrap rails and textile machinery cast. Most of the steel is for Weirton, W. Va., and Boston dock delivery, the latter at $7.50 to $7.75 a ton on dock. A boat will load 5000 tons of steel and scrap rails May 26 for Danzig, and in June another boat will take an equal tonnage, bringing 1928 exports to that port to 15,000 tons. Textile cast is being delivered in Pennsylvania at $14 to $14.50 a ton, for which dealers pay $11 to $11.50 on cars shipping point. Quite a tonnage of No. 2 machinery cast was sold at $10 a ton on cars shipping point last week for Pennsylvania delivery, while the Mystic Iron Works continues to purchase sheared pipe and stove plate at $10 a ton, delivered. No. 1 machinery cast is in limited supply and somewhat better demand from New England foundries.

Buying prices per gross ton f.o.b. Boston rate shipping points:

No. 1 heavy melting steel	$9.25 to $9.50
Scrap T rails	8.50 to 9.00
Scrap girder rails	7.50 to 8.00
No. 1 railroad wrought	10.00 to 10.25
No. 1 yard wrought	7.50 to 8.00
Machine shop turnings	5.50 to 5.75
Cast iron borings (steel works and rolling mill)	6.00 to 6.25
Bundled skeleton, long	5.75 to 6.25
Forge flashings	6.60 to 7.25
Blast furnace borings and turnings	5.75 to 6.25
Forge scrap	6.00 to 6.50
Shafting	13.00 to 13.50
Steel car axles	15.50 to 16.00
Wrought pipe (1 in. in diameter, over 2 ft. long)	7.50 to 8.00
Rails for rolling	10.00 to 10.25
Cast iron borings, chemical	9.50 to 10.00

Prices per gross ton delivered consumers' yards:

Textile cast	$13.50 to $14.00
No. 1 machinery cast	15.00 to 15.50
No. 2 machinery cast	13.00 to 13.50
Stove plate	10.00 to 10.50
Railroad malleable	13.00 to 13.50

Detroit

High Production Continues in Michigan Automobile Plants

DETROIT, April 24.—Increases in production in the automotive industry characterize the situation in this area. The General Motors Corporation broke records in March in dealer sales and consumer sales, the former 197,821 cars against 161,910 for March, 1927. March sales to consumers totaled 183,706 units, compared with 146,275 for March, 1927.

The Reo Motor Car Co. is running at the highest rate in the company's history. Production on April 16 developed a new "high" of 285 units. Daily production at the present time is practically 300 units.

Production of the Ford Motor Co. is estimated at 50,000 units for the present month, with approximately 80,000 for the coming month.

The Hupp Motor Car Corporation made a record of 347 cars on April 16. For the first 16 days of the current month 4016 units were shipped, which is approximately the same as the entire April shipment for 1927. Present indications are that the March record of 8034 units will be exceeded this month.

The estimated production of the Paige-Detroit Motor Car Co. for the current month is 7600, practically on the same level as March, but greatly in advance of that of April, 1927, which was only 2838.

The Olds Motor Works reached a total of 9142 units in March, this figure being 800 units ahead of the month's schedule. April production will run approximately 10,500 units.

First quarter production for Cadillac and LaSalle of the General Motors group will run approximately 10,884 units. March shipments were 4526 units, surpassing the largest previous month in the company's history. Unfilled orders for this group of cars is running about 33 1-3 per cent above the high mark for 1927.

Production of the Willys-Overland Co. for the week of April 9 amounted to 7400 units. Although the Willys-Overland Co. had been operating on a 5½-day week, the entire organization now is working on a 6-day week with night shifts.

Pig iron shipments are going forward at a higher rate than last month and promise to about equal those of March, 1927, which was the highest shipping month of last year. There have been no changes in prices on scrap in this district during past two weeks.

Dealers' buying prices per gross ton, f.o.b. cars, Detroit:

Heavy melting and shoveling steel	$11.00 to $11.50
Borings and short turnings	7.25 to 7.75
Long turnings	6.75 to 7.25
No. 1 machinery cast	14.00 to 15.00
Automobile cast	19.50 to 21.00
Hydraulic compressed sheets	9.75 to 10.25
Stove plate	11.00 to 12.00
No. 1 busheling	8.50 to 9.00
Sheet clippings	6.00 to 7.00
Flashings	9.25 to 9.75

NON-FERROUS METAL MARKETS

Zinc, St. Louis	5.82½	5.80	5.77½	5.77½	5.75	5.75

*Refinery quotation; delivered price ¼c. higher.

NEW YORK, April 24.—There is no marked activity in any of the markets. Prices in most of them are holding firm. Demand for copper is exceedingly light and prices are unchanged. The tin market has been quite active, but demand for lead and zinc is only moderate. Zinc prices have been tending higher.

Copper.—Domestic consumers are buying almost no copper, and there has been hardly enough business to establish a market. Large producers are adhering firmly to 14.25c., delivered in the Connecticut Valley, but at least one custom smelter is now and then selling small lots as low as 14.17½c. to 14.20c., delivered. Sales for foreign consumption have been fairly good the past week, estimated at over 1000 tons a day. Just when another buying movement will start is uncertain. Some expect it shortly and others feel that it may be several weeks. Much depends upon the extent to which domestic as well as foreign buyers are covered, as well as upon the rate of consumption, which at present is exceedingly heavy. Mills are being pushed very hard for deliveries. Lake copper is only moderately active, but steady at 14.25c., delivered.

Tin.—About 1600 tons changed hands the past week, most of it in trading among dealers. Interest centers in May-June delivery, with little business being done in forward positions. Yesterday about 300 tons changed hands, consumers taking a small portion, and today the market was quiet, with spot Straits tin quoted at 52.62½c. New York. Prices in London today are a little lower than a week ago, with spot standard quoted at £233 10s., future standard at £233 7s. 6d. and spot Straits at £238 10s. per ton. The Singapore price today was £235 5s. Arrivals thus far this month have been 5910 tons and 6045 tons are reported afloat. The amount of tin in sight for May, with probable stocks, indicates that supplies are none too large. Because this is the most active consuming period, some feel that a stringency in supplies may develop in May and perhaps in June, particularly if consumers come into the market. They will have received in March and April about 15,000 tons. The volume of shipments from the Straits and other sources will also affect the June position.

Lead.—Moderate activity pervades the market, principally for prompt and May delivery. Thus far there is very little interest in June, and producers are not quoting freely for that position. Prices are firm and unchanged, that of the leading interest still being 6.10c., New York, as its contract price. In the outside market the metal is selling at 6c., St. Louis, with now and then a few sales as low as 5.97½c.

Zinc.—Prices for prime Western zinc are gradually working higher, and today quotations are firm at 5.82½c., St. Louis, or 6.17½c., New York. Inquiry is a little better this week, but consumer buying has been by no means large. Higher prices in London and the sentimental effect of the possible formation of a zinc cartel among foreign countries to regulate production are producing a better tone. The ore situation at Joplin is also believed to be clearing up and sales there are continuing at $38, whereas $40 had been predicted as the minimum. Production of ore last week was about 10,000 tons and sales amounted to about the same.

Nickel.—Quotations are unchanged at 35c. for wholesale lots of ingot nickel, at 36c. for shot nickel, and at 37c. per lb. for electrolytic nickel.

Antimony.—This market is quiet, with Chinese metal for all positions quoted at 10c. to 10.25c. per lb., New York, duty paid.

Metals from New York Warehouse

Delivered Prices Per Lb.

Tin, Straits pig	54.00c. to 55.00c.
Tin, bar	56.50c. to 57.50c.

High brass	19.25c.
Copper in Rolls	22.00c.
Brazed Brass Tubing	26.75c.

Aluminum Products in Ton Lots

The carload freight rate is allowed to destinations east of Mississippi River and also allowed to St. Louis on shipments to destinations west of that river.

Sheets, 0 to 10 gage, 3 to 30 in. wide	33.00c.
Tubes, base	42.00c.
Machine rods	34.00c.

Rolled Metals, f.o.b. Chicago Warehouse

(Prices Cover Trucking to Consumers' Doors in City Limits)

	Base per Lb.
Sheets—	
High brass	18.75c.
Copper, hot rolled	22.75c.
Copper, cold rolled, 14 oz. and heavier	25.00c.
Zinc	10.00c.
Lead, wide	9.75c.
Seamless Tubes—	
Brass	25.12½c.
Copper	26.00c.
Brazed Brass Tubes	26.75c.
Brass Rods	16.50c.

Aluminum.—Virgin metal, 98 to 99 per cent pure, is quoted at 23.90c. per lb., delivered.

Non-Ferrous Metals at Chicago

Chicago, April 24.—Sales are more numerous and represent a fair volume of business for the week. Prices are stronger, with advances in tin and zinc. The old metal market is moderately active.

Prices, per lb., in carload lots: Lake copper, 14.25c.; tin, 55c.; lead, 6.15c.; zinc, 6c.; in less-than-carload lots, antimony, 11.50c. On old metals we quote copper wire, crucible shapes and copper clips, 10.50c.; copper bottoms, 9.50c.; red brass, 9.25c.; yellow brass, 7c.; lead pipe, 4.75c.; zinc, 3.25c.; pewter, No. 1, 30c.; tin foil, 36c.; block tin, 45c.; aluminum, 11.75c.; all being dealers' prices for less-than-carload lots.

REINFORCING STEEL

New Projects Will Take 5500 Tons—Awards of 4300 Tons

Awards of concrete reinforcing bars, as reported to The Iron Age during the week amounted to only 4300 tons, the largest being 800 tons for a hospital at Toledo, Ohio. New projects totaled 5500 tons and included 1500 tons for a furniture building at Boston. Awards follow:

White Plains, N. Y., 250 tons, Westchester County building, to Carroll-McCreary Co., Inc.

Brooklyn, 200 tons, telephone building on Avenue U, to Carroll-McCreary Co., Inc.

Buffalo, 180 tons, addition to plant of Trico Products, Inc., to a local maker.

Rochester, N. Y., 170 tons, Auto Inns, Inc., garage, to a Buffalo maker.

Brownsville, Pa., 150 tons, passenger station for Monongahela Railroad, to Fort Pitt Bridge Works.

Wilkinsburg, Pa., 120 tons, telephone exchange, to Carlen Engineering Co.

Pittsburgh, Pa., 220 tons, Koppers Building, to McClintic-Marshall Co.

Davidson, N. C., 120 tons, Davidson College, to Connors Steel Co., Birmingham.

Toledo, Ohio, 800 tons, State hospital, to Pollak Steel Co.

Toledo, 220 tons, Central Catholic High School, to Pollak Steel Co.

Chicago, 130 tons of rail steel bars, hospital at Ashland Avenue and Maypole Street, to Inland Steel Co.

Chicago, 100 tons, building for Peoples Gas, Light & Coke Co., to Concrete Engineering Co.

Chicago, 170 tons, building for the Bassick Mfg. Co., to Barton Spiderweb System.

Chicago, 185 tons of rail steel bars, garage on Greenview Avenue, to Calumet Steel Co.

State of Illinois, 100 tons of rail steel bars, road work, to Calumet Steel Co.

Milwaukee, 290 tons, Safety Building, to Concrete Steel Co.

St. Joseph, Mo., 361 tons, bridge across Missouri River, to Missouri Valley Bridge & Iron Co.

Olympia, Wash., 100 tons, paving State road No. 1, Whatcom County, to Northwest Steel Rolling Mills.

New Westminster, B. C., 100 tons, grain elevator, to Northwest Steel Rolling Mills.

Richmond, Cal., 100 tons, store for Santa Fe railroad, to Gunn, Carle & Co.

San Francisco, 100 tons, Taylor School, to Pacific Coast Steel Co.

Reinforcing Bars Pending

Inquiries for reinforcing steel bars include the following:

State of Vermont, 1000 tons, Lake Champlain bridge.

Boston, 1500 tons, furniture building.

Boston, 100 tons, Faulkner Hospital, Jamaica Plain district.

Charleston, S. C., 500 tons, Cooper River bridge; Foundation Co., general contractor on parts requiring bars.

Chicago, 900 tons, Crawford Avenue bridge approach for Sanitary District trustees.

Chicago, 150 tons, Zoological Gardens.

Chicago, 150 tons, building for General Tire & Rubber Co.

Chicago, tonnage not stated, garage at State and Eleventh Streets; Fox & Fox, architects.

Chicago, 100 tons, building for Crane Co.

Chicago, 500 tons, 18-story apartment building; Levy & Klein, architects.

State of Illinois, 200 tons of rail steel, road work, to Calumet Steel Co.

St. Louis, 600 tons; apartment building in Webster Groves, 250 tons; apartment building at 4630 Lindell Boulevard, 250 tons, and factory building for Waxite Paper Co., 100 tons.

Old Metals, Per Lb., New York

The buying prices represent what large dealers are paying for miscellaneous lots from the smaller accumulators and the selling prices are those charged consumers after the metal has been properly prepared for their uses.

	Dealers' Buying Prices	Dealers' Selling Prices
Copper, heavy crucible	12.00c.	13.50c.
Copper, heavy and wire	11.75c.	12.875c.
Copper, light and bottoms	10.00c.	11.25c.
Brass, heavy	7.00c.	8.50c.
Brass, light	6.00c.	7.50c.
Heavy machine composition	9.50c.	10.625c.
No. 1 yellow brass turnings	7.75c.	9.00c.
No. 1 red brass or composition turnings	8.75c.	9.75c.
Lead, heavy	5.00c.	5.50c.
Lead, tea	4.00c.	4.50c.
Zinc	3.00c.	3.50c.
Sheet aluminum	12.50c.	14.50c.
Cast aluminum	12.50c.	14.00c.

RAILROAD EQUIPMENT

Inquiries for 86 Locomotives and Purchases of 31—Large Passenger Car Orders

Purchase of 20 locomotives by the Texas & Pacific and inquiries for 25 for the Canadian Pacific, 35 for the Erie and 25 electric locomotives for the Cleveland Union Terminals Co. have featured the railroad equipment market this week. Orders were also placed for 120 passenger train cars by the New York Central and 100 sleeping cars by the Pullman Co. The Erie is soon expected to enter the market for 1000 box cars. Details of the week's business follow:

New York Central has placed orders for 120 passenger cars, distributed as follows: 14 passenger, six dining and five horse cars with Pullman Car & Mfg. Corporation; five passenger coaches with Pressed Steel Car Co.; 20 baggage and 14 horse cars with American Car & Foundry Co.; 10 multiple-unit, 10 baggage, three baggage and mail and three passenger and baggage coaches with Standard Steel Car Co., and 30 milk cars with Merchants' Dispatch, Inc.

Illinois Central has ordered 10 motor-passenger cars and 10 trailers for suburban service from Pullman Car & Mfg. Corporation.

Chicago, Rock Island & Pacific is in the market for five horse express cars.

Cudahy Packing Co. has purchased 100 steel underframes for refrigerator cars from Pullman Car & Mfg. Corporation.

Pacific Fruit Express has placed 400 steel underframes for refrigerator cars with Pacific Car & Foundry Co.

Erie Railroad is inquiring for 35 2-8-2-type locomotives and is soon expected to enter the market for 1000 steel box cars, five oil cars and 25 coaches.

Chicago, Milwaukee, St. Paul & Pacific is inquiring for five flat cars.

Barrett Co. has made inquiry for 100 10,000-gal. insulated tank cars.

Canadian Pacific is inquiring for 25 Mikado-type locomotives.

Southern Pacific has ordered three Pacific-type locomotives from Baldwin Locomotive Works.

Texas & Pacific has ordered five Mountain-type locomotives from Baldwin Locomotive Works and 15 2-10-4-type from Lima Locomotive Works, Inc.

Chicago, St. Paul, Minneapolis & Omaha has ordered eight switching locomotives from Baldwin Locomotive Works.

Southern Pacific has ordered 250 automobile cars from Tennessee Coal, Iron & Railroad Co. and 175 tank cars from General American Tank Car Co.

North American Car Corporation will buy 50 express refrigerator cars.

Pullman Co. has ordered 100 sleeping cars from Pullman Car & Mfg. Corporation.

Dominion Coal Co. will buy one locomotive.

Cleveland Union Terminals Co. is in the market for 25 150-ton electric locomotives.

PERSONAL

Robert M. Keeney, for the past five years general superintendent Pittsburgh Crucible Steel Co., Pittsburgh, has been elected president, succeeding F. B. Hufnagel, who since his election as president of the Crucible Steel Co. of America two years ago, has held both offices. Mr. Keeney brings to his new office an experience of more than 20 years in operating capacities. He prepared for college at Phillips Academy, Exeter, Mass., and was graduated from Cornell University in 1907. He entered the employ of the Illinois Steel Co. in its South Chicago open-hearth department in the fall of the same year, and later, following a connection of about a year with the New York State Steel Co., Buffalo, now the Donner Steel Co., he went with the Jones & Laughlin Steel Corporation at its Aliquippa works. He was with this company from 1913 until 1917, when he resigned to become assistant general superintendent Whitaker-Glessner Co., Portsmouth, Ohio. He was next general superintendent of the Central Iron & Steel Co., Harrisburg, Pa. He joined the Pittsburgh Crucible company on Jan. 1, 1923, and for the past two years has been vice-president and a director. He also has been elected a vice-president of the parent company. A. L. Sonnhalter, assistant general superintendent, has been appointed general superintendent. He has been identified with the company since October, 1922, and received his college education at Notre Dame and Ohio State Universities. W. W. Williams, for the past five years general manager of sales, Pittsburgh Crucible company, has been elected vice-president.

—

Eugene G. Grace, president Bethlehem Steel Corporation, entertained at the Metropolitan Club, New York, April 18, in his capacity as president of the board of trustees of Lehigh University, fellow trustees and alumni of the university.

—

J. H. Edmonds has been appointed general manager of the Lebanon, Pa., plant of the Bethlehem Steel Corporation, succeeding the late John Penn Brock. Mr. Edmonds was assistant general manager, and he is succeeded in that position by J. A. Kinney.

—

W. H. Post, for several years in the Cleveland district sales office of the Timken Roller Bearing Co., Canton, Ohio, has been appointed manager of the company's Pittsburgh branch sales office.

—

J. H. James has been appointed purchasing agent of the Pittsburgh & Lake Erie and Lake Erie & Eastern railroads, succeeding C. M. Yohe, who was recently made assistant to the president of the New York Central Lines, with headquarters at Pittsburgh.

—

Joseph T. Ryerson, president Joseph T. Ryerson & Son, Inc., Chicago, has been elected president of the Industrial Club in that city.

—

B. J. Minnier, formerly resident manager at Watertown, N. Y., of the New York Air Brake Co., is now serving as general manager of the Orange, Mass., plant of the Home Sewing Machine Co. William T. Kennedy, who was also formerly with the Air Brake company, has become associated with the Sewing Machine company, as assistant superintendent of its foundry department.

—

S. S. French, manager of the Berger division, Central Alloy Steel Corporation, Massillon, Ohio, has been elected a director of that company to succeed C. E. Stuart, who resigned the presidency last year.

—

Leon R. German has been elected president of the Peerless Motor Car Corporation, Cleveland. He had been vice-president and general manager.

—

Eric Zachau, for several years works manager of the Shaw Crane division of the Shaw Crane-Putnam Machine Co., Muskegon Heights, Mich., a unit of Manning, Maxwell & Moore, Inc., New York, has been appointed to the newly created position of the general manager of the Shaw Crane division. In his new capacity Mr. Zachau will have general supervision of the entire Muskegon Heights plant. He has been succeeded as works manager by W. O. Williams.

—

John S. Oursler Succeeds I. L. Hughes as Vice-President of Carnegie Steel Co.

I. Lamont Hughes who, as announced in The Iron Age last week, has been elected vice-president of the United States Steel Corporation with supervision over manufacturing operations of iron and steel making subsidiary companies, has been associated with the Carnegie Steel Co. for 30 years, most recently as vice-president in charge of Youngstown district and Ohio Valley plants of the company. Following graduation from high school at North Braddock, Pa., in 1894, he was employed by the Edgar Thomson works of the Carnegie company, remaining in that plant until 1901, when he was placed in charge of the engineering department of the Union Steel Co., Donora, Pa. In 1905 he went to Youngstown as master mechanic in the bar mills of the Carnegie company and was subsequently advanced to assistant superintendent and later to superintendent of bar mills. In 1916 he was made assistant general superintendent of the entire Youngstown district. In June of that year he went to Ojibway, Ont., as general superintendent in charge of the Steel Corporation's Canadian steel plant project. In 1918 he was transferred to the office of general superintendent in charge of operations being carried on at Neville Island in the construction of an ordnance plant. When this project was abandoned at the end of the war, Mr. Hughes was made president of the Lorain Steel Co., Johnstown, Pa., and on Jan. 1, 1920, he was made general superintendent of all operations of the Carnegie Steel Co. in the Youngstown district. He later was promoted to vice-president in charge of Youngstown district and Ohio Valley plants of the company. He will remain a director of the Carnegie company.

I. L. HUGHES

John S. Oursler, who has been appointed vice-president of the Carnegie company to succeed Mr. Hughes, has been general superintendent of the Homestead works since the abandonment by the Government of the project to construct an ordnance plant at Neville Island during the war, and since that time has carried through a large reconstruction program covering a period of nearly five years. He was born at Wheatland, Pa., March 3, 1868, was first employed by the Spearman Iron Co., Sharpsville, Pa. Soon afterward he went to the Carnegie company as a foreman at Edith furnace, North Side, Pittsburgh. Successively he became superintendent Mingo furnaces, Mingo Junction, Ohio; superintendent Ohio works furnaces, Youngstown; superintendent New Castle furnaces, New Castle, Pa.; assistant general superintendent New Castle works; general superintendent New Castle works, and general superintendent New Castle district, which included works at Farrell and Sharon, Pa. He held this position until 1918, when he was selected to supervise the building of the Neville Island ordnance plant.

Ralph H. Watson, assistant general superintendent at Homestead, succeeds Mr. Oursler as general superintendent. He went to the Carnegie Steel Co. as a metallurgist's assistant in March, 1902, and has been successively metallurgist, second assistant general superintendent, superintendent of the open-hearth furnaces, and assistant general superintendent, Homestead works. He was born Jan. 7, 1878, at Harvey, New Brunswick, and attended the public schools there. He later removed to Massachusetts where he was graduated from the Lawrence Scientific School, Harvard University. He was first employed in the Bessemer department at the Sparrows Point, Md., plant of the Maryland Steel Co.

J. S. OURSLER

R. H. WATSON

Ernest L. Becker, formerly advertising manager for the Andrews Steel Co. and the Newport Rolling Mill Co., Newport, Ky., is now associated with the H. W. Roos Co., Inc., 2036 Dana Avenue, Cincinnati, manufacturer of adjustable building props, as assistant to H. W. Roos, president of the company.

Duncan P. Forbes, secretary of Ramey-Bassett & Co., Rockford, Ill., is president of the Gunite Corporation, Rockford, recently organized to succeed the Gunite division of the Rockford Malleable Iron Works and manufacture a special gun iron alloy for use in machine parts, locomotive wearing parts and certain automotive purposes. John A. Forbes is secretary and treasurer of the new company.

W. G. Owen, recently sales manager of the Haws Refractories Co., Johnstown, Pa., has joined the sales organization of the General Refractories Co., Philadelphia, and will have charge of the Philadelphia territory. He succeeds L. Tschirky, who will devote his time to general sales promotion work and sales development of the company's specialty products.

Dr. Charles R. Gow, consulting engineer, Boston, has been appointed to a chair of humanics at the Massachusetts Institute of Technology, Cambridge, which has recently been founded by William E. Nickerson, vice-president Gillette Safety Razor Co. The course which will be offered for the first time next fall is designed to give systematic preparation for meeting problems of human relationship in business and industry.

Marcus Chase, sales manager of the Niles-Bement-Pond Co. of New England and for 17 years in charge of the company's Boston office, has retired from active service and will be succeeded by M. S. Bradley, who has been assistant to Mr. Chase for nearly 15 years. Mr. Chase has been continuously associated with the Niles company for 29 years.

T. C. Sternblad has been made vice-president and general manager of Henry Pels & Co., New York, representative in the United States for the German company of the same name which manufactures punching and shearing machines, presses, etc. Henry Pels, who has been elected president of the New York company, will remain in the Berlin office.

W. G. Abel, associated for 20 years with the Bruce MacBeth Engine Co., Cleveland, has joined the engineering department of the Texas Nail & Wire Mfg. Co., Galveston, Tex., and will serve as master mechanic.

A. W. Schneider, works manager, and P. W. McIntyre, vice-president of the Reed-Prentice Corporation, Worcester, Mass., have been elected directors of that company.

Kenneth Grant, formerly identified with the Machinists Supply Co., Chicago, has joined the sales organization of the Foote Brothers Gear & Machine Co., Chicago. His territory will include southern Wisconsin, northern Illinois and eastern Iowa, with headquarters at present at the company's general offices in Chicago.

Dennis A. Merriman, who last January was made general manager of sales and a director of the American Steel & Wire Co., Chicago, has been elected vice-president of the company, continuing as general manager of sales.

Eugene A. Weaver, for several years associated with the Surface Combustion Co., Toledo, Ohio, has been appointed Boston district manager of the company, succeeding L. B. Crossman, who has become identified with the Boston Consolidated Gas Co., in charge of industrial and other commercial activities.

Elmer T. McCleary New Republic Head —Harry T. Gilbert Made Vice-President

Elmer T. McCleary, who has been elected president of the Republic Iron & Steel Co., Youngstown, succeeding Thomas J. Bray, has been associated with the Youngstown Sheet & Tube Co. for 22 years, most recently as vice-president in charge of operations. Born of a family of iron makers at Pine Grove Furnace, Cumberland County, Pa., he attended the public schools of Harrisburg and Pennsylvania State College, having been graduated as a metallurgist from the latter institution in 1901. He began his career with the Diamond State Steel Co., Wilmington, Del., but later went to Youngstown as metallurgist at the Ohio works, Carnegie Steel Co. In 1906 when the Youngstown Sheet & Tube Co. began to build its blast furnaces and steel plant he went with the company as chief chemist. He later became superintendent of blast furnaces, superintendent of the steel department, assistant general superintendent, and in 1923 when the Sheet & Tube company acquired the Steel & Tube Co. of America and

E. T. MC CLEARY

H. T. GILBERT

the Brier Hill Steel Co., he was appointed district manager of the Youngstown district properties. He became assistant vice-president in 1924 and vice-president in January, 1926.

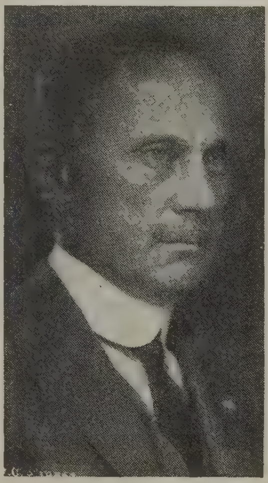
With W. C. Reilly, senior vice-president in charge of operations for the Youngstown company, Mr. McCleary managed the properties of the company during the war and was one of a committee of three named by the Government to determine steel requirements in the shell section of the ordnance department. He took an active part in the merging of the properties of the enlarged Sheet & Tube company in 1923, which experience will be particularly valuable in the consolidation of the Republic and Trumbull properties.

Harry T. Gilbert, new vice-president in charge of sales for the Republic company, comes from the Sharon Steel Hoop Co., Sharon, Pa., with which he has been identified since 1906. For two years he was manager of sales with headquarters at Sharon, and for the next 11 years Chicago district manager of sales. He then returned to Sharon to become executive vice-president of the company, the position he relinquishes to take up his new duties. Mr. Gilbert's connection with the iron and steel industry goes back to 1894 when, following a brief connection with the Denver offices of the Denver & Rio Grande Railroad, he entered the employ of W. W. Bierce & Co., at that time New Orleans representatives of the Illinois Steel Co. He remained with that firm for 10 years, and for about a year before joining the Sharon company was one of the firm of Foust & Gilbert, Birmingham, which did a brokerage business in pig iron, coke and steel.

John U. Anderson, who has been secretary and treasurer of the Trumbull Steel Co., has been elected treasurer of the Republic company, and John T. Harrington, president of the Trumbull company, and Messrs. McCleary and Gilbert have been made members of the board of directors. John A. Topping, chairman, and H. L. Rownd, vice-president, have been reelected.

A new executive committee has been appointed consisting of Messrs. Topping and McCleary, Harry W. Croft, George M. Humphrey and Cyrus S. Eaton.

OBITUARY



G. W. NIEDRINGHAUS

George W. Niedringhaus, chairman of the board of the National Enameling & Stamping Co., Granite City, Ill., and for many years prominent in the industrial development of the St. Louis district, died suddenly at his home in the latter city on April 19. He was born at St. Louis, May 28, 1864, and attended Smith Academy, now a part of Washington University, St. Louis, and the Williston, Mass., Seminary. When 19 years of age he became associated with his father and uncle, William F. and Frederick G. Neidringhaus, in the St. Louis Stamping Co. which they had founded in 1857 to manufacture tin and sheet steel and which had been incorporated in 1866. The plant was removed to Granite City a few years later, the town having derived its name from the granite ware in which the company was specializing at that time. The company later became the National Enameling & Stamping Co. and George W. Neidringhaus had been active in its management until his death. He was also one of the founders of the Commonwealth Steel Co., the American Steel Foundries, and the St. Louis Coke & Chemical Co., all of which have plants at Granite City. At the time of his death he was also chairman of the Granite City Steel Co., recently established steel making subsidiary of the Enameling & Stamping Co.; chairman of the Granite City National Bank; president of the W. F. Neidringhaus Investment Co., a trust estate created by his father; president of the St. Louis & Eastern Belt Line Railroad; president of the Granite City Gas Light & Fuel Co., and a director of the Missouri Pacific Railroad. A son, Hayward, is general manager of the National Enameling & Stamping Co.

William Robert Quinn, Pacific Coast representative of the Combustion Engineering Corporation, New York, died suddenly at the Hotel Manger, New York, on April 12. He was president of the Quinn Oil Burner & Torch Co. until that organization was purchased by the Combination Engineering Corporation in 1922, when he became manager of the fuel oil burning department of the latter company.

James J. Wood, since 1885 consulting engineer for the Thomson-Houston Electric Co., West Lynn, Mass., and the General Electric Co., died on April 20 at Asheville, N. C., where he had gone to recuperate from a recent illness. He was born in Ireland and came to this country with his family when 11 years of age, settling in Brooklyn. He was graduated from the Brooklyn Polytechnic Institute in 1878 and before becoming associated with the Thomson-Houston company he was superintendent and chief engineer of the Brady Mfg. Co., Brooklyn, and a partner in the Fuller-Wood Co. He was prominent in the development of the series arc dynamo and was also active in the development of oil engines.

George P. Bullard, for many years prominently identified with New England steel interests, died suddenly at a Boston hotel on April 17. He was born at West Medway, Mass., June 25, 1857, and went to Boston at the age of 17, where he became a clerk in the hardware firm of A. J. Wilkinson & Co. He then went with Bacon & Co., dealers in iron and steel, and was made a partner in 1886. Later he was New England representative of the Jones & Laughlin Steel Co. In 1891 he founded the Eastern Expanded Metal Co., and afterward the Eastern Concrete Construction Co., both of which companies later were merged with the Penn Metal Co., of which Mr. Bullard was president.

John Challoner, president-treasurer Wilkin-Challoner Co., Oshkosh, Wis., manufacturer of woodworking machinery and tools, died April 18, aged 72 years. The industry was established at Omro, Wis., in 1860 by his father, George Challoner, and was re-established in Oshkosh in 1887.

Charles W. Leavitt, until his retirement in 1904 head of C. W. Leavitt & Co., 30 Church Street, New York, importers and selling agents of ore, metals and alloys, died on April 22 at his home, Meadow Farm, Hartsdale, N. Y., aged 57 years. He had been associated with his father in the founding of the firm bearing their name.

Leon T. Buckwalter, purchasing agent at the Camden, N. J., plant of the American Brown Boveri Electric Corporation, died on April 20 at his home at Merchantsville, N. J., aged 44 years.

John M. Glenn, for 30 years secretary of the Illinois Manufacturers' Association, died April 22, at Hot Springs, Ark.

Gear Manufacturers Make Second Visit to Rochester

(*Concluded from page* 1150)

son, engineer Fellows Gear Shaper Co., also contributed to the success of the occasion.

Doctor Kimball's address, which centered on decoration and proportion in machines and other manufactured goods, was well received. He talked from lantern slides, which pictured the three stages in the development of machines, these three stages being termed the stage of utility, the stage of decoration and the stage of beauty of purpose, the latter usually being entirely devoid of the decorative element. Many examples, some amusing, of machines and other products in all three stages, were shown.

Gear Makers Find Much of Interest at Gleason Works

THE entire afternoon of April 20 was devoted to visiting the plant of the Gleason Works, which was characterized by President Frost, in his opening address, as "one of the great industries connected with the gear makers' art." All departments of the works were open for inspection, and a large number availed themselves of the opportunity of seeing something of the equipment and efficient methods of this plant.

Luncheon was served to the visitors in the plant dining room, in which about 650 persons are accommodated at noon every day. Following luncheon, James E. Gleason, president of the company, in a brief address, called attention to some of the new developments in progress, and something of the object and status of them. Small prints showing the layout of all departments and the route through the plant were provided for each visitor, and a typewritten booklet, prepared for the occasion, described the features of particular interest en route. In addition, a guide was provided for each group of four or five visitors. This "engineering" of the sight-seeing tour, although unnoticed perhaps by most of the visitors, undoubtedly permitted seeing the plant in less time than otherwise, and with less than the usual expenditure of energy.

The Gleason plant covers 22 acres, and most of the 300,000 sq. ft. of floor space occupied is on the ground floor. This permits of excellent lighting conditions, which is one of several noteworthy features of this plant. The working force at present numbers more than 1000.

Among the equipment in the spur gear department, the first to be visited, was a machine for grinding the teeth in straight and spiral bevel gears. Much experimental work has been done on this process and while gears can be ground with accurate profile and bearing, it is said that they are not as quiet as finish cut lapped gears, the grinding process having no distinct commercial advantage as yet. Another machine of interest, for hobbing spiral bevel gears, is an experimental undertaking in line with the company's policy of trying out all possible methods for finishing bevel gears. Of note also was a multiple-spindle continuous spiral gear rougher arranged to produce at the rate of 1300 gears in 24 hr.

In the bevel gear cutting department, 12-in. bevel gear generators of new design were in operation. Features of these machines include quicker set-up, more rapid production, and decreased maintenance cost due to improved lubrication. One of these machines was equipped with an oversize spindle for pinions with large shanks. A special stock dividing gage is being designed and by means of this device stopping of the machine at a specific point will not be required.

Hypoid and spiral generators of 15-in. size are equipped with a new 3 to 1 ratio reverse, which is said to permit a saving of approximately 10 per cent in machine time over the previous reversing mechanism. The new device may be incorporated on machines now in service. The spiral gear roughers have variable feed cams which permit gears to be roughed considerably faster than with the previous type of cam that gives infeed at a constant rate.

Features of the heat-treating department include a hardening furnace of the conveyor type, and electric high-speed tool hardening furnaces of the pusher type. In the latter, which provides two stages of heat, the tools first run through the preheating stage, then through the high-heat stage, and finally are quenched. The tools drop into a tank of oil and the gas that forms passes up into the high-heat section of the furnace, forming a neutral atmosphere and protecting the tools from the air.

Spray painting and other finishing of machines built by the company were explained in detail and the equipment and methods used, and the care exercised, is a story in itself. The various machining departments were visited, as well as tool rooms, assembly and testing departments and the foundry. The large number of standard machine tools and other equipment of recent design, the extensive use of individual motor drive and the safeguarding of all machinery were impressive general features. That engineering of a high order was responsible for the general arrangement and methods of this plant was the impression carried away by visitors, and the inspection trip was obviously thoroughly enjoyed.

Machine Tool Dealers to Meet in May

The Associated Machine Tool Dealers will hold their annual spring meeting at Granville, Ohio, May 23 to 25, inclusive. The organization, which was established "for the promotion of better merchandising methods and closer cooperation with our manufacturer," has the following executive committee: President, J. R. Porter, Marshall & Huschart Machinery Co., Chicago; vice-president, Tyler W. Carlisle, Strong, Carlisle & Hammond Co. Cleveland; secretary E. P. Essley, E. L. Essley Machinery Co., Chicago; treasurer, George H. Cherrington, Brown & Zortman Machinery Co., Pittsburgh; and Charles T. Bush, Charles A. Strelinger Co., Detroit; G. E. Merryweather, Motch & Merryweather Machinery Co., Cleveland; W. F. McCarthy, Henry Prentiss & Co., New York; W. J. Radcliffe, E. A. Kinsey Co., Cincinnati; E. P. Ridings, Syracuse Supply Co., Syracuse; J. R. Vandyck, Vandyck-Churchill Co., New York; and J. W. Wright, Colcord-Wright Machinery & Supply Co., St. Louis.

Much Welding Used in New Yale Library

Fifteen miles of steel columns will be electrically welded to form the book stacks of the $7,000,000 Sterling Memorial Library being built at Yale University. The book tower will consist of 18 stories, a total of 130 ft. high, and will provide space for 4,000,000 books. Eighty thousand feet of steel columns will be needed to construct it.

Arc welding will be employed. The channels carrying the book shelves and the walkways are 5 in. deep.

G. D. Fish, Westinghouse Electric & Mfg. Co., is consulting engineer on welding.

Canadian Automobile Production Declines

March production of automobiles in Canada, as reported to the Department of Commerce by the Dominion Bureau of Statistics, totaled 7478 passenger cars and 2246 trucks, compared with 10,315 passenger cars and 2189 trucks in the previous month and 19,723 passenger cars and 3527 trucks in March, 1927.

Alphabetical and numerical lists of United States Government Master Specifications, as promulgated by the Federal Specifications Board up to Jan. 1, are covered in Circular 319 of the Bureau of Standards, which has just been issued. The pamphlet is of 20 pages and lists several hundred items.

ASK FOR WAGE INCREASES

Amalgamated Iron, Steel and Tin Workers Present New Scale to Mills

A DEMAND that will be made upon steel manufacturers operating under agreement with the Amalgamated Association of Iron, Steel and Tin Workers at the annual wage conference to be held next month, probably at Atlantic City, is a restoration in the 1928-29 tin mill scale of the preamble in the 1922-23 wage schedule. Since the 1923-24 scale year, tin mill crew wages have been based upon the actual average invoiced selling prices of Nos. 26, 27 and 28-gage plain sheet steel as disclosed in the bi-monthly examination of sales records of signatory companies. It is now proposed to base the tin mill crew wages on the price per 100 lb., f.o.b. mill, of coke tin plate prime sheets, starting with a base price of $3.50 per 100 lb.

The preamble to the present tin mill scale reads:

> It is agreed that when the actual average invoiced selling price of 26, 27 and 28-gage plain sheet steel f.o.b. mill is $2.15 per 100 lb., the tonnage rate shall be as below (wages per unit of 1000 lb. for each member of mill crew and according to gage) with 1½ per cent increase for each member of the crew for each 5c. per 100 lb. advance above the said $2.15 selling price and 1½ per cent decrease for each member of the crew for each 5c. per 100 lb. decline in the selling price to $1.80 selling price per 100 lb.

It is now proposed to go back to the 1922-23 preamble reading:

> It is agreed that when the actual average invoiced selling price of a box of 100 lb. of coke tin plate prime sheets is selling at $3.50 f.o.b. mill that the tonnage rate shall be as below (base wage scale) with 1 per cent increase for each member of the crew on each 5c. advance in the price per box and 1 per cent decrease on each 5c. decrease down to $3.20 selling price.

The last bi-monthly settlement disclosed an average price of $3 per 100 lb. for Nos. 26, 27 and 28-gage sheets and, on a basis of 1½ per cent for each 5c. per 100 lb. over $2.15, the scale for this period is 25½ per cent above the base wage rates, which incidentally are not vitally different from those in the 1922-23 scale. Comparing the present market quotation of $5.25 per base box for tin plate, and the proposed base of $3.50, there is a difference of $1.75, which divided by five would produce 35, which would be the percentage of the advance in wages over base. In short, the demand is for a 10 point increase in the wage scale.

Bar iron manufacturers are to be asked to sign a boiling scale calling for 25c. per gross ton advance for each card point (5c. per 100 lb.) advance from the base price, or $7 per gross ton on bar iron at 1c. per lb. The present scale calls for $7 per gross ton for boiling iron selling at 1c. per lb. and advances 22½c. per ton for each advance of 5c. per 100 lb. in the sales price to and including 1.40c. per lb. bar iron. From 1.45c. up, the present boiling rate advances 25c. per ton for each 5c. per 100 lb. in the sales price. The demand for $1.50 a ton extra for boiling in July, August and September, which was asked a year ago and refused, is repeated in the demands formulated at the recent convention at Middletown, Ohio, which also include a demand for 15 per cent increase in the busheling, knobbling and piling on boards scales, and a 10 per cent increase for muck or puddle mill, bar, 12-in. and guide mill, 10-in. hoop and cotton tie mill crew scales. There is also a demand for a guarantee of not less than $5 per day for roughers and catchers on bar and 12-in. mills and that crews be paid the same as millwrights while changing rolls. The pipe or skelp mill scale of the past year appears to be satisfactory to the men, who are asking no change.

Demands in connection with the sheet and jobbing mill scales generally are of minor character, but in the double mill-loose rolling scale the men want 10 per cent advance for working steel under 24 in., and 40 in. or more in width. Tin mill crews are not in favor of daylight saving time, as a resolution favoring United States Government standard time as the work time was passed and will be presented to the manufacturers. An increase of 10 per cent is asked for tin mill screw boys and pair heaters and an extra of 15 per cent for heaters, doublers and screw boys when iron is finished in 10 sheets under the 4-part system. Another demand is that catchers on 3-part system tin mills be given an increase of 5 per cent on all gages from No. 16 to No. 38. There is only one demand for change in the tin house scale, the catcher on combination terne oil finish plates to be paid $6.27 on large plates, instead of $5.83, and $7.04 on small plates, instead of $6.49. A number of other minor changes also are demanded.

To Install Coke-Handling System

A contract has been awarded by the Woodward Iron Co., Woodward, Ala., to the Semet-Solvay Engineering Corporation, New York, to construct a complete new Semet-Solvay coke-handling system, including wharf, screening and loading plant. The new equipment is planned to take care of the entire output of 230 ovens, estimated at up to 2500 tons of coke daily.

Run-of-oven coke will be discharged on an inclined coke wharf 160 ft. long. The coke will be delivered to a 42-in. belt conveyor and carried to grizzly screens of proper size for the production of furnace and foundry coke. A conveyor will deposit the coke in cars.

A by-pass at the screens will permit loading of run-of-oven coke direct, if desired. Shaking screens will handle the rejects from the furnace and foundry screens. Domestic and furnace sizes will be produced at this point and braize separated and sent to the boiler plant. It is planned to have the new plant ready for service this summer.

German Works Experiments with New Open-Hearth Process

HAMBURG, GERMANY, April 10.—Production of steel by a new process, said to be an improvement in open-hearth practice, continues at an experimental stage in the plant of the Stahlwerke Hoesch, Dortmund. In September, 1927, a small plant was established at Dortmund, with a furnace producing about 200 kg. daily. Savings by this process are estimated at 18 to 20 per cent, but no details are given.

Having found the new process practical on an experimental scale, another plant with a capacity of about 30 metric tons a month has been equipped. Should further experiments in this larger plant prove the process to be as practical as now indicated, it is planned to reequip the entire plant of the company for this production method. The company states that, contrary to many reports, the process is not based on direct production of steel from the ore, but constitutes an important improvement in open-hearth practice.

Steel Framed Dwellings Described in Brochure

The Steel Frame House Co., Pittsburgh, a subsidiary of McClintic-Marshall Co., has issued a handsome brochure describing "Steel Framing for Dwellings," a modern method of house construction. Designed especially for architects, although easily understandable by the home owner, the text cites the important advantages of steel over wood for studding, joists and rafters. Architect's perspectives, floor plans, and framing details are also shown for typical houses, ranging from a small bungalow to a pretentious English-type dwelling. Finally some large drawings show how the studding adapts itself equally well to various exterior and interior finishes such as masonry, brick, stucco or timber.

In a recent four-page folder issued by the Louden Machinery Co., Fairfield, Iowa, and devoted to the monorail system of handling materials, two or three quotations are made from articles on materials handling which have appeared during recent months in THE IRON AGE. The folder is illustrated, being devoted largely to the foundry industry. There are, however, other things in it, including dipping tanks for metal culverts and handling equipment in a nickel plating plant.

BOOK REVIEWS

Pearlitic Cast Iron (Perlitguss). By Dip. Ing. G. Meyersberg. Pages 111, 6 x 9 in. booklet, 92 illustrations, published by Julius Springer, Berlin. Price, 7.50 reichsmarks.

This work is a compilation of a number of articles previously published in the technical magazines of Germany, France and the United States dealing with pearlitic cast iron and is an excellent review of the present status of this development. Cast iron is of such importance in the economics of structures that any improvement in its physical properties is of interest, and the development of pearlitic cast iron bids fair to be an improvement of a major order.

The work includes a detailed description of the properties which may be expected of pearlitic cast iron and the uses to which the material may be put. The physical metallurgy involved is thoroughly expounded. The appendix includes basic German patents for the production of pearlitic cast iron. This is the only information in the pamphlet which would indicate how castings of this material are made, and the book suffers decidedly from the omission of data on methods of production. A bibliography is appended, which covers German, English and French literature.

Various special applications of pearlitic cast iron are cited: The properties show an improvement over those of the usual gray cast iron of 78 per cent in bending strength, 65 per cent in the elongation on bending, 92 per cent in tensile strength, 28 per cent in Brinell hardness, 94 per cent in dynamic bend strength and a life 14.7 times as long in the repeated shock test.

Growth of cast iron under repeated heatings is discussed in great detail, and minimum growth is claimed for pearlitic cast iron. The permeability to liquids and the electrical resistance are discussed.

A. B. K.

Logic of Modern Physics. By P. W. Bridgman, professor of mathematics and natural history in Harvard University. Pages, 226, 5½ x 8½ in. Published by the Macmillan Co., New York. Price, $2.50.

To read this book one should have a bowing acquaintance with recently discovered physical facts such as radioactivity, recently proposed theories such as that the atom consists of an assemblage of electricity particles, and recently formulated generalizations such as Einstein's principle of relativity. The book is essentially a critique of the deductive methods whereby physicists' ideas concerning these things have been reached.

Professor Bridgman believes that physical concepts have precision only when they are closely related to operations which can be performed by the human experimenter. To illustrate this point, consider temperature. Atmospheric temperatures are relatively measured by automatic physiological reactions in the human organism. To measure it quantitatively, instruments must reach equilibrium with the object whose temperature is measured. Essentially temperature is a statistical effect of the motion of a large number of atoms. When attempting to define what is meant by the "temperature" of an atom, the expression is found to have no meaning, because we have no measuring instrument of that order of size; furthermore, it takes many atoms to give a statistical average.

Similar analysis of many fundamental mechanical, electrical and optical concepts indicates that as the velocity increases, or distance or time gets either very big or very small, these concepts entirely lose the significance they possess for such dimensions as the human investigator can actually handle; "they have become blurred, fused together and fewer in number." Mathematical formulae may fit the conditions of experience with precision, but there is no warrant in extrapolating them to dimensions of almost infinite interstellar space or of the almost infinitesimal atom.

The discussion on light is interesting because of its relationship to the newer physics of relativity. Professor Bridgman thinks that Einstein may be supplanted by some future physicist who rejects the view that light is a moving thing, and sticks close to the fact that nowhere is there any experimental evidence for the inclusion of a third element (the ether) between the source of the light and the sink. This future physicist would probably hold that the velocity of light is infinite. (As a matter of fact the concept "velocity" derived from finite speeds of ponderable bodies loses meaning when applied to the almost infinite speed of a something which may not be a thing. "Infinite velocity of light" merely means that a distant clock is set on zero at the instant it receives a light signal flashed from a second clock at its zero.) Many interesting possibilities of such a line of thought are indicated by the author.

His stand that most of the deductions of the newer physics have no meaning in operational terms may appear to be destructive criticism, but what it amounts to is that, when considering either the infinitely large or infinitely small, the concepts of everyday experience lose their meaning. With this always in mind, the physical investigator will be led to invent new concepts corresponding with the experimentally independent things discoverable at these extreme magnitudes, rather than try to translate these discoveries in terms of mechanical, thermal, electrical and optical relations of everyday experience. This will make for greater progress in real understanding.

Automobile Industry: Its Economic and Commercial Development. By Ralph C. Epstein. Pages 412, 6 x 9 in., illustrated. Published by A. W. Shaw Co., Chicago, 1928. Price $4.

Much ground outside the mere growth of the automobile industry is covered in this book. It goes into the question of profits, of the falling by the wayside of numerous companies which could not stand the pace set by their competitors, and many other topics throwing a definite light on the economic features governing the development of the industry. It traces the story over a period of something more than three decades, from the time, in 1895, when there were just four automobiles made in the United States.

Early struggles in design to produce a car which would stand the wear and tear of uneven roads, and the earliest efforts leading up to the present well established mass production, are traced by the author. He goes also into the growth of the market, devoting two chapters to this topic, the first covering the growth from 1903 to 1916, and the second the subsequent decade. In this he shows the influence and change of varying price ranges at various times, all being worked out on approved statistical bases. As recently as 1907 there were more sales of medium-priced cars than of the low-priced class. The change in favor of the low-priced units from that date on, however, was rapid, and in 1916 they outnumbered the medium-priced units ten to one.

Concentration and combination of plants and the influence of manufacturers' associations are given a chapter. It is pointed out that in 1903 the largest plant in the industry—the Olds Motor Works—made 3922 cars. "Today the average annual (arithmetic mean) production per factory is 81,000 cars, while several of the larger factories make nearly as many vehicles daily as did the Olds works in an entire year." In this chapter is covered also the famous case of the Selden patent and the litigation, covering several years, between the association of licensed manufacturers under this patent and the outsiders.

"Market Stabilization and Industrial Maturity" is the title of the last chapter. Replacement needs, it is estimated by the author, will shortly be 3,000,000 or more cars a year. This replacement figure for 1926 is estimated at 1,900,000. The question of the used car market is taken up and the relation plotted between the number of automobiles produced and the average annual income of persons gainfully employed in the United States. Exports as a factor in market stabilization are discussed. These have been increasing rapidly, until in the second quarter of 1927 they reached an annual rate of almost 500,000 cars. Marketing policy as to prices, design, finish and general sales effort is given considerable space.

Tables and references in the rear of the volume, giving citations of original sources of information, make a valuable portion of the work, particularly for the student or anyone undertaking research. These features cover more than 100 pages, to which is appended a thoroughgoing index of more than 20 pages additional. All in all, the data in the book cover a surprisingly wide range of information on many subjects not ordinarily found. Correspondingly is the value of the book as a reference work enhanced.

Socrates Spars with an Advertising Agent

Those six galleys of olive oil that just came in must be sold. Zeus-ikin, Athenian merchant, consults Tauros, advertising agent, about a publicity campaign. The methods Tauros uses in attempting to "land the account" form the basis of Mr. Gundlach's satire. (Old Sox on Trumpeting. By E. T. Gundlach. Pages, 362, 4½ x 7½ in., profusely illustrated. Published by Consolidated Book Publishers, Inc., 537 South Dearborn Street, Chicago. Price, $2.)

Old Sox, philosopher, and his disciples neatly puncture Tauros's claims, one by one. But, alas, they are too thorough, for Zeus-ikin, who was at first greatly awed by Tauros's apparent familiarity with the "mass mind," runs to the other extreme and decides that anyone can write advertising. So he will prepare his own!

The author, himself an advertising agent, calls his book "a plea in burlesque form for sane, simple, selling messages in lieu of poetic piffle and artfulness." He wields a wicked battle-axe against those who believe that certain products, perhaps perfumes, are better advertised with incensed words in an arty atmosphere.

Market research undertaken to "prove" something draws Old Sox's most scorching fire. Tauros conducts an investigation to decide whether Zeus-ikin should advertise. To no one's surprise, the answer is yes. The philosopher wonders whether anyone who will gain or lose by the outcome can investigate fairly. "I never investigate anything with a view to *finding* a 'proof' of any theory," says Aristoteles, Old Sox's disciple.

The assembled members of the Tauros agency are aghast at the philosopher's suggestion that a picture of a jug of olive oil would provide the best illustration for the advertising. They favor a painting of an olive tree, about which "twelve beautiful maidens are dancing," but Zeus-ikin hastily rejects it, in the fear it will give his fellow Athenians the impression that he is advertising slaves for sale.

Mr. Gundlach has written an interesting book, and one which contains much of value for those versed in advertising and advertising agency methods. It should not be handed to the layman, however, without a cautioning word to the effect that it presents only part of a picture. Mr. Gundlach is dogmatic, and has no fondness for the qualifying ifs, ands, and buts. His book would be stronger it it were fairer. A. H. D.

The 1928 Standard Steel and Metal Directory, published by the Atlas Publishing Co., 150 Lafayette Street, New York, is now ready for distribution. It contains listings of manufacturers of ferrous and nonferrous metals and metal products, including rolling merchants in iron and steel and other metals, and a classification of dealers in old metals. The new edition contains more than 1000 pages.

"How to Lay Steel Roofing" is the title of 28-page booklet issued by the Sheet Steel Trade Extension Committee, Pittsburgh. Having learned by a market survey that about 70 per cent of the farmers using steel roofing apply the roof themselves the booklet is designed to illustrate the major steps in the application of steel roofs. Another larger booklet, entitled "Steel Roofing—Its Use and Application," is intended for more limited circulation and deals exhaustively with the general merits of this type of roofing for all types of farm building. A further publication dealing with the laying of steel tile and shingles is in the course of preparation.

COMMERCIAL STEEL CASTINGS

Orders Lower in March, but Production Was Best in 11 Months

WASHINGTON, April 24.—Orders for commercial steel casting in March aggregated 81,834 net tons, or 57 per cent of shop capacity, according to reports received by the Department of Commerce from the principal manufacturers. This compares with 90,244 tons, representing 62 per cent of capacity, in February. Production in March totaled 92,193 tons, or 64 per cent of capacity, against 86,806 tons, or 60 per cent of capacity, in February. March production was the highest for any month since last April. It compares with 102,836 tons in March, 1927.

Of the March orders, 30,956 tons was for railroad specialties, being 46 per cent of this kind of capacity, compared with 41,096 tons, or 61 per cent of such capacity, in February. Orders for miscellaneous castings in March amounted to 50,878 tons, or 66 per cent of this class of capacity, against 49,148 tons, or 63 per cent, in February.

Orders for commercial castings during the first quarter aggregated 263,147 tons, or 61 per cent of capacity, against 292,503 tons, or 68 per cent of capacity, during the first quarter of last year. Castings for railroad specialties during the first three months of 1928 totaled 113,328 tons, or 56 per cent of this class of capacity, against 129,496 tons, or 65 per cent of such capacity, for the corresponding period of last year. Orders for miscellaneous castings totaled 149,819 tons, or 64 per cent of this kind of capacity, during the first quarter of the current year, against 163,007 tons, or 70 per cent of capacity, during the corresponding quarter of 1927.

Of the March output 38,417 tons was for railroad specialties, being 57 per cent of this kind of capacity, against 37,719 tons, or 56 per cent of capacity, in February. Production of miscellaneous castings in March was 53,776 tons, or 69 per cent of this kind of capacity, compared with 49,087 tons, or 63 per cent, in February.

Production during the first three months of 1928 totaled 253,078 tons, or 58 per cent of capacity, against 278,837 tons, or 64 per cent of capacity, during the first quarter of last year. Of the output during the first quarter 104,850 tons was for railroad specialties, being 52 per cent of this kind of capacity, against 110,591 tons, or 55 per cent of such capacity, during the first quarter of last year. Production of miscellaneous castings during the first quarter aggregated 148,228 tons, or 63 per cent of this class of capacity, against 168,246 tons, or 72 per cent, during the corresponding period of last year.

Large Increase in Production of Automobiles in March

WASHINGTON, April 23.—Production of motor vehicles in the United States in March totaled 412,825, an increase of more than 27 per cent over February, when the output was 323,514, according to reports to the Department of Commerce. Production of passenger cars in March amounted to 371,408, a gain of more than 27 per cent over the February output of 290,831, while production of trucks in March was 41,417 as against 32,683, an increase of more than 26 per cent. The figures are based on reports received from 160 manufacturers, 49 making passenger cars and 129 making trucks, while 18 make both passenger cars and trucks.

For the first quarter, total production of motor vehicles was 968,032, against 938,133 for the corresponding period of last year. Of the production during the first quarter 867,782 were passenger cars and 100,250 were trucks, compared with 809,732 and 128,401 respectively for the first quarter of 1927. In 1926 the first quarter production totaled 1,108,194 units, of which 990,523 were passenger cars and 117,671 were trucks.

March production was more than that of March, 1927, when 394,443 vehicles were turned out. The increase was wholly in passenger cars—371,408, against 345,911 a year ago—for trucks showed a drop of nearly 15 per cent, from 48,532 to 41,417.

Foundry Equipment Orders Increase

Net orders of members of the Foundry Equipment Manufacturers Association in March are reported at 138.6, compared with a base of 100 represented by the average monthly shipments in 1922 to 1924. The March figure is the highest in more than a year, comparing with 123.6 in February and 132.7 in January and with 131.1 in March, 1927. January and February, 1927, and December, 1926, were exceedingly high months, registering from 180 to 198. Since that time, however, no month has exceeded the record of last month.

Shipments are placed at 147.9 and unfilled orders at 127.1, again on the basis of average monthly shipments. Nineteen firms reported in March, against 18 in the two preceding months.

Steel barrels shipped by members of the Steel Barrel Manufacturers' Association numbered 356,619 in March. Unfilled orders at the end of the month called for 483,481. The business of the month is reported at $1,034,309. Productive capacity was used during the month to the extent of 55 per cent.

Employment in Ohio Reached High Level in March

Employment in the manufacturing industries of Ohio during March reached the highest level since November, 1926, according to the monthly employment bulletin issued by the Bureau of Business Research of Ohio State University. With an average month in 1923 taken as 100, the index for March stood at 103. In the iron and steel group the number of employees was 5 per cent greater than in February and 3 per cent greater than in March, 1927. Of the 15 steel works and rolling mills reporting to the bureau, 12 showed increases over the February rate. Among foundries and machine shops March employment was 3 per cent higher than in February, but was 13 per cent less than in March, 1927. Companies in the machinery group stated that employment in the first quarter was 7 per cent less than in the same period last year, although March records showed a small increase over February.

Production of Coke in United States

Production of by-product coke in the United States is reported by the Bureau of Mines for March at 4,064,940 net tons. This shows an increase over February's 3,723,147 tons that was equivalent to a little more than the difference in length of month. The daily averages are given as 131,127 tons for March and 128,384 tons for February. The recent figure is well above that for March, 1927, which stood at 3,879,655 tons, or 125,150 tons a day.

Beehive coke output has dropped off almost one-half from March 1927, being reported for the latest month at 449,000 tons compared with 890,000 tons a year earlier. The amount in February was 390,000 tons. Total coke production has been about one-fourth greater than pig iron output, as is shown in the subjoined table:

	Pig Iron, Gross Tons	Total Coke		Ratio Coke to Pig Iron
		Net Tons	Gross Tons	
March, 1927.....	3,483,362	4,769,655	4,258,620	1.223
February, 1928..	2,900,126	4,113,147	3,672,452	1.266
March, 1928.....	3,199,674	4,513,940	4,030,304	1.260

Total apparent consumption of babbitt metal in March was 4,927,634 lb., compared with 4,470,368 lb. in February, according to reports received by the Department of Commerce from 31 firms. Consumption for the quarter was 14,326,519 lb., compared with 16,518,289 lb. last year and 17,745,953 lb. in 1926.

LESS COKE MADE IN 1927

Decline Over 10 Per Cent from 1926—More Than 86 Per Cent of Output Was By-Product

WASHINGTON, April 24.—Preliminary reports received by the Bureau of Mines place the total production of coke in 1927 at 50,925,000 net tons, a decrease of 10.4 per cent from 1926. The decrease was in part due to the fact that in 1926 coke was in demand to meet the deficit in anthracite coal caused by the miners' strike, while in 1927 there was an abundant supply of anthracite. The chief cause of the decrease in coke production, however, was the diminished activity of blast furnaces, the output of pig iron having declined 7.3 per cent below the level of 1926.

Most of the decrease in coke production was borne by the beehive branch of the industry, which, the bureau pointed out, is assuming more and more the position of an auxiliary, called upon to furnish only the surplus requirements of the metallurgical industry which cannot be met by the by-product ovens. Thus the total output of beehive coke fell from 12,488,951 tons in 1926 to 7,004,000 tons in 1927, a decline of 44 per cent. The output of by-product coke was 43,921,000 tons, a decrease of only 1 per cent under 1926, when the production was 44,376,586 tons.

A table presented by the bureau showing the production of coke for the period 1913-1927, inclusive, gives a vivid picture of the swing in the position of beehive and by-product output. In 1913 coke production totaled 46,299,530 tons, of which 33,584,830 tons, or 72.5 per cent, was beehive and 12,714,700 tons, or 27.5 per cent, was by-product coke. In 1927, of the estimated total production of 50,925,000 tons, 43,921,000 tons, or 86.2 per cent, was by-product and 7,004,000 tons, or 13.8 per cent, beehive coke.

Pennsylvania, the largest producer of both kinds of coke, has, since 1924, produced more by-product coke than beehive. The output of its by-product ovens in 1927 was 11,329,000 tons. As a producer of by-product coke Ohio ranks second, with 7,129,000 tons in 1927. Indiana was third, Alabama fourth, New York fifth and Illinois sixth.

Three new by-product plants started operations during 1927. In April the Central Alloy Steel Corporation put into blast its new plant at Massillon, Ohio. In July the West Boston Gas Co. began making coke at Framingham, Mass., and in December the Consumers' Gas Co. put into operation a new plant at Flint, Mich. In addition, there were more than 660 new ovens installed and fired at existing plants. At the close of 1927 there were approximately 300 new ovens under construction, 131 of these at two new plants.

The bureau report said that, with the addition of 753 new ovens during 1927, the potential coking capacity of by-product plants at the close of the year, at 100 per cent operation and with all conditions favorable, amounted to about 56,600,000 tons. If all of the ovens now under construction are put into operation during 1928, as contemplated, the coke plants will be capable of turning out, at 100 per cent operation, more than 58,000,000 tons. At this rate the plants in existence have a coal-carbonizing capacity of 81,000,000 tons of bituminous coal, which will be increased to 83,400,000 tons through the addition of new ovens.

Production of by-product ovens at blast furnaces in 1927 totaled 34,065,000 tons, against 34,715,000 tons in 1926 and 31,494,000 tons in 1925, there having been 43 batteries of ovens each year at the furnaces. The percentages of the by-product output at these ovens, compared with the total output for each year, were 77.6, 78.2 and 78.9 respectively.

Preliminary estimates of the amount of by-products obtained in 1927 are as follows: Tar, 523,000,000 gal.; ammonia, sulphate equivalent of all forms, 1,366,000,000 lb.; gas, 698,000,000,000 cu. ft.; crude light oil, 163,000,000 gal. Allowing for imports and exports, the indicated consumption of coke in 1927 was 50,287,000 tons. Of this amount about 37,335,000 tons, or 74.2 per cent, was consumed in blast furnaces.

British Steel Imports Decline, Exports Gain

WASHINGTON, April 24.—Increasing more than 29 per cent, exports of iron and steel from Great Britain in March totaled 409,297 tons, compared with 317,036 tons in February. At the same time imports showed a decrease of 8 per cent in March, declining to 269,526 tons from 292,918 tons in February, according to a cablegram from London received by the iron and steel division, Department of Commerce. The incoming movement in March showed a marked change from that for the first two months, which showed a rising tendency. The outgoing movement was the heaviest for any month since May, 1927, when exports aggregated 422,426 tons.

Production of both pig iron and steel ingots also increased during March, the former amounting to 592,600 tons, an increase of 41,800 tons over February, and the steel ingot output totaling 793,300 tons, a gain of 28,900 tons over February. At the end of the month two more blast furnaces were blown in, bringing the total in operation to 150. There was a decrease of one in the number of open-hearth furnaces in operation, the number making steel at the end of the month being 277.

Declining Shipbuilding in United States

Merchant ships under construction at the end of March are reported by Lloyd's Register of Shipping as totaling 2,893,251 tons, compared with 3,118,721 tons at the end of December. Practically half the total, or 1,440,842 tons, was being built in Great Britain and Ireland, and only 56,049 tons in the United States. The United States total represents a shrinkage from 97,370 tons on Dec. 31. The returns show the United States in tenth position in amount of tonnage under construction, being exceeded not only by Great Britain and Ireland, but also by Germany, Italy, the Netherlands, France, Denmark, Russia, Japan and Sweden, whose totals ranked in that order. Only in Denmark, Russia and Japan has there been an increase in the amount of construction under way as compared with the end of 1927.

A Measure of the Increasing Attention Being Paid to Safety in Industry

Industrial personnel work has been studied by the United States Bureau of Labor Statistics, a recent report being covered in Bulletin 458 of that bureau. This supplements a similar study made 10 years ago, covering information from about the same number of companies—430. As many of the companies are identical with those in the earlier study, there is afforded an opportunity to observe the lines along which development has taken place in the past 10 years.

In the 1916 study, 375 plants reported some provision for treating sick and injured employees, but 110 of them had nothing more than first-aid equipment. In the present study, only 34 have the limited first-aid equipment, while 373 have a dispensary or emergency hospital, with one or more treatment rooms. In the earlier study, only 171 establishments employed physicians and 181 had trained nurses. In the present survey 311 companies employed full-time or part-time physicians and 332 had trained nurses.

As a sidelight on benefits to employees, it is reported that 133 now give paid vacations to the wage earners, against only 16 such companies in 1916. The usual vacation for employees working on hourly rates is one week each year. Companies having restaurant facilities have increased from less than 50 per cent to about 70 per cent of the total number surveyed. The lunch service is regarded generally by employers as an important factor in maintaining the health and efficiency of the working force.

British Trade Shows Improvement

Large Part of Pig Iron Exports Goes to United States—Tin Plate Mills Have Record Orders—European Prices Unsettled

(*By Cable*)

LONDON, ENGLAND, April 23.

NEW demand for Cleveland foundry and forge iron is dull, partly because of budget uncertainties, but makers are operating on a restricted scale and surplus stocks are not accumulating.

Business in hematite has improved, mainly with Italy and Germany, but stocks are still heavy. As low as £3 8½s. ($16.56) per ton has recently been accepted for East Coast mixed numbers, but makers are now more rigidly maintaining £3 10s. ($17.05) minimum. Foreign ore is quiet as a result of the well-sold condition of mines and the undertone of the market is firm. The peace move in the Swedish miners' strike has not succeeded.

The finished iron and steel market is subdued, with very little new buying and export interest especially quiet. Prospects of business from Australia are poor. Indian demand is fair, but Indian producers are securing the bulk of such trade. British industry lacks animation as a result of the failure of shipyards to secure sufficient new contracts.

The tin plate situation is vastly improved. Restriction of production has been cancelled and there will be no further suspensions after May 28, except for the usual August holiday. There have been very large bookings and the Welsh mills have reached a record for unfilled orders. All markets are heavy buyers of tin plate, including France, where the import duty was recently reduced. The official selling price is unaltered, but actual selling prices are 18s. 3d. to 18s. 6d. ($4.45 to $4.51) per base box, f.o.b. works port.

Galvanized sheets are no better and large exports are accounted for by certain works being unable to sell through the ordinary Indian merchant channels so that they are consigning direct to Bombay and other Indian ports. Prices are £13 (2.82c. per lb.), f.o.b., and higher for No. 24 gage. The lighter gages have been reduced 10s. ($2.44) because of the slackness of demand.

There is only a moderate demand for black sheets, but makers are apparently in a comfortable position. Japanese inquiry for thin gages is fair.

March exports of pig iron were 41,507 gross tons, of which 13,122 tons went to the United States. Total exports of iron and steel were 409,292 tons.

The Continental steel market is variable, but fairly steady. Little substantial demand is in sight, but French mills are extremely well booked although German sellers are seeking orders.

In France "Rombas" is building a new blast furnace and the Forges et Acieries de L'Est is preparing to construct a third furnace at L'Ouvroil. In Germany, the Vereinigte Stahlwerke A. G. is blowing out a furnace at the Dortmunder Union. The Saxon metal workers' strike, involving 200,000 men, is still unsettled. A German consortium has secured the contract for preliminary work on the new Persian railroad.

Indian steel works are reported agitating for a 50 per cent increase in the supplementary import duties, applicable to non-British products.

BRITISH BUSINESS IMPROVED

Semi-Finished Mills Book More Tonnage—Finishing Mills Need Orders—Tin Plate Active

LONDON, ENGLAND, April 12.—Trading in iron and steel has been affected by the Easter holidays just ended, and, as most works have remained closed for the better part of the week, it will be several more days before normal conditions prevail. Meanwhile the outlook continues uncertain in some branches of the industry, but brighter in others. Cleveland pig iron makers are in a strong position. Domestic demand is heavy, and furnaces have substantial orders on hand. Production has been increased by the blowing in of another blast furnace at the Skinningrove plant of Pease & Partners, Ltd., Darlington, increasing the number of active Northeast furnaces to 38, and it is reported that still another one may be blown in soon.

Export trade in Cleveland iron is recovering, but only slowly, as Continental makers secured a firm foot-

---

British and Continental European prices per gross ton, except where otherwise stated, f.o.b. makers' works, with American equivalent figured at $4.87 per £ as follows:

hold during and since the coal strike of 1926, but the higher cost of foreign iron is beginning to make itself felt.

In hematite iron the situation is less satisfactory than with Cleveland makers. There are still heavy stocks to be liquidated, in spite of fair buying, and demand from the steel plants is not brisk. Prices of hematite are unchanged, but it is probable that a substantial order would bring a concession.

In semi-finished material British makers are once more booking a fair tonnage of orders. The increase in the cost of Continental steel since the beginning of the year has considerably lessened the margin in values, and the Welsh tin plate mills in particular are returning to the use of the British product. Sheet rollers, however, are still inclined to rely on foreign steel.

The position of the mills producing finished products is generally unsatisfactory. Mills rolling heavy material are seeking orders, plate producers in particular finding export orders scarce. Shipbuilding, structural and engineering requirements are moderately heavy. Nevertheless, capacity for production of heavy materials is well in excess of demand. In the lighter branches there is some activity, but all mills need more tonnage. An exception is the tin plate industry, which is in a flourishing condition. With the agreement on restriction of output and minimum prices in effect and consumers' demands heavy, most mills are assured of work for a number of months, and some assert that they have the largest order books on record.

RUSSIAN OUTPUT LARGER

Iron and Steel Still Less Than Pre-War, but Agricultural Machinery Greater

MOSCOW, RUSSIA, April 4.—Active measures are being taken by the government to increase the output of coal, heavy iron and steel and machinery in the Soviet Union. The head of the metal board has been instructed to draft a revised five-year production program, calling for an increase over the existing schedule. Vigorous measures are being taken to reduce imports of such foreign made metal products as are not directly needed for production purposes in Russia. Iron, steel and machinery, however, are to be admitted in larger quantities.

In the last completed fiscal year, imports of metal goods of all kinds totaled 378,900 metric tons, compared with 298,600 tons in 1925-1926 and 175,800 tons in 1924-1925. The increase was almost entirely in products classified as "instruments of production."

The report for 1926-1927 states that the output of all sorts of agricultural machinery and tools in Russia, with the exception of sowing and threshing machinery, exceeded the 1913 production. Production of plows was 1,066,000, compared with 768,500 in 1913; harvesting machines, 174,000, compared with 111,000 in 1913, and scythes, 3,700,000, compared with 78,000 in 1913. As a result of this increase in output, the value of agricultural machinery imports was only 26,380,700 rubles in 1926-1927, compared with 47,805,300 rubles in the previous year.

There has been a slight decline in the prices of metal products in Russia. The general wholesale price index, based on 100 in 1913, is 185, but the index number for metal products is only 168.

Production schedules in heavy iron and steel are again threatened by a shortage of coal. Production in the Donetz coal fields has lately reached 95 to 96 per cent of capacity, and the total output has been about 15 per cent greater than in the early months of 1927. The program for coke production has not been fulfilled.

Production of iron and steel has been higher since the beginning of the fiscal year, October, 1927, than in the same period of the fiscal year 1926-1927. In February of this year output of pig iron was 12 per cent greater than a year ago, steel ingot production was 21 per cent greater, and output of rolled products, 19 per cent greater. In the fiscal year 1926-1927 production totaled 2,946,900 metric tons of pig iron, 3,533,000 tons of steel ingots and 2,687,100 tons of rolled products. In the fiscal year beginning with October, 1927, monthly production in metric tons has been as follows:

	Pig Iron	Steel Ingots	Rolled Products
October, 1927.......	261,200	330,800	270,900
November	252,000	335,800	258,700
December	257,900	357,000	275,800
January, 1928......	276,700	353,000	281,000
February	263,200	345,500	274,100

GERMAN MARKET QUIETER

Domestic Demand Smaller but Exports Increase —Last Year Brought Small Profits

BERLIN, GERMANY, April 7.—The general industrial situation is improved, but the domestic iron and steel markets are decidedly weaker. Pressure to increase export business is succeeding, and the export surplus of only 101,000 metric tons in January increased to 150,000 tons in February, exceeding the average monthly surplus of 1927, which was 137,000 tons. There has been a considerable increase in exports of pig iron, semi-finished material and rails, and imports of these products have declined.

Inactivity in the domestic market has been caused partly by a decline in buying by the Railroads Corporation and dullness in the building industry. The railroads complain that finances do not permit of heavy purchases for expansion and improvement. As a result of higher wages and payment of the reparations levy, expenditures this year will exceed those of 1927 by about 575,000,000m. To partially offset this outlay, the Railroads Corporation has proposed an increase in freight rates and passenger fares, which would bring in an additional 25,000,000m. a year, but there has been general protest against such a move.

No serious decline in iron and steel production is expected in the second quarter, although there may be some slight curtailment. Production showed great advances in 1927 and the record rate of output reached then was not expected to be permanently maintained. Recently the Vereinigte Stahlwerke, Düsseldorf, blew out one of its Dortmund Union blast furnaces and plans blowing out another in Ruhrort.

The greatest market activity at present is in steel bars. Demand for semi-finished material has declined, and structural steel bookings are unsatisfactory. Buying of heavy-gage sheets is fair, but below the high level of recent months. Demand for medium and light-gage sheets continues to decline, and mills are unable to obtain the scheduled quotations of 155m. ($37.06) per metric tone for medium-gage and 165m. ($39.45) for light-gage sheets. Bands and steel tubes are quiet, with prices weak. In all these products, however, export business is better than domestic business. In some quarters the opinion is expressed that the steel industry is suffering from the large orders placed at the beginning of the year, when a strike or lockout in the steel mills was in prospect. Others believe that the effects of a normal decline of business activity are being experienced.

Machine tool buying has declined, but makers are still fairly well occupied with orders. Export trade with eastern Europe has been temporarily checked by disagreements with Russia and the slow progress being made in negotiations for a German-Polish trade agreement. There has been no improvement in business among railroad car builders. The Solingen cutlery makers report business satisfactory, with 1200 metric tons exported in January and February and total exports for 1927 estimated at 7500 tons, compared with 6600 tons in 1926. British and Italian consumers are buying heavily.

Friedrich Krupp A. G., Essen, has acquired 43 per cent of the stock of the Norddeutsche Heutte from the Vereinigte Stahlwerke and intends eventually to acquire a 60 per cent interest.

Annual reports for the fiscal year 1926-1927 of steel corporations, most of which are also coal corporations, show considerable increases in output and sales, but only moderate profits. A net profit of 5,980,000m. was reported by the Gutehoffnungshütte A. G., 4,750,000m. by the Hoesch Iron & Steel Co., 6,560,000m. by the

Kloeckner A. G., 13,040,000m. by the Friedrich Krupp A. G., 520,000m. by the Vereinigte Oberschlesische works, and 50,540,000m. by the Vereinigte Stahlwerke. Dividends paid ranged from 5 to 8 per cent.

MACHINERY TO BRITAIN

Heavier Exports to United Kingdom in 1927—American Machine Tools Favored

WASHINGTON, April 24.—American makers of machinery benefited from increased imports into Great Britain in 1927. British imports of machinery in 1927 totaled 101,639 tons, valued at £15,901,428, as against 80,433 tons, valued at £12,782,879, in 1926, according to a report received by the industrial machinery division, Department of Commerce, from William M. Park, trade commissioner in London. One importer and distributer of American machinery is quoted as saying that the increase in his business in 1927 was 50 per cent over that of 1926.

With respect to machine tools only, a similar increase in imports is noted. Total imports of machine tools into Great Britain have risen from £770,738 in 1925 to £927,293 in 1926 and £1,180,370 in 1927. The substantial increase in the value of imports in 1927 compared with 1926 took place despite a decline in weight from 7890 tons to 7678 tons. Imports of machine tools from the United States exceeded those of other countries in value in 1927, amounting to 3275 tons, valued at £744,440, against 3510 tons, valued at £318,886, for Germany. In 1926, American machine tool imports exceeded those of Germany both in volume and value, amounting to 3760 tons, valued at £590,200, compared with 3559 tons, valued at £267,253, imported from Germany. The figures reflect a situation in which American tools, because of their high quality, find a ready market in competition with tools of other countries, despite the fact that the latter are considerably cheaper. The average value per ton of machine tools imported from the United States last year was £227, as compared with only £90 for German equipment and £131 for machines from other countries.

A leading distributer of American machine tools and equipment is reported as saying that his best sales have been in high-production tools, such as milling machines, hydraulic-feed grinding machines, crankshaft lathes, balancing machines and honers. Smaller American machines are said to be barely holding their own. This company also stated that American tools are being copied by British makers, and in such cases the British-made machines are being sold at much lower prices than the American equipment, thus developing a type of competition similar to that which has been experienced from Germany.

Another firm handling American tools attributes its success to the fact that it no longer works through agents, but makes sales direct, and has its own demonstrator and service expert, who was trained in American works. Whereas previously, when operating through agents, the firm's sales volume was approximately $100,000 per year, it has now been able to increase sales to approximately $180,000 through direct selling. This company also complains of difficulty through having its machines copied by British makers and sold at much lower prices, but is of the opinion that this practice could be overcome through taking out patents in Great Britain. Such a procedure would necessitate manufacture in the British Isles, and not only this firm, but several other important ones, advocate having the heavy base castings made in England, thereby saving the bulk of the freight charges and complying with the patent law requirements.

The good market for machine tools in Great Britain is attributed to a few industries. As in the United States, the automobile industry in Great Britain, says the report, is the principal consumer of machine tools and shop equipment. This, it is pointed out, will be fully understood when it is remembered that there are in that country manufacturers of 66 makes of passenger cars and 46 makes of trucks. In addition to these British manufacturers, several leading American, French and Italian companies have assembly plants in Great Britain, in which a large quantity of machine tools is used. Closely allied with the automobile industry is the motorcycle and pedalcycle industry, which is a large consumer of machine tools and has grown rapidly during the past few years.

The electrical industry, making radio equipment and other lines, has undertaken a considerable amount of factory expansion and new building, thus offering opportunities to machine tool distributers. Shipbuilding, likewise, has largely recovered from the effects of the 1926 industrial disputes. The manufacturers of textile machinery and railroad shop equipment have been only moderately active but give promise of improvement.

The report calls attention to the fact that the British market offers the widest foreign field for American precision and high-production tools. As for the so-called "bread and butter" types of machinery and tools, there is declared to be too much competition at low prices from English makers and importers of German lines to make the market attractive to American producers. As industrial conditions of the country improve the demand for machine tools and shop equipment will undoubtedly increase, the report says, and, while British and German competition may be expected to grow, it is predicted American machinery and tools will hold their own.

Careful inquiry is said to confirm the general belief that no import duty will be levied against machine tools.

Practically all importers of American machinery and machine tools complain of the high post-war ocean freight rates, which has caused some producers of American equipment to manufacture heavy base castings in Great Britain.

Imports of Machine Tools into the United Kingdom by Countries of Origin

Country of Origin	1925		1926		1927	
	Tons	Value	Tons	Value	Tons	Value
Germany ..	2,114	£207,386	3,559	£267,253	3,510	£318,886
United States	2,091	476,837	3,760	590,200	3,275	744,440
Others	803	86,515	571	69,840	893	117,044
Total	5,008	£770,738	7,890	£927,293	7,678	£1,180,370

German Small Tool Makers Use Higher-Carbon Steel

HAMBURG, GERMANY, April 10.—There is a growing demand from German small tool makers for steel of 1.10 to 1.40 per cent carbon content for the manufacture of axes. In the past, axe makers used steel containing 0.3 to 0.7 per cent carbon, but it was found that the higher carbon was necessary for axes for cutting hard wood. Prices of the higher-carbin steel are considered high, and, despite the duty of 25m. ($6) per metric ton, there seems to be an opportunity for producers in other countries to supply some of the steel required. No offers by American producers of high-carbon steel are as yet reported to have been made to tool makers.

Germany to Revive Use of Brand Names on Steel

HAMBURG, GERMANY, April 10.—Steel mills are trying to revive the former practice of selling brands, in the belief that it will aid in promoting export trade. Brands were rather general during the nineteenth century, but just prior to the war brand names had been dropped except on alloy and special steels. Producers believe that sales of ordinary steel will increase under brand names and apparently intend to apply brands to structural shapes, bars, sheets and similar materials.

New German Wire Nail Machine

HAMBURG, GERMANY, April 10.—At the Leipzig fair J. A. Wickschtrom, Düsseldorf, exhibited a newly developed wire nail machine. The machine is designed to produce two nails from one wire with each turn of a wheel. Although it does not operate at so high a speed as machines producing one nail to each turn of the wheel, the maker claims that production is about 50 per cent greater.

Machinery Markets and News of the Works

ROCK ISLAND INQUIRY

Western Railroad Comes into Market for List of Machine Tools

General Business in April Holding Up Fairly Well, but May Not Equal That of Last Month

THE Chicago, Rock Island & Pacific Railroad has inquired in the Chicago market for a list of machine tools, including 15 floor grinders. The Union Pacific has bought a number of machines listed on a recent inquiry, but generally railroad buying is light.

Machine tool buying so far this month has continued at a good rate, but indications are that the total may not equal that of last month. Some in the Cincinnati trade estimate that it will not run more than 75 per cent of the March sales. Operations among machine tool plants are holding up well on orders in hand.

In the automotive field buying has dropped off, but there have been some orders from makers of automobile parts who have entered into contracts with the Ford Motor Co. The Dana Mfg. Co., Toledo, Ohio, which is making shock absorbers for Ford cars, has added to its recent purchases of shop equipment.

Agricultural implement manufacturers, who have been a main support of the Chicago market, have satisfied most of their requirements for spring manufacturing, and there is a lessened demand from that source.

New York

New York, April 24.

A GENERAL improvement in machine tool purchases and inquiry compared with the volume of business earlier in the month leads sellers to believe that April business will equal or slightly exceed that of March. There is a substantial number of inquiries for one or two tools each, in addition to the lists that have been issued. The inquiry of Dwight P. Robinson & Co., New York, for about eight machines for export to Argentina, including a pipe threading machine, two engine lathes, a combination punch and shear, a hack saw and a bolt threading machine, is not expected to be closed for several weeks. General Electric Co. has purchased about five tools, but has not yet taken action on the list of equipment for various service stations. The Wright Aeronautical Corporation continues the most active of the aircraft builders and has closed on about 10 tools in the past week, including one turret lathe, two multicut lathes, two drills, two internal grinders and four automatic screw machines. The Fairchild-Kaminez Engine Co., Farmingdale, L. I., expects to cover its machinery requirements at the beginning of each quarter and will probably make some small purchases about the end of June. A manufacturer in this district has closed on four large radial drills, mounted on wheels. The Standard Oil Co. of New Jersey is reported preparing an inquiry for a few machine tools.

Among recent purchases are a 12-in. vertical shaper by a company in Massachusetts; No. 3 Pratt & Whitney die sinker by a Chicago company; No. 3A Pratt & Whitney die sinker by a forging company in Indiana; 13 x 30-in. and 16 x 60-in. Pratt & Whitney lathes by a Chicago manufacturer; three 8-in. rotary surface grinders by a Toledo, Ohio, company; 14-in. vertical shaper by an engineering company in Detroit; 3-spindle Sigourney drill by a Detroit manufacturer; 13 x 30-in. and 16 x 60-in. Pratt & Whitney lathe by a New Jersey company; No. 3 universal bench milling machine by a southern New Jersey manufacturer; No. 2 jig boring machine by a tube mill near Philadelphia; two 7 x 32-in. bench lathes by a company in Camden, N. J.; one 13 x 30-in. lathe by a Pittsburgh company; 4-spindle drum-type Niles milling machine by a Detroit motor manufacturer; 1500-lb. Niles single-frame steam hammer by a Chicago company; 5-ft. Ridgeway plain radial drill by a Pennsylvania coal company; 2-in. bolt machine by a West Virginia company; used 18-in. x 10-ft. Lodge & Shipley lathe by a machinery company in Cincinnati. Railroad purchases of tools have included a 53-in. tire mold mill by the Texas & Pacific and a 36-in. Niles-Acme shaper by the Chicago, Burlington & Quincy.

Contract has been let by Interstate Plumbing Supply Co., 733 Broadway, Albany, N. Y., to D. Anderson, 25 Market Street, Poughkeepsie, N. Y., for a two-story mechanical and distributing plant at Poughkeepsie, with pipe shop, fitting department, etc., to cost approximately $80,000 with equipment.

Kern & Klemm Co., 254 West Forty-first Street, New York, recently organized by George Kern, Jr., and Hans Klemm, plan establishment and operation of a local plant for manufacture of airplanes and parts. Mr. Klemm is head of a company which is manufacturing aircraft at a factory at Sindelingen, near Stuttgart, Germany.

New York, New Haven & Hartford Railroad Co., Grand Central Terminal, New York, has filed plans for a one-story electric inspection and operating shop, 106 x 375 ft., to cost $180,000 with equipment.

L. Pisciotta, 563 East Tremont Avenue, New York, architect, has plans for a two-story automobile service, repair and garage building, 100 x 120 ft., to cost close to $100,000 with equipment.

Johns-Manville, Inc., Madison Avenue and Forty-first Street, New York, manufacturer of power plant equipment, building products, etc., plans construction of new plant at Richmond, Cal., consisting of two one-story units, each 100 x 500 ft., to cost close to $1,000,000 with machinery. San Francisco offices of company are at 159 New Montgomery Street. H. J. Brunner, Sharon Building, San Francisco, is engineer.

In connection with expansion and improvement program to cost $26,403,000, Erie Railroad Co., 50 Church Street, New York, plans enlargement of locomotive and car repair shops at different points, with installation of considerable new machinery, including extensions in yards and shop facilities at Port Jervis, N. Y., Hornell, N. Y., and Meadville, Pa.

Superintendent of Lighthouses, Staten Island, N. Y., is asking bids until May 3 for 600 steel cylinders, each with capacity of 180 cu. ft.; and 200 steel cylinders, each 88-cu. ft. capacity, proposal 26831.

William C. Sommerfeld, 31 Union Square, New York, architect, has plans for a two-story automobile service, repair and garage building, 100 x 200 ft., to cost $100,000 with equipment.

Warner-Quinlan Co., 26 Beaver Street, New York, has begun enlargements and improvements in its petroleum refinery at Warners, N. J., to include installation of machinery for increase in capacity from 6000 to 12,000 bbl. of crude oil per day. Company is disposing of preferred stock issue of $1,000,000, a considerable portion of fund to be used for expansion. W. W. McFarland is president.

Ovens, power equipment, conveying and other machinery Will be installed in addition to be built to baking plant of Cushman's Sons, Inc., White Plains, N. Y., to cost in excess of $90,000. Headquarters are at 1819 Broadway, New York.

Otis Elevator Co., Eleventh Avenue and Twenty-sixth Street, New York, has awarded general contract without competition to James Stewart & Co., 17 East Forty-second Street, for a one and two-story addition to plant at Harrison, N. J., 250 x 450 ft., to cost in excess of $400,000 with equipment.

Berlinger & Kaufman, 66 Fifth Avenue, New York, architects, have plans for a one-story automobile service, repair and garage building, 100 x 200 ft., at Woodside, L. I., to cost $100,000 with equipment.

Board of Education, Park Avenue and Fifty-ninth Street, New York, plans installation of manual training equipment in new John Adams High School at Woodhaven, Queens, to cost $2,500,000, in which amount an appropriation has been approved.

Temlock, Reinbach & Wortman, Inc., New York, operating an iron and sheet metal works, has removed from 767 Tenth Avenue to 607 East Fifteenth Street, where increased facilities will be provided.

Board of Education, Union City, N. J., plans installation of manual training equipment in addition to high school on Morris Avenue, to cost $200,000. Frederick A. Elsasser, 845 Broad Street, Newark, is architect.

Wright Aeronautical Corporation, Lewis Street, Paterson, N. J., is arranging an expansion and improvement to cost about $3,000,000. Work will include a four-story addition for general production, one-story assembling works and improvements in present four-story structure, with installation of additional machinery. Structures are scheduled for completion in fall.

Board of Education, New Milford, N. J., plans installation of manual training equipment in new high school to cost $400,000, for which plans are being drawn by Ernest Sibley, Bluff Road, Palisade, N. J., architect.

Joseph L. Steinan, 46 West Forty-sixth Street, New York, architect, has filed plans for a six-story automobile service, repair and garage building to cost about $200,000 with equipment.

Consolidated Products Co., New York, dealer in used chemical machinery, has removed its offices to sixteenth floor, 15 Park Row.

Copper Radiator Sales Corporation, Imperial Building, Schenectady, N. Y., has been organized to distribute Sage tubular-fin radiators made entirely of copper. At present radiators are being built by G. & O. Mfg. Co., New Haven, Conn., and enclosures by Hart & Cooley Co., New Britain, Conn.

Safety Cable Co., division of General Cable Corporation, 114 Liberty Street, New York, is now located at 420 Lexington Avenue, New York.

Northern Tool Co., Inc., Nelson Building, Utica, N. Y., has been sold to Wilbur R. Ralph. Company manufactures a patent water gage and valves and does a machinery jobbing business. It is planned to enlarge the business.

Wagner Electric Corporation, St. Louis, has removed its New York sales office from 50 Church Street to suite 1110, 30 Church Street. Company's service station remains at 321 West Fifty-fourth Street.

Latendorf Conveying Corporation has moved from Jersey City to its new plant at 55 Oak Street, Bayonne, N. J. General offices, formerly at 90 West Street, New York, have also been removed to Bayonne.

St. Louis

ST. LOUIS, April 23.

BIDS will be asked soon by Century Electric Co., 1806 Pine Street, St. Louis, manufacturer of fans, motors, etc., for a one-story foundry to cost upward of $150,000 with equipment. Klipstein & Rathmann, Security Building, are architects.

Normandy Consolidated School District, Vinita Park, Mo., has plans for two-story vocational school to cost $120,000. William B. Ittner, Inc., 911 Locust Street, St. Louis, is architect.

Lion Oil & Refining Co., Exchange Bank Building, El Dorado, Ark, is contemplating an addition to oil refinery, including still house and other buildings, to cost more than $70,000 with equipment.

United Cold Storage Co., Third and Cherry Streets, Kansas City, Mo., is considering a new cold storage and refrigerating plant, to cost more than $750,000 with equipment.

Pague Mfg. Co., Twentieth Street and Southwest Boulevard, Kansas City, Mo., manufacturer of cans, pails, etc., is planning new one-story factory, to cost more than $40,000 with equipment. F. L. Woodward is general manager.

Capital Garage, Inc., 1025 Wyandotte Street, Kansas City, Mo., Harry Rubin, president, will soon begin erection of seven-story and basement service, repair and garage building, 125 x 130 ft., with foundations for three additional floors later, to cost more than $250,000 with equipment. C. A. Smith, Finance Building, is architect.

Southwestern General Electric Supply Co., 1 West Grand Street, Oklahoma City, Okla., electrical equipment and supplies, has leased a two-story building to be erected at Walker and California Streets, for a new storage and distributing plant, to cost $90,000 with equipment.

Board of Education, Junction City, Kan., plans installation of manual training equipment in new high school to cost $150,000, for which plans will be prepared by Felt, Durham & Kreihn, 300 West Forty-seventh Street, Kansas City, Mo., architects.

John C. Lawrence, Commercial Building, Fairmount, Mo., architect, has plans for a one-story automobile service, repair and garage building, 115 x 125 ft., to cost about $90,000 with equipment.

Southwestern Light & Power Co., Braniff Building, Oklahoma City, Okla., has acquired municipal light and power plant at Erick, Okla., and will make extensions and improvements in that district, including transmission line construction.

Ovens, power equipment, conveying and other machinery will be installed in new two-story and basement plant to be erected at Oklahoma City, Okla., by General Baking Co., Orear-Leslie Building, Kansas City, Mo., to cost upward of $125,000 with equipment. Archer & Gloyd, Pioneer Trust Building, Kansas City, are architects.

Nebraska State Board of Control, State House, Lincoln, Neb., plans one-story equipment repair and mechanical building at Omaha, Neb., to cost about $60,000. L. A. Daly, Peters Trust Building, Omaha, is architect.

Smoke Abater Equipment Co., 909 Grand Avenue, Kansas City, Mo., has been organized to manufacture a device for utilizing waste gases in coal burning. Company purchases castings under contract and owns its own patterns. No additional materials or equipment will be purchased at present.

New England

BOSTON, April 23.

MACHINE tool inquiries continue in moderate volume, but actual sales are few, and consist mostly of single tools of relatively small monetary value. There are enough prospective orders in hand to make an active market should a buying movement really start. New England tool makers generally are fairly busy with orders from the West and South and for export, but there are some with few orders on their books and operating on part time.

Among New England States, Massachusetts and Connecticut show signs of industrial improvement, particularly in relation to metal-working plants. In Connecticut there is an actual scarcity of skilled operators in the metal-working trades, and although there is a surplus in Massachusetts, it is much smaller than it was two or three months ago. In Maine, machine shops are working on part time. In Rhode Island, the machinery trades contribute to unemployment. Conditions in New Hampshire and Vermont are about the same as a month ago, spotty, with part time in most shops and foundries.

United States Gypsum Co., Chicago, has awarded contract for design and construction of new plant in Charlestown district, Boston, to Morton C. Tuttle Co., of that city. It will consist of several units for production of complete line of Gypsum company products for distribution in Eastern territory. Raw materials will be brought by boat from Canadian mines of company and apparatus for unloading will be installed. Construction has been started and it is expected to have plant in production in eight months. Total cost is estimated at about $2,000,000.

Work has been started by Pittsfield Oil Co., 105 Deering Street, Pittsfield, Mass., on a one-story repair shop, 44 by 29 ft.

J. C. and J. H. Stevens, 477 Congress Street, Portland, Me., architects close bids May 7 on shops, garage and other improvements for Portland and Water District, 16 Casco Street.

N. R. Willard, 402 Massachusetts Avenue, Arlington, Mass., architect, is taking bids on a two-story, 68 x 90 ft., manufacturing and storage plant for Cambridge Salvage &

The Crane Market

INQUIRY for overhead traveling cranes continues rather limited and only a small volume of sales is reported. The locomotive crane field, however, is still quite active. The list of five locomotive cranes from the Boston & Maine Railroad closed last week and the list of Dwight P. Robinson & Co. for export to Argentina is still pending. There are a number of inquiries for single locomotive cranes both new and used.

Among recent purchases are:

Day & Zimmerman, Inc., Philadelphia, 15-ton crawl-tread locomotive crane from Browning Crane Co.

Erie Railroad, New York, 30-ton, 65-ft. span, 4-motor traveling gantry crane from Toledo Crane Co.

Otis Elevator Co., Yonkers, N. Y., 15-ton hand power crane from middle western builder.

H. H. Wiggin Lumber Co., Boston, reported to have closed on electric gantry crane.

Black Clawson Co., paper mill machinery, Hamilton, Ohio, 20-ton, 54-ft. span overhead crane with 5-ton auxiliary from Niles Crane Corporation.

Missouri Rolling Mill Corporation, St. Louis, 5-ton, 80-ft. span electric traveling crane from Niles Crane Corporation.

Atwell, Gustin & Morris, New York, 7½-ton motor truck crane from Browning Crane Co.

Boston & Maine Railroad, Boston, five 15-ton locomotive cranes from Link-Belt Co.

Koppers Construction Co., Pittsburgh, two ¾-cu. yd. bucket handling, 56-ft. span cranes, one each for Brooklyn and Philadelphia plants, from Cleveland Crane & Engineering Co.

Reuter Brothers, Chicago, 5-ton, 3-motor, electric crane from an unnamed bidder.

Supply Co., 91 Broadway, that city. Handling equipment is required.

American Gill Screw Co., Euclora Street, Providence, R. I., will start work at once on a one-story, 40 x 82 ft., addition.

Bids closed last week for a one-story mill construction and a three-story and basement, 75 x 105 ft., addition for Collyer Insulated Wire Co., North Main Street, Pawtucket, R. I. Monahan & Meikle, Main Street, Pawtucket, are architects.

Work has been started on a two-story, 40 x 1000-ft. automobile repair shop for Karl A. Karjalainen, 23 Greenwood Avenue, Wollaston district, Quincy, Mass. R. B. Whitten, 101 Tremont Street, Boston, is architect.

W. C. St. Jacques has purchased property of Cape Cod Ship Building Co., at Wareham, Mass., part of which has been occupied by Hayden Cranberry Machinery Co. It is understood alterations will be made for manufacturing purposes. Details are lacking.

Boston & Maine Railroad Co. is to move most of its metal-working equipment at Fitchburg car repair shop to Concord, N. H. and Billerica, Mass., shops. Carwheel work will be continued at Fitchburg.

Atlantic & Pacific Fish Co. has placed orders for three steel fishing trawlers from Bath Iron Works, Bath, Me. Fairbanks Morse Co. will furnish Diesel propulsion and auxiliary equipment at a cost of $100,000.

Philip H. Duprey, Worcester, Mass., has purchased a local five-story manufacturing plant and several smaller structures with 85,098 ft. of land which will be developed for Worcester Lunch Car Co.

Paine, Webber & Co., Boston, bankers, have purchased Veeder Mfg. Co., Hartford, Conn., counting machines and measuring devices, and Root Co., Bristol, Conn., counting and adding devices and hardware specialties. It is planned to consolidate companies and to increase manufacturing facilities.

Boston Ice Co., 110 State Street, Boston, subsidiary of American Ice Co., Philadelphia, is completing plans for one-story ice-manufacturing plant at Dorchester, to cost about $150,000 with equipment. C. L. Weir, 41 East Forty-second Street, New York, engineer for Knickerbocker Ice Co., affiliated organization, is in charge. Parent company has begun work on a similar plant in Cambridge district.

Brown Co., Berlin, N. H., operating paper and pulp mills, and hydroelectric power plants, is disposing of preferred stock issue to total $10,000,000, a portion of proceeds to be used for expansion. H. J. Brown is president.

Collyer Insulated Wire Co., 249 North Main Street, Pawtucket, R. I., manufacturer of electric wire and cables, has plans for a three-story addition, 83 x 108 ft., to cost approximately $100,000 with equipment. Monahan & Miekle, 255 Main Street, are architects.

American Radiator Co., 40 West Fortieth Street, New York, has taken over property at East Springfield, Mass., totaling 10,000 sq. ft., for a new factory branch and distributing plant.

Robert Gair Co., 420 Lexington Avenue, New York, manufacturer of paper boxes and containers, has begun work on a power house at Montville, Conn., to cost about $45,000 with equipment.

Hedstrom Union Co., Gardner, Mass., manufacturer of infant and juvenile vehicles, parts, etc., is having plans drawn for a three and four-story addition, 60 x 132 ft., and 40 x 60 ft., to cost close to $135,000 with equipment. G. A. Johnson, 16 Norwich Street, Worcester, Mass., is architect.

Lynn Gas & Electric Co., Lynn, Mass., has awarded general contract Turner Construction Co., 178 Tremont Street, Boston, for steam power plant, to cost in excess of $400,000 with equipment. Stone & Webster, Inc., 49 Federal Street, Boston, is consulting engineer.

New Home Needle Co., Orange, Mass., recently organized with capital of 1000 shares of stock, no par value, by Leslie M. Dill, 100 Milk Street, Boston, and associates, is said to be planning early operation of local plant.

R. H. Mangan and Frederick Whitaker, co-partners in Mangan Co., 45 Richmond Street, Providence, have purchased the factory of the Metallic Co., 150 Chestnut Street, Providence, and will operate it under name of F. Whitaker & Co. Company will manufacture church metalware, using sheet brass and small amounts of precious metals.

Public Service Co. of New Hampshire, Nashua, plans construction of two new power transmission lines, from Goffstown to Nashua, and from Hillsborough to Henniker.

Gulf States

BIRMINGHAM, April 23.

FIFTEEN acres has been acquired by Beaumont Export & Import Co., Beaumont, Tex., in Vanwormer industrial section, for construction of lumber mill with electrically-operated machinery, to cost about $80,000.

Roberts & Grentner Properties, Inc., Seybold Building, Miami, Fla., will erect a cold storage and refrigerating plant, to cost about $400,000 with equipment. Brewer & Co., Twenty-fifth Avenue, are architects and engineers.

Shell Pipe Line Co., Shell Building, St. Louis, is said to be planning a new pumping station at Westbrook, near Colorado, Tex., to cost more than $45,000 with equipment.

Fort Worth Well Machinery & Supply Co., 63 Jennings Street, Fort Worth, Tex., A. H. Herdman, president, manufacturer of oilwell equipment and supplies, has acquired plant and property of Fort Worth Drilling Tool Co., 2301 South Main Street, manufacturer of similar equipment. Plans are under way for expansion.

Stamford & Western Gas Co., Stamford, Tex., recently formed under Delaware laws to construct and operate a natural gas pipe line and system, is disposing of bond issue of $1,100,000, a portion of proceeds to be used for pipe line and other construction. System will extend from point near Wichita Falls, Tex., to Stamford, Rotan, Hardeman, Tex., and vicinity.

Swift & Co., Chicago, meat packer, have acquired plant of Florida Cotton Oil Co., Jacksonville, Fla., and adjoining property. Plans are under way for expansion, including new vegetable oil mill; a one-story cottonseed oil mill is planned for later date. Expansion will cost more than $175,000 with equipment.

Abilene Plumbing Supply Co., Inc., Abilene, Tex., will erect a one-story storage and distributing plant, 50 x 100 ft., at Midland, Tex., with pipe shop and other divisions.

Texas Power & Light Co., Dallas, Tex., has acquired plant and property of Corsicana Power & Light Co., Corsicana, Tex., and plans expansion and improvements, including transmission line construction.

Beaumont Independent School District, Beaumont, Tex., plans installation of manual training equipment in three-story and basement high school, for which plans will soon be drawn. A bond issue of $900,000 has been approved for structure; also a fund of $240,000 has been authorized for new unit at present high school. M. E. Moore is superintendent of schools.

Board of Public Works, Dallas, Tex., plans installation of pumping station and water purification plant in connection with extensions and betterments in municipal waterworks, to cost more than $1,000,000. Fuller & McClintock, 170 Broadway, New York, are engineers.

Texas-Louisiana Power Co., Fort Worth, Tex., is said to be planning construction of steam-operated electric power house near Yoakum, Tex., to cost about $150,000 with equipment.

Breckenridge Foundry & Supply Co., Breckenridge, Tex., recently organized by L. S. Pelphrey, Breckenridge, and associates, plans early operation of local plant. C. A. Davis, Breckenridge, is also interested in company.

E-Z Opener Bag Co., Decatur, Ill., will soon take bids for new one-story plant, 280 x 600 ft., at Tuscaloosa, Ala., for manufacture of special paper bags and containers, to cost more than $750,000 with equipment. William E. Spink, Pere Marquette Building, New Orleans, is architect.

United Salt Co., Houston, Tex., care of B. V. Christie & Co., Dallas, is arranging for sale of stock to total about $500,000, proceeds to be used for a new plant near Houston for production of sulphurized salt blocks for cattle.

Pure Oil Co., Esperson Building, Houston, Tex., is said to be planning extensions and improvements in refinery in Smith Bluffs section, with additional equipment.

Texas Signal Co., 917 Kirby Building, Dallas, Tex., has been formed to manufacture, distribute and lease automotive safety and advertising devices, including tail-lights for automobiles and other vehicles. It contemplates establishment of plants at Milwaukee and Chicago, and will be in market for materials and equipment from time to time.

Philadelphia

PHILADELPHIA, April 23.

PLANS have been filed by Nice Ball Bearing Co., Thirtieth Street and Nicetown Avenue, Philadelphia, for a one-story addition on Henry Street, to cost about $150,000 with equipment. William R. Sauter, Otis Building, is engineer.

Nevin Bus System, 1903 Market Street, Philadelphia, is reported to be planning a motor bus service, repair and terminal building, to cost in excess of $150,000 with equipment.

Belgrade Wagon Works, Inc., Belgrade and Cambria Streets, Philadelphia, manufacturer of automobile bodies, etc., has awarded general contract to Delrite Contracting Co., 1532 East Berks Street, for a one-story shop.

Paul J. Gramigna, head of Paul Gramigna & Sons, 129 Walnut, Philadelphia, ship chandlers, has acquired plant of Pioneer Iron Works, Second and Chancellor Streets, for expansion. Joseph R. Williams, formerly head of Pioneer company, has organized Pioneer Marine Repairs, Inc., and will operate a main works at Hancock and Naudain Streets.

Conveying and elevating equipment, unloading and other apparatus will be installed in four-story and basement storage and distributing plant, 50 x 235 ft., to be erected by Frankford Grocery Co., Unity and Penn Streets, Philadelphia, to cost close to $200,000. W. E. S. Dyer, Land Title Building, is architect and engineer.

Hemphill & Co., Pawtucket, R. I., manufacturer of knitting machinery and parts, has leased factory at 2625-29 North Lawrence Street, Philadelphia, for a new factory branch and assembling plant.

Goldfine Brothers, 350 North Second Street, Philadelphia, operating a trucking business, have filed plans for a two-story motor truck service, repair and garage building, 75 x 200 ft., to cost about $130,000 with equipment.

Acme Coppersmithing & Machinery Co., 1024 Ridge Avenue, Philadelphia, will make extensions and improvements in plant at Berks and Hancock Streets, to cost more than $30,000.

Trenton Potteries Co., North Clinton Avenue, Trenton, N. J., manufacturer of sanitary ware, is arranging an expansion and improvement program to cost about $400,000, including installation of tunnel kiln, kiln cars, and other equipment.

Samuel M. Langston Co., Sixth and Jefferson Streets, Camden, N. J., manufacturer of paper-box making machinery, has awarded general contract to Fearn & Voegtlin, 223 North Forty-first Street, for a one-story addition, 40 x 100 ft., to cost close to $40,000 with equipment. Lackey & Hettel, 5 Hudson Avenue, are architects.

Linde Air Products Co., 30 East Forty-second Street, New York, has awarded a general contract to F. H. Clement & Co., Bethlehem, Pa., for a one-story plant at Allentown, Pa., to cost about $100,000 with equipment.

Department of Property and Supplies, Harrisburg, Pa., will receive bids on May 8 for engineering and laboratory supplies for fiscal year beginning June 1, Schedule D.

H. M. Fredericks Co., Lock Haven, Pa., operating an electrical equipment works for armature rewinding, etc., has approved plans for a one-story addition, 60 x 65 ft., to cost about $18,000 with equipment.

Harrisburg Light & Power Co., Harrisburg, Pa., has approved an appropriation of $2,600,000 for an expansion and improvement program, including additions to power stations, transmission lines, etc.

Officials of Pennsylvania Power & Light Co., Allentown, Pa., are organizing five subsidiary light and power companies to operate in Columbia County, and plans early construction of transmission lines and power stations.

Fire, April 15, destroyed coal breaker and colliery plant of Archbald Coal Co., Archbald, near Scranton, Pa., known as Whip-Poor-Will Colliery, with loss in excess of $125,000 including equipment.

Pittsburgh

PITTSBURGH, April 23.

THE Westinghouse Electric & Mfg. Co., has begun to close against its regular quarterly list, but machine tool business otherwise runs to occasional single tool purchases and repair items. The trade draws encouragement chiefly from the fact that inquiry is fairly active and the possibility that several steel plant betterments may bring out orders for machine tools. The Pittsburgh Steel Co. has appropriated $2,000,000 for a plant and a like sum or more is to be expended at the Butler works of the American Rolling Mill Co. The American Bridge Co. is planning to convert its foundry at Ambridge, Pa., into a beam shop and may buy some equipment aside from that brought from other plants. The Weirton Steel Co. still is making plant changes.

Alexander Laughlin & Co., Pittsburgh, are taking prices for estimating purposes on considerable equipment wanted in connection with the rehabilitation of a steel company for which the firm is consulting engineer. Purchase by the Pennsylvania Railroad of the site of the Mackintosh-Hemphill Co., at the foot of Twelfth Street, Pittsburgh, probably means erection of another plant, either at Wooster, Ohio, or Aspinwall, Pa., where the company has vacant property, but definite plans have not yet been developed.

Plans have been filed by Union Safety Appliance Co., Pittsburgh, manufacturer of mining equipment, for a new plant to cost close to $100,000 with machinery.

Beaver Valley Water Co., 1006 Seventh Avenue, Beaver Falls, Pa., will soon take bids on general contract for a one and two-story shop, with automobile service and garage facilities, to cost more than $65,000. J. E. Martsolf, 512 Third Avenue, New Brighton, Pa., is consulting architect.

Board of Education, Masontown, Pa., is said to be planning installation of manual training equipment in two-story senior and junior high school to cost about $120,000. H. W. Altman, Fayette Title & Trust Building, Uniontown, Pa., is architect.

Pennsylvania Railroad Co., Pennsylvania Station, Pittsburgh, has approved plans for produce yards, freight terminal, shop facilities and other mechanical buildings between Eleventh and Twenty-fourth Streets, to cost $5,500,000.

City Council, Martinsburg, W. Va., in cooperation with Chamber of Commerce, is said to be planning installation of municipal electric light and power plant. P. W. Leiter is member of committee in charge.

Linde Air Products Co., 30 East Forty-second Street, New York, manufacturer of industrial oxygen, gases, welding apparatus, etc., is said to have plans for new works at Charleston, W. Va., to cost more than $500,000 with equipment. It is understood that Stone & Webster, Inc., Boston, engineer will be in charge of project.

Viscose Co., of America, Inc., Marcus Hook, Pa., plans construction of power plant, machine shop and other units in connection with rayon mill at Meadville, Pa. Entire project will cost more than $2,000,000. Ballinger Co., Twelfth and Chestnut Streets, Philadelphia, is architect and engineer.

United Motors Service Corporation, 5114 Liberty Avenue, Pittsburgh, subsidiary of General Motors Corporation, Detroit, has leased building at 418 Roup Street, totaling 10,000 sq. ft. of floor space, for a branch service, repair and sales building.

Board of Education, Parkersburg, W. Va., is considering installation of manual training equipment in new junior high school to cost more than $200,000. Warne, Tucker, Silling & Hutcheson, Masonic Temple, Charleston, W. Va., are architects.

Ellwood Safety Appliance Co., Ellwood City, Pa., has been organized to manufacture safety appliances and kindred equipment, but for the present will specialize in protection of workmen's feet. Major operations will be done under contract. Equipment and materials have been purchased.

Chicago

CHICAGO, April 23.

AN inquiry for a small list of tools by the Rock Island is the only encouraging feature in this market. The machines needed by this railroad include 15 floor grinders with 12 x 3 x 1¾-in. wheels, a duplex wheel grinder 3 x 12 x 1-in., a 2½-in. universal turret screw machine, an 18-in. selective-head engine lathe and a 20-in. engine lathe. The Santa Fe list is dormant but the Union Pacific has closed for several of its pending items. The Louisville & Nashville has purchased a driving wheel lathe. A forge company in Chicago has ordered a 22-in. x 12-ft. engine lathe and a local tobacco company has placed a 16-in. lathe.

Orders are in no larger volume than in the first week of April when they dropped suddenly following the lessened demand by farm implement and tractor manufacturers. The Dallas Brass & Copper Co., Chicago, has ordered a scrap compressor from Galland-Henning Mfg. Co., Milwaukee.

Illinois Copper & Wire Co., 217 Maplewood Avenue, Chicago, will build a one-story factory addition, 48 x 100 ft. to cost $15,000.

By-Products Coke Corporation, 310 South Michigan Avenue, Chicago, will build a two-story brick boiler house, 52 x 111 ft., to cost $155,000. Sargent & Lundy, 140 South Michigan Avenue, are architects.

Chicago, Burlington & Quincy Railroad, 547 West Jackson Boulevard, Chicago, will build a power house, 49 x 62 ft., to cost $100,000.

Bridges & Turivas, dealers in iron and steel scrap, will move their office May 1 from 10 South La Salle Street, Chicago, to 139th Street and Seeley Avenue, Blue Island, Ill.

King Machine Works, 506 Evans Street, Peoria, Ill., formerly King Light & Machine Works, manufacturer of tools, dies and special light machinery, is building a $40,000 addition to its plant.

Dubin & Eisenberg, 14 West Washington Street, Chicago, architects, will soon take bids on general contract for a two-story automobile service, repair and garage building, to cost close to $100,000 with equipment.

Badger Auto Enclosure Co., 3733 Lincoln Avenue, Chicago, has leased one-story building, 75 x 100 ft. at Catalpa Street and Broadway, for new plant for increased production.

Crane Co., Chicago, is having plans drawn for an addition to plant on South Kedzie Avenue, three-stories, 80 x 500 ft., to cost more than $450,000 with equipment. Graham, Anderson, Probst & White, 80 East Jackson Boulevard, are architects.

City Council, Benson, Minn., is considering installation of municipal electric light and power plant to cost $163,000. Arthur L. Mullergren, Gates Building, Kansas City, Mo., is engineer.

Public Service Co. of Colorado, Gas and Electric Building, Denver, will soon take bids for a two-story equipment storage and distributing plant, with repair department, and service and garage unit, 270 x 280 ft., to cost more than $250,000 with equipment.

Board of Education, Great Falls, Mont., plans installation of manual training equipment in three-story and basement high school to cost $900,000, for which bids will be asked on general contract in June. Bird & Van Teylingen, Great Falls, are architects; Croft & Boerner, 1004 Marquette Avenue, Minneapolis, Minn., are associate architects.

Cooper Mfg. Co., Marshalltown, Iowa, manufacturer of automobile parts and equipment, is reported planning a branch factory at Cedar Rapids, Iowa, to cost approximately $50,000.

Northwestern Light & Power Co., Cherokee, Iowa, plans extensions and betterments in steam-operated electric power plant at Peterson, Iowa, including installation of 600-hp. Diesel engine unit and auxiliaries.

J. W. Hoodwin Co., 2949 West Van Buren Street, Chicago, manufacturer of advertising novelties, has plans for a four-story factory, 75 x 100 ft., to replace structure recently destroyed by fire, to cost close to $100,000 with equipment. David Saul Klafter, 64 West Randolph Street, is architect.

Board of Education, Fairmont, Minn., contemplates installation of manual training equipment in a three-story high and grade school to cost $300,000, for which bids will be asked soon on general contract. G. Pass & Son, Eckle Building, Mankato, Minn., are architects.

Northern States Power Co., Minot, N. D., has plans for extensions and improvements in steam-operated electric power plant, with installation of additional equipment, to cost $80,000.

Fox & Fox, 38 South Dearborn Street, Chicago, architects, have asked bids on general contract for a five-story automobile service, repair and garage building, to cost in excess of $400,000 with equipment.

Cincinnati

CINCINNATI, April 23.

DEMAND for machine tools, indicated by sales the past week, has tapered slightly and April is likely to close with bookings not much more than about 75 per cent of those in March. A few plants are having a very prosperous month from the standpoint of orders, but the majority of companies which reported a large volume of business last month have not done so well during April. However, operations in the larger machine tool shops in this district are being maintained at a fairly good rate on account of the accumulation of orders in the last 60 days, and little change is contemplated in the immediate future. Manufacturers of electrical tools state that sales have been holding up well, particularly in the automotive industry.

Columbia Machine Tool Co., Hamilton, Ohio, has acquired business of Midwest Locomotive Works, Spring Grove Avenue and Alabama Street, Cincinnati, which will be removed to Hamilton.

Procter & Gamble Co., Cincinnati, soap manufacturer, will begin immediately erection of a plant at Baltimore, Md., to cost approximately $4,000,000 including machinery.

Bids will soon be asked by Board of Directors, Battelle Memorial Institute, Columbus, Ohio, through Otto C. Darst, 150 East Broad Street, architect, for two research buildings, each three stories and basement, 60 x 150 ft., with machine shops, laboratories, electric crane, etc., to cost approximately $500,000 including machinery.

A company is being organized by Cincinnati interests under direction of John B. Hollister, Cincinnati, attorney, with capital of $500,000, to construct and operate a plant for manufacture of all-metal airplanes. Initial works will include parts and assembling departments. Hulbert Taft. F. H. and William H. Chatfield, and James Coombe, all of Cincinnati, will head new organization.

Frampton Electrical Co., Dayton, Ohio, manufacturer of electrical equipment, is planning to rebuild plant destroyed by fire April 13, with loss estimated at more than $100,000 with equipment.

Air Corps, Material Division, Wright Field, Dayton, Ohio, is asking bids until April 30 for aircraft supplies, including yoke assemblies, rack assemblies, bomb hoist assemblies, shackle assemblies and handle assemblies, circular 302; and for 36 mount assemblies, circular 303.

Dayton Power & Light Co., Dayton, Ohio, subsidiary of Columbia Gas & Electric Co., Cincinnati, is planning an expansion program to cost close to $2,000,000, including addition to power plant, extensions in transmission lines, power substations and extensions in gas system.

Union Carbide & Carbon Corporation, 30 East Forty-second Street, New York, has purchased Memphis Oxygen Co., Memphis, Tenn., manufacturer of industrial oxygen, gases, etc., and will continue operations as a subsidiary. Plans are under way for expansion.

Officials of Memphis Power & Light Co., Memphis, Tenn., are planning organization of Memphis Natural Gas Co., to construct and operate pipe line and compressor plants. Initial pipe line will be built from Louisiana oil fields to Memphis and vicinity, and is reported to cost about $4,000,000.

Diamond Ice Co., 717 Cooper Street, Knoxville, Tenn., will erect a new plant to cost close to $150,000 with equipment.

Edward J. Bosler, Tyler Hotel, Louisville, is at head of project to construct and operate a three-story and basement automobile service, repair and garage building, to cost more than $300,000 with equipment.

Cleveland

CLEVELAND, April 23.

DEMAND for machine tools continues moderate. The placing of parts orders by the Ford Motor Co. is bringing out some machinery business and that is about the only activity in the automotive field at present. The Dana Mfg. Co., Toledo, is still buying machinery for its new plant under construction to make shock absorbers and during the week purchased several drilling and broaching machines and some toolroom equipment. A Detroit company is in the market for a number of tools to be used in making pumps for Ford cars. The National Malleable & Steel Castings Co., Cleveland, purchased a 42-in. vertical boring mill for its Sharon plant.

Plans are being drawn for one-story addition to plant of United States Air Compressor Co., 5300 Harvard Avenue, Cleveland, 140 x 150 ft., to cost about $65,000 with equipment. G. S. Rider Co., Century Building, is architect and engineer.

American Vitrified Products Co., Toronto, Ohio, will rebuild portion of Plant No. 14 destroyed by fire April 18, with loss reported at close to $200,000 with equipment.

Wilson Mfg. Co., Niles, Ohio, manufacturer of wire goods, will rebuild portion of plant destroyed by fire April 15, with loss reported at $25,000 including equipment. Western Reserve Lumber Co., will also rebuild mill on adjoining site destroyed by same fire.

Vermont Marble Co., 9508 Quincy Street, Cleveland, has asked bids on general contract for a new mill for cutting, grinding, polishing, etc., one story, 80 x 280 ft., with two-story office, 40 x 100 ft., to cost about $125,000 with equipment. H. K. Ferguson Co., Hanna Building, is engineer. Headquarters are at Proctor, Vt.

Pennsylvania-Ohio Edison Co., Youngstown, Ohio, is arranging for an increase in common stock to 2,000,000 shares, no par value, a portion of fund to be used for expansion, including purchase of controlling interest in Northern Ohio Power Co., Canton, Ohio, with extensions in transmission lines.

Board of Education, Cleveland, has plans for one-story foundry for vocational instruction, to cost about $40,000 with equipment. G. M. Hopkinson, Auditorium Building, is architect.

Wellman-Seaver-Morgan Co., Cleveland, has appointed following sales distributers for its new Supertest gate and globe valves: Acme Well Supply Co., 136 Liberty Street, and Eastern Steam Specialty Co., 270 Lafayette Street, New York; Basil S. Burgess, Coal Exchange Building, Huntington, W. Va.; Walter G. Heacock, Detroit; Steam Equipment Mfg. Co., Pittsburgh; R. George Ward, 809 Harrison Building, Philadelphia.

Ohio Adsign Corporation, 2014 East 105th Street, Cleveland, has been organized to manufacture electric signs for interior use. Company does its own assembling and is in the market for electrical materials from time to time.

Buffalo

BUFFALO, April 23.

ARRANGEMENTS have been made by McQuay-Norris Co., Cooper Avenue, St. Louis, manufacturer of piston rings, etc., for purchase of King Quality Products, Inc., 254 Rano Street, Buffalo, manufacturer of nuts, bolts, automotive parts and kindred specialties, a subsidiary of King Mfg. Co., same address, manufacturer of radio apparatus. Purchasing company will remove acquired interest to St. Louis, where production will be concentrated. King company will use available space for manufacture of additional products kindred to radio equipment. E. E. Eckler, formerly manager Rock Island Mfg. Co., Rock Island, Ill., has been elected vice-president and general manager of King Mfg. Co.

International Oxygen Co., 795 Frelinghuysen Avenue, Newark, N. J., manufacturer of industrial oxygen, welding apparatus, etc., has awarded general contract to Kellogg Structural Steel Co., 31 Stone Street, Buffalo, for new two-story plant at Buffalo, to cost more than $75,000 with equipment.

Rochester Gas & Electric Co., Rochester, N. Y., will make extensions and improvements in steam-operated electric power plant, including installation of 5000 kw. turbo-generator unit and accessory equipment.

Rochester Wire Fence Co., Inc., Rochester, recently organized by Howard S. Thomas, 38 Berkshire Street, and associates, with capital of $10,000, plans operation of local factory for manufacture of wire fencing, posts, and kindred products.

Cortland Traction Co., Cortland, N. Y., has secured permission to furnish light and power service at Cortlandville, Preble, Homer and vicinity, and plans installation of equipment, including transmission lines.

Camillus School District No. 2, Warners, N. Y., is said to be planning installation of manual training equipment in a high school unit to cost $110,000, to replace structure recently destroyed by fire. C. W. Clark, Cortland, N. Y., is architect.

Certain-Teed Products Corporation, 100 East Forty-second Street, New York, manufacturer of roofing products, etc., is planning increased production at plant of Beaver Board Companies, Inc., Beaver Road, Buffalo, specializing in manufacture of wallboard products.

International Milling Co., 120 Childs Street, Buffalo, has plans for an addition to cost $100,000 with conveying, unloading and other equipment.

Houser Elevator Co., Syracuse, N. Y., is preparing to remove to Manlius, N. Y., and will occupy former plant of E. U. Scoville Co., which is being remodeled. Company will maintain a factory service station at Syracuse.

Indiana

INDIANAPOLIS, April 23.

PLANS have been authorized by City Council, Kendallville, for an addition to municipal electric light and power plant, to cost upward of $50,000. Froelich & Emory, Toledo Trust Building, Toledo, Ohio, are engineers.

Bucyrus Co., West Decker Road, Evansville, manufacturer of dredging machinery and other heavy equipment, has awarded general contract to International Steel & Iron Co., Edgar Avenue, for a one-story and basement addition, 65 x 180 ft., to cost about $60,000 with equipment. Headquarters are at South Milwaukee, Wis.

Eaglesfield-Link Co., Brazil, recently organized by R. D. Eaglesfield, Brazil, and associates, is said to have plans for a one-story factory for manufacture of molding machines and parts, to cost about $30,000 with equipment.

Board of Education, Sharpsville, is said to be planning installation of manual training equipment in a two-story high school to cost $140,000, to replace a structure recently destroyed by fire. Elmer Dunlap & Co., Kokomo, are architects.

Electric & Mfg. Co., Kendallville, has plans for new one-story factory for manufacture of automatic electric water heaters and parts, to cost about $40,000 including equipment.

Board of Education, South Bend, plans installation of manual training equipment in new Madison junior high school, two stories and basement, to cost $600,000 with equipment. Revised plans are being prepared by Austin & Shambleau, 111 North Fayette Street, architects.

Atlas Plywood Co., Bloomington, will build a new one-story plant to cost about $80,000 with equipment. Headquarters are at 31 St. James Avenue, Boston.

Ovens, power equipment and other apparatus will be installed in addition to plant of Omar Baking Co., East Sixteenth Street, Indianapolis, to cost $60,000 including improvements in present bakery. W. E. Long Co., 155 North Clark Street, Chicago, is architect.

Pierce Governor Co., Anderson, Ind., is finishing an addition, 50 x 75 ft., which will practically double its plant capacity.

Lucey Slicing Machine Corporation, 334 East Colfax Avenue, South Bend, has been formed to take over Lucey Slicing Machine Co. and will manufacture electric meat slicing machines. It has contracted with General Electric Co. for ⅛ and 1/16-hp. motors and will purchase castings locally. Monel metal in sheets and bars, bronze gears, silent chain drives, sprockets, etc., will be purchased from time to time.

Detroit

DETROIT, April 23.

BOARD OF EDUCATION, Muskegon, Mich., has plans for extensions and improvements in Hackley Manual Training School to cost $70,000. F. Forster, Lyman Block, is architect.

Grand Rapids Gas & Electric Co., Grand Rapids, Mich., plans rebuilding portion of power house recently destroyed by fire, with loss reported at close to $150,000 including equipment.

Pontiac Sheet Metal & Roofing Co., Pontiac, Mich., recently organized, will occupy a new local building for production of general line of sheet metal products. It is a subsidiary of Glendon A. Richards Co., Grand Rapids, Mich., and is affiliated with Flint Cornice & Roofing Co., Flint, Mich., and Michigan Sheet Metal Works, Lansing.

Kalamazoo Vegetable Parchment Co., Kalamazoo, Mich., has awarded general contract to O. F. Miller Construction Co., Pratt Building, for two and one-half story addition, to cost about $900,000 with machinery. Billingham & Cobb, Pythian Building, are architects. Jacob Kindlebarger is president.

Durant Motors, Inc., Lansing, Mich., has awarded general contract to H. G. Christman Co., Stevens Building, Detroit, for additions to local plant, to cost $700,000 with equipment. Headquarters are at 250 West Fifty seventh Street, New York.

Officials of Rich Steel Products Co., Battle Creek, Mich., have reorganized with incorporation of new company of same name capitalized at $2,500,000. Increased output will be carried out. George R. Rich will continue with company in official capacity.

Chevrolet Motor Car Co., Detroit, has awarded general contract to Everett Winters Co., 1651 East Grand Boulevard, for one-story addition to local plant, 400 x 800 ft. Albert Kahn, Inc., Marquette Building, is architect.

Florin Mfg. Co., Carson City, Mich., recently organized, has authorized plans for one-story factory for manufacture of a patented washing machine, including parts and assembling departments. Murt D. Smith, formerly of Portland, Mich., will be manager.

Consumers' Power Co., Jackson, Mich., is planning extensions in gas system, in connection with general expansion program, to cost more than $200,000.

AC Spark Plug Co., Flint, Mich., has completed plans for a three-story addition, to cost more than $50,000 with equipment. Wright & Nice, South Saginaw Street, are architects.

Pennsylvania Salt Mfg. Co., Widener Building, Philadelphia, will build an addition to plant at Wyandotte, Mich., to cost upward of $75,000 with equipment. C. M. Matson will be supervising engineer in charge.

Zima Sign Co., 9117 Joseph Campeau Avenue, Detroit, manufacturer of electric signs and displays, is planning installation of sheet metal working equipment.

Marvel Carbureter Co., Flint, Mich., has purchased Wheeler-Schebler Carbureter Co., Indianapolis.

Huron Gray Iron Foundry, Ypsilanti, Mich., is building new plant at 824 Railroad Street, Ypsilanti, which will be ready for occupancy May 1. Arthur A. Corbeill is president and general manager.

Milwaukee

MILWAUKEE, April. 23.

A MODERATE run of orders for one or two machines is reported by most shops, sources being widely diversified, with no single line of industry predominating. Acquisition of new equipment is limited to urgent needs, and replacement business probably accounts for the major share of orders. Employment conditions are improving, with the metal-working industries showing the best absorption and building trades ranked second.

Atlas Engineering Co., 3038 Galena Street, Milwaukee, has completed purchase of Topp-Stewart Tractor Co., Clintonville, Wis., manufacturer of quadruple drive tractors, and on May 1 moves its Milwaukee operation to Clintonville, manufacturing its line of conveyors, loaders and bucket elevators, and continuing production of Topp-Stewart tractors under Atlas trade name. Plans are being drawn for a one-story addition, 25 x 199 ft. for manufacturing and storage. Atlas company some time ago sold its plaster and mortar mixer business to Chain Belt Co., Milwaukee, retaining its conveyor manufacturing business. A sales office and warehouse will be continued in the old quarters in Milwaukee, in charge of H. W. Zimmermann, president. C. W. Zimmermann is vice-president, D. J. Rohrer, Clintonville, treasurer and Arthur Nickel, secretary.

George J. Meyer Mfg. Co., 598 Clinton Street, Milwaukee, manufacturer of bottling machinery, on April 21 took possession of property of Worthington Pump & Machinery Corporation in Cudahy, and besides moving equipment of present plant to newly acquired works, will install considerable additional machinery to effect an increase of 100 per cent in capacity.

Great Lakes Coal & Dock Co., Minneapolis, Minn., has engaged Roland C. Buck, consulting engineer, Superior, Wis., to design a new screening plant at its Superior docks, to cost about $50,000. Contracts are expected to be let about May 15 or June 1.

Standard Oil Co. of Indiana, 910 South Michigan Avenue, Chicago, will invest about $75,000 in construction and equipment of a distributing plant, warehouse, garage and work shop at Wisconsin Rapids, Wis., to be under supervision of H. E. Bruce, district manager, 2 Copeland Avenue, LaCrosse, Wis. R. N. Allen, company architect, is completing plans.

Edward Boehmer, Mayville, Wis., has placed general contract with Immel Construction Co., Dana Building, Fond du Lac, Wis., for erection of a brick and steel automotive building, to cost $40,000 with shop and other equipment.

Unit Corporation of America, Milwaukee, representing the recent consolidation of Obenberger Forge Co. and Dallmann Machine & Mfg. Co., both of Milwaukee, has acquired plant and business of Fuller & Sons Co., Kalamazoo, Mich., manufacturer of automotive gears and transmissions. Negotiations are about completed for purchase of a Wisconsin company manufacturing gasoline engines, forming a complete manufacturing unit producing motors, transmissions and differentials for automotive industry. W. H. Schmidt is president.

Pacific Coast

SAN FRANCISCO, April 18.

PLANS are being drawn for a new plant for Pacific Mfg. Co., Santa Clara, Cal., manufacturer of sash, doors and other millwork products, one story, 385 x 486 ft., to cost about $220,000 with equipment. Machinery will be electrically operated. A boiler plant will also be built. Hamm, Grant & Bruner, Inc., Ferguson Building, Los Angeles, is architect.

Board of Education, Phoenix, Ariz., is considering installation of manual training equipment in new high school unit, for which appropriation of $300,000 has been arranged. Lescher & Mahoney, First National Bank of Arizona Building, are architects.

International Harvester Co., San Francisco, has leased a two-story factory, 100 x 140 ft., to be erected at Fifteenth Street and Potrero Avenue, to cost about $50,000, for a new factory branch and distributing plant. Headquarters are at 606 South Michigan Avenue, Chicago.

Great Western Power Co., 530 Bush Street, San Francisco, has acquired plant and property of Quincy Electric Light & Power Co., Quincy, Cal., and plans expansion in that section, including transmission line construction.

Gate City Co., Mesa, Ariz., has approved plans for one-story ice-manufacturing plant, to cost about $45,000 with machinery.

Escalante Light & Power Co., Escalante, Utah, is considering plans for one-story steam-operated electric light and power house, to cost close to $50,000 with equipment. Local franchise has been asked.

Adcox Auto & Aviation School, Portland, care of Claussen & Claussen, Macleay Building, architects, will build two-story plant, 100 x 100 ft., to cost approximately $45,000.

City Council, Eugene, Ore., will ask bids in May for municipal hydroelectric power development in connection with Leaburg power project, including power plant, power dam, penstocks, etc. Station will have capacity of 210,000 hp. Project will cost $1,500,000, including transmission lines and power substations. Stevens & Koon, Spalding Building, Portland, are architects and engineers.

Atchison, Topeka & Santa Fe Railroad Co., Los Angeles, and 80 East Jackson Boulevard, Chicago, is reported contemplating a new ice-manufacturing and refrigerator car re-icing plant at Ashfork, Ariz., to cost more than $750,000 with machinery.

A. Pratt, care of Wolfe & Higgins, Realty Building, San Jose, Cal., architects, has plans for a one and two-story machine shop to cost about $23,000 with equipment.

Grays Harbor Railway & Light Co., Aberdeen, Wash., has plans for an addition to steam-operated electric generating plant, to cost about $1,200,000 with transmission lines.

W. R. Voorhees & Co., San Francisco and Seattle, are now representing Billings & Spencer Co., Hartford, Conn., manufacturer of wrenches, hammers, pliers, clamps, special forgings and machinery, in Montana, Colorado, Wyoming, Idaho, Utah, Nevada, Washington, Oregon, California, Arizona, New Mexico, and El Paso, Tex.

South Atlantic States

BALTIMORE, April 23.

PLANS are being completed by General Elevator Co., Bush and Ridgely Streets, Baltimore, manufacturer of passenger and freight elevators, for one-story addition, 22 x 140 ft., to cost more than $45,000 with equipment. W. S. Austin, Maryland Trust Building, is consulting engineer.

Hill & Tibbitts, 301 Fourteenth Street, N. W., Washington, local representative for Ford automobile, is considering a new three-story service, repair and garage building, to cost $200,000 with equipment.

Intercontinent Gas Corporation, 11 Broadway, New York,

M. W. Ditto, representative, has leased 50 acres at Lowmoor, Va., and plans construction of industrial gas plant to cost more than $5,000,000. Pipe lines will be built to Covington, Clifton Forge, Va., and vicinity. Company is affiliated in enterprise with Shenandoah Gas & Utilities Co., recently chartered under Virginia laws. Joseph M. Ligon is president of last noted company.

United States Engineer, Savannah, Ga., is asking bids until May 14 for one centrifugal dredging pump and spare parts, circular 123.

F. S. Royster Guano Co., Royster Building, Norfolk, Va., has plans for a one-story fertilizer manufacturing plant at Wilmington, N. C., to cost more than $60,000 with equipment. J. N. Waddell is company engineer in charge of erection.

Carolina Cement Co., Raleigh, N. C., R. C. Clark, secretary, is reported planning a new mill in vicinity of New Bern, N. C., to cost more than $1,500,000 with machinery. A power house and machine shop are proposed.

Signal Corps, Baltimore, is asking bids until May 16 for two 150-ft. steel radio towers, including hoisting winch, etc., circular 1.

Officials of Copeland Products, Inc., 630 Lycaste Avenue, Detroit, manufacturer of electric refrigerating equipment, have organized Copeland-Silica Gel Corporation in cooperation with officers of Davison Chemical Co., Garrett Building, Baltimore, with capital of 90,000 shares of stock, no par value, to manufacture refrigerators for domestic and commercial use, with silica gel method of refrigeration, controlled by Davison company. It is purposed to develop the Detroit works for new manufacture. George W. Mason and Edwin H. Brown of Copeland company are at head of new organization.

General purchasing officer, Panama Canal, Washington, is asking bids until May 14 for wire rope and cable, chain, magnet wire, motors, bolts, pipe fittings, metal valves and other mechanical products, Panama circular 1874.

Valley Springs School District, Asheville, N. C., is reported planning installation of manual training equipment in new high school, for which fund of $100,000 has been arranged. Ronald Green, County architect, is in charge.

Makepeace Mill Work Co., Sanford, N. C., has awarded general contract to Jewell-Riddle Co., Sanford, for new one-story mill, 60 x 150 ft., to cost upward of $40,000 with equipment. It will replace a works recently destroyed by fire.

Columbus Electric & Power Co., Columbus, Ga., has applied for permission to proceed with hydroelectric power development on Chattahoochee River in Troup and Heard Counties, with two generating stations near Maple Creek and Harrison Island. Plants will have rated output of about 40,000 kw., and will cost upward of $1,000,000 with transmission system.

City Council, Norfolk, Va., is completing plans for a municipal automobile service and repair building, to cost close to $80,000 with equipment.

Oil Seed Crushing Corporation, Baltimore, recently organized, has acquired local mill of Maryland Vegetable Oil Co., Fifteenth Street and Seventh Avenue, and is reported planning operation. M. C. Jones, Gettysburg, Pa., heads organization.

Canada

TORONTO, April 23.

MACHINE tool sales fell off the past week and were confined to single tools for replacement needs. At present only a small amount of business is coming from the automotive industry. The Chrysler Corporation of Canada, Windsor, Ont., has not fully completed its buying for an addition now under construction. While current demand is limited, a large volume of business is in prospect which is expected to stimulate sales during the next six weeks.

W. J. Fraser, 12 Sylvan Avenue, Toronto, is inquiring for a milling machine, small universal or bench type.

Service Stations, Ltd., which recently took over plant of John Woods, Ltd., Toronto, contemplates erection of an addition to its works on Coxwell Avenue, and has secured 2½ acre site. Company will manufacture gasoline pumps, air compressors, automatic lifts, lubricating outfits, steel drums, etc.

Lake Simcoe Ice Co., 102 Dupont Street, Toronto, will build a three and four-story addition to its plant, 48 x 138 ft., to cost $80,000.

St. Maurice Valley Corporation, Cap de la Madeleine, Que., is having plans prepared by its engineer, C. H. Jette, for a two-story machine shop, 40 x 100 ft., to cost $25,000.

Taylor Electric Co., 526 Adelaide Street, London, will build an addition, one story, 70 x 150 ft., to cost $40,000, for which tenders are now being received. Watt & Blackwell, Bank of Toronto Building, are architects.

C. D. Howe & Co., engineers, Whalen Building, Port Arthur, Ont., will call for bids about May 16 for construction of superstructure of a 1,000,000 bu. reinforced concrete grain elevator at Toronto, for James Playfair & Associates, Ltd., Midland, Ont. E. G. M. Cape & Co., 10 Cathcart Street, Montreal, have contract for excavating and piling.

Chrysler Corporation of Canada, Ltd., Windsor, Ont., has let general contract to Border Construction Co., and the steel work to Trussed Concrete Steel Co. of Canada, Ltd., for erection of an addition to cost $200,000. Pennington & Boyd are architects.

Ingersoll Machine Co., Ingersoll, Ont., has started work on an addition, 40 x 110 ft., for which it will require machinery and tools.

Chats Falls Power Co., Ottawa, Ont., plans installation of a hydroelectric power development station on Ottawa River to cost approximately $2,500,000. Plans have been filed with Department of Public Works, Ottawa.

Cowie & Drury Interests of Montreal, have awarded contract to W. F. Bedwin & Co., Ltd., general contractor, Halifax, N. S., for excavation and laying of foundations for a cold storage plant at Halifax, to cost $1,600,000. Actual construction work will be started within the next few weeks. When completed it will include two seven-story, reinforced concrete cold storage warehouses; a power house and ice-making plant; a one-story warehouse and a 900-ft. dock. Plans have been prepared by F. W. Cowie, consulting engineer.

Western Canada

Construction work on the first unit of proposed elevator at New Westminster, B. C., for Pacific Coast Terminals, Ltd., will be started early in May, according to Valentine Quinn, organizer. Estimated cost is approximately $1,000,000. Some contracts have been awarded.

Montreal Engineering Co., Regina, Sask., is contemplating construction of a power plant at Estevan, Sask., to cost $250,000.

R. Russell Symington, vice-president and managing director of Western Steel Products, Ltd., Winnipeg, and associates, have obtained control of company from former owners. Enlargements are contemplated and it is understood that production at plant at Winnipeg, Regina, Saskatoon, Edmonton and Calgary will be extended.

Foreign

PLANS are being arranged by Commissariat of Transportation, Russian Soviet Government, Petrograd, for a mechanical coaling station at Sukhum, to be used in connection with coal-mining developments in Tkvarchelsk district, to cost more than $500,000. American-Russian Chamber of Commerce, 50 Broad Street, New York, has information regarding project.

American Chamber of Commerce in France, 32 Rue Taitbout, Paris, has received an inquiry (L-3666) from a local company desiring to get in touch with American manufacturers of automatic nailing machinery; also an inquiry (P-3668) from a concern in Paris interested in American-made all-steel thermos flasks; and an inquiry (B-3665) from a concern near Paris desiring to get in touch with American manufacturers of machines for sharpening safety razor blades.

Bureau of Yards and Docks, Navy Department, Washington, is asking bids (no closing date stated) for generating and other power equipment for Government naval station, Guantanamo Bay, Cuba, including two 250-kw. Diesel engine-generator sets, with starting equipment, etc.; motor-generator sets, centrifugal oil purifiers, water-softening equipment; motor-driven centrifugal pumps; motors for existing air compressors, ammonia compressors, etc., specification 5356.

Yale & Towne Mfg. Co., 9 East Fortieth Street, New York, manufacturer of builders' hardware, locks, hoists, etc., with main plant at Stamford, Conn., has arranged for purchase of Damm & Ladwig Co., Velbert, Germany, manufacturer of kindred products, and control of its affiliated companies, and will operate as a foreign subsidiary. Expansion in production will be arranged. Purchasing company has authorized a stock issue to total about $1,000,000, portion of proceeds to be used for acquisition and extensions.

A company in England is planning early construction of a beet-sugar refinery near Bridgewater, to cost close to $1,800,000, of which more than $500,000 will be expended for machinery. American Consulate, London, William L. Cooper, commercial attaché, has information regarding project.

Philadelphia Chamber of Commerce, Twelfth and Walnut Streets, Philadelphia, has received an inquiry from a company in France desiring to get in touch with American manufacturers of automobile parts and accessories.

CARNEGIE LIBRARY OF ATLANTA

THE IRON AGE

New York, May 3, 1928

ESTABLISHED 1855 VOL. 121, No. 18

Anneal Each Heat Independently

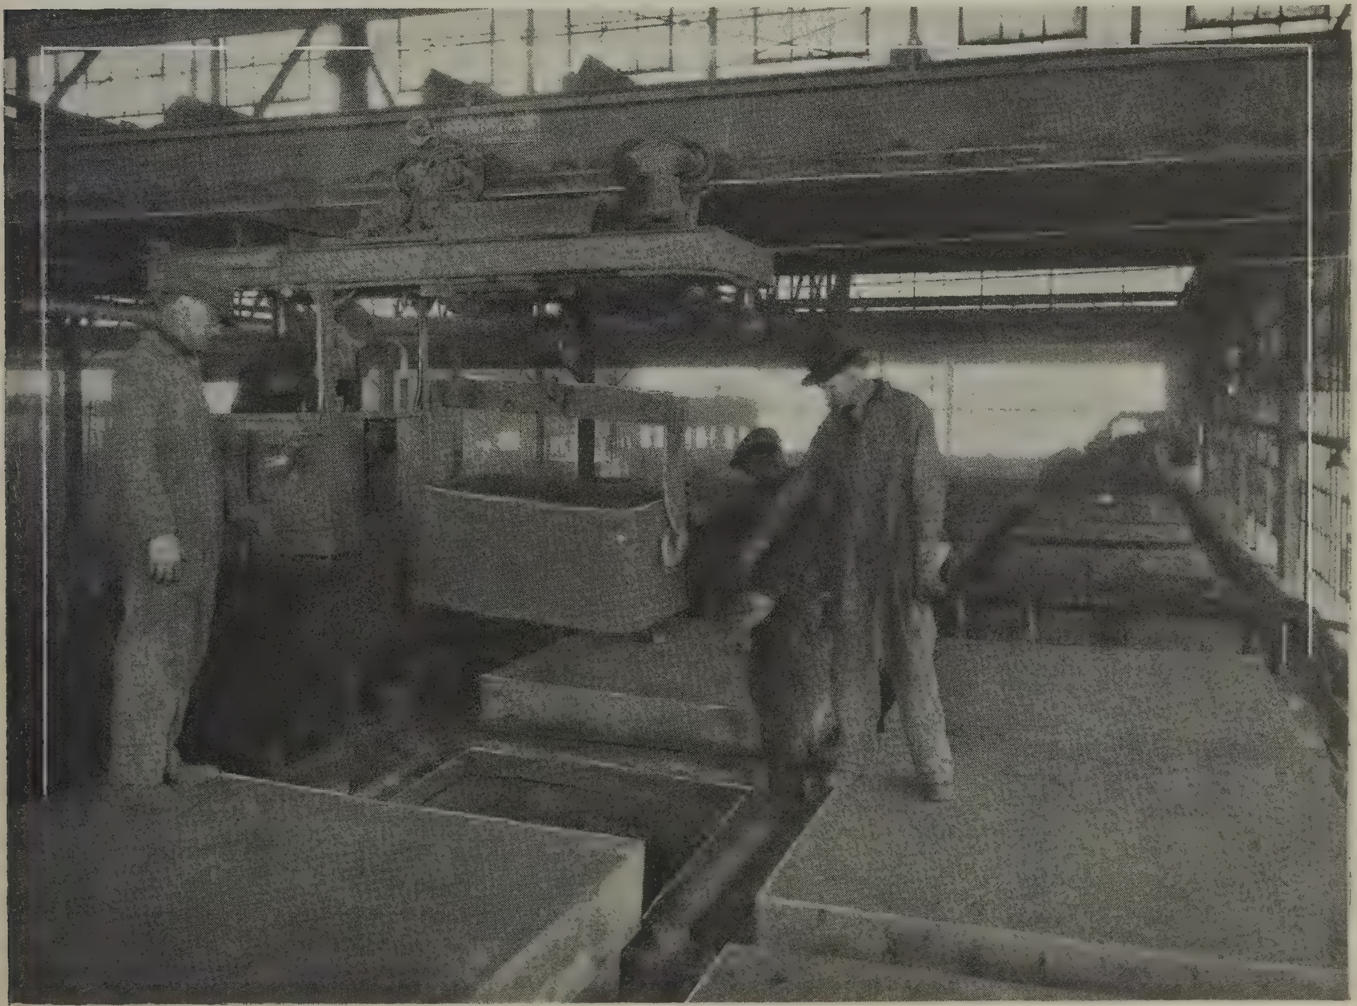
Close Control Features New Practice in Malleable Plant—Ovens Charged Through the Top—Handling Devices Save Labor Costs

BY BURNHAM FINNEY*

ANNEALING malleable castings in mixed heats—a long-established practice—has been abandoned by the Southern Malleable Iron Co., East St. Louis, Ill., which has installed a system of single-heat annealing. By strict adherence to definite heat-treating schedules the company has never had an anneal run under 98.5 per cent, nor has it produced over-annealed castings.

Since malleable castings should show some combined carbon as evidence that they have not been over-annealed, the percentage of anneal is determined by the amount of combined carbon in the malleable test bar. By close control of the temperature during the annealing process, the normal maximum of 2.7 per cent of combined carbon has been reduced to an average trace of as little as 0.03 per cent.

The annealing cycle for the castings from each heat is scheduled after an analysis of the iron has been made. Consequently, the heat treatment is made to vary according to the requirements necessary to produce a perfect anneal. Obviously, castings from two



Annealing Pots Are Lowered into the Ovens by Crane, the Tops of the Ovens Being Removable heats that differ from each other as much as 0.05 per cent cannot be placed in the same annealing oven.

---

*Resident editor at Cincinnati for THE IRON AGE.

Annealing practice at this plant calls for a maximum temperature of 1720 deg. Fahr., which is reached at a uniform rate of increase in 36 hr. This temperature is held for a specified time, then is gradually reduced to a determined temperature known as intermediate and later is decreased to a temperature known as equilibrium. These decreases are never more than 10 deg. an hour and often are only 6 deg. The period covered by this process ranges from 48 to 100 hr.

By means of its mix and its single-heat annealing practice the company has found, from numerous tests, that, with three times the amount of sulphur ordinarily considered as a deterrent, the tensile strength of the castings is as good as that of iron in which the sulphur content is low, and in some cases better. In putting into effect the new method, which specifies that only the castings from a single heat be placed in an annealing oven, the company has constructed ovens which differ materially in design from those used in most malleable foundries.

Ovens Are Charged From Above

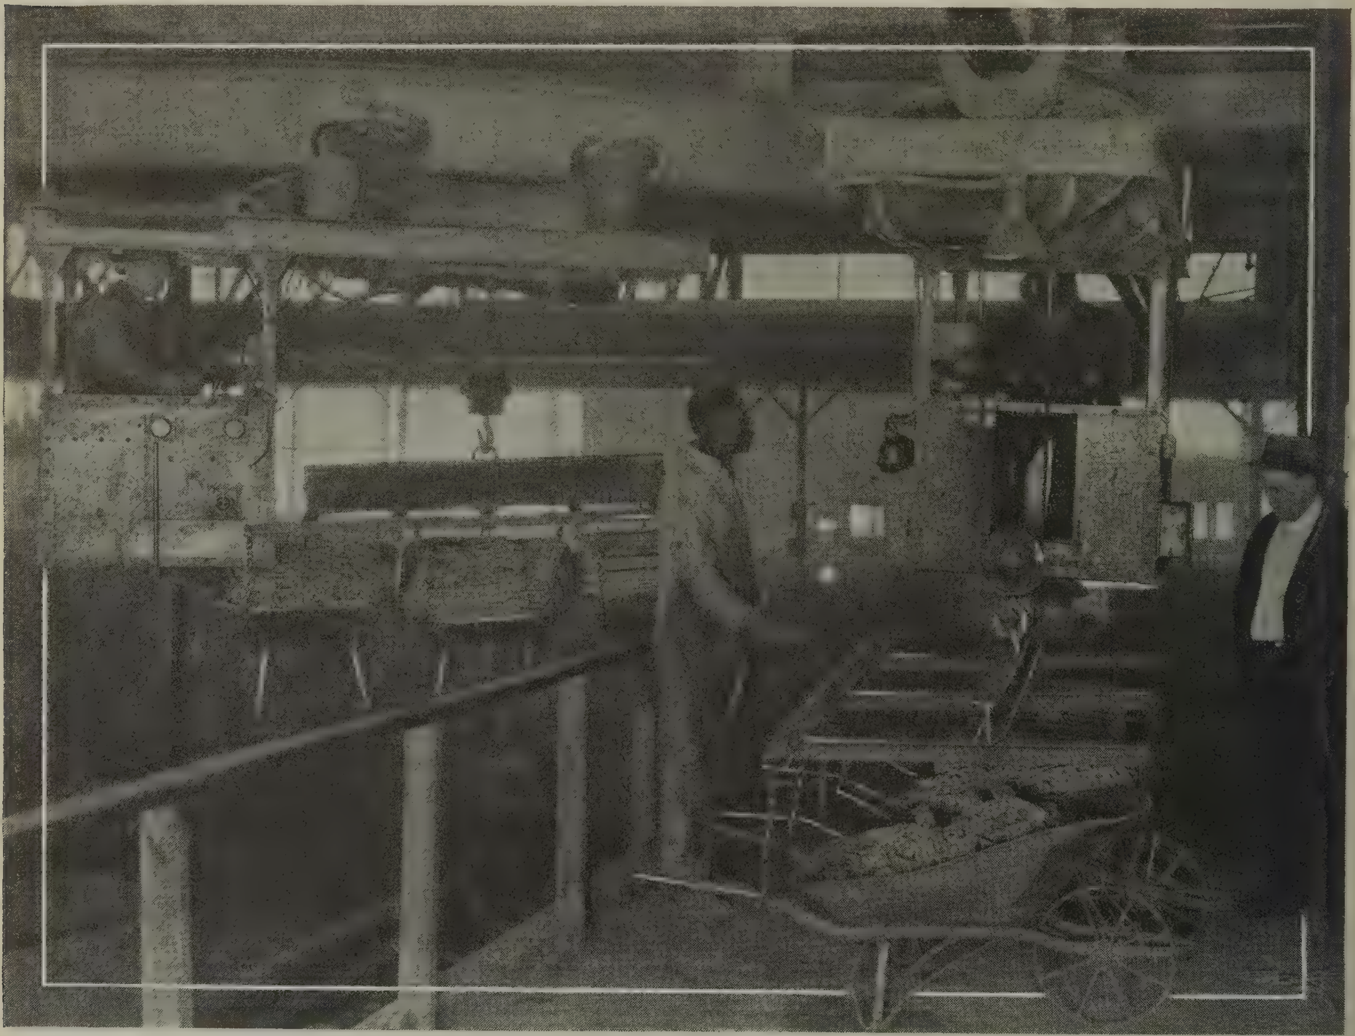
Annealing ovens are built in batteries of 12, each oven being 5 ft. wide, 6 ft. deep and 7 ft. high. Since they rest on a foundation 2 ft. below the floor level, their height above the floor is only 5 ft. The interior walls of each oven are lined with fire brick, and they are covered by an insulating material on the outside. The exterior consists of a steel jacket. The top, made of insulating material, is removable, having holes in the four corners to accommodate hooks. This design makes it possible to attach a chain of four hooks from an overhead crane, and lift the top off the oven, whenever annealing pots are to be put in or taken out. Thus the top, instead of the customary door at the front of the oven, serves this purpose.

Each oven holds eight annealing pots, the capacity of each of which is 1200 to 1500 lb. The design of the ovens is such that the pots can be arranged in two vertical rows, the pots being handled by crane. All ovens are gas-fired and are controlled by pyrometers. It is the duty of one man constantly to watch the temperature of the ovens and to take readings every 30 min. The pyrometric equipment is housed in a small wooden structure at the end of the row of ovens. A portable check pyrometer, which is calibrated once a week, is used to test the pyrometers.

Eighteen test bars are made from each heat, so that customers can obtain test bars on every heat, if called for within six months of its date. Adoption of this plan has eliminated the possibility of dispute regarding the analysis of the iron. Furthermore, every casting of a size has two test lugs. One is broken off in the foundry immediately after the annealing cycle is completed, while the other forms a sample for the use of customers.

Iron is melted in a 20-ton oil-fired air furnace, which has a waste-heat boiler attached. At the head of the boiler is a suction fan. When the damper of the furnace is opened and the fan is turned on, the hot gases going to the furnace stack are drawn up through the boiler. This boiler furnishes steam for the operation of a steam air compressor, which supplies 500 cu. ft. of air a minute. The air from the compressor carries a pressure of 100 lb. and is used for molding, sand blasting and sand riddling.

On either side of the furnace stack there are large openings, just above the channel, where hot gases pass to the boiler. The cold air that is introduced, mixing with the hot gases in the stack, modifies the tempera-



A Special Carrier Suspended from an Overhead Crane Has Three Hooks and Six Rings. One hook is attached to the wheel of a wheelbarrow and two rings are slipped over the two handles. In this manner the carrier is capable of holding three wheelbarrows loaded with castings. The photograph shows the castings ready to be dumped on a platform over the tumbling mills

Hard Iron Department—Compact Arrangement Minimizes the Handling of Castings

ture to such an extent that the upper part of the stack is never hot enough to glaze the brick, thereby materially increasing the life of the lining.

The melting time of an 18-ton heat is considerably less than that of the average coal-fired furnace, because of greater efficiency in combustion. The experience of the company with oil instead of coal as fuel for the furnace has proved that better control is achieved and time and labor are saved. These items over a long period of time mount to impressive figures from the standpoint of costs. Two men operate the furnace, as against four or five in the case of a coal-burning furnace. Incidentally, the first heat of the day comes off at 10 a.m. and the second at 4 p.m.

Treatment of Castings After a Heat

Within 30 min. after a heat is poured, all of the castings are broken off the gates, and the sprues and castings are in wheelbarrows placed under a monorail conveyor. From an electrically-operated overhead crane is suspended a special carrier having three hooks and six rings, which picks up the wheelbarrows. One hook is attached to the wheel of the barrow and two rings are slipped over the two handles. In this manner the carrier takes three wheelbarrows loaded with castings, transports them to a platform in the hard iron department and dumps them. The carrier then returns the three empty wheelbarrows to the molding floor. Since wheelbarrows are standard equipment and replacement parts can be purchased in quantities at a low price, this form of container has been given preference over others.

Compactly arranged so that the handling of castings is minimized, the hard iron department has some interesting features. From the platform, which is 8 ft. in height, the castings are dumped into a chute leading directly to the tumbling mills located below and just to one side of the platform. The castings pass into the mills through a hinged door, which is opened and held in position by a small carrier attached to an overhead monorail. The mills are operated by an electric chain drive under the platform.

From the mills the castings are dropped on to tables where they are inspected. Any defective castings are put into wheelbarrows under the tables, while the others are chipped by workmen, who place them on tables immediately behind them, ready for grinding. After the castings are ground, they are again inspected and are counted and weighed. On each casting is the molder's mark, so that it is possible to ascertain the number of castings that each molder produces. The number and weight are recorded on a ticket, from which the molder's pay is computed. One copy of the ticket goes to the office and the other to the molder. In this way each molder knows every day exactly what he has earned on the last heat accounted for, which is usually the third day after the iron is cast. Disputes regarding the amount of work done are thus greatly reduced.

After inspection the castings are placed in annealing pots ready for the annealing operation. Only in case of small castings is packing used, and then only to hold the castings straight for annealing purposes. Castings are not pickled because a rust is set up under the scale which causes the scale to drop off. Moreover, an oxidizing condition is created which may continue indefinitely.

In many foundries silicon and carbon are considered the two most important factors in annealing. Here, however, all elements are regarded as having a direct bearing on the way castings are to be annealed.

When the annealing operation has been completed, a test bar taken from one of the annealing pots is broken. From the appearance of the fracture is determined further progress of the castings. If the anneal has been satisfactory, the castings are dumped from the pots on to the floor, where they are picked up by a magnet and taken to an elevated platform the same height as that in the hard iron department. From the platform they pass to the malleable mills or to the sand blast room, after which operation they are assorted. Stove plate castings go to the straightener to be straightened either by hand or by drop hammer. At this point they pass a final inspection, during which only the surface is examined, and are packed ready for shipment to customers.

Charges Made Up Mechanically

Materials used in making up charges for the melting furnace are handled mechanically. Pig iron is taken by magnet attached to an overhead crane from

Patented Special Vent Board Which Eliminates Possibility of Rats and Pin-Holes in Castings. The device consists of a backing device with a number of venting pins or wires

the receiving bin to bins in the charging department. Here pig iron, sprues and other scrap are picked up by the magnet and are dropped into charging buckets, which are weighed and are carried on a monorail by a bridge crane to the furnace. By following this procedure a crane operator and three other men make up two 18-ton heats daily. Equipment includes a number of buckets in which charges are prepared considerably ahead of the time when they are needed. As a result the average time required to charge the furnace with 18 tons of materials is only 30 min.

For mechanical handling of materials the foundry is served by a monorail crane system on which are operated three hoists with cabs. The operator of the first cab has charge of the east end of the foundry, and it is his duty to transport pig iron from the receiving bins to the charging department and sand to the molding floor. In addition, he makes up the charges and takes them to the melting furnace, bringing back to the charging department wheelbarrows filled with sprues. The operator of the second cab "cleans the floors," distributes sand to the molding floors and carries core racks from the core room to the core setters. The third operator is responsible for transporting castings from the molding floor to the tumbling mills and for loading and unloading the annealing ovens.

Special Vent Board Features Molding

In the molding department air-operated portable molding machines are used. The gangways between the rows of molding floors are made of concrete for the convenient transportation of the machines. Sand is tested for moisture and for bond, and every casting is faced with a special facing sand, the preparation and testing of which are in charge of one man. All molds have perforated metal bottom-boards to permit the gas to escape through the bottom of the mold. In addition, every molder has a patented special vent board, the application of which eliminates rats and pin-holes in the castings.

This device comprises a board or other backing device, which may or may not be a part of the flask, with a number of venting pins or wires. Made of case-hardened steel, the pins or wires are of varying lengths and are so arranged that the vent holes which they produce are of the proper depth to permit the steam and gas to escape from the mold, all vent holes terminating approximately the same distance from the cavity, even though it may be irregular in shape. When a mold is made on a molding machine the venting pins or wires may be attached to, and movable with, a part of the molding machine. Of paramount importance in connection with the process is the fact that the venting pins or wires are distributed on the board or other backing member to which they are secured so as to produce a configuration corresponding to the shape of the cavity in the mold.

If desired, the venting pins or wires can be attached to the board or other backing member so that they can be individually removed. By this arrangement certain of the pins or wires can be located at various angles to avoid such conditions of the mold as blows. In this case the angularly-arranged pins or wires can be individually removed from the board before it is withdrawn from the mold.

All molders wear white duck pants and the foremen of the molding floors are in white union-alls. When pouring iron, the molders are required to don canvas leggings. The clothing is laundered weekly by the company and at its expense.

Avoiding Excessive Handling of Cores

In the core room large racks are placed immediately behind the core makers. The green sand cores are put on the racks which, after being filled, are picked up by lift trucks and placed in gas-fired core ovens, of which there are four. When the cores are properly baked, the racks are removed from the ovens by lift trucks and are put under the crane runway, where they are picked up by monorail hoists and are carried to various parts of the molding floor. After the cores have been taken from the racks by the core setters, the empty racks are returned by the monorail hoists to the core room, where they are again placed behind the core makers, to be refilled. By following this method, the company has avoided unnecessary handling of cores by the workmen. An exception is made in the case of cores to be delivered to nearby parts of the molding floor, transportation being by means of stretchers instead of racks, carried by air hoists.

The entire foundry consists of a large area without partitions. This arrangement is advantageous in giving supervising officials an opportunity to see in a moment what is going on in any part of the plant. Furthermore, the absence of partitions conserves floor space and thereby cuts down plant investment.

Can Make Own Power in Emergency

Unless some adequate provision is made for meeting emergencies, companies depending upon outside sources for power are likely to experience much difficulty and considerable loss in case of a breakdown. Anticipating such a situation, the company has established adjoining its foundry a small power house equipped with a Diesel engine (manufactured by the Busch-Sulzer Brothers Diesel Engine Co., St. Louis) and an 85-kw. generator set. This electrical unit is for use in completing a heat in case trouble develops in the outside power line. In fact, the value of this reserve unit has already been proved, for on several occasions work would have had to be suspended if the emergency equipment had not been available.

The Southern Malleable Iron Co. is the only manufacturer of malleable iron using the single-heat annealing ovens described. V. S. Durbin, manager, states that the company's method of determining the percentage of anneal or the amount of combined carbon not only is new, but also is probably the only accurate way of finding out the percentage of the anneal. The value, he says, lies in the fact that practically no losses have been incurred in the form of defective castings, and that the quality of the castings has been above the average. In connection with the new practice of making malleable iron, the company has a number of patents pending.

Continuous Furnace to Heat 50 Tons of Billets an Hour

The continuous furnace to serve the continuous mill being built for the Timken Roller Bearing Co., Canton, Ohio, by the Mesta Machine Co. will be furnished by the Rust Engineering Co., Pittsburgh. The heating hearth will be 33 ft. wide by 51 ft. in length. The furnace will have an output of 50 gross tons of billets an hour, varying in size from 2 x 2 in. to 5 x 5 in., and 30 ft. in length. To give this high tonnage, billets will be charged in the side, pushed the length of the heating hearth and discharged from the opposite side of the furnace directly into the first stand of the continuous mill. The fuel to be used will be natural gas. Combustion control and draft regulation equipment will be furnished by the American Heat Economy Bureau, Pittsburgh.

Electric Steel Staybolts Tested in Locomotive Service

To test out staybolts made of electric steel, in comparison with those made of charcoal iron, the Atlantic Coast Line Railroad fitted one side of the fire box of engine 921 with the one type of staybolt and the other side of the same fire box with the other type. This installation was made in May, 1922, the staybolts of both types being the product of the Old Dominion Iron & Steel Works, Richmond, Va. Periodical reports made by the general superintendent of motive power of the railroad have shown how these different types of staybolts have stood up in service. In the table are listed the number of bolts which had to be removed up to various dates, the latest being Jan. 31, 1928.

Removed Prior To	Charcoal Iron	Electric Steel	Ratio
Jan. 1, 1925.......	32	11	2.9
July 1, 1927.......	51	15	3.4
Jan. 31, 1928......	65	16	4.1

Core Room—Large Racks, Which Are Lifted by a Jack-Lift Truck, Are Placed Immediately Behind the Core Makers

Sandless Foundry Makes Progress

Plant of Holley Carburetor Co., Detroit, Has Developed Long-Life Mold Production Successfully—Large Output Obtained in Relatively Small Space With Unskilled Labor

BY HARRY KIMBER*

THE adoption of the long-life or permanent mold by the Holley Carburetor Co., Detroit, was the subject of a paper read by Dr. Richard Moldenke before the 1923 convention of the American Foundrymen's Association in Cleveland and published in THE IRON AGE *of May 3, 1923, page 1251. In the following article written for* THE IRON AGE *the author, a member of the Holley organization, describes the results which have been achieved by the use of the long-life mold and the improvements which have been developed in practice and in the design of the machines used.—EDITOR.*

THE Holley Carburetor Co. of Detroit was one of the first of the automobile carburetor manufacturers to produce carburetors having cast iron bodies. Great difficulties were experienced in securing sand castings that were impervious to gasoline and commercially machinable, because of extremes in cross-section in these 2-lb. castings. Malleable iron castings and box annealed semi-steel castings were tried with fair success, but were not comparable with gray iron when price, machinability and appearance were considered.

The demand for this particular carbureter increased steadily, while fewer foundries were available that could produce satisfactory castings, until only one foundry remained as a dependable source of supply.

The management decided that the permanent or long-life mold was a possible way out of this uncomfortable situation, and experimental work began in 1922. They knew that an unprotected cast iron mold was impractical; so an intensive search was soon under way to find a suitable protection for such a mold. Many coatings were tried before the satisfactory combination was discovered. This refractory coating, which is cheap, easy to prepare, easy to apply and permanent, made the Holley long-life mold a definite success. Production was begun at once on the abovementioned carbureter casting, and when it was finally discontinued over 7,000,000 castings had been produced in Holley molds in a little over two years.

Adopted by Ford Motor Co. and Others

Henry Ford became interested in this mold and the automatic machine which was developed to carry it. The Ford Motor Co. now has nine of these machines in its foundry, producing hundreds of thousands of small gray iron castings for the Model A car and pistons for the Fordson tractor. Thousands of cast iron pistons were also made for the Model T car by this process. The carbureter body for the Model A is now being produced in large quantities on these machines in the Holley Carburetor Co.'s new sandless foundry.

The production possibilities of this machine were soon recognized by manufacturers and foundrymen both in this country and in Europe, and many of them now are using the machines in their own foundries. The Delco Remy Corporation, a subsidiary of the General Motors Corporation, is completing plans for the erection of a new 100-ton sandless foundry at Anderson, Ind.

Castings ranging from 6 oz. to 25 lb., thick and thin, and with and without cores, are now being produced in large quantities in the Holley molding machines.

The Holley foundry is a two-story steel and concrete building, having the core room and the molding department on the second floor, and the annealing, cleaning and inspection on the ground floor. A balcony, 12 ft. wide, extends over the entire length of the core room. All of the core sand is mixed on this balcony and delivered to the coremakers' benches by means of hoppers. All high-production cores are made on core-blowing machines, and every core used is treated with a core wash.

There is one No. 6 Whiting cupola lined to 46 in. in operation. The building was designed, however, for two cupolas and mechanical charging.

The molding department, which is 48 x 84 ft., contains eight automatic 12-headed rotating machines and eight No. 3 single-headed machines, which are manually operated. The molten iron is delivered to these machines with 300-lb. bull ladles, which travel on an overhead monorail. The hand ladles are suspended in pairs from a specially designed mast in such a manner that one ladle may be filled from the bull ladles while the operator is filling molds with the other. In this way the operator always has a hand ladle full of iron ready for him when the one that he is using becomes empty.

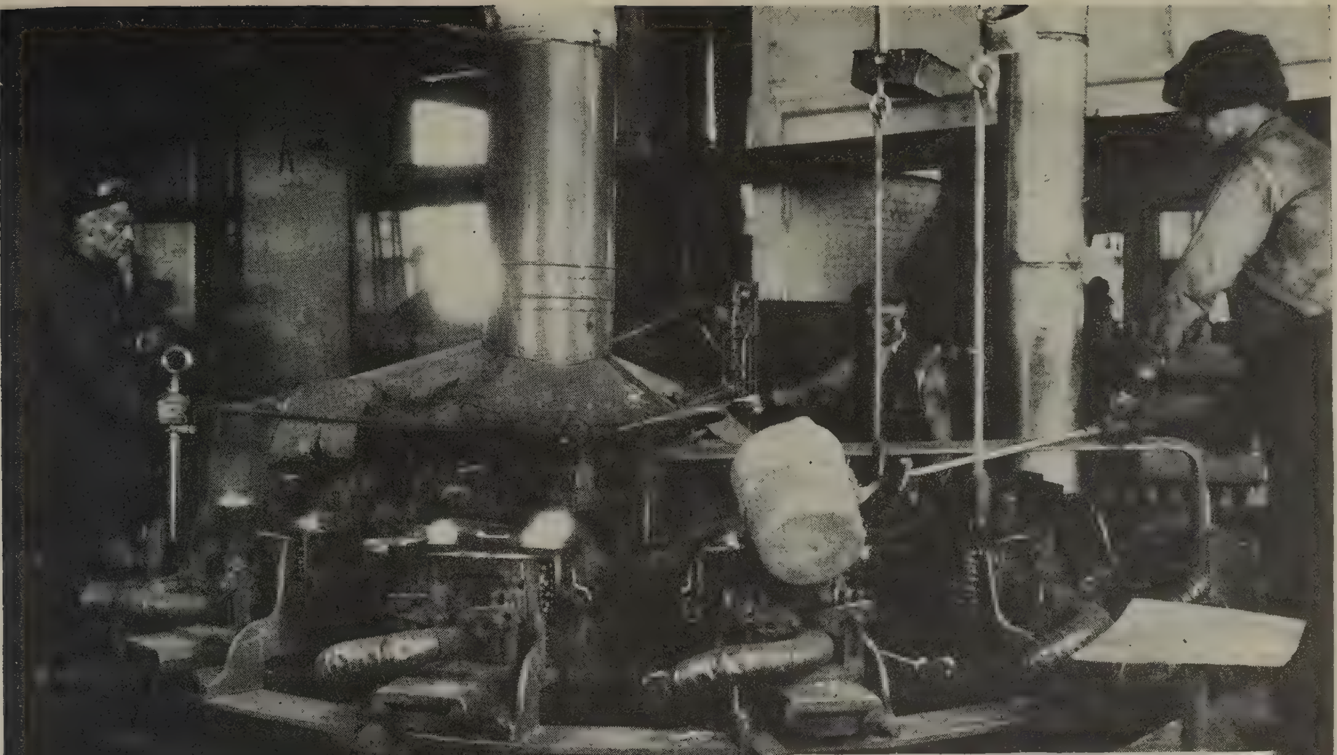
Automatic Turntable Carries 12 Molds

The automatic machine consists of a turntable carrying 12 molds. It rotates intermittently with an indexing time of approximately 3 sec. The operator at the knockout position starts the machine to rotating, but it stops automatically by means of a trip switch. The molds are poured while the machine is stationary.

The mold is first cleaned by a blast of compressed air and is then re-coated with a fresh coating of lamp black for every casting. This is accomplished with a specially designed cleaner and acetylene burner. After passing this burner, the cores are put in place by an operator and the table continues to rotate until the mold arrives at the pouring station. When the pouring, which takes from 5 to 7 sec., is completed, the operator pushes a button and the next mold moves round to the pouring station. The mold that is full of iron continues around to a certain point, where it opens, and the casting, which has set but is still red hot, is ejected. This casting drops into a hopper in the floor on to an inclined chute which delivers it to a continuous pusher-type, gas-fired annealing furnace on the first floor beneath. It enters directly into the furnace at a temperature of approximately 1000 deg. Fahr. and is rapidly brought

---

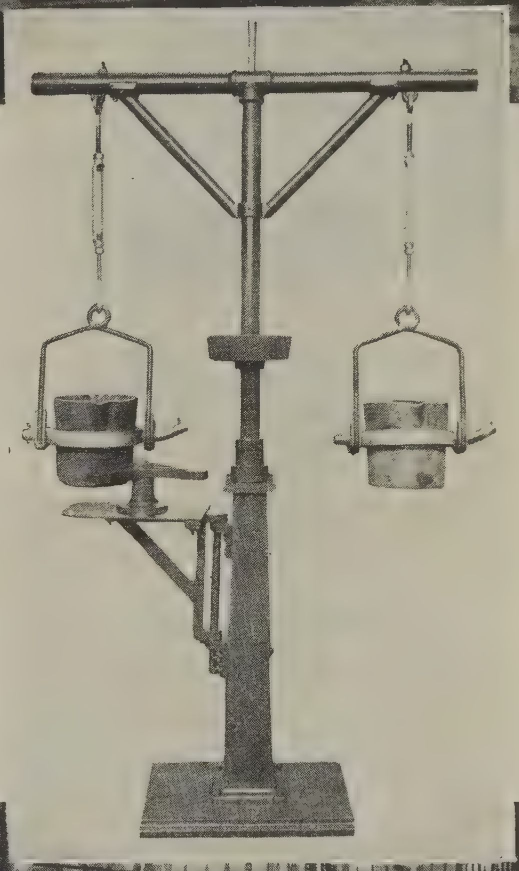
*Holley Carburetor Co., Detroit.

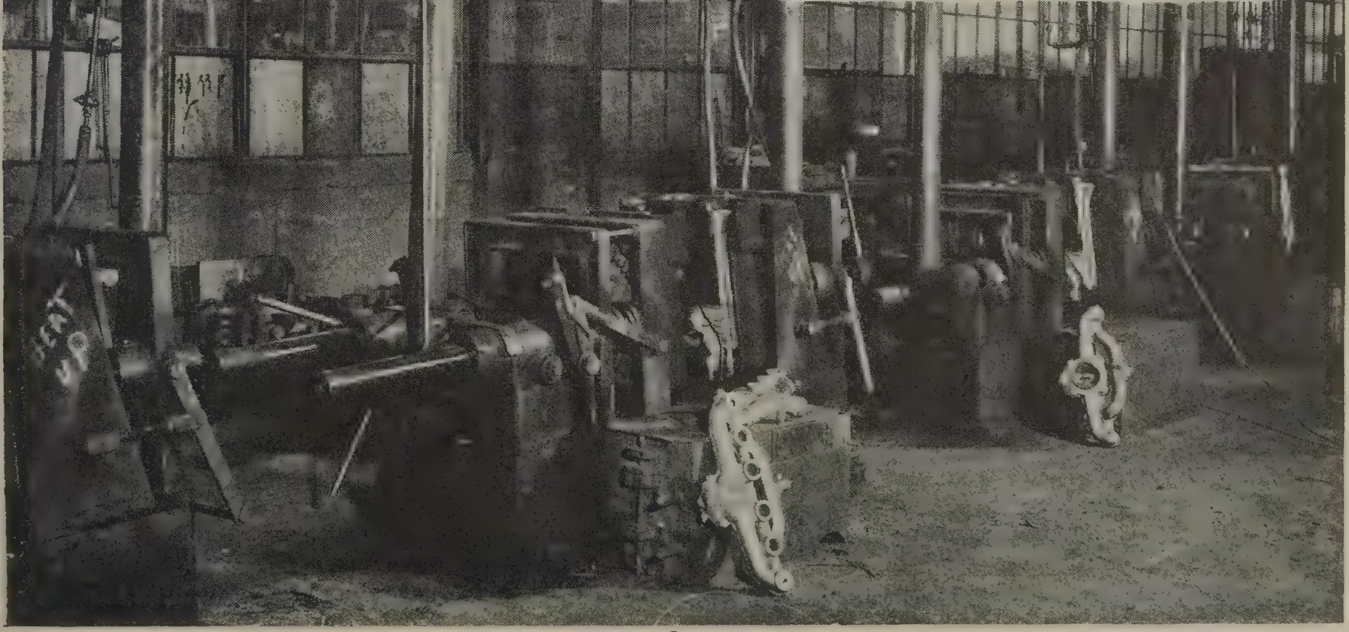


POURING Molds on a 12-Headed Holley Molding Machine (Above). The machine carries 12 permanent molds and rotates intermittently with an indexing time of about 3 sec. On one of these molding turntables 7500 1¼-lb. castings are being produced in 8 hr. The curved pipes shown carry air to the molds to control the temperature. The blower is arranged so that heated air is blown on the molds in cold weather, while air is drawn over them and exhausted out of the building in hot weather

Molds Are Poured from Hand Ladles Suspended from a Mast and So Arranged That One Ladle Is Being Filled from a Bull Ladle While Molds Are Being Filled with the Other Ladle (Right)

Some of the Larger Castings, Such as Tractor Manifolds, Are Made on a Single-Headed Manually Operated Machine (Below)





up to 1600 deg. Fahr. It is held at this temperature for 20 min. and is allowed 1 hr. to cool to 900 deg. Fahr., when it leaves the furnace to be tumbled, snagged and sand blasted. After the final inspection it is ready for shipment.

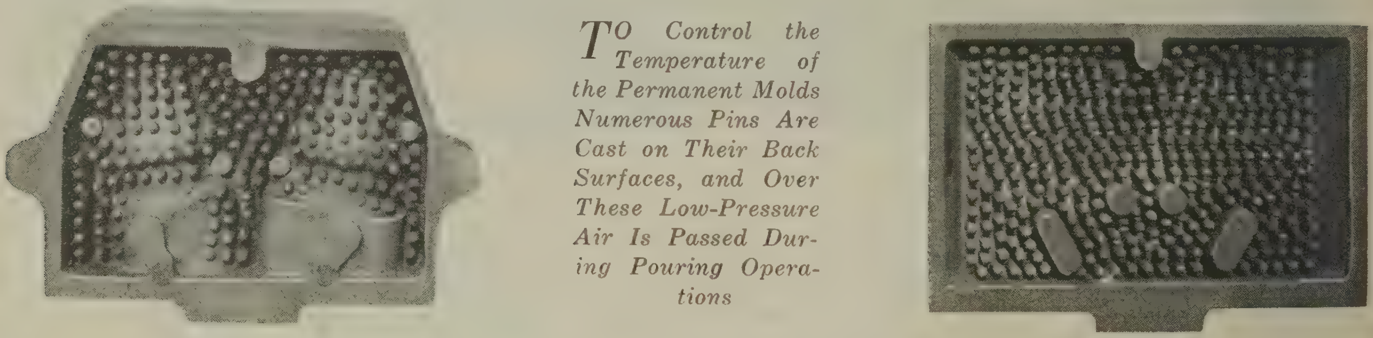
One Machine Produces 7500 Plain Castings Per 8-Hr. Day

One of these automatic 12-headed machines is producing 7500 1¼-lb. castings (without cores) while another is producing 4000 4¼-lb. cored castings in 8 hr., with an average scrap loss of considerably below 10 per cent. The molds in both cases are designed for two castings.

The No. 3 manually operated machines are used in the Holley foundry for the production of the Ford tractor manifold, with the intake and exhaust cast together. One operator produces 200 of these 22-lb. castings in 8 hr. with two machines. He cleans and soots the mold and sets two cores for each casting. One pourer services four machines.

This means that two operators and one pourer produce approximately 5 tons of cored castings in 8 hr. These castings are quite bulky, and therefore occupy considerable floor space in a sand foundry. The four machines occupy an area of 200 sq. ft. of floor space.

The cost of these 12-headed and the hand-operated machines compares very favorably with the cost of sand-handling and pattern equipment and completely eliminates the mold and sand conveyors which are a necessity in the modern high-production sand foundry.



To Control the Temperature of the Permanent Molds Numerous Pins Are Cast on Their Back Surfaces, and Over These Low-Pressure Air Is Passed During Pouring Operations

Improvements Made in Recent Machines

A number of machines have been designed and built during the last five years, and with each succeeding design, an improvement has been made. Water and oil as cooling mediums were experimented with, but air was finally selected because of its safety, efficiency and the simplicity of its application.

The rotating 12-headed machine has recently been redesigned and is now under construction. It is a decided improvement over the machines now in service.

The molds now in use are cast in dry sand molds with the same iron as that used for the castings. These molds have a multiplicity of pins cast on the back, and, when mounted on the machine, low-pressure air is passed over these pins at the rate of 100 to 200 cu. ft. per min. The volume of air is regulated so that the temperature of the mold remains within a certain range. One of the pictures shows the pipes that carry this air to the molds. The blower is overhead along the wall of the building, and is arranged so that the air blows on the molds in cold weather, and is drawn over them and exhausted out of the building in hot weather. This takes care of the heating and ventilating of the foundry very satisfactorily.

A series of tests with molds cast of various alloy irons is now in progress but will not be completed for some time. However, with proper control of the cooling system, ordinary gray iron molds have an average life of 15,000 castings on the automatic machines.

The molds are cast to size and require very little machining. After the machine work is completed, they are heated to about 500 deg. Fahr., and the refractory coating is applied to the face of the mold with a soft brush. As previously stated, this coating is permanent, but it does wear off in places where there is only a slight draft and in the sprue. These spots are touched up at the end of the day's run while the molds are still hot. Care of the molds is a most important, though simple, task.

At the beginning of the day the molds are heated with gas to a temperature of 500 deg. Fahr. before the first castings are poured. From then on the pouring is continuous throughout the day, except when the crew is out to lunch.

Cupola Practice Follows General Production Foundry Methods

The cupola practice, therefore, is the same as in that of any other production foundry. The first iron is tapped at 7.30 a. m., and the melting is continuous until 4 p. m., when the bottom is dropped. The tuyeres are cleaned out twice during this period, and the slag hole is kept open from 10 a. m. until the bottom is dropped in the afternoon. The blast pressure is 12 oz. No mixing ladle is used, but the cupola bottom is designed to hold about 3 tons of molten iron. This enables the cupola tender to supply the traveling bull ladles at all times. The charging is done by hand and every charge is weighed.

The charge is as follows:

Pig iron	500 lb.
Scrap	500 lb.
Limestone	75 lb.
Coke	150 lb.

The analysis of the resulting cast iron is as follows:

	Per Cent
Total carbon	3.50
Silicon	2.50
Sulphur	0.090
Phosphorus	0.330
Manganese	0.55

No alloys or special fluxes are used at any time. The slag is greenish gray in color, indicating proper melting conditions in the cupola.

Production has not been interrupted because of cupola trouble in more than two years, a record of which the management is very proud. The average daily melt is 45 tons for 8½ hr. Between 11 a. m. and 12.30 p. m. the wind is off for a part of the time while the various machine crews are taking their half hour for lunch.

Test bars are poured off four times a day; at 9.30 and 11.30 a. m., and at 2 and 4 p. m. These bars are Brinelled and analyzed daily.

To determine the effect that the Holley mold has upon cast iron, American Society for Testing Materials standard test bars were cast in both green sand and a Holley mold from the same ladle. Those cast in the Holley molds were given the regulation annealing. Some of each of these bars were sent to several different testing laboratories, and their reports were almost identical. In every case and in every test the sand castings were inferior. A summary of these tests follows:

Type of Test	Sand	Holley
Brinell No.	184	179
Transverse strength in lb. (12-in. centers)	3,083	5,024
Tensile strength (standard A.S.T.M. 8-in. bar), lb. per sq. in.	20,970	26,980
Impact on Olsen machine, ft.-lb.	37	67

Formation of Large Graphite Flakes Prevented

When one stops to consider, this great difference in physical properties is to be expected. The rapid rate of cooling produces a very fine grain structure and prevents the formation of large graphite flakes. Carbon has an atomic number of 12 as compared with 56 for iron. In other words, a unit weight of carbon will occupy almost five times the space of the same unit weight of iron. This means that an enormous pressure is generated within the casting itself when the graphite begins to separate out at the instant of solidification. This also prevents the formation of large crystals and graphite flakes and eliminates internal shrinks. The subsequent annealing relieves all casting strains, and, as a final result, the finished product has qualities which enable the machine shop to increase production from 10 to 20 per cent. It is this saving, added to the saving in producing the castings, which has justified the Holley Carburetor Co. in spending the time and money in the development of this process.

The outstanding features of the Holley process are a very large production in a relatively small space with unskilled labor. The resulting castings are stronger, easier to machine, freer from blow holes, shrinks and sand, and cost less to produce than sand castings.

In general, the Holley process lends itself to the modern trend toward mass production.

Materials Handling by a Variety of Methods

Engineers Discuss Cost Saving Features of Special Shipping Containers—Pneumatic Systems

HANDLING of materials by transportation entities occupied the attention of the Philadelphia meeting of the Materials-Handling Division of the American Society of Mechanical Engineers at the morning session of April 24. Three papers were scheduled, of which only two were delivered. The paper "Store-Door Delivery of Freight by Motor Trucks," by F. J. Scarr of the Scarr Transportation Service, New York, was deferred because of Mr. Scarr's illness. Two papers read included "Modern Handling Methods in Railroad Transportation," by G. C. Woodruff, assistant freight traffic manager New York Central Railroad, and "Materials Handling on Steamship Piers at Home and Abroad," by Willard C. Brinton, president Terminal Engineering Co., New York. Mr. Brinton's paper was illustrated by lantern slides, which he discussed at some length as they were shown.

Two sessions in the afternoon were devoted respectively to interior handling and to bulk handling (coal, ore, ashes, etc.). "Modern Handling in Enameling Work," by Edwin P. Smith, will appear in an early issue of THE IRON AGE. "Pneumatic Handling of Materials," by Harry S. Parks, follows, in abstract.

Pneumatic Handling of Materials

LANTERN slides featured the presentation of a paper by Mr. Parks, who is engineer of the Holly Pneumatic Systems, New York. The paper traced something of the history of the development of the pneumatic method, before going into the details of the Holly system. The author defined pneumatic conveying as a system "of a high-velocity stream in which the material conveyed is suspended."

Generally speaking, Mr. Parks was not inclined to place a limit on the distance material could be transported by this means. Practically, however, the systems are usually not over 350 to 400 ft. in length unless there is a booster inserted. Occasionally, however, a line as much as 800 ft. long is used. The vacuum system consists of a suction nozzle, a pipe line, a recipient, a discharging device which extracts the material from the air stream without breaking the vacuum. Suitable apparatus must be provided for cleaning from the air stream all finely divided material and thus preventing it from carrying over into the vacuum equipment.

Advantages of the System

Such a system of handling is not only extremely flexible, but makes possible a wide variety of combinations. Among the particular advantages of pneumatic conveying may be enumerated labor saving, dustless operation, low upkeep in maintenance costs, and ease of installation. There are no shovelers or other manual laborers. One man can handle all the material direct, without intermediate handling. Being nothing but a pipe line, a pneumatic conveyor can bridge gaps resulting from the plant layout.

There is no dust in pneumatic handling. It thus eliminates unhealthful working conditions and prevents a great amount of waste and spoiled material. In many cases it ends a serious fire hazard. Where handling combustible materials, however, pneumatic systems must be adequately protected by suitable grounding against static sparks.

As there are few moving parts in the system, maintenance costs are reduced to a minimum. As the material is suspended in the center of the channel of flow, it does not come in contact with the conveying line, except at the elbows or turns. Here the wear is confined and replacement of worn elbows is provided for in the design. Even then the wear is not serious, except in handling abrasive substances.

Ease of installation is promoted by the fact that a pneumatic conveying system is almost wholly a pipe-fitting job. The principal equipment is easily located and takes little floor space. The conveying lines can be laid out over or under roadways, up the side of a building, or through it, or wherever required.

Heating Automobile, Furniture Sheets by Continuous Pack Method

Continuous pack heating of sheets is to be done in a new furnace now under construction at the plant of the Newton Steel Co., Newton Falls, Ohio. The Rust Engineering Co., Pittsburgh, is making the installation, which, it is expected, will be completed and in operation in about six weeks. Continuous pack heating of tin plate gages of sheets has been practised, but this will be the first application of the method to sheets, and in this case to automobile body and metal furniture sheets, the principal tonnage of the Newton company. The new furnace is 5 ft. wide and approximately 47 ft. long inside, and will have an output of 30 tons a shift. The packs are carried through the chamber on Kathner-type disk rolls, manufactured by the Duraloy Co., Pittsburgh. Producer gas is the fuel. Preheated air is to be supplied by an alloy metal recuperator.

American Foundrymen's Association to Meet in Philadelphia, May 14

THE American Foundrymen's Association will hold its convention and exposition of foundry equipment and supplies in Philadelphia during the week of May 14. The exhibits will be in the Commercial Museum, where will be assembled many new and improved machines for the modernization of the foundry and also the time-tried equipment developed in recent years.

This will be the first exposition of the American Foundrymen's Association since that held in Detroit in September, 1926, and in the interim progress has been made in many lines associated with improvement in foundry practice.

A feature of this issue of THE IRON AGE is the presentation on pages which follow of installations of equipment that have brought up the standard of foundry work, or have increased production and reduced costs. Illustrations of some of the new equipment to be exhibited at Philadelphia are also to be found in this issue.

List of Exhibitors and Products They Will Show

A

Abrasive Co., Philadelphia. Booth Nos. 136, 138.
Demonstration of snagging wheels, including the Red Center Borolon Bakelite, Borolon Vitrified, Electrolon Bakelite and the K Bond Electrolon. Representatives attending: Samuel M. Hershey, L. R. Burnes, E. M. Wilkinson, J. F. Fischer, R. A. Shaffer, W. A. Ruppel, I. R. Blair.

Adams Co., Dubuque, Iowa, Booth No. 181.
Adams jolt squeezers, pneumatic sand riddle, cherry snap flasks, cherry slip flasks, steel jackets, steel bands, vibrators, rappers, sprue cutters, etc., steel bottom plates. Representatives attending: Waldo Adams, Lester Demkier, W. J. Spensley, John Cameron.

Air Reduction Sales Co., New York. Booth Nos. 489-491.
Airco 99.5 per cent oxygen, Airco acetylene, Airco National Carbide and Airco Davis-Bournonville apparatus for oxyacetylene welding and cutting; Argon, Neon, Helium and other rare atmospheric gases; demonstrations with hand welding and cutting outfits, and the Radiagraph and Oxygraph, motor driven machines for oxyacetylene cutting. Representatives attending: W. W. Barnes, W. H. Eliason, H. B. Hand, J. F. High, C. D. Trout, W. L. Humphreys, F. Judelsohn, C. S. Peters, H. L. Rogers, R. F. Helmkamp, and G. Van Alstyne.

Ajax Electrothermic Corporation, Trenton, N. J. Booth No. 484.
A 3 kv.-a. Ajax-Northrup high frequency induction furnace melting steel, copper, etc., and a model of a 500 lb. high frequency furnace for steel melting. Representatives attending: G. H. Clamer, president and general manager; Dr. E. F. Northrup, vice-president and technical adviser; Dudley Willcox, secretary and treasurer; R. N. Blakeslee, F. T. Chesnut.

Ajax Metal Co., Philadelphia. Booth Nos. 481, 482, 483, 484.
Brass and bronze ingot metals, also castings produced by customers from these ingots; Ajax process babbitt metals; Ajax-Wyatt electric furnace; types of Ajax-Northrup electric furnace and accessories. Representatives attending: G. H. Clamer, president and general manager; W. J. Coane, first vice-president and general sales manager; Frank M. Willeson, Zeno D. Barns, A. MacDougall, J. Millson Graham, S. E. McClure, J. C. Brightbill, R. J. Keeley, J. R. Wyatt, Henry Gieseke, William Adam, Dr. Edwin F. Northrup, Dudley Wilcox, R. N. Blakeslee.

Albany Sand & Supply Co., Albany, N. Y. Booth No. 344.
Foundry sand.

Alloys and Products, Inc., New York. Booth No. 291.
Deoxidizers, densifiers, hardeners, technical alloys, rich alloys and special alloys in ingot, shot and lump form. Representatives attending: Henry Hecht, president; Charles Vickers, Adam J. Hecht, Frank J. McCaul, Gilbert T. Mason, John A. Fletcher, William J. Bullock, Charles J. Harney, E. E. Berliner.

Alpha-Lux Co., Inc., New York. Booth No. 2.

American Boron Products Co., Inc., Buffalo. Booth No. 216.
Boronic alloys. Representatives attending: J. B. Mendenhall, W. A. Sharp, R. E. Molley.

American Brake Shoe & Foundry Co., Chicago. Booth No. 8.

American Engineering Co., Philadelphia. Booth Nos. 105, 107, 109.
A 220-volt, d.c., 1-ton plain trolley hoist with foundry control; a 220-volt, 3-phase, 60 cycle, a.c., 2-ton hoist with 2-speed control, cage controlled, with fully inclosed motor driven trolley and 2-speed squirrel cage motors on both hoist and trolley; new pressed steel ¼-ton hoist recently added to the Lo-Hed line in three types; with plain trolley, with bolt suspension, with hook suspension; other Lo-Hed monorail hoists and a stationary hoist. Representatives attending: R. H. McGredy, J. M. Combs, George L. Drake, W. A. Hummel.

American Foundry Equipment Co., Mishawaka, Ind. Block Q.
Complete line of foundry equipment, including sand-cutting machines, flasks, sand-blast equipment, rod straighteners and shears, core machines, tumbling barrels, dust arresters and incidental equipment. Also a new tumbling barrel and the new American Preparator, a sand preparing machine.

American MonoRail Co., Cleveland. Booth Nos. 334, 336.
Overhead MonoRail conveying equipment. Consisting of overhead MonoRail tracks, trolleys, switches, cranes, chain hoists, electric hoists. Representatives attending: L. E. Gaston, J. W. Clokey, F. C. Harris, J. P. Lawrence, H. M. Miller, B. D. Jeffs.

American Saw Mill Machinery Co., Hackettstown, N. J. Booth No. 195.

American Steel Abrasives Co., Galion, Ohio. Booth No. 299.
Samples of American "Eversharp" steel grit, and American standardized steel shot; metallic abrasives for use in blasting equipment for the cleaning of castings, forgings, heat treated parts, etc. Representatives attending: L. A. Cline, president and treasurer; S. D. Layton, vice-president and general manager; Ira T. Armstrong.

American Vent Wax Co., Lockport, N. Y. Booth No. 210.
Vent wax. Representative attending: N. L. Nankey.

Ames Shovel & Tool Co., Boston. Booth No. 289.
Shovels. Representatives attending: N. E. Brooks, Maynard Swift.

Arcade Mfg. Co., Freeport, Ill. Booth Nos. 383 to 387.
Power moderns—jolt, rollover, squeezer, pattern draw; hand moderns—rollover, squeezer, pattern draw; jolt stripper, air stripper, jolt squeezer, jolt squeezer (heap straddler), core machines, pouring devices. Representatives attending: L. L. Munn, vice-president and general manager; B. C. Trueblood, treasurer; Mentor Wheat, sales manager; Henry Tscherning, V. S. Firestone, August Christen, R. E. Turnbull, Herman Kasten, G. D. Wolfley, Herman Meyers, William Herman.

Asbury Graphite Mills, Asbury, N. J. Booth No. 81.

G. H. Clamer
Ajax Metal Co.,
Philadelphia.
Chairman,
General Committee

W. J. Rice
Ajax Metal Co.,
Philadelphia.
Secretary,

Laird U. Park
Park & Williams, Inc.,
Philadelphia.
Chairman,
Reception Committee

Austin Co., Cleveland. Booth Nos. 83, 84.
The Austin method as applied to the development and construction of complete foundries shown by means of models, photographs, plans and reports. Use of labor-saving devices and material-handling equipment also will be featured. Representatives attending: G. A. Bryant, vice-president and sales manager; H. E. Stitt, O. D. Conover, J. C. Childs, Charles E. Covell, E. F. Scott.

Automatic Transportation Co., Buffalo. Booth Nos. 315, 317.

Axmann Sand-Throwing Machine Co., Cleveland. Booth Nos. 72, 74.
Axmann sand-throwing machines in operation, conditioning sand, filling overhead sand bins, conveying sand from one location to another, etc. Representatives attending: S. L. Dryfoos, vice-president and general manager; Eric Wisbrun, C. M. Holcomb, E. J. Welter, M. A. Beltaire, Jr.

Ayers Mineral Co., Zanesville, Ohio. Booth No. 257.

B

The Baker-Raulang Co., Cleveland. Booth No. 312.
Baker electric locomotive-type crane, 3000-lb. capacity at a 7 ft. radius; Baker electric hy-lift truck, 60-in. lift, 6000-lb. capacity; Baker series D 3-ton elevating truck, special foundry type. Representatives attending: H. B. Greig, C. H. Remde, D. L. Darnell, H. W. Faunt Le Roy, S. M. Conant, Nathaniel Platt, H. C. Sherer.

C. O. Bartlett & Snow Co., Cleveland. Booth Nos. 401, 403, 466, 468.
Continuous sand blender, pug mill, conditioner, elevator, conveyor parts, photographs of installations of continuous molding and pouring equipment, moving picture of large production foundry operation. Representatives attending: H. L. McKinnon, secretary; H. C. Orr, M. E. First, W. W. Dodge, W. H. Norrington, Oliver S. Kelly, C. W. Ross.

H. L. Baumgardner Corporation, Chicago. Booth Nos. 405, 470.

Bausch & Lomb Optical Co., Rochester, N. Y. Booth No. 201.
Optical and scientific instruments, photomicrographic apparatus and microscopes, toolmaker's microscope, optical index device for dividing head, diamond tools, thread profile gage, magnifiers and readers, etc. Representatives attending: I. L. Nixon, J. A. Scheick, E. H. Anthes.

Beardsley & Piper Co., Chicago. Booth Nos. 407, 409, 411, 413, 415, 472, 474, 478, 480.
Sandslingers.

Berkshire Mfg. Co., Cleveland. Booth No. 450.
Molding machines and vibrators, jolt squeezers, plain squeezers, pattern draw machines, aluminum flasks. Representatives attending: Guy L. Cameron, H. F. Henriques.

Bethlehem Steel Co., Bethlehem, Pa. Booth Nos. 239, 292.
Automobile engine block, carbureter casting, electric refrigeration cylinder casting, a number of small intricate die castings, and other castings, all made with Mayari pig iron. Representatives attending: Messrs. MacDonald, Fisher and Pritchard, and representatives from Bethlehem district offices in Boston, New York, Philadelphia, Pittsburgh and Baltimore.

Biax Flexible Shaft Co., New York. Booth No. 370.

Black Diamond Saw & Machine Works, Natick, Mass. Booth No. 179.

Black & Decker Mfg. Co., Towson, Md. Booth Nos. 27, 29.

Blaw-Knox Co., Pittsburgh. Booth No. 93.
Blaw-Knox clamshell buckets, steel grating and open flooring, air preheaters, standard steel buildings, Tracyfiers (steam purifiers). Representatives attending: E. L. Harrington and J. W. Hemmerle.

Bloomsbury Graphite Co., Bloomsbury, N. J. Booth No. 241.
Foundry facings, Ceylon plumbago, plumbago blacking, Ceylon silver lead, plumbago core wash; all grades Ceylon graphite. Representatives attending: Edwin R. Wolverton, vice-president and general manager; M. F. Murphy.

Botfield Refractories Co., Philadelphia. Booth No. 430.
Adamant fire brick cement, brick, Adachrome, Adachrome-fines, Adapatch. Representatives attending: W. B. Smith, S. C. Lott, Ires Prosser, J. J. Sweeney.

Box Crane & Hoist Corporation, Philadelphia. Booth Nos. 96, 98.
Type "C" heavy duty standardized crane trolley 10-ton capacity; type "BR" hand operated crane trolley; load lifter electric hoist; type "L" electric hoist for alternating current operation and equipped with foundry control; type "L" electric hoist combined with motor operated trolley for running on I-beam track. Representatives attending: George A. Mitchell, secretary and sales manager; Arthur E. Hogrebe, C. Henry Schramm, Harold W. Noble, Myles W. Jones.

Bradley Washfountain Co., Milwaukee. Booth No. 112.
One 54-in. type "D" (foot-controlled) white marmorite circular Bradley washfountain. Representative attending: Alec Hicks.

Brown Instrument Co., Philadelphia. Booth No. 259.
Temperature measuring equipment for core drying; indicating and recording pyrometers for annealing malleable castings, etc.; cupola thermocouple assembly for recording molten iron temperatures; quick temperature reading of non-ferrous molten metal temperatures; equipment for economically controlling galvanizing temperatures; Brown electric flow meters to be shown for first time to the foundry field. Representatives attending: R. P. Brown, president; G. W. Keller, sales manager; J. P. Goheen, secretary; L. M. Morley, Mr. Lukens, Mr. Knoblauch.

Buckeye Portable Tool Co., Dayton, Ohio. Booth No. 395.
Complete line of portable tools, including drills, grinders, sanders, screw drivers, nut setters, etc. Representatives attending: W. R. Gummere, H. O. Gummere, G. A. Barden.

C

Campbell-Hausfeld Co., Harrison, Ohio. Booth Nos. 311, 313.

Carborundum Company, Niagara Falls, N. Y. Booth Nos. 267 to 273.
Abrasive division: A complete line of snagging wheels for the foundry trade, including Carborundum and Aloxite wheels and high-speed wheels in Redmanol and rubber bonds. Representatives attending: S. F. Courter, general sales manager; W. J. Griffith, G. T. Kretschmar, E. C. Maguire, H. L. Henszey. Refractories division: Small core oven with part of one side and front removed to show method of applying Carboradiant chambers; model of malleable iron annealing furnace; sectional Carborundum lid and lining for brass melting pit furnaces; sample jars of Carborundum No. 3 cement and Firefrax cements Nos. 1 and 2. Representatives attend-

ing: C. E. Hawke, general sales manager; J. G. Fritzinger, J. A. King, F. W. Miller, E. W. Woodruff, S. A. Fenno. Globar division: A small pot type non-ferrous melting furnace; display of a high temperature furnace showing Globar heating elements and terminals in actual operation. Representatives attending: H. N. Shaw, Arnold Pfau, Jr.

Carr Fastener Co., Dot Lubrication Division, Cambridge, Mass. Booth No. 167.
Industrial lubrication devices for bearings of machinery used in foundry industry; Dot guns and nipples, Dot-O-Matic pressure cups, electric lubricator, Dot lubricant; also Dot lubrication as standard equipment on the Sandslinger exhibited by Beardsley & Piper Co., on Simpson mixer manufactured by National Engineering Co., and on sand blast mill of W. W. Sly Mfg. Co. Representatives attending: Louis H. Hein, C. L. Hall, P. K. Niven.

Chicago Crucible Co., Chicago. Booth No. 207.
Graphite crucibles and refractories; special refractory shapes. Representatives attending: W. MacFadden, vice-president; T. W. Jones, Barney Bernbaum, J. K. Moses, Frank P. Maujean, Leo A. Behrendt.

Chicago Pneumatic Tool Co., New York. Booth Nos. 30 to 36.
An air compressor, chipping hammers, sand rammers, riveting hammers, air grinders, pneumatic drills, pneumatic wood-borers and air hoists; also Hicycle electric grinders, drills, reamers, nut runners and a Hicycle frequency changer. Representatives attending: A. E. Goodhue, Huvane, T. P. Harris, Eissler, Estergreen, P. J. Christy, H. G. Barbee, L. J. Walker, A. C. Andresen, Straub, A. M. Brown.

Chisholm-Moore Mfg. Co., Cleveland. Booth No. 363.
"C-M" electric hoist; Cyclone high-speed, spur-geared chain hoist; new improved ball bearing Model "K" I-beam trolleys, overhead traveling cranes, cupola charging equipment. Representatives attending: J. R. Mears, sales manager; F. F. Seaman, W. H. Morgan, E. S. Ludlow, G. L. Hunt.

Clark Tructractor Co., Battle Creek, Mich. Booth No. 53.
Clarktor sand digger exhibited for the first time. Representatives attending: R. J. Burrows, president; E. W. Clark, vice-president; D. D. Burnside, A. S. Rampell.

Clearfield Machine Co., Clearfield, Pa. Booth Nos. 393, 395.
Machine for mixing, tempering, and bonding foundry sand. Representatives attending: P. B. Reed, general manager; J. M. Gallaher, W. E. McMurray, C. D. Johnson.

Cleveland Electric Tramrail Division, Cleveland. Booth Nos. 22 to 26.
A working exhibition of Tramrail equipment especially adapted to foundry uses, consisting of necessary crane runway with a standard Tramrail underslung type crane of 28 ft. span, and a track system of Tramrail showing operation of a number of types of Tramrail carriers, including a push-button pouring device, a turntable pouring device operated and controlled from the operator's cab; a rack carrier for use in conveying flasks about the foundry.

Cleveland Flux Co., Cleveland. Booth Nos. 418, 419.

Cleveland Pneumatic Tool Co., Cleveland. Booth Nos. 432, 434.

Clipper Belt Lacer Co., Grand Rapids, Mich. Booth No. 420.
Clipper belt lacers, fasteners, cutters, with safety feature connecting pins; also the new Clipper speed lacer which will lace both ends of an 8-in. belt in 1½ min. Representative attending: Carl P. Field.

Thomas E. Coale Lumber Co., Elizabeth, N. J. Booth No. 488.

Combined Supply & Equipment Co., Buffalo. Booth No. 265.
Angle Stem and Double Angle chaplets. Representatives attending: Stephen LeViness, Jr., E. E. LeViness.

Corn Products Refining Co., New York. Booth No. 260.
Corebinders, Kordek and Mogul. Representatives attending: S. B. Krantz, R. H. DeWaters, H. A. Crown, F. G. Faller, Jr., A. H. Kreischer, P. J. Dapkus, William T. Maguire, J. M. Millikan, H. C. Knubbe.

D

Dayton Oil Co., Dayton, Ohio. Booth No. 229.
Core oils and cores of all kinds. Representatives attending: D. S. Hopping, Geo. A. Storer.

Debevoise-Anderson Co., New York. Booth No. 233.
Pig iron, coke, nichrome, etc. Representatives attending: Nils Anderson, president; Paul Brooks, vice-president; A. Rhodes, W. K. Callow.

Decatur Milling Co., Decatur, Ill. Booth No. 209.

Deister Concentrator Co., Fort Wayne, Ind. Booth No. 116.
Mobile type Leahy foundry screen for preparation of sand on the foundry floor. Representatives attending: Don A. Weber, general manager; N. A. Rhune, chief engineer.

William Demmler & Brothers, Kewanee, Ill. Booth Nos. 458 to 462.

Detroit Electric Furnace Co., Detroit. Booth Nos. 451, 453.
A type LFA, 350-lb. Detroit electric furnace in operation; also a display of castings and products of Detroit electric furnaces in the brass, bronze and gray iron industries. Representatives attending: Edward L. Crosby, president and general manager; A. E. Rhoads, vice-president; L. C. Wilson, L. B. Barker, F. A. Herrmann.

De Walt Products Co., Leola, Pa. Booth No. 191.
De Walt "Wonder-Worker" woodworking machines, tools and equipment. Representatives attending: W. Ross Stevens, sales and advertising executive; T. E. Brown and E. L. Duncan of Duncan-Brown Co., Inc., Westville, N. J.

Diamond Clamp & Flask Co., Richmond, Ind. Booth No. 310.
Diamond snap flasks, steel jackets, bands, core plates, bottom plates, core boxes, wedges, clamps and flask fittings. Representatives attending: F. J. Gartside, treasurer and president; E. A. Kinley.

Dietert, Harry W., Detroit. Booth No. 301.
Foundry sand control machines, consisting of permeability machine, sand rammer, strength machine (Shear bond—complete for green and dry bond of molding sand and cores); moisture indicator, water meters, oven, balance, laboratory Simpson mixer. Representatives attending: H. W. Dietert, Arthur Nearon.

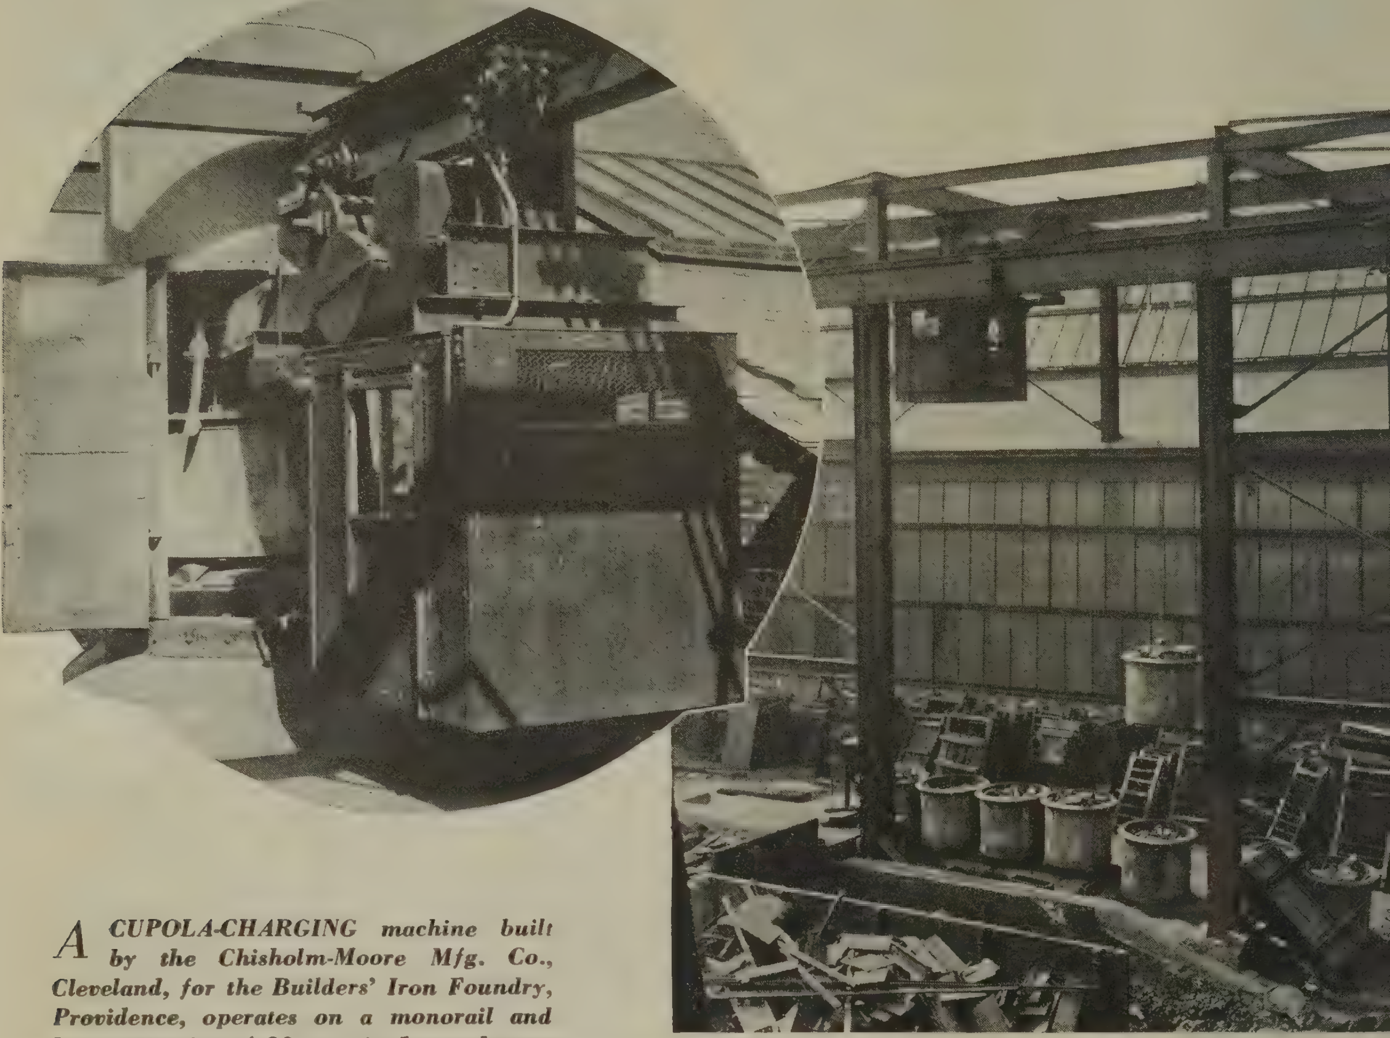
Joseph Dixon Crucible Co., Jersey City, N. J. Booth No. 270.

E

Eastern Clay Products, Inc., Buffalo. Booth No. 284.
Samples of Revivo bond, a clay binder. Representatives attending: S. H. Cleland, vice-president; C. B. Schureman, G. H. Barnes, R. S. Holland, N. J. Dunbeck, R. L. Cleland.

(*Continued on page* 1226)

Cupola-Charging Machine Takes Charge from Yard



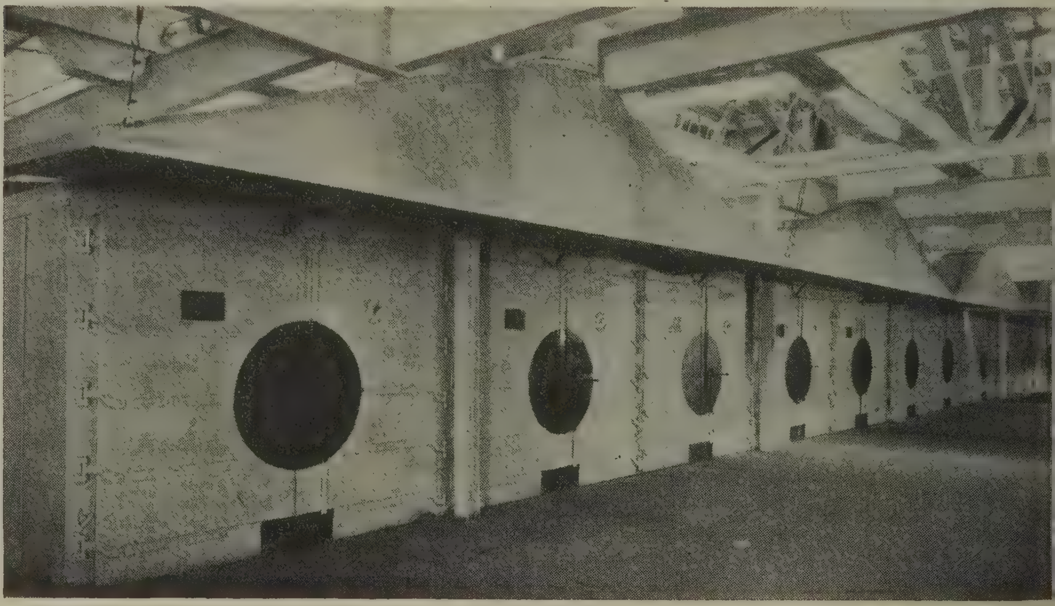
A CUPOLA-CHARGING machine built by the Chisholm-Moore Mfg. Co., Cleveland, for the Builders' Iron Foundry, Providence, operates on a monorail and has a capacity of 90 tons in 1-ton charges in an 8-hr. day. It handles the charge from the make-up scales on the ground into the cupola. Coke and limestone are handled separately from the pig iron and scrap.

One man operates the charger, while two men on the ground make up the charges.

The yard picture shows buckets of metal passing across the scale on a gravity conveyor. The charger picks them up at this point and deposits the material on the center line of the cupola, as shown in the other illustration.

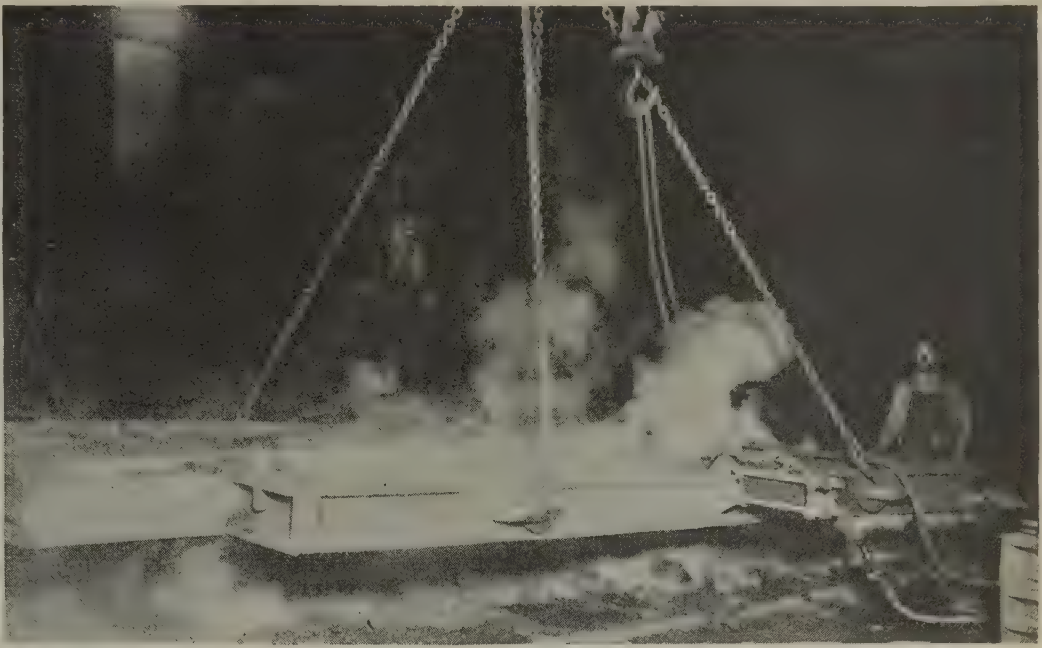
Extensive Core Baking Installation

A ROW of 11 rack-type core ovens was installed in the plant of the American Radiator Co., Gloucester, N. J., by the Swartwout Co., Cleveland. The door of each oven carries a clock face for designating the time for removing cores. Oil fuel is used, the firing aisle being at the rear, where valves and control apparatus are accessible. The doors of the ovens have five hinges each



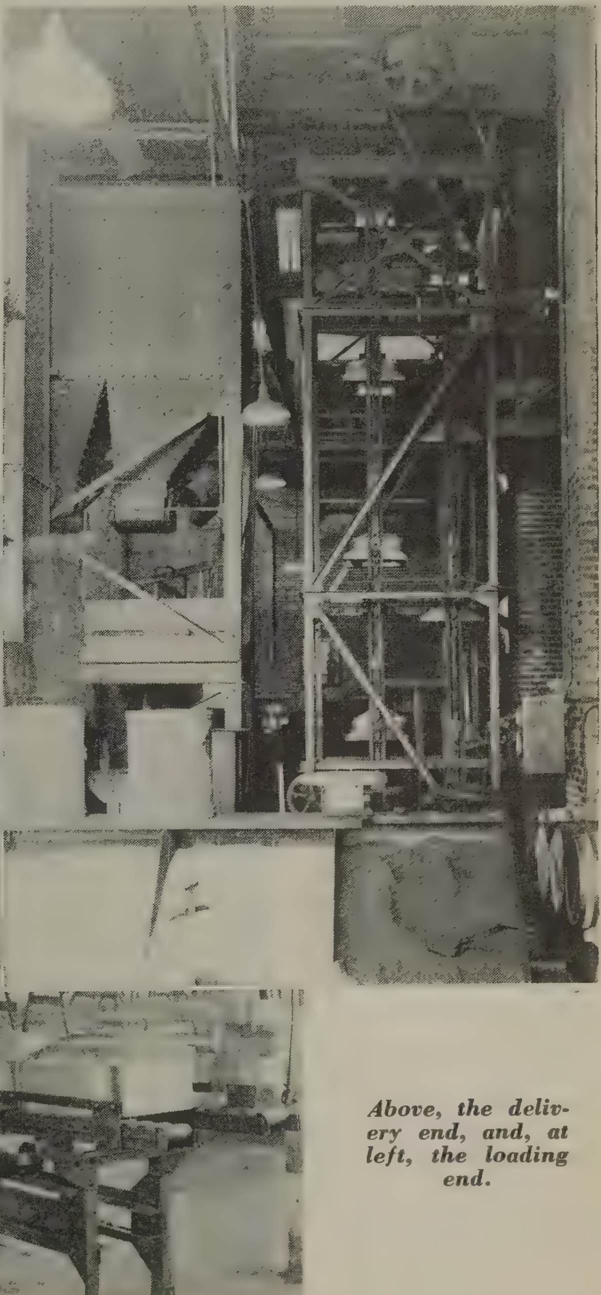
Flask Rapper Shakes Out Cope in Seven Minutes

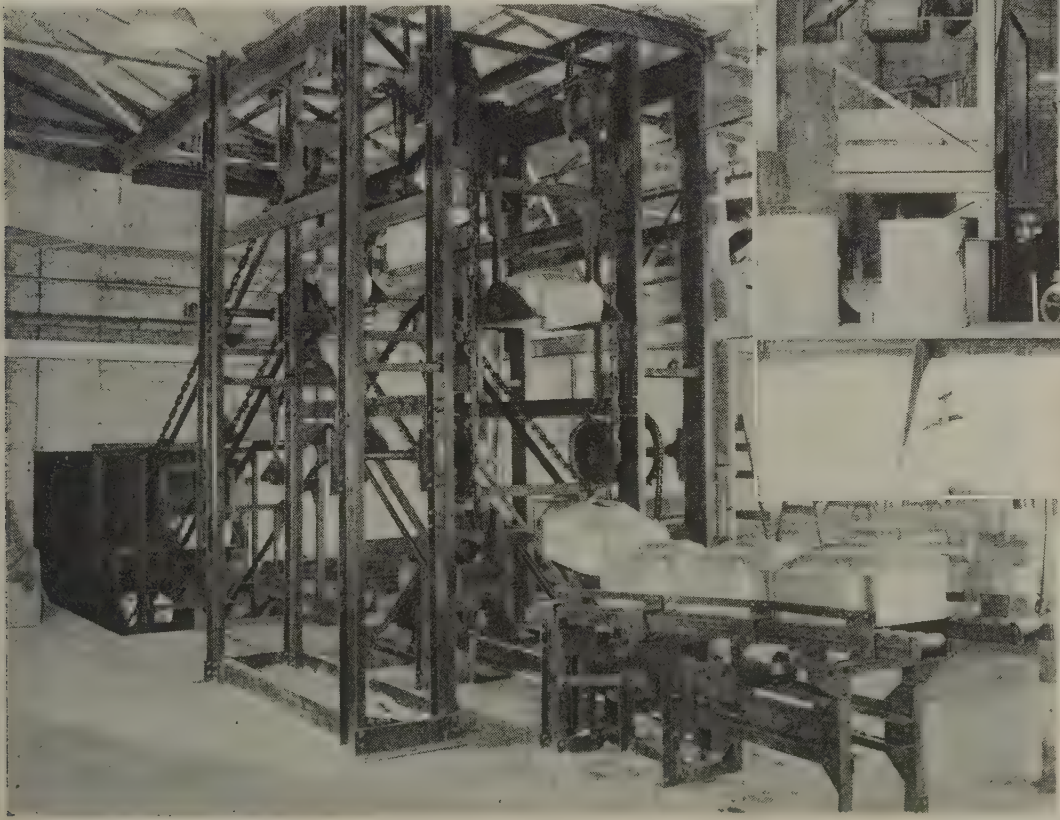
A 5-in. Branford flask rapper which has been installed by the Malleable Iron Fittings Co., Branford, Conn., in the plant of the Farrel Foundry & Machine Co., Ansonia, Conn., shakes out a cope 10-ft., 6in. x 20-ft., 12 in. in 7 min.—an operation that formerly took six men ½ hr. This cope, with 18-in. gaggers and 12-in. wood soldiers, was rammed with green sand by pneumatic sand rammers.



Automatic Transfer of Castings to Machine Shop

THE loading station and the delivery end of an automatic conveyor equipment for the Maytag Co., Newton, Iowa, was designed by H. M. Lane Co., Detroit, and built by R. W. McIlvaine Co., Chicago. The aluminum foundry is separated from the machine shop and assembly by the iron foundry. A tunnel was constructed under the iron foundry, and the conveyor equipment shown was installed for carrying the thin aluminum tubs, or boxes of aluminum castings, from the short roller conveyor in the aluminum finishing department, down through the tunnel, and then up to a gravity carrier line delivering to the machine shop.

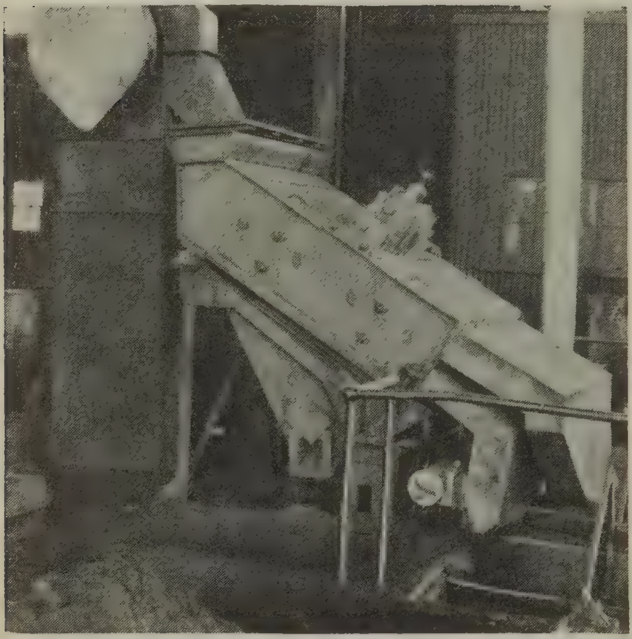




Above, the delivery end, and, at left, the loading end.

Conveying Equipment Eliminates Third Man at Harvester Plant

THE labor of one man was saved at the plant of the Western Harvester Co., Stockton, Cal., by equipment consisting of a Louden 36-ft., 10-in. transfer crane of 2000-lb. capacity equipped with trolley and 1-ton Shepard electric hoist and 50 ft. of Reelite. The crane is pushed by one man, who also handles the flasks. A second man "sands and fills."

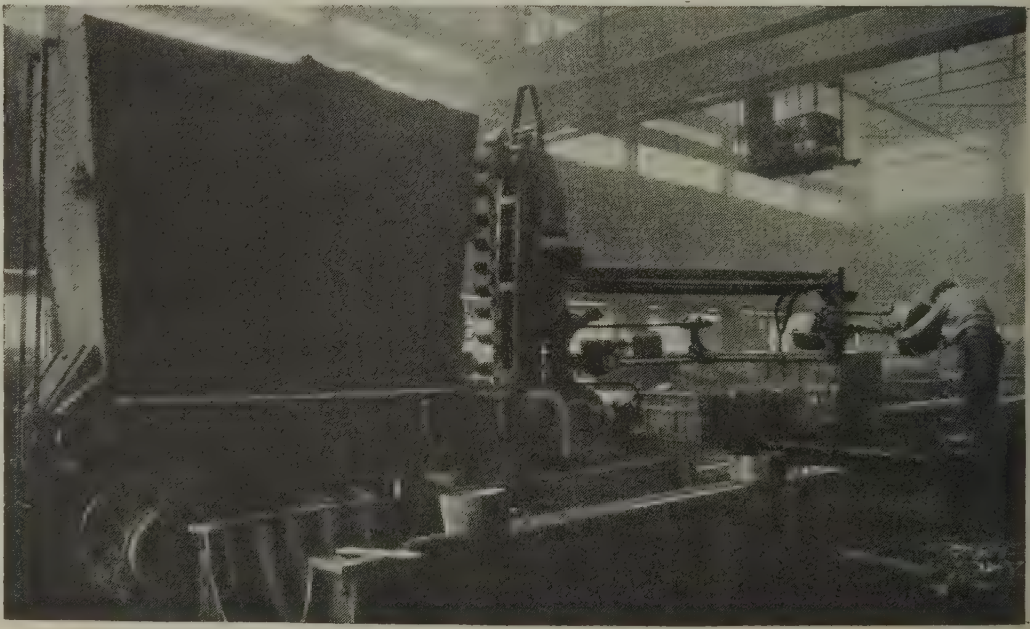


Sand Screening Outfit

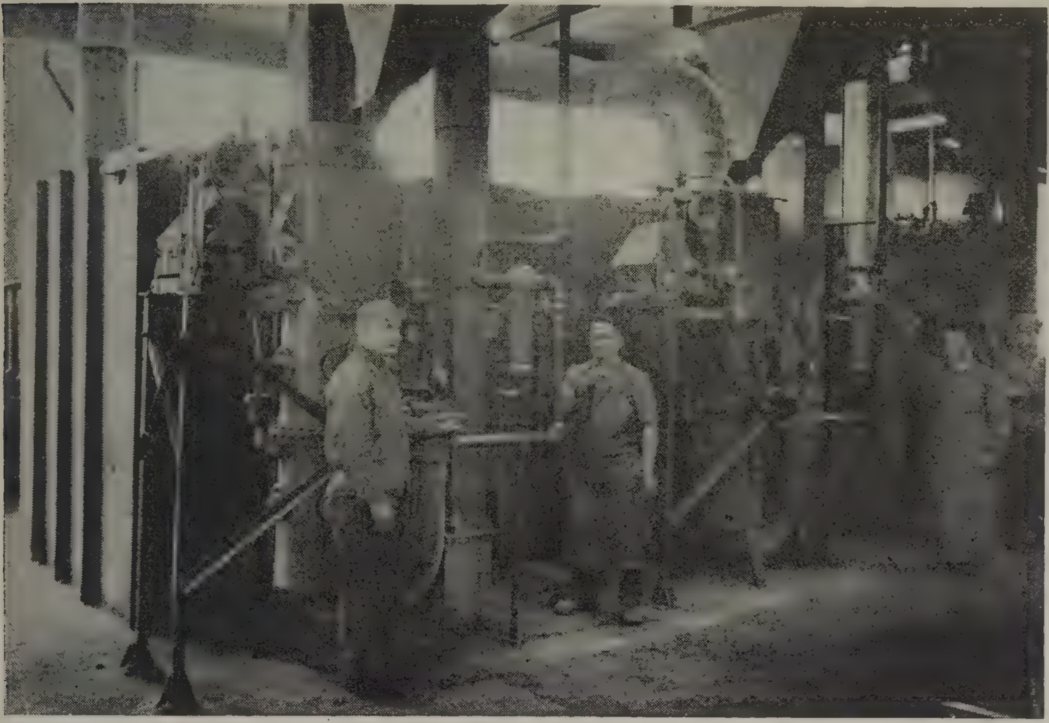
INSTALLED by the W. S. Tyler Co., Cleveland, in the plant of the Crucible Steel Castings Co., Cleveland, is a small bucket elevator and the Tyler company's Hum-mer screen, used for the preparation of foundry sand. Sand is fed by hand shoveling into a hopper of the elevator placed level with the floor line. A 2-in. grating prevents large pieces of scrap or lumps from entering. Right and left hand discharge spouts deliver the reclaimed sand and oversize into different buckets and a special hopper placed underneath the apparatus collects the fines. The reclaimed sand is taken by an overhead crane to a Simpson mixer for the final preparation. The unit handles 5 tons of sand hourly.

Motive-Type Sandslinger on Jobbing Type of Work

A MOTIVE type Sandslinger in the plant of the Bartlett-Hayward Co., Baltimore, is used in the making of pipes and fittings. The work comes under the jobbing classification. On two typical jobs there were savings of $6.09 per hour on a simple job and $4.65 per hour under unfavorable conditions.



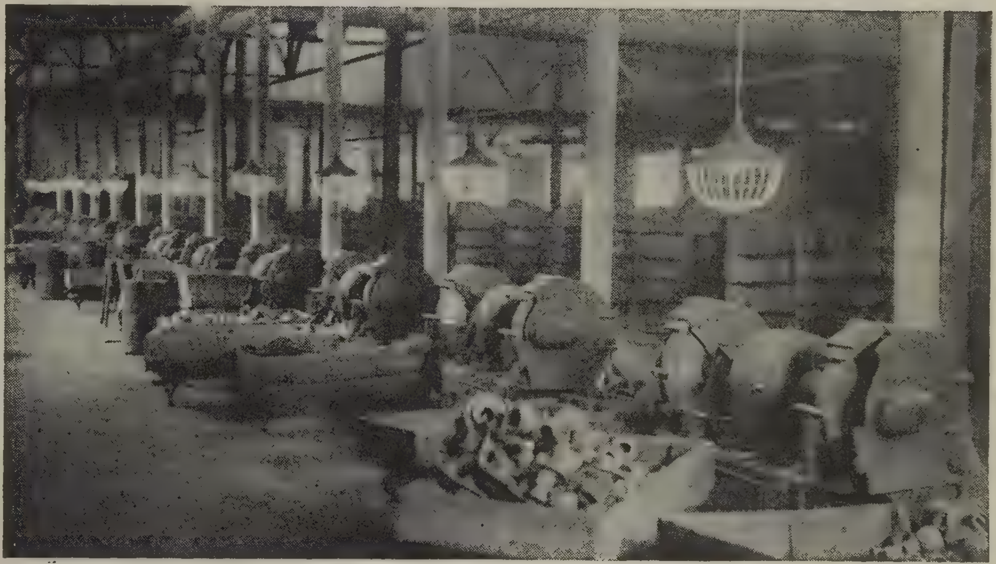
Continuous Automatic Sandblast Tanks for Uninterrupted Production



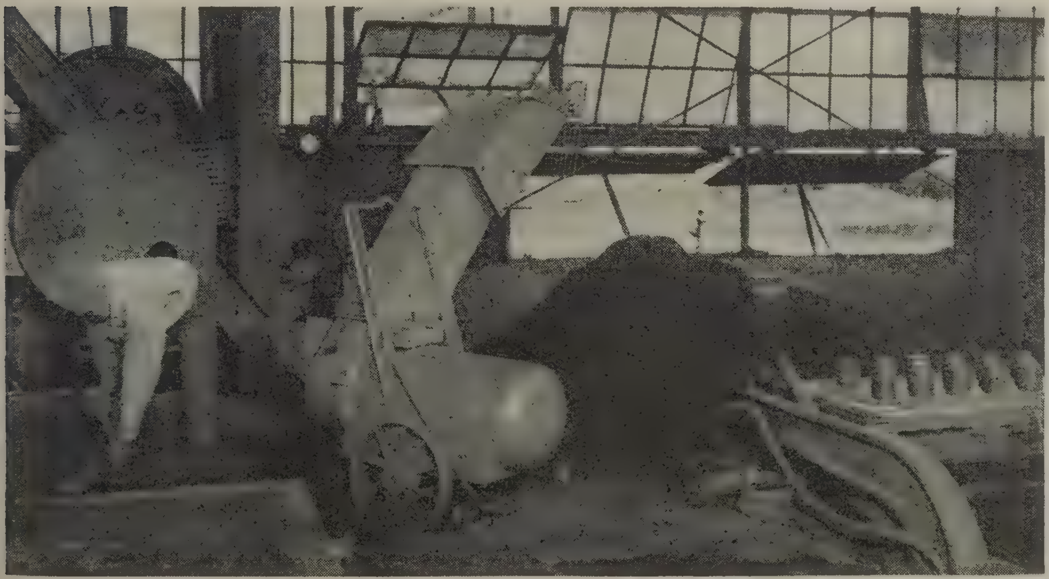
IN its new department for the manufacture of electric refrigerators, the General Electric Co., Schenectady, N. Y., has installed a battery of six continuous sandblast tanks. Five supply abrasive to five Slyblast turntable rooms and one to a positive pressure rotary table. The continuous tank does away with the waiting for a sandblast tank to refill as when one or two tanks are used. The equipment was furnished by the W. W. Sly Mfg. Co., Cleveland.

Stand Grinders in Malleable Foundry

THE large battery of stand grinders shown in the accompanying illustration is in the foundry of the Benton Harbor Malleable Industries, Benton Harbor, Mich. The machines were furnished by the Marschke Mfg. Co., Indianapolis, the grinder division of the Black & Decker Mfg. Co.



Sand Thrower Conditions and Returns Sand in One Operation



THE Axmann sand thrower is shown in operation at the plant of the McMyler-Interstate Co., Cleveland. One man now shovels the sand into the sand thrower, which conditions it and returns it to the molding station in one operation. The machine is made by the Axmann Sand-Throwing Machine Co., Cleveland.

Eastern Steel Castings, Newark, N. J. Booth Nos. 365, 367. Various sizes of a precision type of sandproof, ball-bearing, roller conveyor for green sand mold transportation, and other foundry uses; also a variety of electric steel castings of intricate design, including a new proprietary product, a cast steel automotive wheel, made in green sand entirely without cores. Representatives attending: W. D. Sargent, president; E. F. Miltenberger, vice-president; H. S. Otto, F. D. Campbell, A. L. Bussman, M. C. Renshaw, M. R. Wolfe, C. Rampolla, G. Nelson, F. Paffrath, W. Cadwallader, O. D. Fedderman, S. McClure, F. Sieder.

D. A. Ebinger Sanitary Mfg. Co., Columbus, Ohio. Booth No. 122.
Sanitary toilet and wash room. Representative attending: Mr. Evans.

Edison Storage Battery Co., Orange, N. J. Booth Nos. 9, 10. Edison steel-alkaline storage batteries. Representatives attending: G. E. Stringfellow, J. F. Coakley, J. K. Mahaffey, L. R. Lindsley, W. M. Taylor.

Electric Storage Battery Co., Philadelphia. Booth No. 421. Exide Ironclad batteries for propelling electric industrial trucks and tractors. Representatives attending: William Van C. Brandt, W. C. Hooven, J. L. MacBurney, W. W. MacCallum, E. C. Kline.

Electro Refractories Corporation, Buffalo. Booth No. 228. Tercod crucibles, Buffalo patch cement, Kellogg refractories. Representatives attending: L. U. Milward, president; C. A. Asher, Grant S. Diamond, Tom W. Campbell.

Elwell-Parker Electric Co., Cleveland. Booth No. 448. Tructors (lift or self-loading type); tiering and self-unloading type; oven charger; heavy-duty crane. Representatives attending: F. B. Neely, W. G. O'Brien, R. F. Crawford.

F

Fanner Mfg. Co., Cleveland. Booth No. 253. Foundry chaplets and hard tumbling stars. Representatives attending: J. R. Raible, president; C. G. Raible, vice-president; C. E. Ireland, P. D. McDonnell, E. Durant, S. H. Gibson, F. W. Beck.

Federal Foundry Supply Co., Cleveland. Booth Nos. 359, 361. Sand testing equipment for the laboratory, such as bond strength determining apparatus; permeability determining apparatus equipment for making screen analysis. Representatives attending: Ralph Ditty, president; L. H. Heyl, general manager; T. H. Terry, O. E. Peterson, Walter Gerlinger, Geo. H. Donoghue, Elmer Ditty, Geo. A. Fuller, T. J. Brown.

Fisher Governor Co., Marshalltown, Iowa. Booth No. 438. Reducing valves and pressure regulators, steam governors, etc., featuring Fisher type 78 combination air regulator for controlling air pressures in connection with sand blast operation.

Foundry Equipment Co., Cleveland. Booth Nos. 75, 76. Coleman rolling drawer core oven, Coleman portable rack-type core oven, Coleman continuous core oven, etc. Representatives attending: C. A. Barnett, general manager; H. W. Steindorf, M. A. Beltaire, Jr., E. J. Welter, C. M. Holcomb.

Foundry Manganese Co., Philadelphia. Booth No. 155.

Fowler & Union Horsenail Co., Buffalo. Booth No. 224. Moldochil nail. Representative attending: Charles A. Reamer.

General Electric Co., Schenectady, N. Y. Booth Nos. 375, 377, 379, 381.
Welding equipment, motors and control, and a foundry cupola blowing equipment. T. H. Reeves in charge.

Girard Smelting & Refining Co., Philadelphia. Booth No. 261. Brass and bronze ingots, brass and bronze castings, pig and cake lead, babbitt and solder metal. Representatives attending: Louis Schwab, Albert Katz, George Sall.

Globe Steel Abrasive Co., Mansfield, Ohio. Booth No. 45. Globe cornered steel grit and Globe H. C. chilled shot. Representative attending: C. H. McConnell, manager.

Great Lakes Foundry Sand Co., Detroit. Booth No. 277. Molding, core, and sand blast sands, fire clays, mill stars, coke, limestone. Representatives attending: William J. Muhlitner, vice-president and general manager; John D. Cronenweth, president; James G. Mendenhall, secretary; Neil I. McArthur, H. P. Mackinnon, P. E. Giberson, John E. Lambrix.

Great Western Mfg. Co., Leavenworth, Kan. Booth No. 114. Type HL Combs gyratory laboratory sifter; type V Combs gyratory foundry riddle; new type V-5 Combs gyratory foundry riddle. Representative attending: Charles F. Murphy.

Grindle Fuel Equipment Co., Harvey, Ill. Booth Nos. 319, 372. No. 30 Grindle multi-stage unit pulverizer; No. 3 impact pulverizer with air separation for firing malleable iron annealing ovens; No. 1 pulverized coal burner. Representatives attending: W. R. Bean, D. J. Reese, J. E. Charles, C. R. Taylor, M. F. Becker.

H

Hayward Co., New York. Booth Nos. 47, 49. Hayward electric motor clam shell bucket, air-operated clam shell bucket, automatic take-up reel, air-operated orange peel bucket. Representatives attending: H. S. Atkinson, H. C. Ryder, C. S. Sargent.

Herman Pneumatic Machine Co., Pittsburgh. Booth Nos. 338, 340, 342.
Rapid production type 1000-lb. capacity jarr independent rollover and pattern drawing machines. Representatives attending: Thomas Kaveny, president; Thomas Kaveny, Jr.; A. G. Doyle, vice-president; R. F. Ringle, I. J. Oesterling, R. Harris, C. W. Miller, R. P. Morgan, C. S. McMath, W. W. Hughes, Robert M. Porteous, L. L. Johnston, Joseph Gibson, Clarence Short, T. A. Renkenberger, Alfred Herman.

Hill & Griffith Co., Cincinnati. Booth No. 222.
Representatives attending: John Hill, Bruce Hill, F. W. Weissmann, William Oberhelman, C. L. Gysin, Matt Geier.

Holley Permanent Mold Machine, Inc., Detroit. Booth Nos. 461, 463.
Permanent molding of gray iron castings. Representative attending: H. P. Kimber.

Hynson, Westcott & Dunning, Baltimore. Booth No. 286, 288. Mercurochrome. Representatives attending: W. Rodney Burton, Nathaniel Nicolai, L. C. Shepherd.

I

Illinois Clay Products Co., Joliet, Ill. Booth No. 221. Fire clay, fire clay flour, castings from rebonded sand, etc. Representatives attending: O. L. Jones, president; A. S. Nichols, sales manager; Howard Blackwell, Lee Everett.

Charles C. Kawin Co., Chicago. Booth No. 212.

Keller Mechanical Engineering Corporation, Brooklyn. Booth No. 165.
Keller BK flexible shaft grinders and the KELLocatER. Representatives attending: Paul C. Renno, Henry Schreiber.

Spencer Kellogg & Sons, Inc., Buffalo. Booth Nos. 145, 200.
Core oils, cores made of same, finished castings. Representatives attending: W. L. Goetz, V. A. Acer, E. G. Allen, E. J. Felt, D. J. Healy, E. A. Medbery, H. J. Strassberger, J. N. Yaeger.

Keystone Coal & Coke Co., Greensburg, Pa. Booth No. 238.
Keystone selected foundry coke. Representatives attending: F. B. Miller, W. F. Elwood, S. J. Stump, M. T. Dean, J. M. O'Brien, R. E. Diehl, F. H. Pharaoh, H. Geisel, Jr.

Keystone Lubricating Co., Philadelphia. Booth Nos. 151, 153.
Foundry equipment fitted with the Keystone safety lubricating system; new Keystone pneumatic safety lubricator; various Keystone lubricants. Representatives attending: H. A. Buzby, president; G. W. Hall, T. B. Little, J. R. Lawrence, C. T. Moyer, F. D. Street.

Kling Bros. Engineering Works, Chicago. Booth No. 68.
New high-speed double-end heavy duty grinder. Representatives attending: P. E. Kling, H. J. Aagaard.

Knefler-Bates Mfg. Co., Indianapolis. Booth No. 290.
K-B core binder. Representatives attending: Ernest Knefler, president; Geo. B. Hill, sales manager; Herbert J. Bever, John A. Green.

H. W. Knight & Son, Seneca Falls, N. Y. Booth No. 3.
White metal and brass pattern letters and figures and foundry trademarks. Representative attending: H. D. Knight.

Kramer & Co., H., Chicago. Booth No. 274.
Ingot brass and bronze, brass and bronze castings. Representatives attending: I. Kaden, vice-president; L. Chapman, sales manager; William Romanoff, S. M. Marks, George H. Grone.

L

William Laidlaw, Inc., Belmont, N. Y. Booth No. 428.

Lancaster Coal & Sand Co., Lancaster, Ohio. Booth No. 223.
Indian red molding sand and Flex-Spar bond. Representatives attending: T. E. Hummell, president; D. L. Hansberger, secretary and treasurer; E. L. Smitherman.

H. M. Lane Co., Detroit. Booth No. 208.
Drawings and photographs of foundries and equipment. Representatives attending: H. M. Lane and G. Pitt.

Lava Crucible Co. of Pittsburgh, Pittsburgh. Booth No. 280.

Leeds & Northrup Co., Philadelphia. Booth No. 417.
L & N potentiometer pyrometers for automatic control, for automatic recording and control, for automatic recording only and for indicating temperatures. These are the powerful, motor-driven type of pyrometers operating on the potentiometer principle or on the resistance principle. Also optical and portable instruments. Representatives attending: Henry Brewer, E. B. Estabrook, Oscar Brewer, E. C. Wood.

Lehigh Safety Shoe Co., Allentown, Pa. Booth No. 5.
Safety shoes for every department of industry. Representatives attending: Charles Clauser, John Clauser.

Linde Air Products Co., New York. Booth Nos. 281, 283.
A complete line of Oxweld acetylene welding and cutting equipment, showing by actual examples the application of the acetylene process in the foundry industry. Representatives attending: E. B. Farwell, W. E. Mittenmeyer, R. W. Boggs.

Lindsay McMillan Co., Milwaukee. Booth No. 307.
Rosinal and its various uses in foundry practice; also an interesting display of the different items used in the manufacture of Rosinal. Representatives attending: W. R. Pate, vice-president; J. A. Gitzen, M. A. Pollard, A. E. Welch.

Link-Belt Co., Chicago. Booth Nos. 90, 92.
An operating mold conveyor, speed reducers, belt conveyor idlers, vibrating shakeout riddle, elevating machinery and drive chain; also photographs of Link-Belt foundry installations. Representatives attending: E. L. Berry, W. C. Carter, J. J. Hartley, R. J. Heisserman, A. H. Moore, G. L. Morehead, George O'Connor, Norman Smith, H. L. Strube, M. Tholen.

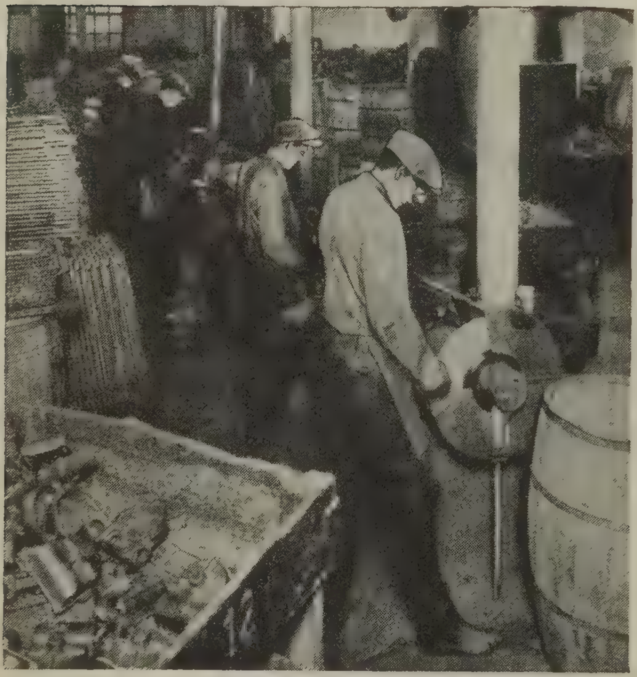
Reduce Mold Drying Time Nearly 50 Per Cent

TWO large Coleman mold drying ovens, which have been installed in one of the plants of the Worthington Pump & Machinery Corporation by the Foundry Equipment Co., Cleveland, have reduced drying time nearly 50 per cent, it is claimed, with a corresponding saving in fuel. The ovens are 16 ft. wide, 30 ft. long and 10 ft. high. Molds, it is emphasized, require no patching or secondary heating.

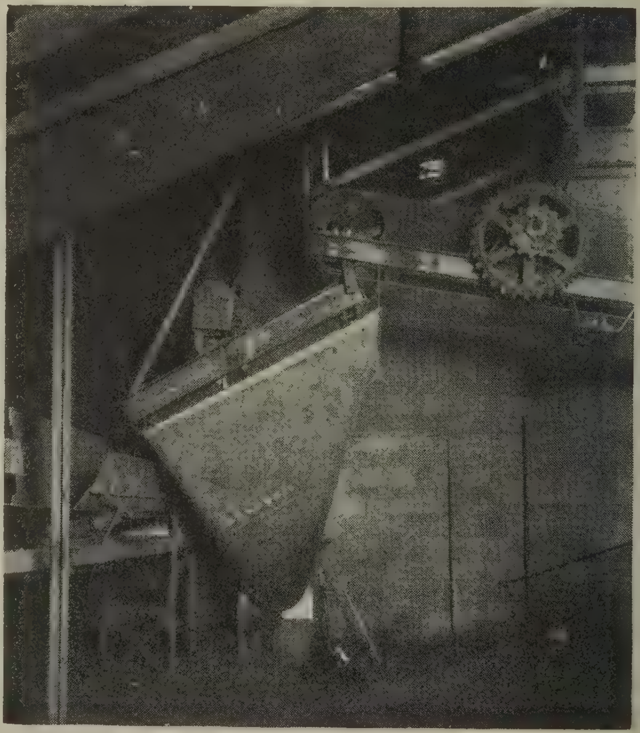
Grinder Maintains Surface Speed as Diameter Is Reduced



A MULTI-SPEED grinder, which is one of an installation by the United States Electrical Tool Co., Cincinnati, at the plant of the Peerless Foundry Co., Cincinnati, can be adjusted to maintain a high surface speed as the diameter of the wheel is reduced. The original wheel is 24 x 4 x 2¼ in. and the speed at this size and down to 19 in. is 900 r.p.m., no load, with a periphery maximum of 5700 ft. per min. and a minimum of 4500 ft. At this point the speed is changed to 1200 r.p.m. by adjusting the wheel guard to gain accessibility to the wheel and the maximum is then 6600 ft. per min. The wheel is carried at this speed down to 14-in. diameter when another adjustment is made and thence down to 10-in. diameter at which point the wheel has approximately 4700 ft. speed. Thus a surface speed above 4500 ft. per min. is maintained from a 24-in. to a 10-in. diameter without changing. The guards are arranged to prevent running a large wheel at an unsafe speed.

Vibratory Screen Handles 90 Tons of Sand Per Hour

ONE of the large foundries in Detroit has installed equipment which handles foundry sand at the rate of 90 tons per hr. The equipment includes a Leahy No-blind vibrating screen, 3 x 6 ft., motor driven, manufactured by the Deister Concentrator Co., Fort Wayne, Ind. The sand drops from a belt conveyor to the vibrating screen, which has clear openings of ⅝ in., the finer sand dropping into a hopper below and through a hole in the bottom to the floor, while the coarser particles are directed to the left as indicated.



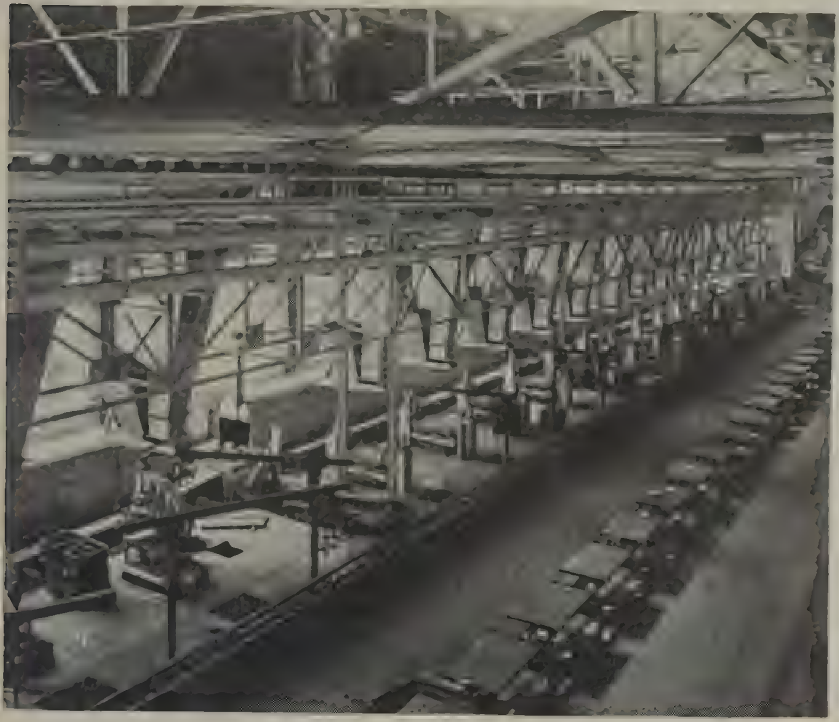
Molding Units in the Buick Foundry

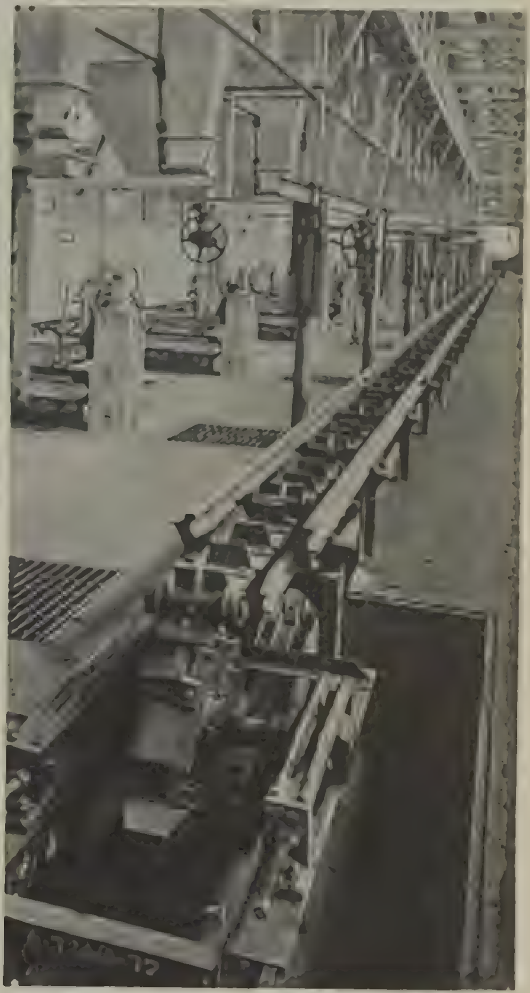
SIX molding units designed, built and installed by the C. O. Bartlett & Snow Co., Cleveland, are included in the Buick foundry at Flint, Mich. General description of the foundry and its component parts was given at pages 643 of THE IRON AGE of Sept. 8, 1927; 1217 of Nov. 3; 1363 and 1372 of Nov. 17; 1582 of Dec. 8, and 1784 of Dec. 29.

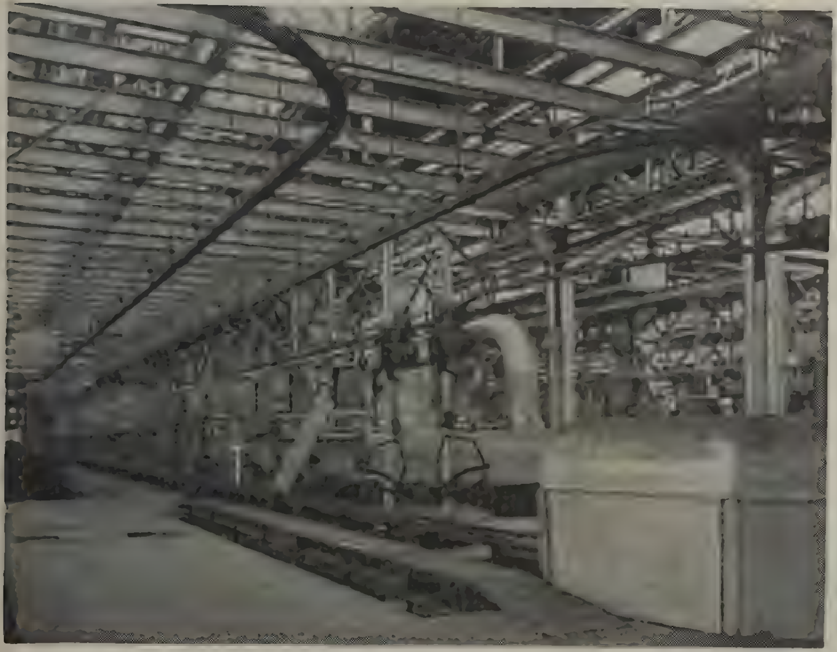
Some of the features not covered specifically in the descriptions previously printed are shown in the three photographs on this page. The upper left picture gives a general view of part of one of the molding units, including the mold conveyor, facing and molding sand hoppers, return conveyor for flasks, overhead belt conveyor for sand and, in the background, the hooded mold cooling conveyor depended upon to keep the foundry measurably free from fumes and heat.

The picture at the right shows the sprocket wheel drive and conveyor construction of the molding conveyor running alongside the molding machines. This is a detail of the general view. Into the gratings in the steel plate floor alongside the conveyor is disposed the sand spilled in handling, to keep the floor clean.

The picture at the lower left shows the pouring end of a molding unit. In the foreground is a moving walkway from which metal is poured into the molds just before they enter the hooded cooling conveyor. The conveyor makes a complete 180-deg. turn at this point, that portion showing in the background being an extension of the portion in the right foreground. Two of the ladle carriers appear above the pouring platform.



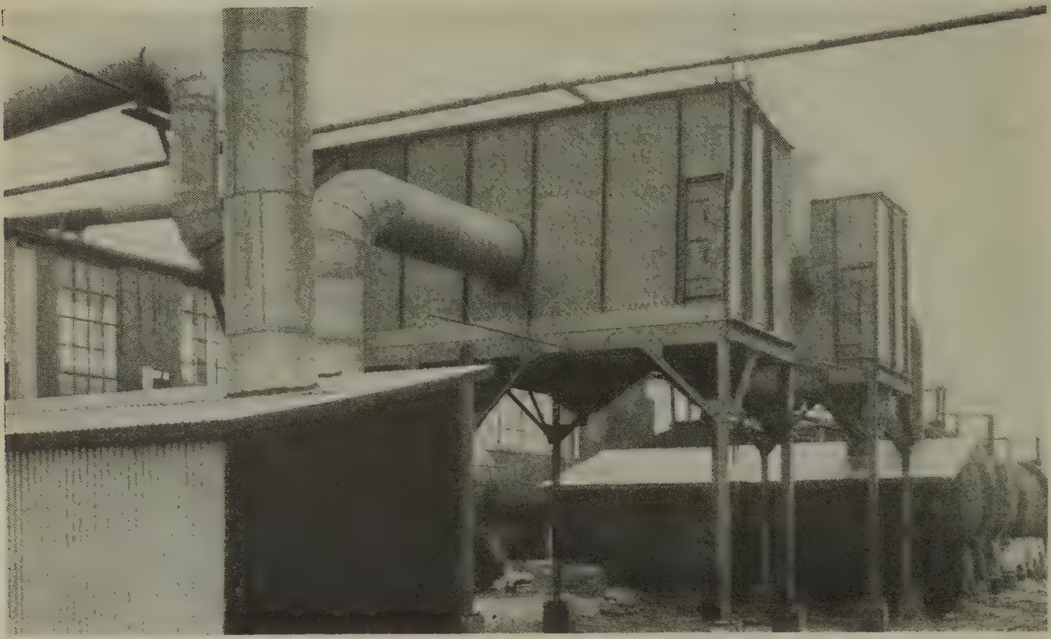




MOLDING UNITS OF THE BUICK FOUNDRY AT FLINT, MICH.

Publication No. 204 in a series of translations of industrial standard specifications contains the English text and a Portuguese translation of the standard specifications for the manufacture of open-hearth steel girder rails, A.S.T.M. standard A2-27. This series is issued by the United States Department of Commerce, and the publication cited may be obtained from the Superintendent of Documents, Washington, D. C., for 5c.

Filter Equipment for Dust from Grinders and Tumblers

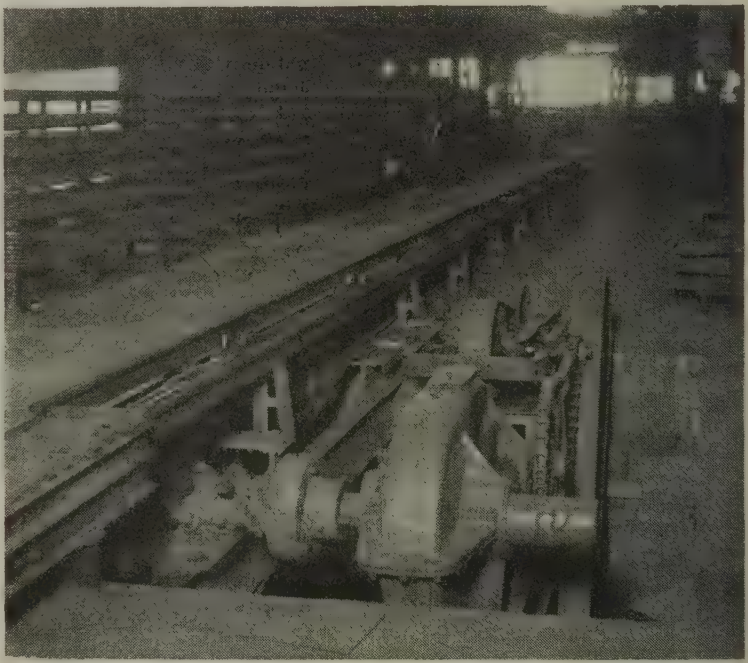


THE Glancy Malleable Corporation, Waukesha, Wis., recently installed dust filter equipment, which was built by the Whiting Corporation, Harvey, Ill. The equipment consists of one 17-ft. filter with a 5-ft. settling chamber, providing exhaust for grinders, and one 8-ft. filter for exhausting the tumbling barrels.

Slide-Rail Conveyor for Handling Molds

MOLDS are carried along the slide rails by means of dogs. The driving mechanism is a heavy Falk speed reducer with 6-in. low-speed shaft. Variable speeds from 2½ to 7½ ft. a min. may be obtained.

Designed especially for handling heavy molds, the slide-rail conveyor is of massive construction. It is mounted on a steel base made of 9-in. channels set flush with the floor. On these are fastened the cast steel brackets carrying the rails. These rails are 50 lb. a yard on the load side and 20 lb. a yard on the return side. The equipment was installed by the Jeffrey Mfg. Co., Columbus, Ohio. Each attachment or pusher link of the chain has a 4-wheel truck, these being spaced on 6-ft. centers. The trucks are not lubricated, but heavy oil is placed on the slide rails.

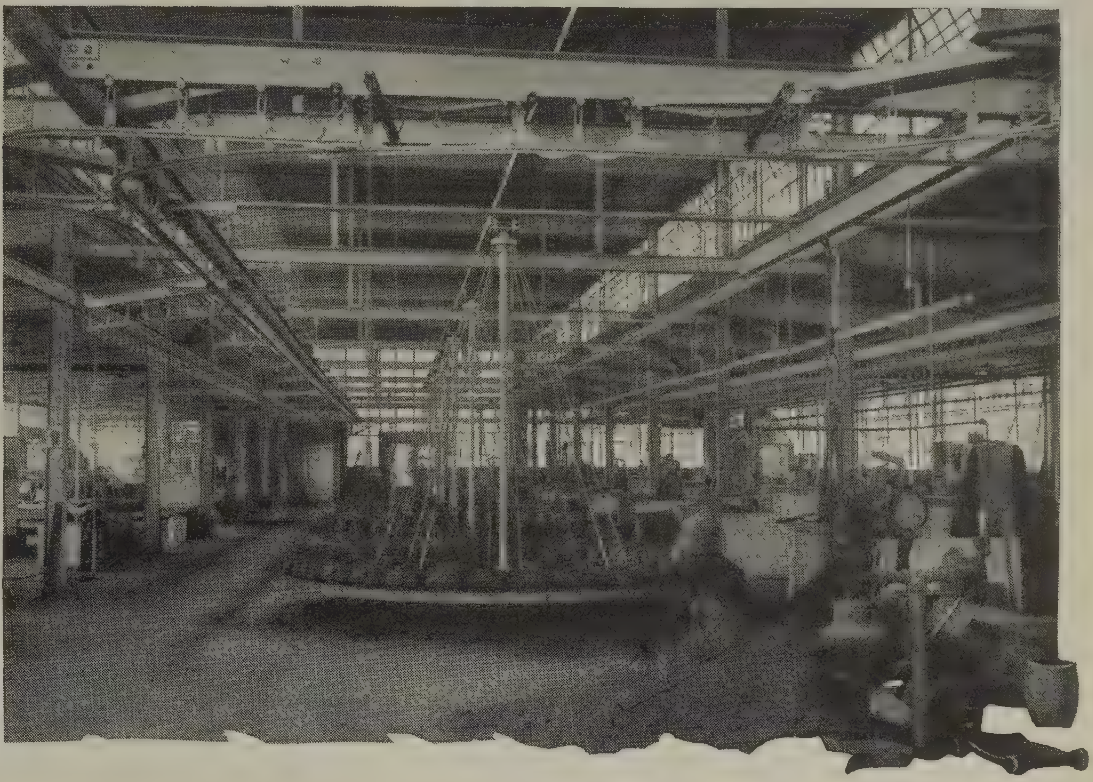


Sand Digger for Transferring Sand to Molding Floor

THE Clarktor sand digger as used at the plant of the Lakey Foundry & Machine Co., Muskegon, Mich., to transfer sand from the sand storage bins to the molding floor. The machine, which is manufactured by the Clark Tructractor Co., Battle Creek, Mich., is shown with the scoop driven into the sand pile.

Monorail Track for Serving Mold Turntables

AT the Metric Metal Works, Erie, Pa., a Louden monorail track serves the mold turntables. The metal is poured into molds directly from a ladle on the track. A second parallel track was installed for the return of ladles to the furnaces.



Cope Molding Machine with Tapered Cope Flask

THE Electric Household Utilities Co., Waukegan, Ill., has speeded up production in its foundry by the use of cope and drag machines furnished by the Arcade Mfg. Co., Freeport, Ill. The cope machine, which is illustrated, has a 7-in. jolt cylinder, two 5-in. strip cylinders and an 18-in. draw. The cope flask is unusual in that it is tapered; the dimensions at the parting line are 22 x 25 in., at the top 18 x 20 in. and the depth is 21 in. The drag flask is straight, 22 x 25 in., and 3 in. deep. Before installing these machines the company's production of an ironer base casting was 12 per day for two men, or a total of 96 per day for the 16 men employed at this work; the new equipment, it is stated, has shown a maximum production of 110 castings in one day with five men working.

Louden Machinery Co., Fairfield, Iowa. Booth Nos. 148 to 154. Double bead and super-track monorail systems; electric hoists; electric ladle pouring device; transfer cranes. Representatives attending: R. B. Louden, president; R. Bruce Louden, secretary; Roy Louden, advertising manager; L. F. Berthold, sales manager; P. M. Hassler, H. L. Stetser, P. L. McCain, E. H. Seelbach, W. H. Eldridge, Philip Kinzel.

Lowe Mfg. Co., Detroit. Booth No. 436. Electric sifting machines. Representative attending: R. G. Lowe.

Lupton's Sons Co., David, Philadelphia. Booth No. 236. Pond continuous windows, Pond operating device, Lupton pivoted windows, Lupton skylights, Pond roof designs tives attending: Clarke P. Pond, George N. Hingston, including Pond truss and Pond A-frames. Representa- J. W. Kauffman.

M

McCormick Co., J. S., Pittsburgh. Booth Nos. 158, 160, 162. Foundry facings, supplies and equipment. Representatives attending: J. S. McCormick, president; H. T. Herr, Jr., vice-president; Frank J. Buerger, secretary; H. D. Fowler, C. C. Bumbaugh, Harry J. Winters, James W. Early.

R. W. McIlvaine Co., Chicago. Booth No. 237.

Macleod Co., Cincinnati. Booth No. 39. New type sand blast hose machine, cupola lighter and skin dryer, pressure type sprayer, steel swab, brass swab. Representative attending: James Lauder.

Maehler Co., Paul, Chicago. Booth Nos. 61, 63. Rack type oven in operation with Universal gas heater and temperature control equipment; Universal heaters and blowers and control equipment for core ovens. Representatives attending: A. E. Maehler, R. C. Schwarz, H. R. Fox, H. M. White.

Malleable Iron Fittings Co., Branford, Conn. Booth Nos. 31, 33. Branford flask rapper vibrators, pot rapper vibrators, dual purpose vibrators, long stroke vibrators, regular vibrators, knee valves, hand valves, sprayers and other foundry accessories. Representatives attending: George B. Pickop, Raymond F. Wright, Thorwald F. Hammer, George Agnew, Oscar Montelius, Lincoln Fitzpatrick.

Manhattan Rubber Mfg. Co., Passaic, N. J. Booth No. 70. Grinding wheels and machines. Display in conjunction with that of Kling Brothers Engineering Works of Chicago. Includes Kling heavy-duty grinder stand and Manhattan swing-frame grinders such as are generally used in steel foundries. Manhattan rubber bonded wheels mounted on machines and both in operation to show actual performance. Representatives attending: N. Clif Hilton, W. H. Steinberg, W. F. Bechtel.

Marschke Mfg. Co., Indianapolis. Booth Nos. 102, 104, 106, 108. Complete line of motor driven grinders in stand and swing frame, for both standard vitrified speeds and high-speed bakelite wheels. Representatives attending: W. A. Marschke, Luke M. Boyd, J. A. Fairfield, W. T. Johnston.

Martin-Rosebury Corporation, New York. Booth No. 82.

Mathews Conveyor Co., Ellwood City, Pa. Booth No. 15. Mathews heavy duty foundry roller conveyor and pallet conveyors shown handling castings, molds, etc.; also overhead chain-operated trolley conveyor. Representatives attending: F. E. Moore, president; J. H. Hough, sales manager; F. A. Francois, H. F. Davis, O. P. Hicks, E. F. Smith, F. W. Achuff, C. E. Achuff.

Mathieson Alkali Works, Inc., New York. Booth No. 7. Purite (Fused soda ash). Representatives attending: G. S. Evans, R. G. Kendrick, W. D. Marshall, J. R. Schmertz.

Mercury Mfg. Co., Chicago. Booth Nos. 330, 332. Mercury electric industrial tractors, Mercury gasoline industrial tractors, Mercury industrial trailers for foundry use. Representatives attending: Conrad Hibbeler, C. H. Clare, A. L. Wood, Charles Keiper, P. W. Cyphers, L. J. Kline.

Milwaukee Foundry Equipment Co., Milwaukee. Booth No. 17. Moving pictures showing molding equipment in operation in various foundries. Representatives attending: E. J. Byerlein, general manager; H. E. Fellows, L. E. Gregory, C. J. Jurack, J. E. Lambrix, T. J. Magnuson, J. H. Morton, M. F. Byrne.

Monarch Engineering & Mfg. Co., Baltimore. Booth Nos. 485, 486, 487. No. 92 Simplex furnace complete with oscillating device; double chamber furnace No. 1; revolving core oven; Acme core oven, coal, coke, oil or gas fired; 250-lb. iron pot tilting aluminum furnace; No. 60 tilting oil-fired furnace; No. 40 stationary gas-fired furnace on legs; new No. 60 stationary preheated air furnace; 250-lb. capacity tilting reverberatory furnace, etc. Representatives attending: Harry D. Harvey, James V. Martin, William H. Raber, Mack C. Losinski, Wilford Wilkins, Harold L. Harvey, William Chenowith.

Mt. Jewett Fire Clay Co., Mt. Jewett, Pa. Booth No. 214. Blended fire clay for bonding iron foundry and steel foundry molding sands; ground fire clay for general purpose use in foundries; Waldak treated clay, a refractory cement. Representatives attending: Edward M. O'Neill, general manager; A. F. Shaffer, sales manager.

N

National Engineering Co., Chicago. Booth Nos. 37, 110. No. 3, 8-ft. dia. pan, Simpson intensive sand mixer with speed reducer, motor base and couplings, including motor; also No. 0, 3-ft. pan, Simpson mixers with motor and worm gear reducer for demonstrating the blending action of the Simpson mixer. Representatives attending: H. S. Simpson, president; A. G. J. Rapp, Barney Castor, W. A. Kellogg, H. N. Schreuder, W. C. Edgar, C. D. Hollins.

National Pulverizing Co., Millville, N. J. Booth No. 305. Sand blast sand, dry sands, ground silica or mold wash. Representatives attending: Wilbert Bivins, president; A. S. Carman, treasurer; F. M. Wheat.

National Smelting Co., Cleveland. Booth No. 285.

New Haven Sand Blast Co., New Haven, Conn. Booth Nos. 137, 139, 141, 143, 190, 192, 194, 196. Barrels, dust arrestor, rooms, tumbling mill, cabinet. Representatives attending: D. S. Sammis, C. E. Billings, G. C. Fatscher, S. S. Parsons, Robert Wisely, L. Thompson.

New Jersey Silica Sand Co., Millville, N. J. Booth No. 247. Molding sands, sand blast sands, silica flour or mold wash, special blended sands. Representatives attending: Burdette Tomlin, president; Clarence R. Wolf, secretary-treasurer; Jack Hallard.

Niagara Falls Smelting & Refining Corporation, Buffalo. Booth No. 218. Special non-ferrous alloys; unusual castings made with Falls Brand alloys. Representatives attending: Ernest G. Jarvis, Raymond Hunter, George B. Michie, Samuel Frankel.

Nicholls Co., Inc., William H., Brooklyn. Booth Nos. 69, 71, 140, 142. Molding machines. Representatives attending: William H. Nicholls, president; Fred W. Dixon, Dominic Petrocelli, G. Anderson, L. R. Schocken.

Northern Engineering Works, Detroit. Booth Nos. 369, 371. Standart-ized crane trolley; Hi-Lift electric hoist. Representatives attending: Henry W. Standart, H. C. Rood, S. E. Schneider.

Norton Co., Worcester, Mass., Booth Nos. 443 to 449. Grinding machines and grinding wheels.

O

Obermayer Co., S., Chicago. Booth Nos. 38, 40, 42. Foundry facing, foundry equipment, refractory and facing gun, molding equipment, etc. Representatives attending: Theodore Kauffmann, president; S. T. Johnston, vice-president; E. D. Frohman, vice-president; J. L. Cummings, F. Flynn, W. R. Cummings, W. C. Samuels.

Oiless Core Binder Co., Cleveland. Booth No. 272. Oiless core binder together with two new products, Oiless core-mold wash and core paste; also a few cores, dry sand molds and difficult castings showing results as actually produced in the foundry. Representatives attending: J. H. Bruce, president; J. A. Hamilton, vice-president; H. A. Baker, secretary-treasurer; H. B. Fischer, sales manager.

Oliver Machinery Co., Grand Rapids, Mich. Booth Nos. 129 to 133 and 182 to 186.
Woodworking machines including: No. 94-D Straitline cut-off saw; No. 94-T metal table for operating with saw; No. 199-D motor arbor single surface planer; No. 34-E disk and spindle sander; No. 116-D motor arbor band saw; No. 51-B motor head speed lathe; No. 25-B motor head pattern makers' lathe; No. 72-D motor arbor vertical single spindle boring machine; No. 88-D tilting motor arbor miter saw; No. 12-AD motor arbor pattern shop jointer; No. 144-D motor arbor 6-in. jointer; No. 585 oilstone tool grinder; No. 462 electric band saw brazer; No. 190-D motor-driven self-contained inside edge and scroll sander; No. 191 7-in. tilting arbor saw bench; No. 192 18-in. direct motor band saw; No. 182 direct motor disk sander; No. 181 motor-driven spindle sander. Representatives attending: A. S. Kurkjian, general sales manager; Arthur Blake, Charles A. Ginter, J. R. Duthie, J. E. McLauchlen, C. R. Crosley.

Tinius Olsen Testing Machine Co., Philadelphia. Booth No. 197.
Several transverse testing machines for testing the standard transverse foundry bar, both of indicating and recording type; Herbert pendulum hardness tester with various attachments; motor-driven production type Brinell hardness tester; Olsen-Boyd automatic testing machine for testing foundry cores; Honda sharpness tester, special extensometers and recording instruments. Representatives attending: T. Y. Olsen, R. B. Lewis, Jacob Lundgren, B. D. Lewis.

Osborn Mfg. Co., Cleveland. Booth Nos. 425 to 439.
Improvements in sand treating and sand and mold handling equipment; also a squeezer machine making molds continuously. Representatives attending: F. G. Smith, president and general manager; H. R. Atwater, vice-president; E. S. Carman, secretary and chief engineer; M. W. Zeman, E. T. Doddridge, J. C. Alberts, F. T. Spikerman, R. E. Kiefer, H. B. Klar, G. G. Adam, R. C. Miller, R. W. Hisey, P. F. Smith, J. D. Wise, R. F. Lincoln.

Ottawa Silica Co., Ottawa, Ill. Booth No. 275.
Flint shot sand and Diamond sand blast sand. Representatives attending: E. O. Schneider, sales manager; Edward H. Stehman, sand blast engineer.

Albert T. Otto & Son, New York. Booth Nos. 19 to 23.

P

Pangborn Corporation, Hagerstown, Md. Booth No. Block E.
Sand-blast room, barrel and table equipment, dust arresters, and protective clothing; sand-blast abrasives and supplies. Representatives attending: Thomas W. Pangborn, president; John C. Pangborn, vice-president; H. D. Gates, sales manager; W. C. Lytle, J. J. Carr, C. T. Bird, L. W. Wagner, Wm. T. Randall, Fred E. Wolf, Jesse J. Bowen, E. C. Gilmour, George A. Cooley, B. R. Artz, Charles A. Boultman, L. L. Stouffer, M. I. Dorfan, P. J. Potter, Foster J. Hull, William A. Rosenberger, E. J. Dunbeck.

Patent Cereals Co., Geneva, N. Y. Booth No. 303.
Rex core and facing binder. Representatives attending: A. N. Duncan, T. K. Fahy.

Paxson-Taggart Co., Philadelphia. Booth No. 293.
Foundry equipment and supplies.

Pennsylvania Foundry Supply Co., Philadelphia. Booth No. 300.
Foundry supplies.

Pettinos, Charles, New York. Booth No. 252.
Various kinds of molding sand, core sand, plumbago, various foundry facings, core blacking, dry sand blacking, ingot mold blacking, etc. Representatives attending: Charles Pettinos, W. T. Bennett, J. Howard Bing, Marshall M. Houskeeper, Walter H. Laros, Walter J. Meighan, Martin Meiss.

Pettinos, George F., Philadelphia. Booth No. 254.
Foundry sands, foundry facings, foundry supplies. Representatives attending: George F. Pettinos, George A. Doughter, B. M. Bird, James H. Hatten, T. H. Walker, F. H. Goodfellow, Miss A. M. Kunkle, D. S. Yeomans, J. R. Cooney, E. G. Stratton, George F. Pettinos, Jr.

Pittsburgh Electric Furnace Corporation, Pittsburgh. Booth Nos. 461, 463, 465, 469.
Small 'Lectromelt furnace pouring iron for castings to be made in Holley Carburetor Co. permanent molds; joint exhibit Pittsburgh Electric Furnace Corporation and Holley Carburetor Co. Representatives attending: W. B. Wallis, president; W. E. Lewis, R. D. Thomas, Alexander Haigh, Presley Hamilton, W. H. Payne, W. L. Kammerer.

C. E. Schley
Pennsylvania Bronze & Brass Co., Philadelphia. Member, Plant Visitation Committee

W. B. Coleman
W. B. Coleman & Co., Philadelphia. Member, Plant Visitation Committee

R. B. Van Norman
Cleveland Pneumatic Tool Co., Philadelphia. Member, Plant Visitation Committee

Port Crescent Sand & Fuel Co., Detroit. Booth No. 278.

Portage Silica Co., Youngstown. Booth No. 306.
Samples of Portage steel molding, core and sand blast sands; samples of Portage silica conglomerate in its natural state. Representatives attending: E. E. Klooz, C. F. Eberhart, Lee R. Farrell.

Precision Grinding Wheel Co., Philadelphia. Booth No. 175.
Grinding wheels.

Production Equipment Co., Cleveland. Booth Nos. 124, 126.
Cleveland sandcutters. Representatives attending: L. P. Orr, H. E. Johnson, L. Vergith.

Pulmosan Safety Equipment Corporation, Brooklyn. Booth No. 296.
Safety equipment including dust respirators, sand blast hoods, helmets, acid hoods, first-aid equipment, safety shoes, paint spray respirators, goggles, asbestos equipment, gas masks. Representatives attending: Frederick Wahlert, president; William H. Wahlert, secretary.

Pyrometer Instrument Co., New York. Booth No. 248.
Optical, insertion and radiation pyrometers. Representative attending: F. Heidorn.

R

Cyrus Rapoport, New York. Booth No. 424.

Reading Chain & Block Corporation, Reading, Pa. Booth No. 59.
Chain hoists, electric hoists, I-beam trolleys, traveling cranes, mono-rail systems. Representatives attending: F. H. Howard, Fred A. Howard, Philip K. Howard, Lloyd W. Lutz, E. I. Huff, H. A. White.

Charles Reines, Brooklyn. Booth No. 287.

Robeson Process Co., New York. Booth No. 215.
Glutrin and Goulac core sand binders. Representatives attending: Gordon I. Lindsay, president; B. W. Bullen, secretary; T. J. Ryan, T. J. O'Hara, J. A. Smith.

William C. Robinson & Son Co., Baltimore. Booth No. 314.

Rogers Brown & Crocker Bros., Inc., New York. Booth No. 220.
Pig iron, coke, ferroalloys, molding sand fire clay, etc. Representatives attending: C. H. Newcomb, George R. Sullivan, W. J. Gallana, L. H. Hoskins, L. H. Miller, L. Tierney, C. E. Trommer, J. A. Claussen, C. A. Reed, H. W. Fernald, Thomas A. Wilson, Harwood Wilson, F. W. Bauer, Grant B. McLaughlin, J. R. Morehead.

Rohrbacher Shoe Co., Boston. Booth No. 295.
Safety shoes for foundry workers.

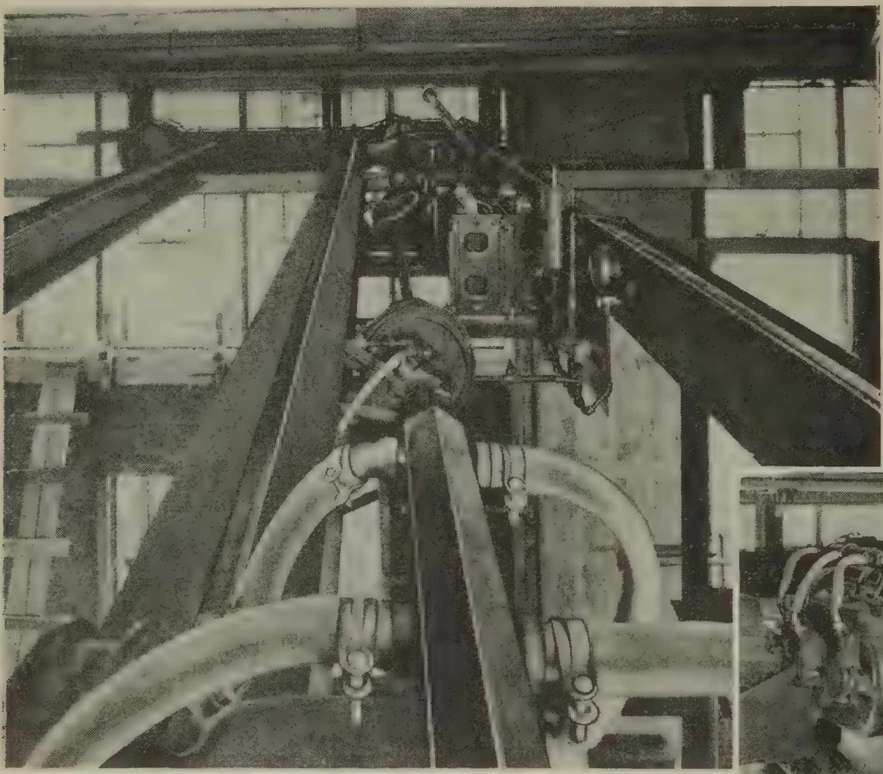
Rotor Air Tool Co., Cleveland. Booth No. 51.
D-1 Rotor grinder with vitrified wheels; D-1 high production model, running 5400 r.p.m., with rubber bonded and bakelite wheels, on both cast iron and steel; Rotor sander finishing welds, with cup wheel, also sanding welds and automobile body parts, with Carborundum disk; D-3 grinder with vitrified wheel; D-3 high production model with rubber bonded and Bakelite wheels; new E-5 drill, 29/32 and 1¼ in. capacity; new E-7 drill, 1¼ in. heavy duty and 2 in., both drills rigged up for reaming demonstrations as well as drilling; new quick-as-a-wink buffing wheel, shown on type D-1 Rotor buffer; new type of buffing wheel utilizing straight strips of abrasive and giving flat contact. Representatives attending: H. P. Bailey, president; K. L. Pohlman, vice-president; F. R. Moore, G. O. Singer, L. K. Berry.

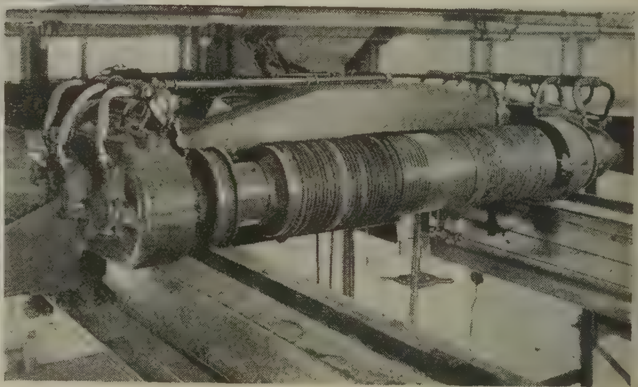
(Continued on page 1238)

Forced Lubrication System on Overhead Crane

ONE foundry using five overhead electric traveling cranes found it possible to dispense with one of them, through improvement in operation of the other four from controlled lubrication. Elimination of delays and repairs is reported responsible for this result. The lubricating devices were installed by the Keystone Lubricating Co., Philadelphia. Two illustrations show how this equipment was put in. One is a general view of the lubricator installation on the bridge, while the other shows the installation on the trolley.

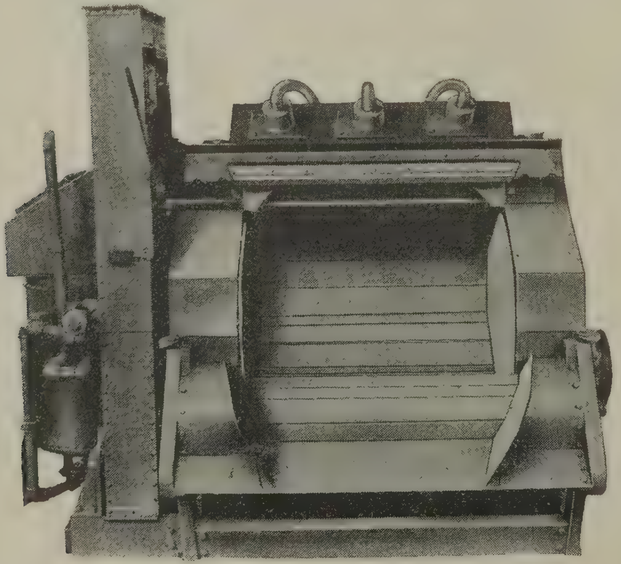
In the trolley view the hand wheel shown below the rope drum may be reached by the operator from his cab. The gage is hidden behind the drum in this view. Connections from manifolds are shown in both views; the gage and lubricator appear near the center of the general view. The truck wheels are designed for oil waste lubrication by capillary feed from below the journal. The grease line enters through the top of the bearing, the grease being discharged directly on top of journal. The wool waste is left in the box, acting as a wiper to collect and reapply the grease to the journal.

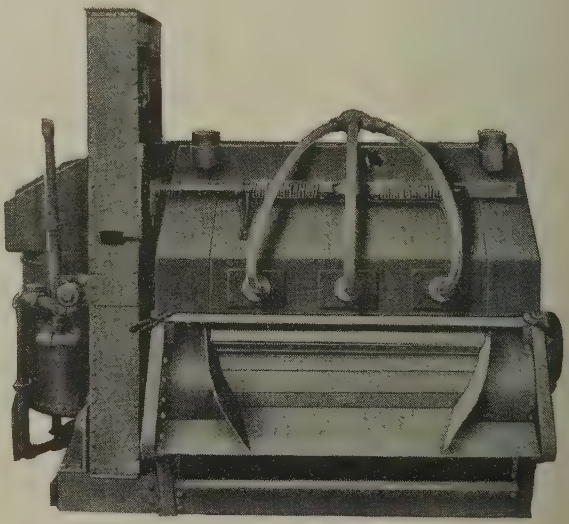




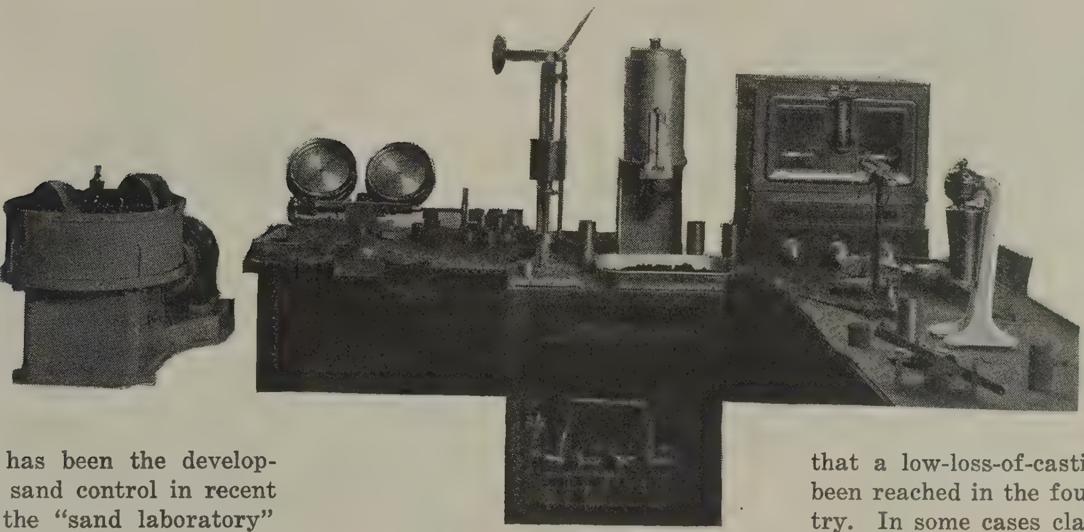
Quick Loading in New Blasting-Tumbling Application

REDUCTION of cleaning costs in the foundry is the purpose of a new application of the blasting-tumbling idea which has been made by the American Foundry Equipment Co., Mishawaka, Ind. The device consists of an incased apron conveyor that travels from front to back. It will take 2000 lb. or more of castings, which are continuously cascaded into position in front of the three blast nozzles. At the conclusion of the operation the conveyor travel is reversed and the load is fed onto an unloading belt or convenient receptacle. Features claimed for the device are quick loading, large capacity, easy inspection, reduced cleaning time, automatic unloading and elimination of dead areas.





Sand Laboratory Has Come to Stay



SO rapid has been the development of sand control in recent years that the "sand laboratory" now takes its place beside the chemical and physical laboratories in many modern foundries. One of the outstanding achievements of the technical work of the American Foundrymen's Association in recent years has been the gradual development of methods of testing and of apparatus to control sand mixtures and the selection of sands. The picture here reproduced is representative of the modern sand laboratory as furnished by Harry W. Dietert, Detroit.

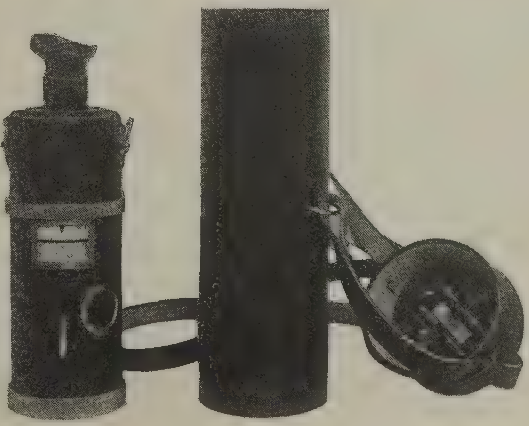
By the intelligent use of a sand laboratory it is generally conceded that a low-loss-of-casting era has been reached in the foundry industry. In some cases claims of a 50 per cent reduction in losses are recorded. One foundry goes on record to the effect that its losses in castings are now around 5 per cent as against 15 per cent before sand control by means of a sand laboratory was introduced. Evidently the sand laboratory has come to stay.

Trucks for Various Foundry Uses

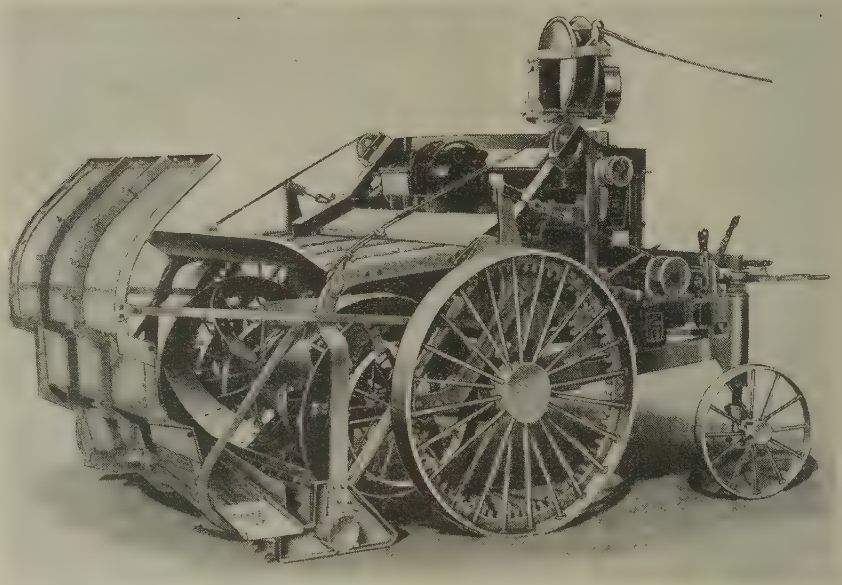
INDUSTRIAL trucks have been adapted for a number of purposes in the foundry. The illustration shows a Baker charging truck for charging castings into a malleable annealing oven. This truck has four-wheel steer for flexibility and is rated at from 4000 to 8000 lb. A similar type of truck equipped with a swivel crane and magnet has been successfully utilized in handling bagged castings, doing the work of seven or eight men. An elevating truck, equipped with duplex compensation suspension to eliminate jars in starting and stopping, is designed for handling fragile cores without breakage. These trucks are built by the Baker-Raulang Co., Cleveland.

Simplified Optical Pyrometer

THE Pyrometer Instrument Co., New York, recently brought out a simplified optical pyrometer which combines lightness of weight (3 lb.) with other convenient features. Its overall dimensions are only 4 x 9 in. It is provided with a standard lamp which can be checked at the moment desired. The cylindrical casing contains the optical system, comprising adjustable objective, reflecting prisms, monochromatic red glass and adjustable eyepiece; the electrical system, comprising standard lamp, ammeter, rheostat, dry battery and press switch, and the diffusor and temperature scale. A flashlight battery suffices for the operation of the instrument. The light intensity of the hot body under observation is compared with that of a small electric lamp.

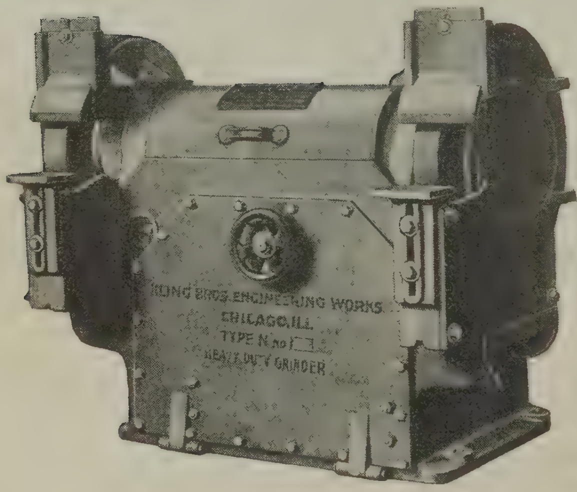


Sand Preparator Screens, Aerates, Cuts and Piles



AFTER six years of experiments and tests, the American Foundry Equipment Co., Mishawaka, Ind., has placed on the market the American Preparator, a sand preparation machine. The Preparator screens, aerates, cuts and piles sand. The cutter blades throw the sand through a screen, and aeration takes place as the sand falls to the floor.

High-Speed Heavy-Duty Grinder



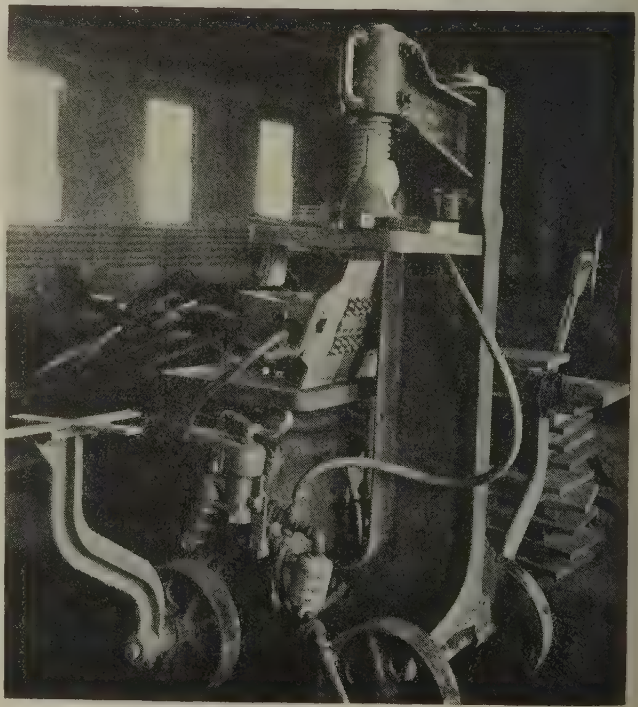
A HIGH-SPEED heavy-duty grinder built by the Kling Brothers Engineering Works, Chicago, is designed for grinding gray iron, malleable and steel castings and iron and steel forgings and for the job work of snagging and rough grinding.

Fitted with 24-in. wheels, the machine is 59 in. long, 38 in. wide and 49 in. high. It weighs about 3700 lb. and has a 15-hp. ball-bearing motor at 1800 r.p.m. The wheels are 3 in. thick and run at a constant peripheral speed of 8500 ft. a minute. As the chucks upon which they are mounted require a 12-in. bore, they allow for grinding to a 14-in. diameter. This gives a minimum of stub loss and maximum grinding service.

Compressed Air Separator Drains Out Water

THE illustration shows a ⅜-in. Gast compressed air separator furnished by the Smith-Monroe Co., South Bend, Ind., installed on a molding machine to eliminate the troubles sometimes experienced from condensation of the water content of the air. Moisture in the air sometimes causes the vibrator to congeal and stick. The separator is relied upon to avoid this and at the same time to provide dry, clean air for the air gun. It is drained by a small air cock which is opened periodically by the operator.

As it is important that moisture be excluded from the air on sand blast equipment, particularly where steel abrasives are employed, this same device is designed for such use. Here a larger size is designed to effect entire removal of the entrained moisture. It is fitted in this case with an air trap, to drain it automatically. For this service a 2-in. separator is customarily used.

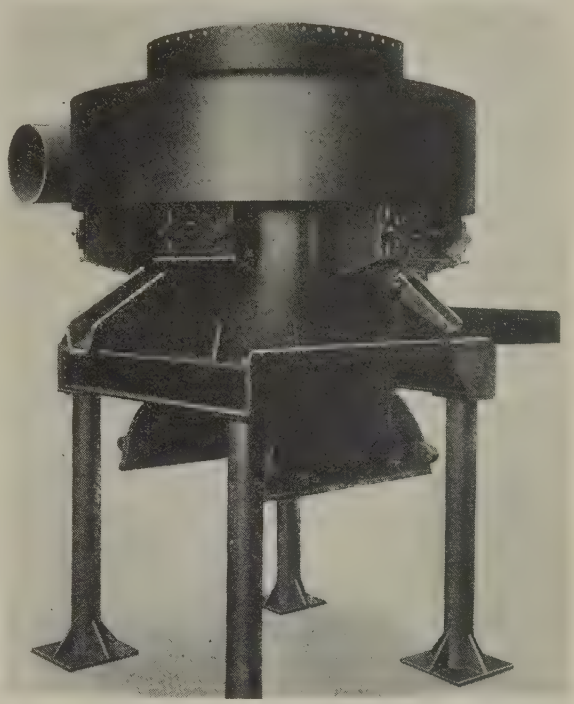


New Model B Whiting Cupola

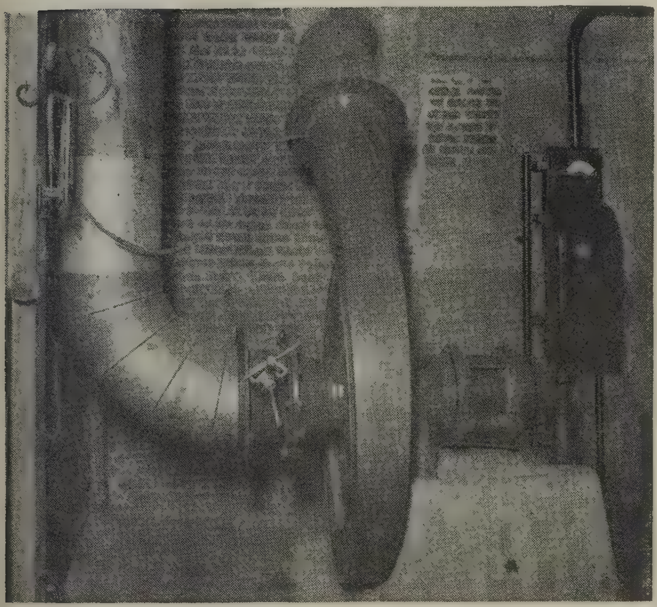
A NEW foundry cupola, model B, is being introduced by the Whiting Corporation, Harvey, Ill. One of the improvements is a heavy structural bottom plate fabricated from boiler plate and structural shapes, to do away with the cracking and distortion sometimes experienced with cast iron plates, and, of course, to prevent leaks in the windbox resulting from the distortion. The model B has straight cylindrical columns of wrought steel, which are filled with concrete when installed. This also helps to overcome the danger of cracking when they are exposed to the heat of the drop and cooling water is thrown on them.

The company for the safety opening has provided a fusible lead plate of some size, tightly clamped in a vertical position so that it will not become covered with coke, etc. The safety channel is merely a depression in one tuyere, 2-in. deep, leading to the safety spout.

The windbox is placed above the tuyere boxes or elbows, to eliminate the possibility of iron and slag flowing into the wind chamber, and the joints of the windbox are welded. The windbox and tuyere elbows are relatively larger than usual.



New Cupola Blowing Equipment



THE General Electric Co., Schenectady, N. Y., has brought out a cupola blowing equipment of a new type rated 2800 cu. ft. of air at 1-lb. pressure, at 3500 r.p.m. It is designed to insure the supply of a constant weight of air to the cupola, irrespective of atmospheric conditions and the resistance through the cupola. Instead of operating the cupola by supplying a constant volume of air, or air at a constant pressure, it supplies a constant weight of air or oxygen. The idea is that a definite weight of oxygen is required to burn a certain weight of coke.

The equipment can be used with either hand or automatic control, and can be set to give the desired weight of oxygen to meet varying operating conditions. The weight is not controlled by variable speed, but by opening and closing the blast gate.

Modifications Add to Flexibility of Elevating Truck

ATTACHMENT of underslung forks for picking up heavy flasks has adapted the elevating platform truck shown for work which cannot readily be done by man power. The truck, which is built by the Yale & Towne Mfg. Co., Stamford, Conn., may also be modified by the attachment of extended arms or rams on the platform for the handling of very heavy castings, such as boiler sections. The flexibility of the truck is designed to speed up the flow of materials in process and the lifting features often enable the saving of considerable space in storing foundry products.

Royer Foundry & Machine Co., Wilkes-Barre, Pa. Booth Nos. 471, 473, 475, 477, 479.
Royer sand separator and blender. Representatives attending: G. F. Royer, president; John Lloyd, vice-president; S. B. Davies, treasurer.

Ruemelin Mfg. Co., Minneapolis, Minn. Booth No. 455.
Sand blast guns, sand blast generators, sand blast cabinets, exhaust fans. Representatives attending: Richard Ruemelin, president; Harold Flitz.

S

Safety Equipment Service Co., Cleveland. Booth No. 204.
Super-Drednaut line of goggles, Dr. Woos respirator, Kleanair respirator, Safety Service shoes, Keyfel leggin, spring knee leggin, asbestos gloves, asbestos and F. P. suits, Adjusto ladder shoes, various other safety devices and appliances. Representative attending: B. W. Nutt.

Sager Glove Co., Chicago. Booth No. 250.

Semet-Solvay Co., New York. Booth No. 328.
Semet-Solvay foundry coke. Representatives attending: E. J. Burnes, D. S. MacEachern, D. H. Putnam, E. J. Rowe, W. S. Shelow, R. H. Watson, Samuel Weiss, J. M. Woods, A. F. Stengel.

Service Caster & Truck Co., Albion, Mich. Booth No. 366.

Shepard Electric Crane & Hoist Co., Montour Falls, N. Y. Booth Nos. 12 to 16.
Electric cranes and hoists.

Shevlin, Carpenter & Clarke Co., Minneapolis, Minn. Booth No. 11.
Lumber for foundry and pattern shop. Representatives attending: N. H. Morgan and H. A. Habeck.

Simons Paint Spray Brush Co., Dayton, Ohio. Booth No. 43.
Mechanical method of painting interiors of foundries and other manufacturing plants by the use of a spray gun outfit operated by compressed air. Spray can also be adapted to painting of castings.

W. W. Sly Mfg. Co., Cleveland. Booth Nos. 346, 348, 350, 352, 354, 356, 358, 360.
Slyblast room, positive pressure rotary table, Nos. 00 2 and 4 tilted mills, tumbling mill, dust arrester, sand reclaiming system. Representatives attending: S. C. Vessy, president; George A. Boesger, chief engineer; F. A. Ebeling, sales manager; L. B. Brewster, C. P. Guion, M. T. Mortensen, D. L. Harris, W. L. Kammerer, R. W. Hasselle.

Werner G. Smith Co., Cleveland. Booth Nos. 255, 308.
Samples of Linoil and other core oils and specimen cores. Representatives attending: Werner G. Smith, president; N. A. Boyle, treasurer; Milton S. Finley, vice-president; Frank H. Dodge, Dr. F. S. Havens, George H. Graham, I. R. Gerteis, L. P. Robinson, L. F. Ferster, Wallace Alexander, William Rayel, George Furman, Thomas Procter, M. M. Werckman, John M. Glass, A. S. Coulter.

THE IRON AGE will occupy Booth No. 1 at the exposition of the American Foundrymen's Association in Philadelphia the week of May 14. Representatives of the editorial, advertising and subscription departments in attendance.

Smith-Monroe Co., South Bend, Ind. Booth No. 177.
Gast compressed air separators. Representatives attending: R. O. Monroe, A. F. Squier.

Smith Oil & Refining Co., Rockford, Ill. Booth No. 235.
Core oil and liquid rosin. Representatives attending: Omer S. Smith, Stanton K. Smith, Frank C. Maley.

Spencer Turbine Co., Hartford, Conn. Booth No. 391.
Spencer turbo-compressors for supplying air for foundry cupolas, oil and gas burning industrial furnaces, etc. Representatives attending: S. E. Phillips, F. A. Wright, O. J. Dingee, F. D. Bailey.

Springfield Facing Co., Springfield, Mass., and Newark, N. J. Booth No. 41.
Foundry facings and supplies. Representatives attending: L. S. Brown,president; H. E. Beckman, general manager; H. Z. Dingee, vice-president; William Lawson, Frank Kumer, Harold Hamlen, F. P. Bullion.

Standard Sand & Machine Co., Cleveland. Booth No. 67.
Exhibiting latest model core and facing sand mixer, equipped with motor and speed reducer, Timken bearings and hexagonal screen. Representative attending: Harry E. Boughton, vice-president and general manager.

Sterling Wheelbarrow Co., Milwaukee. Booth Nos. 324, 326.
Foundry flasks, trucks, shop boxes, wheelbarrows, casters, wheels and other foundry specialties. Representatives attending: H. H. Baker, secretary; R. F. Jordan, assistant sales director; G. H. Lambkin, J. M. Dickson, H. J. Felsburg, L. P. Robinson, J. A. Patterson, J. J. Coyne, O. E. Steep.

Frederic B. Stevens, Inc., Detroit. Booth No. 91.
A general display of foundry facing, foundry supplies and foundry equipment; also a working model of the Auto-Plate. Representatives attending: Frederic B. Stevens, president; W. H. Joseph Cluff, vice-president; John M. Mayers, secretary; Lewis H. Kirby, treasurer, and branch managers.

Stoney Foundry Engineering & Equipment Co., Cleveland. Booth Nos. 452, 454, 456.
Shakeout bail, vibrators, core knockout machine (standard "B" type), knockout machine (bench type), core grinding machine, ladles, hose clamps and fittings. Representatives attending: E. S. Cohen, L. J. Reinhard, G. A. Scott.

Sugar Pine Exhibits, San Francisco. Booth Nos. 77, 78.
Lumber for foundry uses.

Sullivan Machinery Co., Chicago. Booth Nos. 457, 459.
A Sullivan angle compound compressor in operation to supply other exhibitors with compressed air; a Sullivan class WG-6 12 x 10 straight line single-stage, belt-driven compressor; a new Sullivan two-cylinder vertical compressor, type WL-22, direct connected to a 25 hp. motor, all mounted on a self-contained base; two Sullivan portable hoists suitable for car pulling, light hauling, and miscellaneous industrial jobs. Representatives attending: Howard C. Sargent, E. F. Pie, L. R. Chadwick, Oscar R. Cundy, and Robert H. Moth.

Superior Sizing Co., Inc., Lockport, N. Y. Booth Nos. 240, 242.
Core oils and parting. Representatives attending: R. M. Snell, E. J. Johnstone, F. A. Roehlk, C. E. Schaad, J. E. Kershaw, Harry Knight, Joseph M. Remmes.

Swan-Finch Oil Corporation, New York. Booth No. 297.
Core oils specialist. Representatives attending: Nelson V. Joyce, vice-president; H. F. Moncrieff, J. W. Closterman, Jesse Jones, T. L. Brennan, G. S. Robinson.

Swartwout Co., Cleveland. Booth Nos. 18, 20.
Ovens (core baking and mold drying). Representatives attending: C. F. Mayer, C. J. Pimsner, H. A. Bogardus.

T

Tabor Mfg. Co., Philadelphia. Booth Nos. 54 to 66.
Complete line of foundry molding machines, including several new types never before exhibited. Representatives attending: Wilfred Lewis, president; F. R. Wallace, vice-president; Robert M. Maull, secretary and treasurer; J. T. Ramsden, R. H. Wiensner, Philip J. Shire, James H. Coleman, Harry W. Impey, John Pfendner, William E. Sewell, Thomas L. Sumner, John A. Rathbone, E. A. Platt.

Titgen-Eastwood Co., Philadelphia. Booth No. 316.
Cupolas and sand blast equipment. Representatives attending: Harry W. Titgen, A. B. Eastwood, William Dunbar, Christian Gunther.

Tinoa Petroleum Co., Philadelphia. Booth No. 364.

Tottenville Copper Co., Tottenville, N. Y. Booth No. 149.

Truscon Steel Co., Youngstown. Booth Nos. 412, 414.
Alloy steel flasks for a large variety of jobs; also foundry accessories such as gaggers, flat bands, pouring jackets, bottom boards, core plates and core racks; various types of steel platforms for handling sand, castings and other materials with greater efficiency. Information regarding Truscon industrial buildings available. Representatives attending: N. C. Ferreri, G. E. Madden, A. W. Ferguson, F. J. Vlaskamp, A. L. Abrahams.

Twentieth Century Woodworker, Philadelphia. Booth No. 120.

W. S. Tyler Co., Cleveland. Booth Nos. 171, 173.
Hum-mer electric screen for reclaiming and screening foundry sand; Ro-Tap testing sieve shaker; Tyler standard screen scale testing sieves, and samples of wire cloth in various metals, meshes and weaves suitable for foundry use. Representatives attending: N. E. Kile, M. D. Pugh, D. V. Vigneron.

U

United Compound Co., Buffalo. Booth No. 206.

United States Electrical Tool Co., Cincinnati. Booth Nos. 183, 185, 187, 189.
Electric drills, drill stands, electric blower, disk sander, high-cycle drills and grinders, multispeed grinders, light and heavy-duty grinders, combination disk grinder, motor-in-the-base selective speed buffers. Representatives attending: H. N. Kelsey, W. B. DaSilva, W. R. Dorsey, C. G. Cresswell, M. A. Weidmayer, G. M. Lawrence, G. E. Smith.

United States Graphite Co., Saginaw, Mich. Booth No. 226.
Complete line of Mexican graphite foundry facings and core washes and other graphite products. Representatives attending: J. J. Edmiston, O. R. Miller.

V

Vesuvius Crucible Co., Swissvale, Pa. Booth No. 245.

W

Wadsworth Core Machine & Equipment Co., Akron, Ohio. Booth No. 219.
Core making machines, core cutting-off and coning machines, core testing machines, steel core plates, steel bottom plates. Representatives attending: George H. Wadsworth, M. C. Sammons.

White & Brother, Inc., Philadelphia. Booth No. 227. Ingot brass, casting copper, lead, solder, babbitt metal. Representatives attending: Clarence B. White, Harry A. White, John T. Fegley, Raymond Hunter, Frank Ogden, Frank Krug, Irving G. Smith.

Whitehead Brothers Co., New York. Booth No. 144. Molding sands and foundry supplies. Representatives attending: A. J. Miller, J. H. Whitehead, V. L. Whitehead, Jr., C. E. Andrews, R. L. Carpenter, H. J. Gerrard, R. J. Hashagan, T. F. Hogan, A. J. Miller, Jr., B. D. Fuller, A. J. McBride, A. Y. Gregory, F. B. Clarke.

Whiting Corporation, Harvey, Ill. Booth Nos. 321 to 327, 374 to 380. New style steel plate tumbling mill equipped with our positive door clamp, combination clutch and brake and motor for operation; cloth screen dust filter; helical worm-geared crane ladle, new style, with ball thrust bearings; new model "B" Whiting cupola; 5-ton electric crane trolley in operation; photographs, drawings, etc., of cranes and foundry equipment. Representatives attending: J. H. Whiting, chairman; T. S. Hammond, president; A. H. McDougall, vice-president; M. J. Evans, sales manager; R. E. Prussing, vice-president; R. H. Moore, F. P. Walsh, J. R. Bates, H. E. Reynolds, S. R. Vanderbeck, M. F. Beetham.

Wilbraham Green Blower Co., Pottstown, Pa. Booth No. 373.

G. H. Williams Co., Erie, Pa. Booth No. 163. Miniature model crane operating miniature bucket. Representatives attending: W. C. Swalley, acting general manager; T. D. Harter, assistant general manager.

J. E. Williams Shoe Co., Spring City, Pa. Booth No. 234. Patented safety shoes, in Congress and lace styles. Representatives attending: James E. Williams, George S. Peterman.

E. J. Woodison Co., Detroit. Booth No. 57. Foundry supplies, core room and molding machines. Representatives attending: E. J. Woodison, president; J. C. Woodison, vice-president; C. D. Yahne, treasurer; G. A. Burman, W. J. Wark, R. S. Hoffman, L. A. Dawson, B. E. Beldin, F. W. Blanchette, R. G. Fritts, F. W. Shortsleeves.

T. B. Wood's Sons Co., Chambersburg, Pa. Booth No. 146. Equipment for the Wood system of molding, comprising the Peerless aluminum tapered slip flask, the Peerless cherry wood tapered slip flask, and the automatic adjustable slip jacket in various sizes adapted to a wide range of work. Representatives attending: T. B. Wood, superintendent; W. H. Fisher, vice-president and secretary; Charles M. Wood, Victor Leisher, George W. Leisher, A. H. Slothour.

Y

Yale & Towne Mfg. Co., Stamford, Conn. Booth Nos. 318, 320. Chain blocks, electric hoists, overhead cranes, electric industrial trucks, tractors and trailers. Representatives attending: H. J. Fuller, R. B. Kite, M. G. Peck, George Sherrill, W. T. S. Quicke.

Young Brothers Co., Detroit. Booth Nos. 79, 80. Full size power conveyor oven in operation; an operating model of an overhead horizontal conveyor type core oven; laboratory oven; photographs of installations. Representatives attending: C. G. Lisch, V. A. Fox, T. P. McVicker, G. I. Thatcher, G. H. Walsh, P. A. Meyer.

Z

Zanesville Sand Co., Zanesville, Ohio. Booth No. 147.

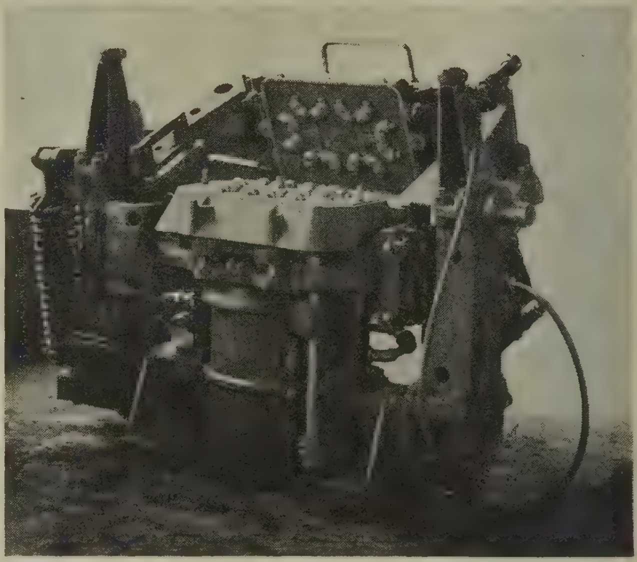
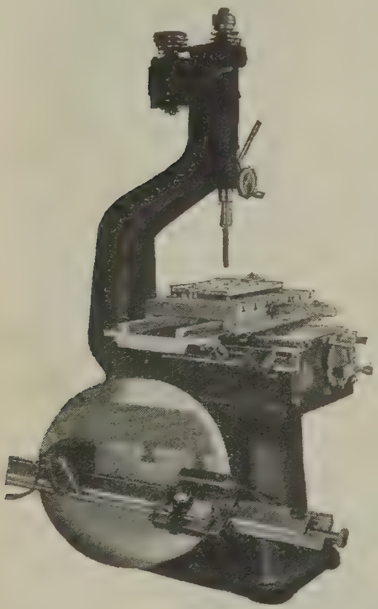
Multiple Molding Machine Has Power-Operated Head

THE power-operated head in the new multiple molding machine brought out by the Tabor Mfg. Co., Philadelphia, relieves the operator of a tedious operation and further simplicity in operation is achieved by the arrangement of the guides so that the two heads are guided in all directions and may be readily adjusted. The drawing speed and vibration operation are automatic. A special type of swinging yoke is used and alinement between the upper and lower head while squeezing is insured.



Self-Contained Layout Table

FOLLOWING the introduction last year of the Kellocater layout table, the Keller Mechanical Engineering Corporation, Brooklyn, encountered a demand for a complete self-contained unit with overarm, spindle and base, and accordingly has developed such a machine. The overarm is equipped with a hardened and ground spindle and with a No. 1 Morse taper hole for drills up to ½ in The vertical motion of the spindle is equipped with hand screw feed, capable of boring a hole up to 2 in. Eight spindle speeds are provided, ranging from 175 to 3500 r.p.m., four speeds being through back gears and four through open belt.



Air-Tool Grinding Cuts Time

BY substituting air-tool grinding for hand filing, the V & O Press Co., Hudson, N. Y., has cut the time to one-third of that formerly taken in grinding the small radii of a fly-wheel web. The work at the V & O plant is now done by a 2¼-in. diameter cone shaped wheel furnished by the Rotor Air Tool Co., Cleveland.

Air-Driven Portable Grinder

A PORTABLE grinder now made by the Buckeye Portable Tool Co., Dayton, Ohio, is air driven and operates on a rotary principle, emphasized as reducing vibration to a minimum and providing a smooth running constant source of power. The high-speed grinder is within the safety code rating, attaining a surface speed of 8000 to 9000 ft. per min. The grinder may also be procured in ratings from 4800 to 6200 r.p.m. Bakelite, rubber or other elastic bonded wheels are used, and the tool is made in a number of models, sizes and speeds for various classes of work.

Present Status of Pearlitic Iron

What It Actually Is—Separate Foundry Needed to Produce It—Advantages and Disadvantages Involved—Similar to High-Test Irons

BY DR. RICHARD MOLDENKE*

CONSIDERABLE attention has been directed recently to a class of cast iron exhibiting a pearlitic microstructure. Pearlite, it will be remembered, is a grouping of alternate layers of pure iron—called ferrite in micrometallurgical parlance—and iron carbide, similarly called cementite. The microscopically small particles of hard cementite, separated from each other by equally small particles of soft iron, together with what graphite may be there, present a metal which seems to wear better than when made up of either component, and it can also be more readily machined. Since much of the newly developed "high-test" cast iron, with the astonishingly high strength values, exhibits the same pearlitic microstructure, though produced under entirely different conditions, a discussion of the present status of so-called pearlitic cast iron is appropriate at this time.

Pearlitic Iron Falls in Low-Silicon Ranges

In contrast with the new high-test cast irons, those irons designated particularly as pearlitic fall within the low-silicon ranges. The reason for this is connected with the slow rate at which the molten metal is allowed to cool in setting. In the production of cast iron the rate of cooling the molten metal is most important, and this rate is fastest when pouring it into iron molds, which chill the metal. A slower rate of cooling is had with the green sand mold, where the damp sand lowers the metal temperature rather rapidly in the case of thin castings. Dry sand molds cool the iron still more slowly than green sand molds; but the slowest rate of the entire series exists when sand molds are not only dried, but are actually brought up to an almost incipient red heat.

It will be readily appreciated that a cast iron of the ordinary silicon range stipulated for, say, machinery castings, will chill but very little in an iron mold at room temperature, will be reasonably fine-grained in green sand, a little coarser in dry sand, but will be soft and coarse grained to the extent of practical uselessness when made in a highly heated sand mold. Hence, castings thus produced must be quite low in silicon to be acceptable, apart from their pearlitic microstructure.

Silicon Content and Mold Temperature Chief Factors Involved

Coming down to practical considerations, the two chief factors to be considered are the silicon content of the molten iron and the sand mold temperature, for these have the greatest effect upon the amount and condition of the graphite formed. Where a gray iron only is demanded, the range of each factor is necessarily large, for one can begin with either a green sand or dry sand mold at room temperature and the highest point on the silicon range involved and go successively up to an almost red hot mold with the silicon down to 0.50 per cent, and always have a gray iron casting. But only the upper end of mold temperatures with the lower end of the silicons will give a gray iron casting with the desired pearlitic structure.

The idea of using hot molds with lower-range silicon mixtures is not a new one with foundrymen, though they were probably not aware of the specially good structures attained. Professor Lanz and Director Sipp of Germany, however, went into this matter thoroughly and constructed tables of correlated compositions and mold temperatures, giving recommended combinations for the several metal-section conditions found in light and medium castings—for heavy work does not seem to be so readily controlled. These correlations are covered by the patents granted in the industrial countries, other combinations of composition and mold temperature, as well as the pearlitic character of the metal itself, being without the range of a patent monopoly.

It is further understood that considerable in the way of expert practical manipulation is required to get satisfactory results. This will be appreciated by foundrymen experienced in low-silicon work, for the volume reduction in the setting of such metal—perhaps twice that of high-silicon irons—means extraordinary attention to the gating of the molds, the design of the castings and more particularly the cupola melting operation, which is that of making cupola-malleable cast iron. The chances for oxidation, unless small charges, a high bed and plenty of intermediate coke are used, are such that larger-section castings often show up large internal shrinkages because of either improper gating or, more likely, on account of a serious reduction in the time interval between pouring and setting temperatures, which cut off the proper feeding of the mold in spite of what should be an extension of the rate of cooling by reason of the highly heated sand.

Advantages and Disadvantages of Pearlitic Iron

There remains, then, but to contrast the advantages and disadvantages of making pearlitic cast iron. These are as follows: When highly superheated in melting and not oxidized, with gating and risers properly placed, the iron is fairly fine grained and dense. It is strong, and has excellent wearing qualities. The disadvantages are that it is not easy to produce without much experience with low-silicon cupola mixtures. Extra care is required with pattern equipment, gates and risers. It is necessary to install mold-heating ovens allowing high-temperature operation and flexibility of operation for pouring off.

But most serious is the fact that no sane foundryman will want a low-silicon operation side by side with his ordinary mixtures in the same building. Sooner or later iron will get into the wrong molds, the sprues will be mixed, and confusion will result, with large scrap piles. Hence pearlitic cast iron should only be made with a separate melting installation and in a special building.

Highly super-heated cast iron mixtures, supercooled before pouring off, with not too long a rate of cooling to give large graphite crystals, yield remarkable high-test iron castings, exhibiting much of the pearlitic structure, but the outlook for low-silicon pearlitic cast iron is not very bright if a special foundry has to be provided. Nevertheless, there is no reason why this kind of iron may not be made a specialty by foundries looking for new markets for their output.

Welding Chrome Irons and Steels

Must Prepare a Clean Joint, Use a Proper Flux and a Strictly Neutral Flame of Minimum Dimensions, Ending with a Properly Adjusted Heat Treatment

INFORMATION on welding chrome irons and steels is given in the April issue of *Oxy-Acetylene Tips*, the monthly publication of the Linde Air Products Co., New York. This company is closely associated with Electro Metallurgical Co. and the Union Carbide & Carbon Research Laboratories, which have been responsible for many advances in high-chromium alloys.

For the purposes of discussion, commercial high-chromium alloys may be classified as follows:

	Name	Carbon, Per Cent	Chromium, Per Cent	Nickel, Per Cent	Silicon, Per Cent
Group I	Rustless chromium irons	less than 0.12	12 to 18	....	0.3 to 1.2
Group II	Stainless chromium steels	over 0.30	11 to 17	....	....
Group III	Rustless chrome-nickel irons	less than 0.17	17 to 25	7 to 9	....
Group IV	Chrome-nickel-silicon alloys				
	Class I	....	17 to 19	24 to 26	2.5 to 3
	Class II	....	25 to 27	20 to 22	2 to 3
	Class III	....	7 to 9	20 to 22	1 to 2
Group V	Extra high chromium irons	less than 0.30	25 to 30	....	....
Group VI	Castings	higher	....	....	....

Under proper conditions, and with proper procedure, all these can be welded with the oxy-acetylene flame. Difficulties in making a sound, clean joint increase as the chromium content increases, as a result of the formation of infusible oxides, consisting chiefly of chromium oxide together with smaller amounts of iron oxide, manganese oxide and silica. Ordinary fluxes for welding or brazing are therefore unsatisfactory. Fluxes must be sufficiently fireproof to protect adequately the molten metal and hot metal adjacent to the weld from oxidation, and must be correctly compounded to dissolve the refractory chromium oxide with ease. A specially designed flux, known as "Cromaloy Flux," is recommended.

Rustless chromium irons of Group I are used chiefly as sheet metal, and as such are frequently welded into vats, tanks and container linings. Up to 16 gage, welds are usually made between upstanding flanged edges, turned 1/16 in. high. The sheet is carefully cleaned of scale and dirt along the edge, and painted *top and bottom* with a water paste of cromaloy flux. Then the joint is assembled with clamps and the upstanding edges are melted together in the usual way.

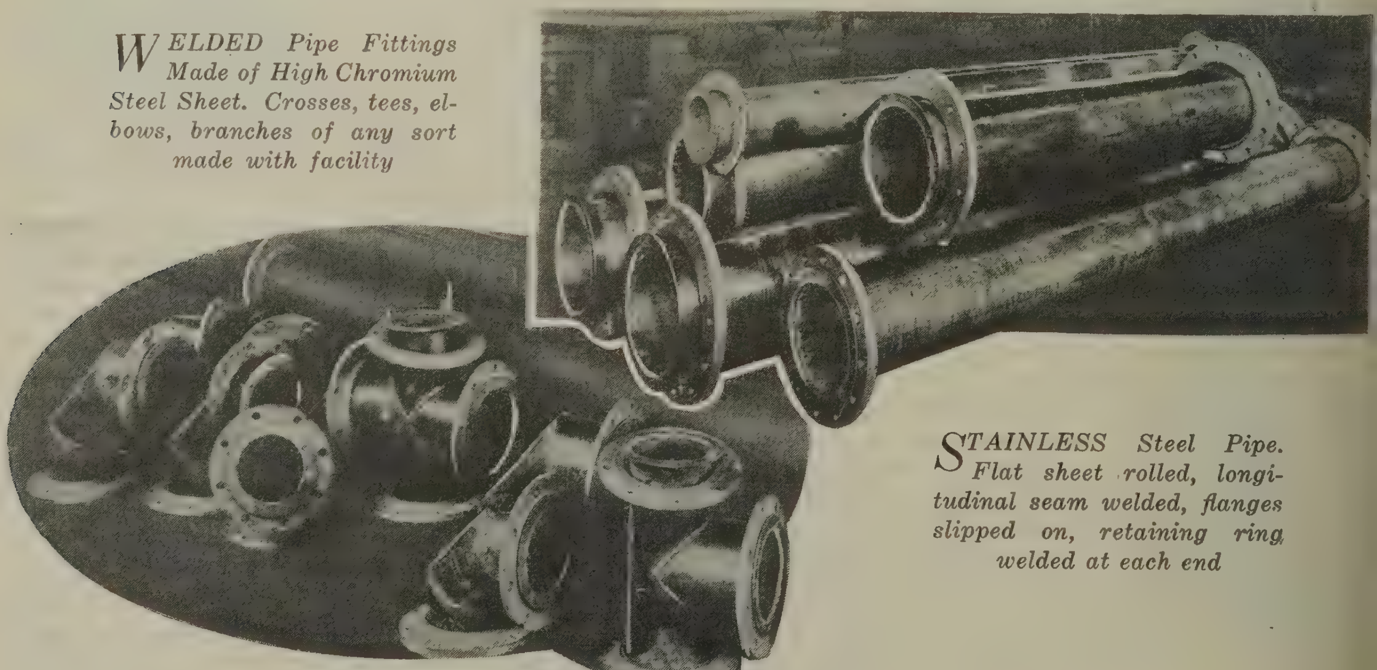
A most important detail of correct practice is to use a neutral flame just large enough to insure proper fusion, since too large a tip causes the molten metal to boil and results in porous welds. An excess of acetylene will cause an increase in the carbon content of the metal in the weld, lowering its resistance to corrosion. It will also increase the hardness and lower the ductility of the weld metal. An excess of oxygen results in dirty metal and porous welds, because of the excessive formation of infusible oxide.

With the aid of rods of the same composition as the base metal, good butt welds can be obtained in metal 1/16 to ⅛ in. thick, without beveling. Flux should be applied to the line of the weld on both the top and bottom surfaces of the sheet. This prevents oxidation on the under side and allows good fusion and union to take place under the protecting film of slag. Without the use of flux, it will be impossible to obtain complete fusion at the bottom of the seam. The rod should be clean and painted with a thin coating of the flux.

In making welds in heavier gages, the plate is beveled and the faces of the bevel are coated with the flux. The welding should be carried through to completion rapidly and, if possible, should be of the single vee type.

Heat Treatment of Welded Joints

As a result of the high temperature attained during welding, the structure of rustless iron is changed within the weld metal and in adjacent portions of the sheet. Rustless irons, particularly those containing 12 to 14 per cent chromium, are subject to air-hardening, and require annealing to soften and toughen the metal at the joint. Best results are obtained by heating the



WELDED Pipe Fittings Made of High Chromium Steel Sheet. Crosses, tees, elbows, branches of any sort made with facility

STAINLESS Steel Pipe. Flat sheet rolled, longitudinal seam welded, flanges slipped on, retaining ring welded at each end welded part in a furnace at a temperature between 650 and 700 deg. C. for a half hour, and allowing it to cool slowly, either in the furnace or in warm, quiet air. The blowpipe is often utilized for applying the heat in cases where it is not possible to employ furnaces. Great care must then be exercised to heat the metal no more than the maximum temperature given. The benefit to be derived from blowpipe annealing will depend on the care used in controlling the temperature and time of heating. Usually about 3 min. within the above temperature range will have some softening effect, but a longer time is to be preferred. The temperature may be judged by touching the hot metal with a piece of pure aluminum wire (melting point 658 deg. C.). A tiny liquid drop of aluminum should remain. A dull red heat just discernible to a keen eye is about 700 deg. C., the top limit for annealing.

Recuperator of High-Chromium Steel before Assembly

Tensile tests show the results obtained from welds in 18-gage rustless iron:

Condition	Yield Point, Lb. per Sq. In.	Ultimate Strength, Lb. per Sq. In.	Per Cent Elongation in 2 In. Over Weld	Remarks
Unwelded	53,000	78,200	36.0	Per cent elongation over fracture
As welded	32,400	43,700	4.0	Broke in sheet near weld
Blowpipe annealed	55,350	76,400	6.5	Broke in weld
Furnace annealed	45,400	72,900	7.6	Broke in sheet and edges of weld

The higher silicon content found in some of the commercial grades facilitates welding. Higher chromium rustless irons have less tendency to air-harden but are more subject to grain growth in the weld and base metal adjacent. Excessive grain growth results in a brittle condition, which can be remedied, particularly on light gages, by annealing at 650 to 700 deg. C. for 3 min. and air-cooling.

After furnace annealing, welds in 16-gage material will stand considerable bending without fracture.

Cutlery Steels Infrequently Welded

Stainless chromium steels of Group II are used for cutlery and heat-treated machine parts, and are therefore seldom welded. Procedure as outlined above will make a joint which is extremely hard and brittle, due to its air-hardened condition. Furnace annealing at 750 to 800 deg. C., followed by very slow cooling, is necessary to make the weld machinable. A second suitable heat treatment is then required to restore stainless properties to the entire part.

Rustless Chrome-Nickel Irons Give Ductile Welds

Alloy irons of Group III containing chromium and nickel are not subject to the brittleness encountered in the former types of alloys after being exposed to the heat of the welding blowpipe. They do not air-harden, and weld metal cooled either rapidly or slowly is malleable and ductile and therefore requires no heat treatment. Whenever the welding of high-chromium alloys must be considered, the use of alloys of this group is recommended both on account of the easy weldability and of the superior physical properties of a weld completed without heat-treating or annealing. Best results are obtained with the use of cromaloy flux. Welds in 18-gage sheet will have a yield point of 50,000 to 60,000 lb. per sq. in., an ultimate strength of 65,000 to 70,000 lb. per sq. in., with about 15 per cent elongation in 2 in. over the weld. Blowpipe annealing or any simple annealing does not improve the quality of welds in this material and is not recommended.

Alloys of Group IV have been developed to meet special industrial demands. They are all easily welded, but joints in thicker gages or sections must be made in such a way as to reduce residual or internal stresses to a minimum, because most of the alloys are red short. No subsequent heat treatment is necessary or recommended.

Extra High Chromium Induces Brittleness

Alloys of Group V are characterized by great resistance to oxidation and chemical corrosion. On account of their high chromium content they present some difficulty in welding when ¼ in. or more thick, because of the formation of infusible oxides or slag. The use of flux will help prevent oxide formation if painted along the clean edges of the seam and on the welding rod. Flange welds in thin material are easily made.

Welding Upstanding Seam at Corner of Tank

When subjected to the heat of welding, these alloys undergo considerable grain growth with resulting brittleness. This condition cannot be removed by annealing.

Much the best results are obtained by using flux and a strictly neutral flame. Welds may, however, be made in the metal with an excess acetylene flame without the use of flux, bearing in mind the fact that the welds will be hard, brittle, high in carbon and less resistant to chemical corrosion than the plate. This method of welding, however, suffices for annealing boxes which are not to be treated very roughly.

Castings Should Be Welded Hot

Several grades of high-chromium castings are sold, some containing appreciable amounts of nickel or silicon or both. Castings, as a rule, contain considerably more carbon than the rolled products. For welding castings containing high carbon and designed for wear resistance, it is preferable to preheat to a good red heat to avoid cracking. Cooling should be relatively slow; after this the entire casting may require further heat treatment to produce the necessary hardness. Welding rods of the same composition as the base metal should be used. An excess acetylene flame aids in welding and is permissible for castings which already have a high carbon content. For thin-walled castings, however, it is best to use a neutral flame and cromaloy flux. When using an excess acetylene flame, flux should also be used, since it facilitates fusion and assists in removing oxide and sand spots in defective castings.

Qualifications for Welders

American Welding Society in Annual Meeting Holds Symposium on Acceptance Tests for Workmen—Standardization for Code Purposes to Follow Detailed Study

TESTS whereby the skill of welders can be appraised before entrusting them with important work was the theme of the principal session of an American Welding Society meeting in New York last week.

Testing workmen is more than a mere mechanical operation, as pointed out by G. A. Caldwell, vice-president and general superintendent Mississippi Valley Structural Steel Co., St. Louis. In his opinion, character is the most essential qualification for a welder, and this can be appraised only by contact with the man. Hence his organization prefers to train its own welders, selecting those shop men of more than average ability who desire to become welders and who look upon welding as a skilled trade that will lift them above the humdrum routine. In most shops using welding the situation would be met in the same manner: by selecting a promising apprentice, having him work as helper to the best qualified journeyman, then using him for minor details where utmost quality is unnecessary, gradually increasing his skill by constant instruction and frequently breaking test welds and studying the results. Only as the force of welders increases is a supervisor necessary, together with more definite acceptance or appraisal tests before employing self-styled welders.

Welds Appraised by Bending Tests

E. E. Shanor, vice-president Petroleum Iron Works Co., Sharon, Pa., agreed with Mr. Caldwell that apprenticeship is the best way to train welders—in his plant principally for production of large diameter pipe by automatic machines rather than hand welding structural steel. At Sharon the apprentice is given roustabout jobs for two months, to become acquainted with the plant and to test his mettle. Then he becomes a fitter's helper. After learning the essentials of joint assembly, he spends some time behind a pneumatic caulking or chipping hammer and another period as a helper on the testing machine (for each pipe section gets a hydraulic test). Meanwhile he is encouraged to try his hand at welding test pieces, and from then on his progress is about as sketched by Mr. Caldwell. In Mr. Shanor's organization a further step is taken after the man becomes a reasonably proficient hand welder, namely, he becomes a helper on a row of automatic machines, and finally a machine operator. Much information must be given him either through books or by word of mouth about the functions of the various electrical auxiliaries. The greatest aid to improvement is thought to be a broken practice weld, studied for blowholes, inclusions and adhesions. When butt welds can be consistently bent 180 deg. around a pin five times the thickness of the plate, the welder is regarded as proficient by the Petroleum Iron Works Co.

Standard Acceptance Tests Not Yet Formulated

Speaking for the committee on qualification of welders, H. H. Moss, Linde Air Products Co., New York, said that it is proving difficult to prepare specifications on the subject, because the requirements for various types of production work are not only different for different classes of structures, but even in shops doing the same type of work the practices are not uniform. The committee has made a special study of pipe welding, of which a great deal is being done. All pipe welding is not alike; the welding ability required for joints on long lines for oil, gas, water or low-pressure steam is quite different from corresponding requirements of a worker on pumping station specials, high-pressure air, steam or hydraulic lines, or refrigerating systems. A proficient workman on rolling joints of the first classification should not, in Mr. Moss's opinion, be rated by the same tests which would seek out a man of far greater general ability for the second. In view of the many kinds of welding encountered in pumping station work—butt welds in all kinds of positions, double and single-vee welds in extra heavy metal, fillet welds on branches and the joining of steel castings to wrought pipe—the committee was undecided on the number and variety of tests for ability which should be specified.

Work on the qualifications of pipe welders, structural steel welders and pressure vessel welders is well under way, however, and must be pushed to conclusion so as to enable the society to cooperate with various code-formulating bodies now considering the matter. These regulations, when written, would have the effect of imposing upon industry certain tests, licensing or qualifications for the workman. This would doubtless work temporary hardship on many workmen and employers. The former can usually improve in skill readily. Manufacturers will also profit from a higher grade of welding through added neatness of the work, a higher reputation for dependability and an economic saving through the use of less metal and a 100 per cent joint.

Simplicity Desirable

C. E. Loos, American Bridge Co., Ambridge, Pa., made a plea for simplicity in testing. In his opinion it is unnecessary to test the welder in every style of joint he would be called upon to make. In the structural field nearly all the joints are lap joints with fillet welds. In training, a welder makes such joints in great number, in plates of various thickness and arranged in various positions. He splits these apart and studies them for penetration, fusion, dimension, grain size, soundness and freedom from slag. But to determine a workman's all-around ability, simple vee butt welds, pulled in tension, bent in a vise, sawed across and pickled in strong acid, are all that are necessary. These give a numerical rating to the welder. Mr. Loos also believes that important welds should be marked with a hammer stamp for identification, in order to spot the qualified but unconscientious workmen.

Important Studies on Pressure Vessels and Structural Steel

TWO research committees are sponsoring important investigations. One, under the chairmanship of E. H. Ewertz, past president, is arranging to have constructed

Opposes Anti-Injunction Bill

National Metal Trades Association Goes on Record Against Legislation to Curb Power of Federal Courts—Harold C. Smith, Illinois Tool Works, Chicago, Elected President

THE National Metal Trades Association at its thirtieth annual convention at the Hotel Astor, New York, April 25 and 26, went on record in opposition to anti-injunction legislation pending in Congress which would curb the power of the Federal courts in labor disputes. A bill introduced by Senator Shipstead of Minnesota which would have this effect was attacked by speakers at the convention, and the resolutions committee was supported in its recommendation that the association go on record as follows:

> Be it resolved, that the National Metal Trades Association, in convention assembled, having confidence in the rights of the individual as constitutionally provided, and feeling that the present efforts to limit these rights and to restrict the functions of our Federal courts are not truly representative of American ideals, urges that the existing equity power of the Federal court should be continued.

Attack Limiting of Protective Functions of Courts

Discussing the Shipstead and other similar legislation, President Paul T. Norton stated that this bill, if adopted, would limit the protective functions of equity courts to tangible property only. "In effect," he said, "it would remove the protection and a large part of the value of copyrights, patents and good will, and also the protection of the rights to employ or to be employed."

"As the law now stands," he went on, "members of the trade unions are adequately protected in their right to organize. Those who do not wish organization are protected in their right not to organize. The law does not forbid the expansion of legitimate business or intelligent management of the same. It does restrain such combinations as would restrict interstate trade or enter into forbidden practices by competition. Our association has taken an active part in developing a widespread opposition to the repeal of the anti-trust laws and similar legislation, and it is essential in the combatting of such measures that association members communicate with their legislative representatives."

Oppose Reversal of Judicial Decisions

In an address on "The Significance of the Present Efforts to Change the Laws in Respect to Labor Combinations," Walter G. Merritt, counsel of the League for Industrial Rights, New York, pointed out that the present agitation for amending or passing new laws governing labor relations is aimed at a reversal of judicial decisions upon which the prosperity of our present industrial structure is founded. "The public as a whole," he said, "does not sympathize with this movement, and Great Britain has just paid dearly for her experimentation along the same lines."

Mr. Merritt favored the continuance of the anti-trust laws, stating that their repeal would likely lead to Government interference in business, thus destroying the basis of industrial liberty, founded on unrestrained competition.

Light was thrown on interference with business by the Government by Bernard J. Mullaney, vice-president Peoples Gas, Light & Coke Co., Chicago. He pointed out that the Government had engaged in many lines of business in direct competition with a large number of private enterprises throughout the country and that further expansion along these lines might seriously hinder the development of free competition and individual enterprise.

Association Members Find Business Better

THAT business conditions in the metals industry are considerably better than they were six months ago, that in most cases they are just as good or better than was true one year ago, and that the upward trend will probably continue, were points brought out in the annual address of the president, Paul D. Norton. As has been customary in the past, a questionnaire on business conditions was sent to the entire association membership and the results tabulated in an effort to obtain an index of business activity.

Reporting on the present state of business, 37 members or 8½ per cent found conditions excellent; 173 or 39½ per cent, good; 186 or 42 per cent, fair, and 43 or 10 per cent, poor. "It is curious to note," Mr. Norton said, "that the same percentage of members reporting poor business last year reported poor business this year, while the number reporting conditions good or excellent increased by 2 per cent over last year."

In answer to the question, "How does business compare with six months ago?" 226 of 430 companies reply-

Harold C. Smith Named President

HAROLD C. Smith of the Illinois Tool Works, Chicago, was elected president, succeeding Paul T. Norton of the Case Crane & Kilbourne Jacobs Co., Columbus, Ohio. J. G. Benedict, Landis Machine Co., Waynesboro, Pa., was elected first vice-president and Jacob D. Cox, Jr., Cleveland Twist Drill Co., Cleveland, became second vice-president. J. W. O'Leary of Arthur J. O'Leary & Son Co., Chicago, continues as treasurer. Councilors for two years were named as follows: J. H. Van Alstyne, Otis Elevator Co., New York; H. C. Beaver, Rolls-Royce Co. of America, Inc., Springfield, Mass.; R. J. Russell, Century Electric Co., St. Louis; Theodore Trecker, Kearney & Trecker Corporation, Milwaukee; Paul T. Norton, Case Crane & Kilbourne Jacobs Co.

The growth of the association in its thirty years of existence has been steady, and it now has a membership of 1100 manufacturing plants employing about 1,000,000 metal workers. The increase in membership in the past ten years has been 35 per cent.

ing reported an improvement, the average increase being 35.1 per cent. Conditions were found to be essentially the same by 122 companies, while 82 reported a decrease, the decline amounting to 24.8 per cent. Comparing conditions with one year ago, 181 companies reported improvement, 124 considered conditions about the same, and 122 noticed a decline. It was pointed out that the replies to these questions and a comparison with the replies made to a similar questionnaire last year indicate that there has been a material gain both in the amount of business transacted and in the number of shops enjoying favorable business.

Upward Trend Expected to Continue

That conditions may be expected to improve during the year was brought out in the answers to the question, "What is the outlook for the next six months?" Of the 397 companies replying to this question, 25, or 6 per cent, reported the outlook excellent; 218, or 52.4 per cent, good; 136, or 37.3 per cent, fair, and 18, or 4.3 per cent, poor.

Although 273 out of 427 companies reporting on the availability of labor had experienced no scarcity, lack of skilled machinists and specialists was noted by a number of companies. Fourteen companies reported a scarcity of highly skilled all-round mechanics, four reported a lack of highly skilled specialists, 88 lacked skilled machinists, 41 lacked skilled specialists and seven had difficulty in securing semi-skilled machinists, machine operators and specialists.

To overcome shortage of skilled labor, 281 companies stated that they were carrying on training activities ranging from the training of machinists only to the training of all classes of employees. Apprenticeship training activities were reported by 63 companies, while 24 mentioned foremanship training, although the question asked related specifically to shop labor.

Are Industrial Profits Constantly Increasing?

THAT the average profits of established industrial enterprises have been gradually increasing over the last half-century was suggested by Dr. Charles J. Bullock, director Harvard Economic Society, Cambridge, Mass. Basing his deductions upon a wide investigation of corporate income tax returns, Doctor Bullock stated that he doubted the soundness of the rather frequent statement that 40 per cent of the industrial corporations in the United States are operating without profit, and that, on the other hand, he believed the rate of return on capital invested in industry at the present time is 4 or 5 per cent higher on the average than it was 50 years ago.

An investigation of companies that fail to report profits, he pointed out, usually reveals the fact that a number no longer exist and still remain on the income tax lists. Others are sales organizations for non-resident companies whose profits are included in the returns of the parent companies. In other cases profits are paid to partners and officers in the form of salaries.

Six Per Cent Was a Good Return in 1880

Reviewing industrial evolution over the last quarter-century, Doctor Bullock stated that in the period following the Civil War and up until 1897, 6 per cent was a good average return on capital invested in standard lines of business that were forced to meet the full force of competition. Early in this period, inventory losses often absorbed profits for two or three succeeding years, but the average over a longer period was usually about 6 per cent.

In the period from 1898 until the beginning of the recent war, the speaker went on to explain, profits were somewhat higher, owing to a rising trend of commodity prices and to the gradual introduction of efficiency in business. The average return on capital invested in manufacturing staple lines in this period was slightly over 8 per cent. During those years modern accounting was introduced and other practices were begun which have had widespread use and benefits recently.

Eliminating the war period as a time of great abnormality in all lines of business, Doctor Bullock characterized the last five or six years as a period marked by the greatest industrial accomplishment the country has ever known. During this time, he placed the average profit at about 10.5 per cent. Thus, over a long period of years the profits of American industry have been tending upward, and in spite of the recent years of adjustment, the speaker felt the much talked of "profitless prosperity" is both non-existent and uneconomically improbable.

Unemployment Exaggerated — Not Due to Mechanization

ESTIMATES made during the earlier part of this year of the number of unemployed were characterized as being "possibly interesting from the standpoint of theory but largely valueless and even detrimental to business as far as any practical purpose was concerned," in an address by Magnus W. Alexander, president National Industrial Conference Board, New York. "The widespread publication of some obviously exaggerated estimates," he declared, "have not helped to strengthen business confidence, and their deterrent effect on trade necessarily has not helped the general situation.

"A 'shrinkage' in employment," Mr. Alexander continued, "in only one or two fields of economic activity, like manufacturing and railroad transportation, over a period of two or more years in the past, which constitutes the basis for all estimates because it is the only related information available, is utterly irrelevant and inadequate for any calculation of the total number of unemployed at any given time. This is principally because it cannot account for employment in other fields of activity about which we have no data, but which include more than half of all those working for wages or salaries. While the number of workers required to turn out a certain amount of production has been relatively declining for years, there is also evidence that the number of workers engaged in distribution, trade and service has been constantly increasing, relatively and absolutely."

Mechanization Allows for Readjustment

"The increasing use of labor-saving machinery in productive industry," the speaker declared, "may cause a temporary unemployment, but this so-called mechanization of industry is a relatively slow process, slow enough usually to allow for readjustment. Where temporary unemployment does ensue for some, the necessary readjustment may, and often will, cause temporary individual hardship. In its permanent and fundamental effect, however, progressive development in industry by way of mechanization has been, and is, a blessing in disguise in that it leads to an increase in our national prosperity, an increase of employment in new and correlative fields of industry, higher wages, lower living costs and higher standards of living as well as a greater margin for savings for the masses.

"If such unemployment as existed during the last winter had been largely technological in character, as is claimed by some—that is, if it had been largely due to the increased use of labor-saving machinery and power—then why did we hear practically nothing of unemployment in 1925, when from 1923 to 1925 there was not only a relative, but even an absolute shrinkage in employment in manufacturing and a great increase in the mechanization of this industry? Mass production by a highly mechanized industry was widely hailed as a chief contributing factor to our national post-war prosperity, but suddenly was viewed by some as causing unemployment and hence was pronounced a menace to prosperity. Yet it is significant that this latter view was not voiced until after data had been published in 1927 showing that according to the 1925 census of manufactures a decline in manufacturing employment had taken place from 1923 to 1925."

Employment Now Increasing

"As far as manufacturing activity is concerned, developments since winter point toward increasing employment from now on, the decline in fact having come to a stop with the beginning of the present year. Since December, 1927, employment in manufacturing has been upward, and in February of this year was higher than at any time since July, 1927, and more than 3 per cent greater than in November, 1927, according to reports made to the National Industrial Conference Board, by about 2000 manufacturing establishments throughout the country employing about 1,000,000 persons.

"The Conference Board's index for total man-hours worked in manufacturing for February was 79.3 as against 77 in January, and the highest since last June, when it was 79.8. The average number of hours worked per week per wage earner has risen from 47.9 in January to 48 in February, the slight change in number of hours per worker reflecting the fact that the greater increase in total man-hours worked was due mostly to increase in employment. Average weekly earnings show a slight increasing tendency and in February of this year were at the same level as in February two years ago. Great stability is shown by the average hourly earnings per worker, which principally reflect wage rates paid and which during the two years February, 1926, to February, 1928, have fluctuated over a range of less than 3 per cent of those prevailing in February, 1926. This stability of average hourly earnings shows that such unemployment as has existed has not exerted any great pressure on wage rates, in contrast with the effect of unemployment in 1921 and at other times during the past.

"While these data do not throw any comprehensive light on employment in other occupations, such evidence as is available reveals an increasing tendency of employment in non-industrial fields, particularly in those created by the distribution and servicing of the products of new industries, like the automobile and radio industries. Changed living standards also are absorbing unusually large numbers into hotel and restaurant service. There has as yet been no evidence produced of anything more than a temporary, perhaps somewhat more than seasonal, amount of unemployment. The growing menace of so-called 'technological unemployment' which, it is said, is bound to grow with the mechanization of industry, is as yet an economic myth."

Wage Incentives for Foremen Commended

WAGE incentives for foremen were comprehensively dealt with in two papers, one by H. W. De Bruin, works manager of the Jeffrey Mfg. Co., Columbus, Ohio, who has come up from the ranks, and the other by G. Heding of the Morkrum-Kleinschmidt Corporation, Chicago.

Mr. De Bruin said that in approaching the subject three viewpoints present themselves: 1. Opportunity for advancement; 2. Continuous employment; 3. An opportunity to share in the financial success of the company. Mr. De Bruin said that all of the foremen in the Jeffrey plant are developed from the ranks. Once a man has become a foreman an effort is made to make him feel that his work is important and that his efforts are appreciated; to obtain the best results the company encourages constructive thinking by its foremen and, after a certain preliminary training, it allows him unlimited authority in the conduct of his department. "Thus placing responsibility in your foreman," he said, "you will soon see a great change in him, in his department and in the men under him. He will look at his problem in a different light, and you will broaden his viewpoint and make him a better man for your company. He will be ready for advancement when the time comes."

"The foreman should be coached and trained so that he may realize that continuous employment depends upon the successful management of his duties," Mr. De Bruin said. "His alertness in improved methods of production and reductions in costs will enable the management to increase volume and insure continuous employment. In times of depression there should be some method whereby the foreman may be assured of steady work. This is management's problem and we should accept that responsibility and do our best."

Foremen Should Share in Employer's Success

As to wage incentives, Mr. De Bruin said: "We feel it is desirable and even necessary for the best interests of the company that those who are in position to make a direct contribution to the success of the business share in that success. Any plan of incentive should include those and only those items in which the individual may be expected to exercise some control. It is therefore not advisable to pay the foreman a bonus just because those under him are increasing production on account of some wage incentive. It is very difficult to base a foreman's bonus on tangible results, but unless this is done the results at best will be disappointing and will cause a great deal of dissatisfaction. To be effective, a bonus plan should give opportunity to increase earnings from 10 to 40 per cent. It should be figured and paid often enough so that the foreman will not forget it or lose interest in it. It should be understood that it is not a part of the basic wage, but is a special reward for actually achieving results. It should affect waste, increase in production, reduction in investment, reduce costs and foster cooperation between foreman and management. It should be so simple that the foreman can easily understand the results.

"It should be possible for the foreman to earn a bonus, even in the case of decreasing volume, if the efficiency of his department is increasing. It should be thoroughly understood that the bonus does not remove the possibility of an increase in the basic pay. Foremen should understand that their basic pay depends upon their value to the company reflected in the following: Ability and desire to work, willingness to cooperate, reduction in cost, elimination of waste, maintenance of quality.

Foremen Training and Wage Incentive Go Hand in Hand

"It has been said that the foreman is the spark plug of the industrial machine; if he is not working properly, the machine cannot run smoothly. It is certainly true that the foreman can make or break the spirit of the machine operator or the men under him more quickly than any one else in the organization. In fact, the whole policy of a concern toward its manuufacturing force is largely interpreted or misinterpreted by its foremen.

"Reduction of the percentage of non-productive labor is not well known to the foreman, and, in fact, in some plants little attention is paid to it. Nevertheless, it has a tremendous bearing on the profits of the company.

"It requires considerable explanation and teaching to make the foremen realize what the non-productive labor is and how it can be controlled. The non-productive hours should be maintained in proper proportion to the productive hours at all times. When the foremen are properly trained and have the opportunity to share in the results of better management, they will

Foundry Congress at Barcelona

High Spots of International Meeting, Which Included Exposition of Equipment and Products

(*Special Correspondence*)

THE International Congress of Foundrymen, the annual meeting of European foundry associations, was opened on the morning of April 11 at Barcelona, Spain, as was also the exposition of foundry equipment and products connected with it. The affair was a rather brilliant one, the Crown, the interested ministries, the Province of Catalonia, the city of Barcelona and the Spanish foundrymen being represented by their high dignitaries, some of whom appeared in uniform, brilliantly decorated with orders and attended by a military guard at attention flanking the speakers' platform. The hall was in the palace Victoria Eugenia, one of the buildings now being erected for the Barcelona Exposition in 1929, of superb construction on classic lines and for permanency. The exhibition, therefore, had an ideal housing.

The customary speeches of welcome were given by the hosts, with replies from the representatives of the foundry interests and associations of Great Britain, France, Germany, the United States, Italy, Czechoslovakia, Belgium and Holland. The session was then adjourned, and the exhibition was officially inspected. This, while not very large, nevertheless indicated the growing importance of the foundries of Spain, for many of its important plants displayed fine examples of their work for inspection and study.

Only a few molding machines, and these German, were in evidence. One exhibit attracted special attention in that a combination machine for sifting, tempering, pan-grinding and aerating floor sand for re-use was seen in operation. Among the many castings of automobile cylinders, steel castings for frogs and switches, malleable castings as good as we have them in the United States, and particularly arc castings of cast iron, bronze and aluminum, there were some sections of 2-in. cast iron spiral pipe for chemical purposes showing three convolutions, with about a 3-ft. diameter for the coil and some very good core work to give uniform thickness throughout.

The afternoon of the day was spent in visits to the Hispano-Suiza automobile works, inspecting its shops and foundries, and to the Government foundries for making castings for land and sea purposes.

The first business session convened on April 12, in the morning, and was taken up entirely in reading the following papers:

"Molding Sand Tests," by D. José Cañameras.
"The Cupola Heat Balance," by J. Ferrer Figueras
"Determining the Humidity of Molding Sands by Their Electric Conductivity," by Dr. V. Ferer.
"Molding and Pouring a Locomotive Cylinder," by J. Salgado.
"Foundry Molding Sands," by G. Masson and H. Compere.
"Microscopic Study on the Influence of Phosphorus on Annealed Cast Iron," by Richard Bazant.
"Note on a New Test Piece for Cast Steel for Light Work," by G. Lely.
"Present-Day Cast Iron and Its Improvement," by Dr. Richard Moldenke.
"Nickel in Cast Iron," by Dr. Arthur Everest.

Most of these were discussed, some at great length. As a rule, the discussion drifted back to cupola practice and kindred shop subjects. About 250 members of the congress attended the meetings, the total registration exceeding 320 before the close of the week.

The second session, on the morning of April 13, took up the following papers:

"Three Communications Connected with the Study of Molding Sands," by Dr. V. Prever.
"Improving Our Methods for Diminishing the Cost of the Cupola Returns," by Leon Thomas.
"Study of Present-Day High-Test Cast Iron, and Furnace Control in Making It," by Dr. O. Langenohl.
"Production of Modern High-Test Cast Iron," by Amador G. Soto.
"The Revival of Cast Iron," by M. Jaime Coll.
"Test Pieces for Non-Ferrous Metals," by I. Sans Dernis.

In the afternoon, visits were made to the steel casting plant of La Compañía para la Fabricación de Contradores, where a 5-ton electric furnace heat of steel was poured into mine car wheels, and the heat treatment of manganese steel frogs and switches made in the establishment was observed. Afterward there was a visit to the Fábrika Sert, where gas meters are made in quantity.

In the evening there was a brilliant reception to the members of the congress and their ladies in the Palace of Deputies, the Governor of the Province of Catalonia receiving. This will be long remembered by those who attended, the great palace being of beautiful architectural design, with frescoes depicting historical occurrences, stately rooms with paneled walls and ceilings, and gold and color everywhere. The Governor, who is a Spanish grandee and the essence of courtliness, conducted the guests through all the chambers and gave a final collation. At noon there had been a special luncheon for the prominent visitors and foundrymen of Spain at the Ritz, which also proved a delightful function.

The third business session, and the closing of the congress, was enlivened during the reading of the second paper by a heavy detonation in the exhibition. A reservoir for compressed air had suddenly blown up and gone through the roof, smashing a large skylight. Fortunately no one was near and only one man was injured by the flying glass. It seems that this reservoir had been poorly welded and the whole bottom came off suddenly, the rest of the tank going straight upward. The following papers were read:

"The Control of Foundry Products," by Professor Portevin.
"Testing Cast Iron," by A. Plana.
"The Use of Cast Iron in Railroad Construction," by J. Manuel Lacleta.
"Study of the Relation of Tensile to Flexure Tests on Cast Iron," by J. Serrat Y Monastre.
"Observations on Iron Bars Embedded in Cast Iron," by Professor Dresden and D. Stoffel.
"Criticism of Methods for Determining Carbon in Iron Products," by Llamas del Toro.
"A Study of Foundry Technical Terminology," by J. M. España in collaboration with A. de Sequeria.
"A Laboratory for a Small Foundry," by F. Cuesta.
"The Fundamental Properties of Brass," by M. F. Ladreda.
"Proposed Classification of Analyses and Tests of Cast Iron," by M. Serrano.

The customary thanks and expressions of felicitations were interchanged, and the International Congress of Foundrymen then adjourned, London being the city selected for next year.

In the early afternoon the banquet was held, which proved another brilliant affair. Lieut. Col. Don César Serrano presided and the Governor was guest of honor. The speeches indicated the best of international feeling among foundrymen, and much may be expected from this annual interchange of technical foundry information. The following morning the party of 52 foundrymen and their ladies started on a tour through Spain to extend as far south as Seville.

Placing Marketing Costs on Sound Basis

Selling Does Not Receive Attention Given to Production—13-Month Calendar and Unemployment Also Considered at Management Meeting

THE costing of marketing activities, operation of the 13-month work calendar and the unemployment situation were among the topics considered at a meeting of the financial executives' division of the American Management Association, held at the Hotel Pennsylvania, New York, April 26 and 27.

Of particular interest was a discussion of the now widely used distribution methods in the manufacturing industries, which were characterized by J. P. Jordan, of Stevenson, Harrison & Jordan, New York, consultants on business problems, as being unnecessarily expensive, and, in most cases, lacking in the careful analysis and equitable proportioning of costs which are usually found in production activities.

Marketing Functions Classified

In suggesting a sound method for the proper costing of marketing activities, Mr. Jordan stated that the principal functions should first be classified roughly into the following groups: Market research, or an investigation of where and in what volume goods may be sold; sales promotion or the use of demonstrations and other methods of interesting the public in a product; advertising and publicity; warehousing and shipping; statistical work; sales engineering or definite technical assistance in the use or consumption of a product, and direct selling activities in the various branches. The speaker pointed out that these classifications are not arbitrary, but may be generally adhered to in the marketing of any nationally consumed line of goods.

In costing these various functions Mr. Jordan declared that as many as possible should be charged directly to the branch office in which the activity is carried on and a complete profit and loss statement prepared for each district. As the result of this the direct cost of selling may be obtained and also the expenses of headquarters expended in market research, national advertising, etc., may be arrived at. Similarly the cost of sales made may be deduced and finally the unit cost of sale for each item. Further division may be made to indicate the cost of sales for each product and in this manner specialties and established staples may be classified as to cost of marketing.

It is usually necessary, the speaker went on to explain, to have a standard sales cost for each item, for, as is true in the steel industry, the cost of manufacture varies in different seasons of the year, depending upon the rate of operation. This enables the management to arrive at a definite trading margin below which no company should be willing to take orders even at the risk of losing business.

Proportioning General Expense to Branches

Proportioning of general sales expenses to individual branch offices was characterized by the speaker as one of the most difficult problems in marketing and one of the reasons for allocating as much of the distribution expenses as possible directly to the branches. The general expenses, he said, cannot be prorated on the basis of sales, for one office may be selling very heavily and yet not be deriving as much benefit from national advertising, market research, etc., as another branch whose sales have become unusually light. National advertising, he pointed out, may usually be charged to the total volume of goods advertised. For expenses in general, Mr. Jordan expressed himself as in favor of prorating on the basis of orders, values and quantities sold, the allocation necessarily being adjusted to meet unusual conditions and figured on a definite basis without guesswork or estimating.

J. T. MacBain, Union Carbide & Carbon Corporation, New York, suggested a comparison of branch offices with the different departments in the plant and thus allocating expenses, but Mr. Jordan pointed out that plant departments are not called upon to meet competitive conditions and other problems which confront the distributing departments.

What Is Accomplished

With the organization of marketing activities as outlined by Mr. Jordan, it is possible to obtain a monthly record of costs of sales offices and branches, a complete record of sales at each branch and gross profits by branches, the sales of each product and class of products, the cost per unit of branch selling expense, the ratio of all sales to branch office sales and the unit selling cost of each product. With the aid of these figures the management is able to allocate sales to individual office, to make use of a definite sales quota plan, to budget the various branch expense accounts, to compare the actual results of sales and expenses to quotas and budgets, to prepare charts showing compliance with quotas and budgets, to institute a fair and equitable bonus plan and to discover what lines are not profitable.

Results of 13-Month Work Period

ADVANTAGES and disadvantages of the 13-month work calendar, as based upon the experience of some 40 companies now using the plan, were outlined in a report by M. B. Folsom, assistant to the chairman Eastman Kodak Co., Rochester, N. Y. As the result of a questionnaire sent to about 70 companies in the United States now using the 13-month calendar in one form or another, Mr. Folsom learned that two companies had been using the simplified calendar for 30 years or more. Ten introduced it in the period from 1911 to 1916; 12, during the next five years, and 15 after 1922. The extra day at the end of the year is sometimes inserted at the end of each thirteenth period, while some companies find it more convenient to add an extra week to the last period every six years. Nearly all the companies using the plan base all their internal records upon it, but in most cases statements to the trade are sent upon the customary dates in the old calendar and accounts payable are paid in the same way. Many companies, however, have made arrangements with banks, vendors and companies supplying light, power, etc., to render statements upon the desired dates in the new calendar. Books are usually closed at the end of the periods, this having led to one disadvantage on account of the unevenness of quarters. To eliminate this inconvenience, a few companies have discarded the practice of quarterly closings, and others have been able to secure all desired results by the use of cumulative closings for comparative purposes.

Advantages and Disadvantages

A large percentage of the companies replying to Mr. Folsom's questionnaire reported little or no difficulty in introducing the new calendar, and listed its principal advantages as the facilitating of comparisons of business, plant operations, etc.; elimination of split payrolls; assistance in budgeting; ending of month at end of week; fixed number of days in month and flexibility of accounts.

The disadvantages of the system, most of which arise on account of the use of two different calendars at the same time, would be largely eliminated by the general adoption of the calendar, according to Mr. Folsom, and also to a consensus of opinion of the companies now using the 13-month plan.

Representatives of several companies operating 13-month work calendars told of their experiences with the introduction and use of the new system and all reported complete satisfaction. L. J. Stewart, comptroller Western Clock Co., LaSalle, Ill., stated that his company had used the simplified calendar for more than 30 years and mentioned most of the advantages listed above as having been derived from its use.

Paul H. Wilson, secretary Graton & Knight Co., Worcester, Mass., said that his company had introduced the 13-month calendar simultaneously with a new accounting system in 1918 and that the results had been very satisfactory. He pointed out that a few inconveniences were met in the first year or two on account of the difficulty of making comparisons with the previous years, but that such disadvantages were automatically overcome as the plan continued in use.

World-Wide Movement to Introduce New Calendar

At the close of the session the plans now under way to secure world-wide adoption of the 13-month calendar were outlined. It was pointed out that the League of Nations at a recent meeting had asked all the Governments of the world to appoint committees to obtain the trend of public opinion in the various countries regarding calendar revision. After the results of the work of these committees have been accumulated a World Congress will be called to compare results, and if favorable to the new plan, to arrange for its universal adoption. It was predicted by some exponents of the revised calendar that present progress indicates its general adoption on Jan. 1, 1933.

Unemployment Analyzed

AN analysis of the present unemployment situation by Dr. H. W. Moorhouse, president Brookmire Economic Service, Inc., New York, was the feature of the luncheon meeting on Friday. Dr. Moorhouse estimated the number of persons unemployed through lack of economic activity as of March, 1928, at 2,632,000. Although this figure is considerably higher than the 1,466,000 of unemployed which he estimated for 1927, it is considerably below the 3,653,000 who were forced into idleness in 1921. He saw no immediate economic danger in the situation and stated that conditions had probably improved somewhat since March, when the last estimate was available.

Dr. Moorhouse derived the above figures by assuming a number of years over a period of the last 19 as periods of full employment owing to the high level of business activity. These years were 1910, 1912, 1917, 1920, 1923 and 1926. The percentage of total population employed was computed for these years and percentages for intervening years interpolated on a straight line and used for computing full employment for intervening years. Actual employment for each year was computed from data taken from a number of official and unofficial sources, and according to the speaker, enough actual figures were obtained to secure a definite index of activity. Unemployment was taken as the difference between the probable maximum employment and actual employment during the year. It does not allow for numbers idle during years of exceptionally high business activity.

Adjustment Is Principal Cause

Dr. Moorhouse pointed out that, although it is true that a certain number of workers were annually thrown out of employment on account of the so-called mechanization of industry, economic adjustment invariably followed which enabled these persons to find a livelihood in other lines of work. The fact that this adjustment usually followed slightly behind the actual mechanical progress of industry, he declared, would account for a certain normal unemployment, an average of 874,000, or 2 per cent, as computed over a 19-year period. A more basic reason, however, for such periods of unemployment as we are now passing through is the business cycle, and so long as the business cycle exists the number of unemployed will fluctuate with it.

Although it is possible to alleviate unemployment to a slight extent by stimulating activity on public works and other projects, Dr. Moorhouse stated that he did not believe this would ever lead to any definite solution of the problem. When appropriations have been made and plans prepared it will be impossible to await a period of unemployment before undertaking a project and likewise work of this sort cannot be created indefinitely at such times.

ORES BECOMING LEANER

Iron Content in 1927 at Lowest Point in 10 Years; Moisture Was High

LAKE SUPERIOR ore decreased in average iron content over 0.5 per cent last year, being 51.19 per cent iron, natural, as compared with 51.75 per cent in 1927. This is the lowest in the past 10 years, as shown in an annual report of the Lake Superior Iron Ore Association, containing tables of ore analyses of all grades and for all ranges and including also the content of phosphorus, silica, manganese and moisture. The highest iron content in the 10-year period was 52.07 per cent, in 1921, which was a very poor tonnage year and during which shipments were more generally confined to the richer grades of ore.

The moisture content increased last year to 11.31 per cent from 10.78 per cent in 1926, and with the exception of 1919 was the largest in the 10-year period. This may have been in part due to the fact that less ore was washed last year than during the preceding year, the percentage of moisture being less in washed than in unwashed ore.

While the percentage of silicious ore was virtually the same as during the previous year, more silicious ore running high in silica was shipped last year than in 1926. The iron content of silicious ore dropped 2.50 per cent to 37.29 per cent, and the silicon content of this ore increased nearly 5 per cent, or from 33.58 per cent to 38.35 per cent. This evidently explains an increase of 0.25 per cent to 8.60 per cent in the average silicon content of all ores. The phosphorus content increased from 0.101 per cent to 0.105 per cent and manganese from 0.80 per cent to 0.84 per cent.

Bessemer ore last year had an average iron content of 54.67 per cent, compared with 55.16 per cent in 1926. Low-phosphorus non-Bessemer ore, comprising over 61 per cent of the total ore shipped, declined in iron content from 51.39 per cent in 1926 to 51.03 per cent last year. In the Mesabi district low-phosphorus non-Bessemer decreased in iron content from 50.94 per cent to 50.40 per cent. High phosphorus non-Bessemer decreased from 51.11 per cent to 50.86 per cent. Manganese ore was the only grade to show a gain in iron content, increasing from 42.64 per cent in 1926 to 42.81 per cent last year.

Taking the ore by ranges, the iron content of that mined on the Mesabi range was 51.47 per cent last year, compared with 52.16 per cent in 1926. On the Gogebic range there was a decline from 52.97 per cent to 52.30 per cent, on the Marquette range a decrease from 50.07 per cent to 49.40 per cent, and on the Cuyuna range from 43.53 per cent to 43.05 per cent. The Menominee range showed an increase from 50.30 per cent to 50.52 per cent, and the Vermilion range an increase of from 58.22 per cent to 58.47 per cent.

Commercial Aviation in the United States

Express and passenger air routes in the United States are placed at 7265 miles in a statement prepared by David Gregg, research engineer AC Sparkplug Co., Flint, Mich. Mail routes measure 7763 miles, and the total length of commercial air routes is 12,627 miles. On these routes 3264 planes are operating, with 3584 pilots licensed. Last year 2011 new commercial planes and 365 military and naval planes were built, a gain of 98.4 per cent over the 1926 output. The largest production by any company was 454 units.

By June 30 air mail planes will be flying 25,000 miles daily. With 80 station stops, these planes will be serving trade areas which include a population of over 62,000,000 persons.

Electrochemists Hold Spring Meeting

Electric Annealing and Melting of Non-Ferrous Products Reviewed—Refractories for Electric Brass Furnaces—New Officers

WITH a registered attendance of about 275 members and guests, the fifty-third meeting of the American Electrochemical Society at the Stratfield Hotel, Bridgeport, Conn., last week, April 26, 27 and 28, was one of the largest the society has held. A variety of subjects, covered by the presentation and discussion of over 30 papers, attracted electrochemists and metallurgists from many industries and localities. One day's sessions were devoted to industrial electric heating, another to a symposium on the chemical production of electricity, at which 18 papers covered the technical and theoretical problems of batteries of all kinds, and a third to the electrodeposition of metals. Besides these there was a round table luncheon on "Refractories for Electric Brass Melting."

Electric Annealing of Non-Ferrous Products

The session on industrial electric heating was held jointly with the National Electric Light Association. Unfortunately there were only two papers in this field finally offered at this session, others originally provided for not being available. The two papers presented dealt with recent important developments in the non-ferrous industry—one the electric annealing of non-ferrous metals and the other, the melting of nickel-silver in high-frequency furnaces.

Taking as his subject "Annealing of Non-Ferrous Metals in the Electric Furnace," Robert M. Keeney, industrial heating engineer Connecticut Light & Power Co., Waterbury, Conn., presented a picture of the latest developments in this field, particularly in Connecticut, where the manufacture of non-ferrous products is a leading industry. For annealing such products the author stated that there are now 27 electric furnaces and annealing machines in that State with an installed capacity of 5865 kw., distributed among 15 plants. These furnaces are used for the annealing of brass condenser tubes, seamless brass tubing, brass shells, brass eyelets, aluminum tubing, nickel-silver stampings and for the bright annealing of copper tubing.

Little progress has been made, says Mr. Keeney, in the application of electric heating to the breaking-down operations of the brass rolling mill, but it is proceeding rapidly on the lighter products which require more finishing. For this class of work the electric furnace has proved more economical than oil or gas, in many cases resulting in an annual return of 50 per cent on the investment. The failure to apply them in rolling mills is due, says the author, to failure to consider economies in over-all cost which electric annealing may produce.

The author discusses the various types of furnaces suited to brass, copper and nickel-silver products. For annealing brass tubing two methods are used: Passing an electric current through it, an adaptation of the Snead machine, and the use of the muffle furnace. For bright annealing of copper tubing the electric water-sealed furnace has proved satisfactory.

Discussion

Discussing this paper, E. W. Beardsley, furnace engineer American Brass Co., Waterbury, Conn., said: "The question is asked, why have no Connecticut manufacturers installed electric furnaces for the rolling and drawing of brass, copper and nickel-silver into sheets, heavy tubing and wire? It is suggested that the answer lies in a failure to investigate the advantages to be gained. This seems to be a common belief among electric furnace salesmen and other engineers who are not acquainted with the manufacturers' conditions. Connecticut manufacturers have installed electric furnaces for the annealing of non-ferrous products other than small tubing. There are various reasons why they have not gone further in that direction. To begin with, I know of no such manufacturer who can buy electric energy for 1c. per kwhr., including demand charges.
